20. In a coin-operated vending-machine, the combination, with a clock-works mechanism and an endwise-movable rock-shaft having a retracting device, of a coin-lever held to said shaft and provided with lateral fingers or support on which the coin lodges, a coin chute or guide into which the lever coin-support passes, and a spring sustaining the lever, when actuated by a coin, in position either to allow or to prevent operation of the clock-works, and connected at one end to the lever and connected at its other end to a plate adjustable for setting the lever by the spring relatively to a coin, and a tripping mechanism of the clock-works which the lever controls, substantially as herein set forth.

21. In a coin-operated vending-machine, the combination of a coin-lever held to an endwise-movable shaft provided with a retracting device and a radial pin, a notched disk or plate on said shaft, and a tappet in a clock-works mechanism adapted to stop at said disk and work through its notch when the coin-lever is tilted, a pin on one of the clock-works wheels, a trip-lever having tappet-arms, one engaged by the clock-works pin and the other engaging the coin-lever shaft, said coin-lever having a lateral support on which the coin lodges, a coin chute or guide in the coin-passage of which the coin-lever support moves while sustaining the coin, and a spring connected to the coin-lever and sustaining it prior to delivery of goods through the medium of the clock-works, which the tilting of the coin-lever trips into action, substantially as described, for the purposes set forth.

22. In a coin-operated vending-machine, the combination, with a coin chute or guide having side slots *l l*, of a coin-lever K, fulcrumed at an even balance by a rock-shaft *k'* and provided with fingers *k k*, said shaft having a notched disk J *i* and a pin R, a trip-lever operated by clock-works and shifting the coin-lever shaft endwise, and a bowed spring K', connected at one end to a suitable support, as the clock-works frame, and connected at its other end to the coin-lever to sustain it and trip the clock-works and a connected goods-delivery mechanism into action, substantially as herein set forth.

23. In a coin-operated vending-machine, the combination, with a coin chute or guide having side slots *l l*, of a coin-lever K, having fingers *k k* entering said slots and geared to start a clock-works and goods-delivery mechanism by its tilting movement, and a spring K', connected at one end to the coin-lever and connected at its other end to an adjustable plate S, substantially as described, for the purposes set forth.

24. In a coin-operated vending-machine, the combination, with a coin-chute and a coin-receiving lever movable bodily to discharge coins from it, of a rod movable by or through the insertion of a coin at the chute and provided with an arm opposing the coin-lever, substantially as described, whereby when the rod is turned by inserting a coin the coin-lever will be moved bodily to discharge a counterfeit coin or other substance previously lodged thereon, as and for the purposes set forth.

25. In a coin-operated vending-machine, the combination, with a case having a coin-admitting slot and a coin-chute, a valve closing said slot, and a coin-receiving lever movable bodily to discharge a coin from it, of a rod movable axially and provided with an arm normally closing the coin-slot valve and provided with another arm opposing the coin-lever, substantially as described, whereby when the coin-slot valve is opened by a coin inserted in the chute the rod will be operated to shift the coin-lever and discharge a counterfeit coin or other substance from it, substantially as herein set forth.

26. In a coin-operated vending-machine, the combination, with a case having a coin-admitting slot and a coin-chute, of a rod T, having an arm *t*, extending to be acted on by or through the medium of a coin passed into the slot for turning the rod axially, a spring T' on said rod normally retracting it, and a laterally-movable lever adapted to tilt after receiving a coin from the chute, said rod T having an arm opposing and giving bodily movement to the lever to discharge a coin or other substance from it each time the rod is actuated by inserting a coin, substantially as herein set forth.

27. In a coin-operated vending-machine, the combination, with a case having a coin-admitting slot and a coin-chute, of a valve closing the slot and having an inclined or cam face, a rod T, having an arm *t*, extending for operation by the valve to turn the rod axially through the medium of a coin passed into the slot, and a laterally-movable lever lowered by receiving a coin from the chute, said rod T having an arm opposing and giving bodily movement to the lever to discharge a coin or other substance from it each time the rod is actuated by inserting a coin, substantially as herein set forth.

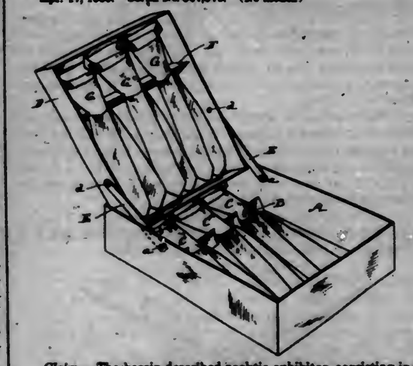
28. In a coin-operated vending-machine, the combination, with a coin-chute, and a laterally-movable coin-lever lowered by receiving a coin, and having lateral fingers or coin-support entering the coin-passage of the chute, and adapted by its downward movement to trip a goods-delivery mechanism into action, substantially as specified, of a rod T, having an arm extending to be acted on by or through the medium of a coin passed into the coin-chute for turning the rod axially, said rod also having an arm opposing the coin-lever and shifting it laterally to discharge a coin or other substance from it each time the rod T is operated, substantially as herein set forth.

29. In a coin-operated vending-machine, the combination, with a clock-works mechanism operating a goods-delivery mechanism and a rod T, having an arm extending to be acted on by or through the medium of a coin passed into a coin-chute for turning the rod axially, said rod having an arm or tappet *v*, substantially as specified, of a tappet *x*, carried by a shaft of the gearing which actuates the goods-delivery mechanism, and a toothed wheel W, actuated from the clock-works, and which is turned as the goods are delivered, said wheel W having an arm *w*, which intercepts the rod-tappet *v* when the last piece of goods is sold from the machine, and thereby locks the coin-slot against insertion of coins, substantially as herein set forth.

30. In a coin-operated vending-machine, the combination, with a clock-works mechanism operating a goods-delivery mechanism consisting of one or more slides reciprocating at the goods-boxes and actuated by tappets driven from the clock-works mechanism, substantially as specified, of a tappet *x*, rotated by or from the goods-delivery mechanism, a rod T, having an arm extending to be acted on by or through the medium of a coin passed into a chute for turning the rod axially, said rod having a tappet *v*, a toothed wheel W, which the tappet *x* turns one tooth each time one package of goods is delivered, and a tappet *w* on the wheel W, which intercepts the rod-tappet *v* when the last piece of goods is sold from the machine, and thereby locks the coin-slot against insertion of coins, substantially as herein set forth.

31. In a coin-operated vending-machine, the coin-chute made with a passage having opposite edge walls presented to the edges of a coin, a side wall holding the coin between these opposite edge walls, and a ledge fixed to one edge wall and forming another partial opposite side wall, leaving a space m^2 next the other edge wall for exit of coins, wires, or other bodies from the chute, substantially as herein set forth.

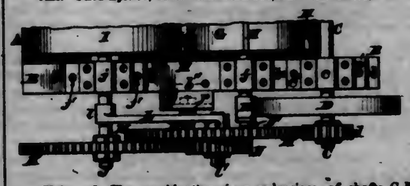
32. In a coin-operated vending-machine, the coin-chute made in zigzag form, with a correspondingly-shaped coin-passage having opposite edge walls presented to the edges of a coin, a side wall holding the coin between these opposite edge walls, and a ledge fixed to one edge wall and forming another partial opposite side wall, leaving a space m^2 next the other edge wall for exit of coins, wires, or other bodies from the chute, and a cutter, as m^3, located at one or more angles or bends of the chute, substantially as herein set forth.



34. In a coin-operated vending-machine, the coin-chute made with strips $m' m^3$, held to a suitable backing, and a ledge or wall m^4, held to the strip m^3 and overhanging the coin-passage, but providing a side slot m^2 next the strip m', substantially as herein set forth.

35. In a coin-operated vending-machine, the coin-chute made in zigzag or sinuous form, with strips $m' m^3$, held to a suitable backing, said strips $m' m^3$ arranged at opposite edges of the chute at necessarily lower angular sections of it, and ledge or wall sections m^4, held to the strips m^3 and overhanging the coin-passage, but providing side slots m^2 next the strips m', substantially as described, for the purposes set forth.

36. In a coin-operated vending-machine, the coin-chute made in zigzag or sinuous form, with strips $m' m^3$, held to a suitable backing, said strips $m' m^3$ arranged at opposite edges of the chute at necessarily lower angular sections of it, ledge or wall sections m^4, held to the strip m^3 and overhanging the coin-passage, but providing side slots m^2 next the strip m', and a cutter m^5, held at one or more angles of the chute, substantially as herein set forth.

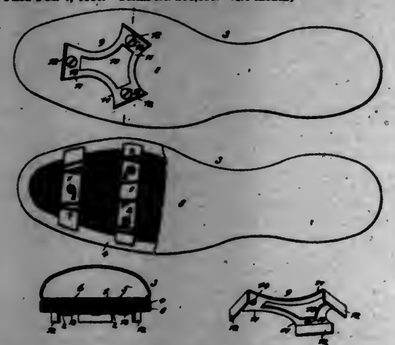


37. In a coin-operated vending-machine, the casing of its mechanism provided with a coin-deposit box or drawer and with a goods-delivery tray, and a removable section having hook and-eye connection with the fixed section thereof, and a lock whose projected bolt locks the removable section by opposing a hook, substantially as herein set forth.

412,470. NECKTIE-BOX. JOSEPH COHN, New York, N. Y. Filed Apr. 17, 1889. Serial No. 307,576. (No model.)

Claim.—The herein-described necktie-exhibitor, consisting in the outer or main box A, having a series of necktie-supports between its ends, the inner shallower box also having a series of necktie-supports, and opposite links E between the sides of the two boxes and pivoted at their forward ends, as at *c*, to the sides of the box A toward its outer end, and pivoted at their inner ends, as at *d*, to the inner ends of the sides of the inner box D, whereby, when the inner box is raised and swung forward until its inner or lower end passes the pivots *c* and the necktie-supports, its bottom will rest against the forward end of the outer box, substantially as shown and described.

412,471. CLAY-PULVERIZER. JONATHAN GERAGHTY, Cincinnati, Ohio. Filed Apr. 13, 1889. Serial No. 307,162. (No model.)

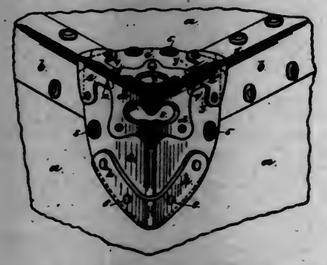


Claim.—1. The combination, in a pulverizer, of shafts C F J, driving-wheel D, wheel E, pinions *d* N, spur-wheels K M, vertically and longitudinally shiftable radius-rod L *l*, stud-shaft *l'*, and a fastener, as P, for retaining said rod at any specific adjustment, the spur-wheel

M and pinion N being journaled on said stud-shaft *I*, for the purpose described.

2. The combination, in a pulverizer, of cylinder G, blade H, slots *h h'*, bolts E E', and adjusting-screws S S', which screws bear against the inner edge of said blade, for the purpose described.

412,472. BASE-BALL SHOE. WILLIAM CRESSE, Brooklyn, N. Y. Filed Feb. 7, 1889. Serial No. 299,289. (No model.)

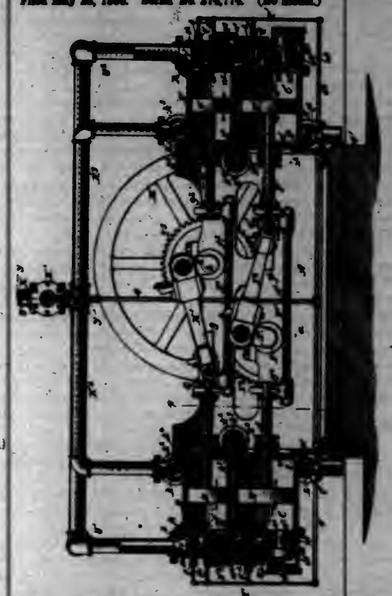


Claim.—1. A base-ball shoe constructed with metallic plates located between the insole and the sole of the shoe, with their ends resting beneath the welt, and having internally-screw-threaded lugs projecting through the sole of the shoe for attachment of the screws of the spike-plate, substantially as shown and described.

2. A base-ball shoe constructed with the narrow metallic plates 1, formed with internally-threaded lugs 2, the plates 1 extending across the sole of the shoe, with their ends resting against the welt 4 and secured by threads 7 to the insole 6 of the shoe, and the lugs 2, projecting through the sole 8 of the shoe, substantially as shown and described.

3. The combination, with a shoe 3, constructed with narrow metallic plates 1, secured between the insole 6 and sole 8, with their ends resting against the welt 4, and internally-threaded lugs 2, projecting through the sole 8, of a spike-plate 9, formed with the arms 11, having spikes 12, and secured to shoe 3 by screws 13 engaging the lugs 2, substantially as shown and described.

412,473. TRUNK-CORNER. GEORGE CROWN, New York, N. Y. Filed Apr. 15, 1889. Serial No. 307,260. (No model.)



Claim.—1. The trunk-corner, of rawhide or vulcanized fiber, in two parts, in combination with metallic corner and angle frames covering the lap-joint of the two-part corner, and secured by rivets with said two-part corner to the body of the trunk, substantially as set forth.

2. The trunk-corner, of rawhide or vulcanized fiber, in two parts, in combination with corner and angle frames covering the lap-joint of the two-part corner, and secured by rivets with said two-part corner to the body of the trunk, and a metal strap *h*, covering and conforming to the lower edge of the corner-piece, substantially as set forth.

3. The combination, in a trunk-corner, with the two-part rawhide or vulcanized-fiber corner *c c'*, of the corner-frame *d* and the angle-frames *e e'*, said corner-frame having concave ends 9, and said angle-frames having one end 10 tapering and a projection or lip at *f* upon the other end, the corner-frames and angle-frames covering and protecting the lap-joint of the two-part rawhide or vulcanized-fiber corner, substantially as and for the purposes specified.

412,474. AIR-COMPRESSOR. URIAH CRESSLER, Buffalo, N. Y. Filed May 28, 1888. Serial No. 274,774. (No model.)

Claim.—1. The combination, with a high-pressure and a low-pressure actuating cylinder and the pistons working in the same, of steam-valves whereby steam is admitted into the high-pressure cylinder, exhausted therefrom into the low-pressure cylinder, and discharged from the low-pressure cylinder, air-valves whereby the air is admitted into the low-pressure cylinder and from the latter into the high-pressure cylinder and discharged from the latter, a fly-wheel shaft rotated from said pistons, and valve mechanism, substantially as described, whereby the steam-valves are actuated from said shaft, substantially as set forth.

2. The combination, with the high-pressure cylinder and the low-pressure cylinder arranged side to side, pistons working in the same, and connecting mechanism, substantially as described, whereby the pistons are caused to move in opposite directions, of a steam-induction valve, an intermediate steam-valve, and a steam-exhaust valve, all arranged at one end of said cylinders, and an air-inlet valve, an intermediate air-valve, and air-discharge valve, all arranged at the opposite ends of said cylinders, substantially as set forth.

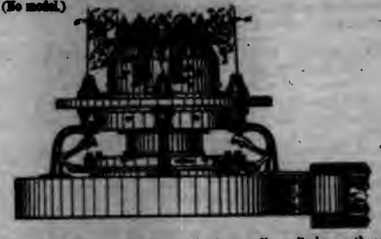
3. The combination, with a pair of high-pressure and low-pressure cylinders arranged side to side at each end of the machine and the pistons working in said cylinders, of two geared shafts arranged between the two pairs of cylinders, one shaft connected with the pistons of the high-pressure cylinders and the other shaft with the pistons of the low-pressure cylinders, steam-induction valves, intermediate steam-valves, and steam-exhaust valves arranged at the inner ends of the cylinders, and air-inlet valves, intermediate air-valves, and air-discharge valves arranged at the outer ends of the cylinders, substantially as set forth.

4. The combination, with a compressing-cylinder provided with a cylindrical air-inlet passage having air-inlet openings in its side, of a cylindrical air-valve arranged in said passage and provided at its outer end with an enlarged piston, a cylinder in which said piston moves, a valve-chamber, ports connecting said valve-chamber with the piston-cylinder on opposite sides of the piston, and a valve arranged in said valve-chamber, whereby a fluid under pressure can be admitted to the cylinder on either side of the piston, substantially as set forth.

5. The combination, with the low-pressure cylinder provided with an air-inlet valve, a high-pressure cylinder, a positively-controlled intermediate valve whereby the compressed air is excluded from and admitted to the high-pressure cylinder, and a check-valve arranged in the air-passage between the intermediate valve and the low-pressure cylinder, substantially as set forth.

6. The combination, with the low-pressure cylinder provided with an air-inlet valve, a high-pressure cylinder, a positively-controlled intermediate valve whereby the compressed air is excluded from and admitted to the high-pressure cylinder, a check-valve arranged in the air-passage between the intermediate valve and the low-pressure cylinder, and an air-inlet valve connected with the high-pressure cylinder and admitting external air thereto, substantially as set forth.

7. The combination, with the compressing-cylinder, of an air-inlet valve provided with an actuating-piston, a cylinder in which said piston moves, a valve whereby the flow of the actuating-fluid to and from opposite ends of the valve-cylinder is controlled, valve-gear whereby said valve is actuated, and an automatic regulator whereby the fluid-pressure can be shut off from said valve, thereby suspending the action of the air-inlet valve and allowing it to be opened and to remain open for the passage of air in both directions until the fluid-pressure is again applied, substantially as set forth.



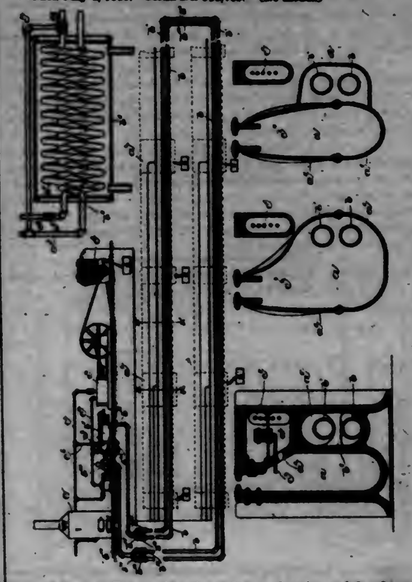
8. The combination, with the air-compressor and its steam-supply pipe, of the regulator-casing connected with the steam-supply pipe and provided with steam-inlet openings v^3 and steam-outlet openings v^4, a piston-valve adapted to open and close said openings and receiving the steam-pressure in the casing on its front side, and the air-pipe V^2, admitting the compressed air to the valve-casing on the rear side of the valve, substantially as set forth.

9. The combination, with the compressor and its steam-supply pipe, of a regulator-casing receiving steam from said pipe, a piston-valve arranged in said casing, and whereby the steam-passage is opened and closed, an air-pipe connecting said casing with a conduit containing compressed air, whereby the air-pressure tends to move the valve in the direction in which the steam-passage is closed, while the steam-pressure tends to move the valve in an opposite direction, and a stop whereby the closing movement of the valve is limited, substantially as set forth.

10. The combination, with the compressor, its steam-supply pipe and its air-valves and their actuating mechanism, of the regulator-casing connected with the steam-supply pipe and provided with steam inlet and outlet openings, a piston-valve arranged in said casing, an air-pipe admitting compressed air to the casing on one side of said valve, a hollow stem projecting from the opposite side of said valve and receiving steam from the casing, a chamber receiving the steam from the hollow stem, and a pipe conducting this steam to the actuating mechanism of the air-valves, substantially as set forth.

11. The combination, with the compressor, its steam-supply pipe, its air-valves, and their actuating mechanism, of the regulator-casing provided with steam inlet and outlet openings v^3 v^4, and an air-pipe V^2, a piston-valve arranged in said casing and provided with a hollow stem *w*, having steam-inlet openings w^2, an adjustable sleeve *w'*, surrounding the open end of the hollow stem and provided with steam-passages w^4, a steam-chamber surrounding said steam-passages, and a pipe O, connecting said chamber with the actuating mechanism of the air-valves, substantially as set forth.

412,475. THREAD-GUIDING DEVICE FOR KNITTING-MACHINES. HENRY CHEEK, Little Falls, N.Y. Filed Jan. 26, 1889. Serial No. 297,269. (No model.)



Claim.—1. In combination with the needle-cylinder, a thread-guide support of circular form in cross-section of its body sustained at the outside of the needle-cylinder, a bracket provided with a corresponding circular eye and mounted thereby on the aforesaid support and adapted to turn thereon toward and from the needle-cylinder, and a set-screw clamping the thread-guide in its position, substantially as described and shown.

2. In combination with the needle-cylinder and reciprocating needles, the bracket C, formed with the lugs C C', perforated in line with each other, the tube *t*, inserted in the lug C', the set-screw *u*, retaining the tube in the lug, and the arm *a*, extending from the bracket and provided with a passage through which the thread runs, as set forth and shown.

3. In combination with the needle-cylinder and reciprocating needles, the ring B, of circular form in cross-section of its body, sustained at the outside of and concentric with the needle-cylinder, brackets O O, provided, respectively, with a circular eye *b'*, and mounted thereby on the aforesaid ring, set-screws *b b*, attached to the brackets and engaging the ring, and tubes *t t* on the brackets and having their inner ends over the path of the needles, substantially as described and shown.

412,476. ELECTRIC CONDUIT. JAMES P. CROMPTON, Beverly, Mass. Filed July 8, 1889. Serial No. 316,725. (No model.)

Claim.—1. The combination, with an electric conduit, of a main and return circulating-pipe extended the length of the conduit to convey a heating medium to heat the said conduit, a heater connected to said pipes, and a pump to maintain a circulation through the said heater and circulating-pipes, whereby the electric conduit is heated, substantially as described.

2. The combination, with an electric conduit having a slot-chamber, a communicating accessible chamber, and an auxiliary chamber, of circulating-pipes located in said auxiliary chamber, a heater connected to said pipes, and a pump to maintain a circulation through said heater and pipes, substantially as described.

3. The combination, with an electric conduit having a slot-chamber, a communicating accessible chamber, and an auxiliary chamber, of circulating-pipes located in said auxiliary chamber, a heater consisting of an inclosing-case b^2, connected to said circulating-pipes, and heating-coils b^3 b^3, located within said case, and a pump to maintain a circulation through said heater and pipes, substantially as described.

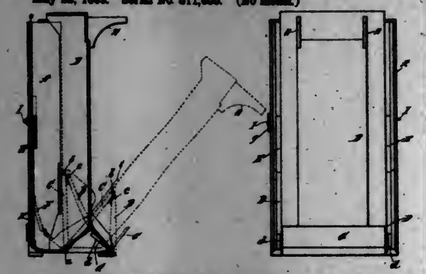
4. The combination, with two electric conduits laid side by side, of circulating-pipes for each conduit connected at the terminal of the conduit, a heater connected to said pipes, and a pump to maintain circulation of fluid through said pipes, substantially as described.

412,477. WIRE-DRAWING MACHINE. FRED H. DANIELS, Worcester, Mass. Filed May 24, 1888. Serial No. 311,988. (No model.)

Claim.—1. In a wire-drawing machine, a spool and an operating-drum for supporting and revolving the spool at uniform speed as the coil of wire thereon increases, a guide for directing the wire onto the spool, and means, substantially as described, for moving said guide, in combination with a series of wire-drawing dies and rotatable draft-pulleys arranged for reducing the wire in continuous successive order.

2. In a wire-drawing machine, the combination, with the series of wire-drawing dies and draft-pulleys, of a winding-on spool, an advance draft-pulley between the finishing-die and spool, and a traversing guide for leading the wire onto the spool.

3. In a wire-drawing machine, the combination of a spool, an operating-drum for revolving the spool by peripheral contact with the



barrel of the spool or wire wound thereon, and an advance draft-pulley disposed between the spool and the final wire-drawing die for exerting the strain required for drawing the wire, substantially as set forth.

4. In a wire-drawing machine, the combination of a spool, an adjusting support or hanger for retaining the spool-axis, and an operating drum or roll for revolving the spool at uniform peripheral speed as the coil of wire thereon increases in diameter, as set forth.

5. In a wire-drawing machine, the combination of a spool and operating drum for revolving the spool by peripheral contact, a hanger for maintaining the spool in proper relation to the drum, and a spring for giving pressure of the spool against the surface of the drum, substantially as and for the purpose set forth.

6. In a wire-drawing machine, the combination, with a series of wire-drawing dies and draft-pulleys, of a spool for winding the finished wire, an operating-drum for revolving said spool by peripheral contact, an adjustable frictional operating-wheel for imparting rotative motion to said drum, and means, substantially as set forth, for adjusting said frictional operating-wheel for varying the speed of the drum, as and for the purpose set forth.

412,478. FOLDING BED. JACOB DAVIS, Brooklyn, N. Y. Filed May 22, 1889. Serial No. 311,603. (No model.)

Claim.—1. In a folding bed, the combination of a stationary casing, a movable bed, hinge-arms connected with the bed and casing, and legs or props hinged near the upper or outer pivotal points of the hinge-arms, the same being arranged to touch the floor and transfer the weight of the bed from the casing to the floor, substantially as and for the purposes set forth.

2. In a folding bed, the combination of a stationary casing, a movable bed, hinge-arms connected with the bed and casing, and legs or props hinged upon said arms and arranged to touch the floor and transfer the weight of the bed thereto, substantially as and for the purposes set forth.

3. In a folding bed, the combination of a stationary casing, a movable bed, hinge-arms connected with the bed and casing, legs or props hinged near the upper or outer pivotal points of the hinge-arms, and guides or directors for said legs located in the spaces between the bed and casing, substantially as and for the purposes set forth.

4. In a folding bed, the combination of a stationary casing, a movable bed, hinge-arms connected with the bed and casing, legs or props hinged near the upper or outer pivotal points of the hinge-arms, the said legs or props arranged to touch the floor and transfer the weight of the bed thereto, and the vertically-moving back-board hinged upon the bed, substantially as shown and described.

5. In a folding bed, the combination of the casing A, bed B, pivoted thereto, the head-board pivoted to the head of the bed and provided with projections *h h'*, a rod I, revolubly attached across the back of the casing and provided with a doubly-notched catch adapted to engage the projections *h h'*, said rod having also one end bent at an angle, and a spring-plate attached to the side of the casing, adapted to engage with the angle end of the rod, substantially as shown and described.

412,479. HANDLE FOR TOOLS OR OTHER ARTICLES. CHARLES A. DAVIS, Washington, D. C. Filed Nov. 9, 1888. Serial No. 290,378. (No model.)

Claim.—The herein-described method of fitting handles to the head, which consists in forming or providing the handle with a body of material capable of being rendered plastic, softening said material, grasping the same in the manner of grasping it in use, applying pressure sufficient to cause the material to conform accurately to the hand or hands, and, finally, causing or permitting the material to harden.

412,480. PUMP. JOHN O. DAVIS, Hartford, Conn. Filed Jan. 6, 1887. Serial No. 223,503. (No model.)

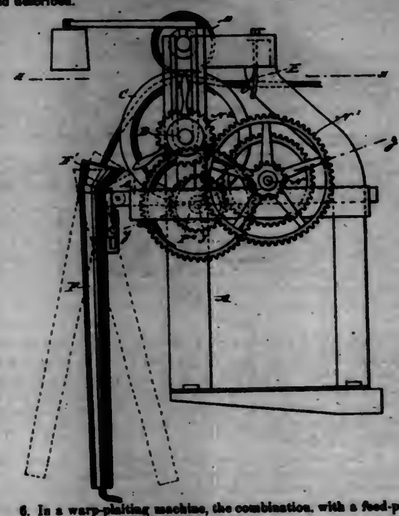
Claim.—In combination with a pair of suction and forcing pumps, a frame-work chambered out to form a common reservoir to supply both pumps, and having a suction-duct leading from the chamber to each pump, a valve seated in each suction-duct with an upward-projecting stem fitting a socket in the frame-work to insure its seating itself properly, a channel leading from one suction-duct to the other, a valve seated in an enlargement of said channel, said valve having a portion of its stem threaded to fit a threaded socket in the frame-work, with its end projecting beyond the frame-work and terminating in a handle, whereby the capacity of the connecting-channel may be regulated by turning the handle of the valve-stem, substantially as described, and for the purpose specified.

412,481. HYDROCARBON-BURNER FOR FURNACES. JOHN B. DENIS, Terre Haute, Ind., assignor of one-half to John C. Watson, same place. Filed Aug. 9, 1888. Renewed Aug. 15, 1889. Serial No. 320,794. (No model.)

Claim.—1. A hydrocarbon-burner consisting of a suitable retort or pan having a curved top, and a portion thereof elevated and provided with an escape opening for the generated gases, and also having air-inlet K and liquid-fuel-supply pipe, in combination with a steam or air injector, whereby a current of steam or air may be injected into the ignited gases to increase the draft and insure perfect combustion, substantially as specified.

2. The combination, with a furnace, of a hydrocarbon-burner having a curved top and a portion thereof elevated and provided with an opening at the apex of the elevated portion, and the same also having inlet K, a suitable liquid-fuel-supply pipe, and an injector, whereby air or steam may be injected into the said furnace into the ignited gas or vapor, substantially as specified.

412,482. WARP-PLAITING MACHINE. CLAYTON DAVIS, Philadelphia, Pa. Filed July 15, 1889. Serial No. 317,510. (No model.)



Claim.—1. The combination, with a vibrating tube or warp-guide, of mechanism for moving the tube or guide simultaneously slowly in a direction at right angles to its vibratory path, substantially as set forth.

2. The combination, in a warp-plaiting-down machine, with the warp tube or guide, of mechanism for vibrating the tube and simultaneously moving it slowly in a direction at right angles to the direction of its vibrations, and mechanism for changing the said two movements and vibrating the tube at right angles to its first vibrations and moving it simultaneously slowly at right angles to its first slow movement, substantially as set forth.

3. The combination, in a warp-plaiting-down machine, with the warp tube or guide, of mechanism for vibrating the tube and simultaneously moving it slowly in a direction at right angles to the direction of its vibrations, and an automatically-operated mechanism for changing the said two movements and vibrating the tube at right angles to its first vibrations and moving it simultaneously slowly at right angles to its first slow movement, substantially as set forth.

4. In a warp-plaiting machine, the combination, with a tube and a warp-feeding mechanism discharging the warp into the said tube, of means, substantially as described, for vibrating the tube and simultaneously moving it slowly in a direction at right angles to the direction of its vibrations, and mechanism for changing the said two movements and vibrating the tube at right angles to its first vibrations and moving it simultaneously slowly at right angles to its first slow movement, as described.

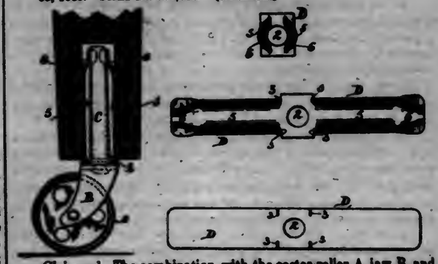
5. In a warp-plaiting machine, the combination, with a feed-pulley mounted to rotate and a tube mounted to swing in two directions at right angles to each other and into which discharges said feed-pulley, of a mechanism operated in conjunction with the said feed pulley and serving to impart an alternate fast and slow sidewise motion to the said tube, and a mechanism operated in conjunction with the said feed-pulley and serving to impart an alternate slow and fast transversely-swinging motion to the said tube, substantially as shown and described.

6. In a warp-plaiting machine, the combination, with a feed-pulley mounted to rotate and a tube mounted to swing in two directions at right angles to each other and into which discharges said feed-pulley, of a mechanism operated in conjunction with the said feed-pulley and serving to impart an alternate fast and slow sidewise motion to the said tube, a mechanism operated in conjunction with the said feed-pulley and serving to impart an alternate slow and fast transversely-swinging motion to the said tube, and means, substantially as described, for alternately shifting said mechanisms from a fast to a slow motion, as set forth.

7. In a warp-plaiting machine, the combination, with a tube mounted to swing longitudinally and transversely, of a heart-shaped cam mounted to rotate, connections between the said cam and tube to impart to the latter a transverse swinging motion, a cam-wheel rotated simultaneously with the said heart-shaped cam, connections between the said cam-wheel and tube to impart to the latter a longitudinal swinging motion, and means, substantially as described, for rotating the said heart-shaped cam and the said cam-wheel slowly and fast alternately, as set forth.

8. In a warp-plaiting machine, the combination, with a tube mounted to swing longitudinally and transversely, of a heart-shaped cam mounted to rotate, connections between the said cam and tube to impart to the latter a transverse swinging motion, a cam-wheel rotated simultaneously with the said heart-shaped cam, connections between the said cam-wheel and tube to impart to the latter a longitudinal swinging motion, gear-wheels connected with the said heart-shaped cam and the said cam-wheel for imparting an alternate fast and slow motion thereto, and a clutch mechanism for connecting the said gear-wheels with and disconnecting them from the said heart-shaped cam and cam-wheel to reverse said motion, substantially as shown and described.

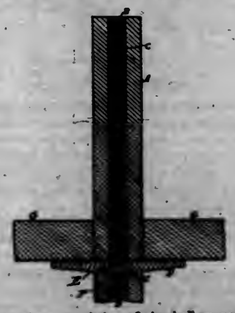
9. In a warp-plaiting machine, the combination, with a tube mounted to swing longitudinally and transversely, of a heart-shaped cam mounted to rotate, connections between the said cam and tube to impart to the latter a transverse swinging motion, a cam-wheel rotated simultaneously with the said heart-shaped cam, connections between the said cam-wheel and tube to impart to the latter a longitudinal swinging motion, gear-wheels connected with the said heart-shaped cam and the said cam-wheel for imparting an alternate fast and slow motion thereto, a clutch mechanism for connecting the said gear-wheels with and disconnecting them from the said heart-shaped cam and cam-wheel to reverse said motion, and means for shifting the said clutch mechanism, as set forth.



412,483. ADJUSTABLE CLEVIS-ARM FOR ICE-PLOWS. HERMAN F. DURRELL, Athens, N. Y. Filed Nov. 30, 1888. Serial No. 292,949. (No model.)

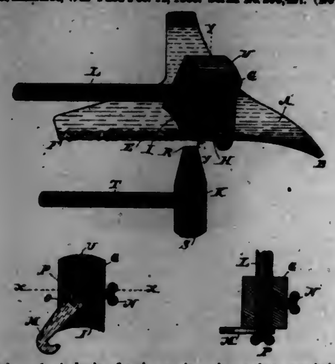
Claim.—1. The combination, with an ice-plow having an inclined clearing-tooth with a point located beyond the forward end of the plow-beam, of a vertically-swinging arm pivoted at its rear end to the forward end of the plow-beam and projecting beyond the same clevis at the forward end of the projecting arm located in advance of the point of the clearing-tooth, and means for holding the projecting arm in vertically-adjusted position, substantially as shown and described.

2. The combination, with the ice-plow 1, having the inclined clearing-tooth 2' projecting beyond the forward end of plow-beam 3, of the vertically-swinging arm 4, consisting of bars 5, connected at their forward end by a bolt 6 and 7, and pivoted at their rear end to a bolt 8 on the forward end of plow-beam 3, with depending arms 12 located adjacent to their rear end and having curved slots 13, a bolt 14, passing through beam 3 and slots 13, with a nut 16 and washer 17, and a clevis 11, mounted on bolt 6, substantially as shown and described.



412,484. CASTER. ALBERT R. DEN, Brooklyn, N. Y. Filed Apr. 15, 1889. Serial No. 307,311. (No model.)

Claim.—1. The combination, with the caster-roller A, jaw B, and pintle C, of a sheet-metal socket formed in one piece, having a flat caster with a hole 2 through it, and the end portions bent into semicircular tapering troughs and brought together at their upper ends for receiving and supporting the pintle C, substantially as set forth.



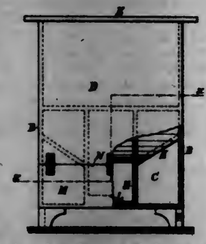
2. The sheet-metal socket for a caster-pintle, formed of sheet-metal in one piece, having a central hole 2, notched at 3, bent to form semicircular troughs at 5, and having the contracted semicircular bearings at 6, with the edge portions of the sheet metal projecting outside the semicircular bearings and adapted to be received within the hole in the bedstead or other leg, substantially as set forth.

412,485. COMPOUND FIRE-PROOF BEAM. WILLIAM H. DRAKE, Chicago, Ill. Filed June 1, 1889. Serial No. 312,863. (No model.)

Claim.—A column consisting of the hollow wood portion and a metal post cemented within the same and the post extending below the wood portion, in combination with a girder-iron provided with a socket to engage the lower end of the iron post, and the girder-iron provided centrally on its under side with a projection to engage the top end of a lower metal post which is below the top end of the wooden portion, as and for the purpose specified.

412,486. DEVICE FOR SHARPENING PLOW-POINTS. JOHN BIRT, Amherst, Wis. Filed Feb. 11, 1889. Serial No. 299,427. (No model.)

Claim.—1. A device for sharpening plow-points, consisting of a metal anvil having a straight edge, a handle, and a hook rigid to the handle, the handle being so fitted into the anvil as to be revolubie therein, substantially as described.



2. An anvil for sharpening plow-points, constructed of metal and having a straight edge H, a concave face I, a revoluble handle L, and a hook M, the hook being rigid to the handle, and the handle being capable of adjustment in the anvil by means of a thumb-screw N, substantially as described.

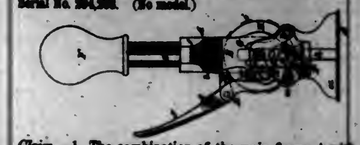
3. An anvil for sharpening plow-points, having a concave face I and a convex face U, in combination with a revoluble handle, and hook M rigid thereto, substantially as described.

4. In a device for sharpening plow-points, a metal anvil having a face or faces adapted to bear against the side of a plow-point, and a hook secured adjustably to a handle revolubie in the anvil, the hook being provided with a slot and secured to the handle by means of a thumb-screw passing through the slot and turning into the handle, whereby the hook is made adjustable, substantially as described.

5. A device for sharpening plow-points, consisting of an anvil having a straight edge H, a concave face I, and a hook M, rigid on a handle revolubie in the anvil, in combination with a hammer having a narrow flat face R and a large flat face S, substantially as described.

412,487. COAL-RECEPTACLE. EDWARD S. FARLEY and MILFORD R. STRONG, Jersey City, N. J. Filed Dec. 24, 1888. Serial No. 294,497. (No model.)

Claim.—1. The box-shaped receptacle having bottom A, sides B, back C, front D, and a swinging flap M between the lower edge of the front and the bottom A, in combination with the vertical partitions H, having inclined upper edges, and the inclined partitions G and K, resting upon such partitions H and forming a hopper-shaped bottom to the coal-receptacle, with an opening at the back and between the partitions H, substantially as specified.

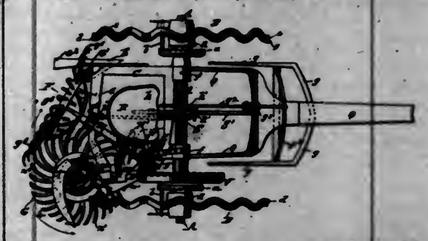


2. The box-shaped receptacle having bottom A, sides B, back C, front D, and a swinging flap M between the lower edge of the front and the bottom A, in combination with the vertical partitions H, having inclined upper edges, and the inclined partitions G and K, resting upon such partitions H and forming a hopper-shaped bottom to the coal-receptacle, with an opening at the back and between the partitions H and the ledge L at the front part of the bottom and between the partitions H, substantially as specified.

412,488. LABEL ATTACHMENT FOR CIGAR-BOXES. GARDNER H. FREEMAN, Syracuse, N. Y. Filed May 27, 1889. Serial No. 312,302. (No model.)

Claim.—The combination, with the box, of a label pasted at its back lengthwise to the inner side of one of the vertical walls of the body of said box, and having its main portion free and adapted to sustain itself independently in an erect position above the box, and to fold across the top of the interior of the box on a line parallel with and in proximity to the top edge of the box, substantially as described and shown.

412,489. CONSECUTIVE-NUMBERING MACHINE. WILLIAM A. FORCE and WILLARD W. SAWYER, Brooklyn, N. Y. Filed Dec. 31, 1888. Serial No. 294,302. (No model.)



Claim.—1. The combination of the main frame A with the sliding frame B, having the shaft G, pad-yoke P, having arms Q, that straddle the frame B, and the plates R, having slots *v*, said plates being pivoted each at one end to the arms Q and at the other end to the frame A, the shaft G, passing through the slots *v*, whereby as the shaft G is depressed the pad-yoke P will be moved to one side, substantially as described

2. The combination of the frame B, having shaft G, and the disks H, carried by said shaft, with the lever J, pivoted in the frame B, said lever having projections S, and with the pad-yoke P, having arms Q, that straddle the frame B, the projection S on the lever J being adapted to engage the pad-yoke and to push said pad-yoke from the disks H, substantially as herein shown and described.

3. The combination of the frame A, sliding frame B, and spring E, with the shaft G, type-disks H, disk-actuating lever J, inking-pad O, pad-yoke P, slotted plates R, pivots *t u* of said plates, and with the projection S on lever J, as specified.

412,490. POTATO-DIGGER. ELIAS T. FOSS, Stillwater, N. Y. Filed Feb. 3, 1881. Serial No. 26,267. (No model.)

Claim.—1. In a potato-digging machine, an earth-penetrating rotary digging-wheel having tines bent backward from their shank ends on curved inclines and divergent in reverse direction to their rotation and terminated in spirally-twisted ends turned toward the line of draft of the machine, substantially as and for the purpose described.

2. In a potato-digging machine, an earth-penetrating rotary digging-wheel F, having an incline-surfaced hub F' and tines f^3, bent backward from their shank ends on curved inclines and divergent in reverse direction to their rotation and terminated in spirally-twisted ends turned toward the line of draft of the machine, substantially as and for the purpose described.

3. In a potato-digging machine, an earth-penetrating rotary digging-wheel F, having an incline-surfaced hub F', with discharge-openings *m* through it, and armed with tines f^3, bent backward from their shank ends on curved inclines and divergent in reverse direction to their rotation and terminated in spirally-twisted ends turned toward the draft of the machine, substantially as and for the purpose described.

4. In a potato-digging machine, a rotary conveyer separator-wheel which is inclined from its outer highest portion to its lower lowest portion downwardly, inwardly, and forwardly, and has its tines divergent in reverse direction to their rotation, said conveyer discharging the potatoes and adhering substances laterally on one side of the machine, substantially as described.

5. In a potato-digging machine, in combination, a driving-gear V, a gear J, a diagonal shaft H, a supporting-frame C, and a rotary digging-wheel F, having tines f^3 bent backward from their shank ends on curved inclines, and divergent in reverse direction to their rotation, and terminated in spirally-twisted ends turned toward the line of draft of the machine, substantially as described.

6. In a potato-digging machine, in combination, a conveyer separator-wheel, a shielding and discharging diverter arranged transversely of the said wheel and the line of draft, and a backwardly and laterally inclined revolving shaft carrying the conveyer separator-wheel, substantially as and for the purpose described.

7. A rotary conveyer separator-wheel having all of its upper surface, outside its hub, on the same plane from its inner lowest point of contact with the ground to its upper outer highest point, in combination with a shielding and discharging diverter arranged transversely of the said wheel and the line of draft, substantially as and for the purpose described.

8. In a potato-digging machine, in combination, the supporting-frame C, hung to vibrate on the axle A, a diagonal shaft H, an oblique shaft I, a shaft J', inclined from its upper to its lower end from a vertical line both backwardly and sidewise, gears for operating said shafts, a rotary digging-wheel, and a rotary conveyer separator-wheel, substantially as described.

9. In a potato-digging machine, a rotary conveyer separator-wheel, a rotary digging-wheel, and the specified gearing for driving the wheel and separator and giving a relatively faster revolution to the separator than to the digging-wheel, substantially as described.

10. In a potato-digging machine, in combination, the frame C, carrying plows and digging and separator wheels, and hung on the axle, and having pendent hangers made in two parts, and the pole or tongue Q, substantially as described.

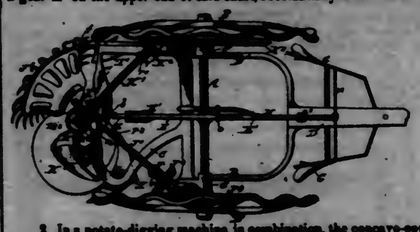
11. In a potato-digging machine, in combination, the frame C, hung on the axle A, compound lever S S', one part pivoted on the axle and extended under the pole or tongue, and also forming a standard for the driver's seat, and the other part connected to said frame, digging and separator wheels, and plows, substantially as described.

12. In a potato-digging machine, in combination, a vibrating frame C, hung upon and in rear of a transverse axle A, a tongue or pole pivoted to said frame, two supporting-wheels, one or both of which being capable of actuating the driving mechanism of the machine, a diagonal shaft H, gear V on the axle and gear J on the shaft H, a rotary digging-wheel which penetrates the earth to a depth sufficient for digging the potatoes out of the row and discharges the potatoes, vines, and other adhering substances obliquely on one side of the machine, and two plows D E, preceding the digging-wheel, for plowing, respectively, under the right and left sides of the potato row, substantially as described.

13. In a potato-digging machine, in combination, the axle A, supporting-wheels B, vibrating supporting-frame C, pivoted tongue Q, vine-gatherers *g g*, plows D E, digging and conveyer separator-wheels F G, shielding and discharging diverter T, gearing for operating said wheels, and levers and clutch for controlling the parts, substantially as described.

14. In a potato-digging machine, in combination, a vibrating frame C, hung on axle A and carrying digging and conveyer separator-wheels, and a plow E, having an adjustable sole-plate e^3 and arranged on the left-hand rear portion of said frame, whereby the frame with its attached parts is mainly sustained on the left side of the machine, and the plow and digging-wheel and separator-wheel can be adjusted to operate at different depths, substantially as described.

15. In a potato-digging machine, in combination, the plow E and a tined digging-wheel F on an inclined diagonal shaft, the tines of said wheel serving for clearing the plow-standard and its mold-board of vines and trash, substantially as described.



16. The traction-wheels having a serpentine rim *c* and extended in diameter by a narrow serpentine flange *d*, substantially as described.

17. In a potato-digging machine, in combination, a conveyer separator-wheel G and a backwardly and laterally inclined revolving shaft J' on one side of the machine, carrying said separator, substantially as described.

18. In a potato-digging machine, in combination, the main rotary conveyer separator-wheel G and the auxiliary separator U beneath it, substantially as and for the purpose described.

412,491. POTATO-DIGGER. ELIAS T. FOSS, Stillwater, N. Y. Filed Feb. 26, 1889. Serial No. 300,991. (No model.)

Claim.—1. In a potato-digging machine, in combination, the axle A, ratchet-connected traction-wheels B B, frame C, gears K^2 J^2, fixed on the axis, diagonal shafts J K', gears J^3 K^3 on said shafts, a rotary conveyer separator-wheel, shaft K^4, carrying said separator-wheel, and a gear K^5 on the upper end of said shaft, substantially as described.

2. In a potato-digging machine, in combination, the concave-convex conveyer separator-wheel set inclined to the horizon, an inclined shaft, a hinged frame, a diagonal shaft, gears on axle, and the traction-wheels, substantially as described.

3. In a potato-digging machine, in combination the concave-convex conveyer separator-wheel K and the transverse directing and discharging shield L, conforming on its under side with the concave form of the separator, substantially as described.

4. In a potato-digging machine, in combination, the concave outwardly and forwardly flared continuous-edged digging-wheel J, diagonal and inclined shaft J', hinged frame C, gears J^2 J^3 for operating said wheel, the axle A, and supporting ratchet-connected traction-wheels B B, substantially as and for the purpose described.

5. In a potato-digging machine, the concave outwardly and forwardly flared continuous-edged digging-wheel J, having spaced arms *p*, which are united forward of the wheel upon a conical hub and extended backward on segmentally curved and inclined lines upward and forward and united to the cutting-rim *j* of the wheel, the diagonal shaft J' for producing a rotary shearing cut with said wheel, gears J^2 J^3 for operating said shaft, a hinged frame C, an axle A, and ratchet-connected traction-supporting wheels, substantially as and for the purpose described.

6. In a potato-digger, in combination, a rotary concave conveyer separator-wheel and a continuous-edged rotary digger-wheel, each of said wheels being driven by an independent diagonal shaft, one of said shafts crossing the other, substantially as and for the purpose described.

7. In a potato-digger, in combination, the digging-wheel, inclined diagonal shaft J', hinged frame C, and adjustable bearing-box r^4, substantially as and for the purpose described.

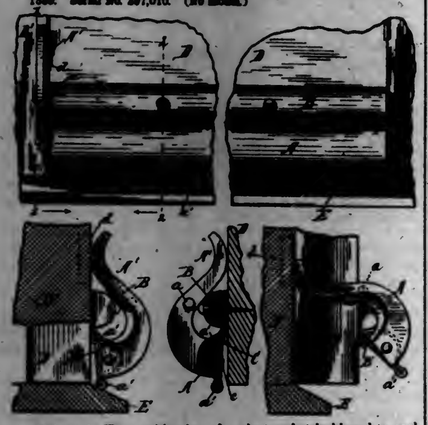
8. In a potato-digger, in combination, the double bearing-box bracket *n'*, hinged frame C, diagonal shaft K', and inclined shaft K^5, carrying the conveyor separator-wheel K, substantially as and for the purpose described.

9. In a potato-digging machine, in combination, the double mold-board I, provided with an upright rod *s* forward of its standard, a hinged frame C, and a revolving conveyor separator-wheel K in rear of the plow, substantially as described.

10. In a potato-digger, in combination, a hinged frame C, a left-hand plow I', having a pivoted sole-plate *f*, means for raising, lowering, and holding the heel of said sole-plate, a digging-wheel, a conveyor separator-wheel, and a right-hand plow I, substantially as and for the purpose described.

11. In a potato-digger, in combination, a digging-wheel, the conveyer separator-wheel, diagonal driving-shafts, a vertical inclined shaft, and gears which give the conveyor, separator, and the digging-wheel different speeds, substantially as described.

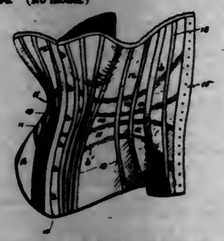
412,492. CAR-COUPLING. SIMON J. FREEMAN, Bradford, Pa. Filed Feb. 16, 1889. Serial No. 300,114. (No model.)



Claim.—1. A car-coupler comprising the draw-bar A, the horizontal hook E, pivoted to swing vertically on the front end of said draw-bar, the lever L, pivoted to the side of the draw-bar to swing at right angles to the hook E, and having its front end L' projecting forwardly alongside the hooked end F thereof, and a spring pressing the rear end of the said lever outward, substantially as set forth.

2. The combination, with a draw-bar having horizontal coupling-hooks on its front end pivoted to swing vertically only, of a spring-pressed lever pivoted on the side of the draw-bar to swing horizontally toward and from the hooked end of said coupling-hook, said

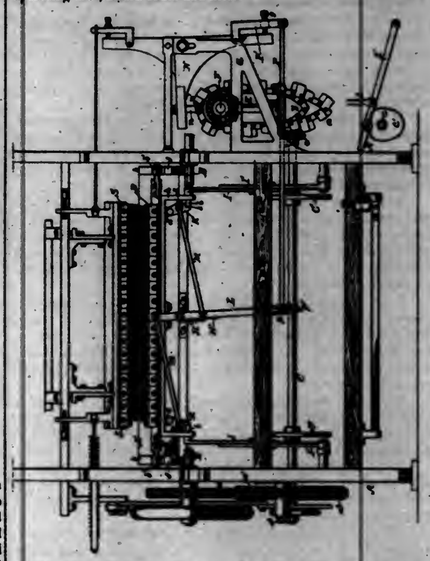
lever and hooked end being independent one of the other, substantially as set forth.



412,493. WEATHER-STRIP. WILLIAM H. PYE, Chicago, Ill., assignor of one-half to Frederick W. Meyer, same place. Filed Jan. 21, 1889. Serial No. 297,010. (No model.)

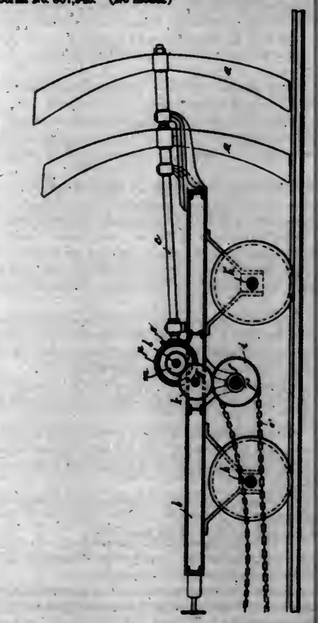
Claim.—1. The combination of a cleat and strip hinged to each other edge to edge, a spring connecting them so as to force their free edges out of their common plane, felt or other elastic material secured to corresponding sides of the strip and cleat and extending beyond the edge of the strip opposite to the cleat, and a lever rigidly secured to one end of the strip at right angles to the same, having its free end beveled or carved and having a stop on its side next to the strip and cleat, as and for the purpose stated.

2. The combination of the door D, the door-jamb D', the cleat B, secured to the door near its bottom, the strip A, hinged to the cleat on its lower edge, the spring C, connecting the cleat and strip and adjusted to throw the lower edge of the strip from the door, felt or other elastic material a', secured to like sides of the strip and cleat and to the lower edge of the strip, and the lever A', rigidly secured at one end to the strip at the end of the same next to the latch-edge of the door and adjusted to act across the said edge and to strike the door-jamb above the strip, substantially as and for the purpose specified.



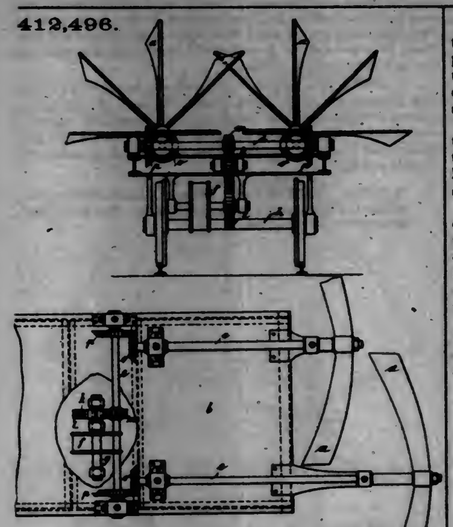
412,494. CORSET. THOMAS S. GILBERT, New Haven, Conn., assignor to Weingarten Brothers, New York, N. Y. Filed Mar. 7, 1889. Serial No. 302,396. (No model.)

Claim.—As an improved article of manufacture, a corset having the sides thereof built up of a transverse gore at the waist-line having oppositely-concaved longitudinal edges, a transverse gore at each side of the waist-gore of greater width than the said waist-gore, provided with a convexed inner longitudinal edge and a concaved outer opposite edge, and a gore of greater width than the intermediate gores at each side of the intermediate gores, having the inner longitudinal edge conforming to the concavity of the intermediate gores, substantially as shown and described.



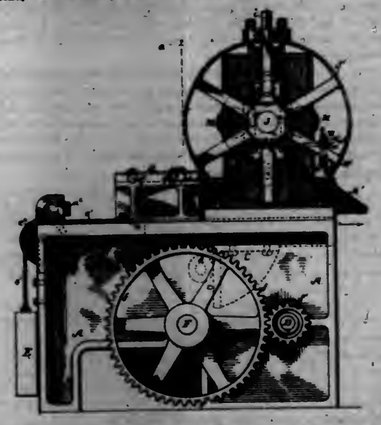
412,495. STRAIGHT-FRAME KNITTING-MACHINE. SAMUEL H. GOODMAN, Philadelphia, Pa., assignor to Conyers Button and Martin L. Finckel, both of same place. Filed Sept. 15, 1888. Serial No. 285,405. (No model.)

Claim.—1. The combination of the needle-bar of a knitting-machine, a reciprocating lifter therefor, a stopped jack, through the medium of which the lifter acts on the bar, a pattern-chain, means whereby the same is caused to adjust the jack, and mechanism for operating the pattern-chain and lifter.



2. The combination of the needle-bar of a knitting-machine, a guide-frame therefor, vertically-reciprocated lifters, stopped jacks carried by the needle-bar and adapted to engage with said lifters, a pattern-chain, and mechanism actuated thereby for adjusting the jacks, and means for operating said pattern-chain, substantially as described.

412,496. APPARATUS FOR CLEANING SNOW FROM RAILROAD-TRACKS. PAUL GRAHL, Berlin, Germany. Filed Apr. 20, 1889. Serial No. 307,943. (No model.)



412,496.

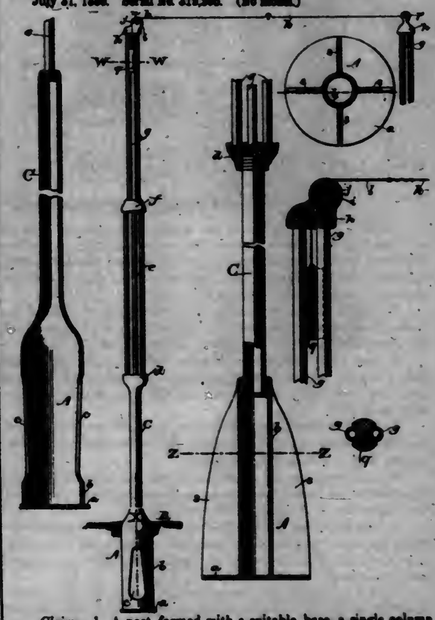
Claim.—1. A snow-plow consisting of a carriage having mounted thereon rotary shafts of different lengths and projecting forward from the carriage, helical blades mounted on the projecting ends of the rotary shaft, the blades on one shaft being in advance of and at one side of the blades on the other shaft, and a driving mechanism connected with the rotary shafts, substantially as shown and described.

2. A snow-plow consisting of the carriage *b*, the rotary shafts *c*, of different lengths, projecting forward from the carriage and mounted thereon, the pairs of helical blades *a* on the outer ends of shafts *c*, one pair of blades being in advance and at one side of the other, a gearing on the carriage *b*, connected with shafts *c*, and a pulley *f*, substantially as shown and described.

412,497. HORSESHOE-MACHINE. PETER F. GARNETTSON, Richmond, Va. Filed May 1, 1889. Serial No. 308,167. (No model.)

Claim.—1. The combination, in a horseshoe-hammering machine, of the hammers, the traveling table carrying the horseshoes to be hammered, said table having a projection or knee with which engages an arm on a disk or disks secured to a power-driven shaft, substantially as described.

2. The combination of the hammers, the moving table, mechanism for moving the same, said table carrying the horseshoes, pivoted levers for holding the said horseshoes on the table, with cam-plates so cut as to hold the shoe as it passes under the hammer and to release the shoe at the end of both the forward and backward movement, substantially as described.



3. The combination of the movable table having projections of the contour of the outside heel portion of the shoe, and having levers pivoted to said table, one arm of each of said levers bearing against the inner portion of the shoe and the other arm bearing upon the cam-faces of the cam-plates, the whole acting substantially as described.

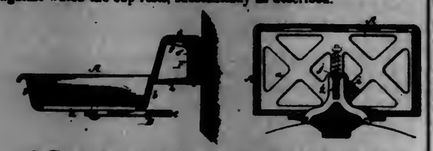
4. The combination, in a horseshoe-hammering machine, of the traveling table, and the hammers, with a beveling-die situated on the table in a position directly under the front portion of the shoe to be hammered, so that said shoe will receive the necessary inner bevel, substantially as described.

5. The combination of the table, the hammers, mechanism for operating the hammers and table, with a die for the shoe to be hammered, devices for retaining the shoe on the die with the finger pivoted to the head, so that the shoe to be removed can ride under said finger, but will be withdrawn on the return movement of the table, and devices for releasing the shoe on its return movement, substantially as described.

6. The combination, in a horseshoe-hammering machine, of the hammers with a traveling table carrying the shoe to be hammered, said table having water-passages, substantially as and for the purpose set forth.

412,498. METAL POST. GEORGE B. HALL, Malden, Mass. Filed July 31, 1888. Serial No. 282,266. (No model.)

Claim.—1. A post formed with a suitable base, a single column or tube rising from said base to the requisite height and terminating with a head formed to receive a plurality of rods or tubes, and one or more sections above said head, having a plurality of tubes or rods in each section, substantially as specified.



2. A metal post formed with a suitable base and subdivided into lengths or sections, the lower section being formed of a single tube or column, and the other and upper lengths being formed with a plurality of tubes or rods in each length, said several lengths being coupled together, in manner substantially as specified.

3. A metal post provided with a sheave or truck, pivoted and arranged in manner substantially as specified, and a weight arranged in and to be guided and supported by the post and to coact with said sheave, substantially in manner as specified.

412,499. SOAP DISH OR CUP. WILLIAM A. HAMILTON, Philadelphia, Pa. Filed Feb. 1, 1889. Serial No. 298,317. (No model.)

Claim.—1. The combination of the soap-cup having a projecting lip with a central depending lug and a removable plate provided with arms projecting beyond the under edge of the soap-cup, said projecting arms forming with the lug a support for the soap-cup when applied to a bucket or light receptacle, substantially as described.

2. The combination of the soap-cup having a lip with depending leg and a socket-piece having an orifice for the reception of the leg, and provided with projections at the top and base of said socket-piece, against which the cup rests, substantially as described.

3. The combination of the soap-cup with a lip having a central depending leg and a slotted adjustable plate removably secured to the under side of the soap-cup, substantially as described.

4. The combination of the soap-cup having a central depending lug with a slotted adjustable plate removably secured to the under side of the said soap-cup, and a spring to force the plate outward from the cup, substantially as described.

412,500. HEN-HOUSE. SOLOMON HARBAUGH, Geneva, Nebr. Filed Apr. 19, 1889. Serial No. 307,982. (No model.)

Claim.—1. In a hen-house, the combination, with the elevated entrance E, of the combined stairway and nest-boxes composed of the horizontal boards H, of different lengths, the vertical partition-boards I, formed with the openings *i*, and the rear boards J, formed with the openings *j*, substantially as set forth.

2. In a hen-house, the combination, with the floor M N, of the V-shaped supports O O', formed with the notches *o*, the hanger P, and the removable roost-bars W, substantially as set forth.

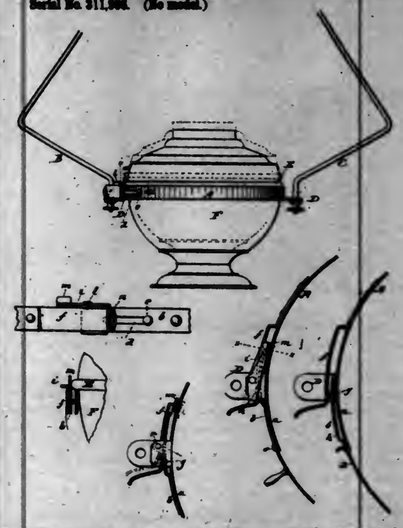
3. In a hen-house, the combination of the hinged longitudinal door S and the lever T, centrally pivoted to the inner side of the said door and formed with the wide end and the narrow end *t*, substantially as set forth.

4. In a hen-house, the combination of the hinged longitudinal door, the centrally-pivoted lever having the narrow and the wide ends, and the strip U, substantially as set forth.

5. In a hen-house, the combination, with the joists, of the floor composed of the loose wide planks and the narrow upper planks and the longitudinal door, substantially as set forth.

6. In a hen-house, the combination of the notched V-shaped supports, the roost-bars, the floor composed of the loose wide lower boards and narrow upper boards, and the longitudinal door, substantially as set forth.

7. In a hen-house, the combination, with the entrance, of the combined stairway and nest-boxes, the stairway leading from the same to the upper floor, the floor composed of the loose wide lower boards and the narrow upper boards, the notched V-shaped supports, the removable roost-bars, and the hinged door having the pivoted lever, substantially as set forth.



412,501. LIFT-PUMP. CHARLES A. HOLLAND, Maxton, N. C. Filed Apr. 20, 1889. Serial No. 308,073. (No model.)

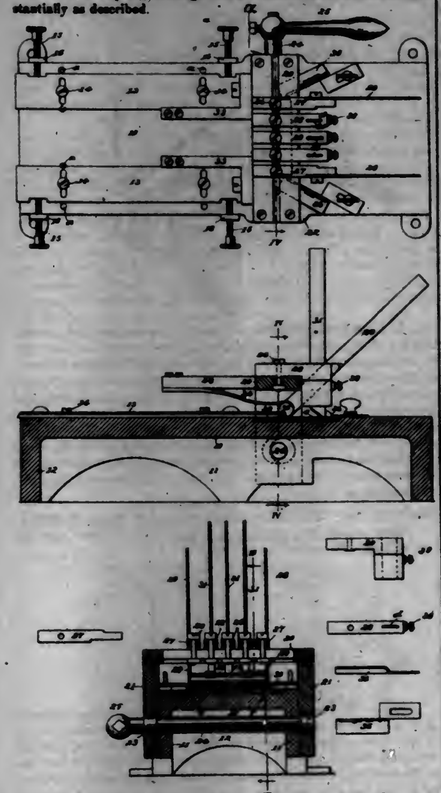
Claim.—1. A lift-pump having a valved piston provided with a conical seat, a poppet-valve thereon having its upwardly-extending stem loosely socketed in the lifter-head, and the two heads or disks with their coupling-rods, which form the cargeon or frame of said piston, the lower disk being of greater diameter than the upper and provided with a suitable packing.

2. A lift-pump having an inlet-valve frame formed with a conical seat, a double-disk poppet-valve located thereon, a plunger having a frame of tapering form, a conical elongated valve-seat thereon, a poppet-valve with a loosely-socketed upwardly-extending stem thereon, and a disk at the lower section of said frame provided with suitable packing.

412,502. HANGING LAMP. WILLIAM C. ROMAN, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed May 24, 1889. Serial No. 311,906. (No model.)

Claim.—1. In a hanging lamp, the ring for the support of the fount, divided, its ends overlapping, and adapted for expansion and contraction, the ring supported upon the frame, and the overlapping ends of the ring, the one provided with a latch and the other constructed to engage said latch when in the contracted position, substantially as described.

2. The fount-supporting ring of a hanging lamp, constructed from a strip of metal, its two ends overlapping, the one constructed with a circumferential slot and the other with a corresponding headed stud through said slot, to permit the expansion and contraction of the ring, combined with a spring-latch upon one end, the other end constructed for engagement with said latch when the ring is in the contracted position, substantially as described.



3. The fount-supporting ring of a hanging lamp, constructed from a strip of metal, its ends overlapping, combined with a latch upon one of said ends adapted to engage the other of said ends when in the contracted position, and a guard between the said latch and fount, substantially as described, and whereby when the fount is in place the said guard is brought into contact therewith to hold the latch in its engaged position, substantially as described.

4. The fount-supporting ring of a hanging lamp, constructed from a strip of metal, its ends overlapping, combined with a spring-latch upon one of said ends and adapted to engage the other of said ends when the ring is in the contracted position, a guard hung upon said ring to swing in a horizontal plane, one end of said guard adapted to bear upon the back of said spring-latch, the other end of said guard adapted to bear against the fount when the fount is set upon the ring, substantially as and for the purpose described.

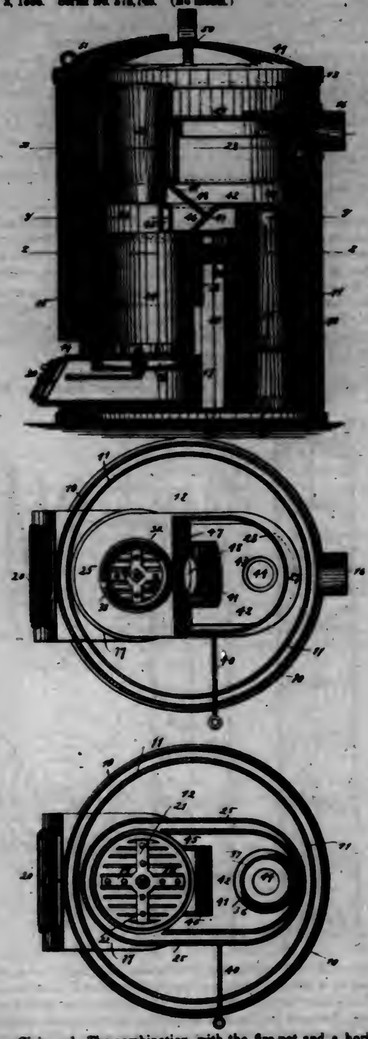
412,503. LEATHER-STRIPPING MACHINE. WILLIAM H. HOOPER, Brooklyn, N. Y. Filed May 29, 1889. Serial No. 312,492. (No model.)

Claim.—1. In a leather-stripping machine, the combination, with a base-plate, of a plate 20, arranged above the base-plate, blades carried by the plate 20, a friction-roller 35, arranged beneath the plate 20, and springs 34, arranged in connection with the roller, substantially as described.

2. In a leather-stripping machine, the combination, with a base-plate, of a plate 20, carried thereby, a plate 20, standards by which the plate 20 is supported, a shaft 24, eccentrics carried by said shaft and arranged to engage the standards, blades carried by the plate 20, a roller 35, and springs arranged in connection with the roller, substantially as described.

3. In a leather-stripping machine, the combination, with a base-plate, of guides 13, carried thereby, a plate 20, also carried by the base-plate and formed with recesses *c* and *c'*, a plate 20, a means for raising and lowering said plate, blades 29 and 31, brackets by which said blades are supported, adjustable connections between the brackets and plate 20, a roller 35, springs arranged in connection with the roller, and deflecting-plates 36, substantially as described.

412,504. CROCK-PRESS. MARTIN J. HOUSE, Akron, Ohio, assignor to the Akron Stoneware Company, same place. Filed Oct. 21, 1887. Serial No. 253,081. (No model.)



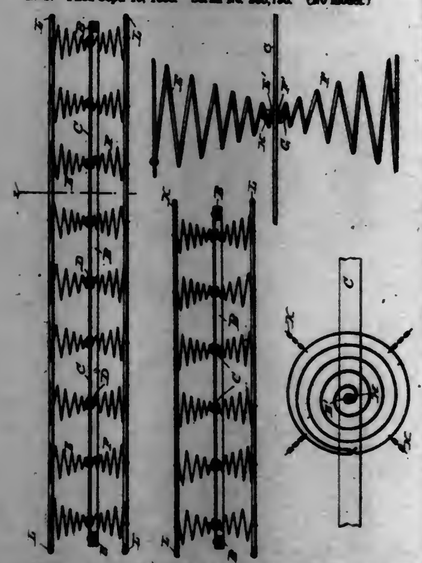
Claim.—1. In a press of the kind designated, the combination, with the lower cylinder-head and the mandrel suspended centrally therein and having for its base a revolving disk receiving motion from a shaft disposed centrally within said cylinder and mandrel, of a knife mounted in said disk capable of radial reciprocating movement and mechanism within said mandrel for communicating movement to said knife, substantially as shown and described, and for the purpose specified.

2. In a press of the kind designated, the combination, with the revolving disk forming the base of the mandrel and a knife arranged to slide radially in said disk and project beyond its periphery, of a cam to actuate said knife and devices for causing said cam to engage and actuate said knife, substantially as shown, and for the purpose specified.

3. In a crock-press of the kind specified, the combination, with the disk J, of the radially-sliding knife O, spring P, and movable cam R, all constructed and arranged substantially as shown, and for the purpose specified.

412,505. STOVE. DANIEL HUBBARD, Oswego, N. Y. Filed July 3, 1888. Serial No. 278,703. (No model.)

Claim.—1. The combination, with the fire-pot and a horizontal casing, forming a combustion-chamber, extending rearwardly from the fire-pot and provided with an outlet, of a burner in the rearward-projecting part of the said chamber and provided with spaced air-channels opening over the fire-pot, and a jacket surrounding the fire-pot provided with an air-inlet and connected with said channels, substantially as set forth.

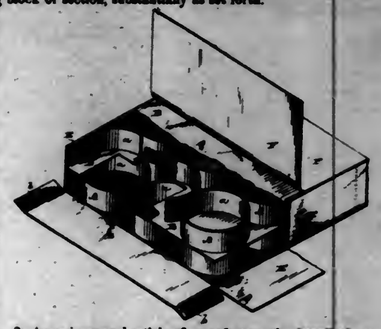


2. The combination, with the fire-pot and horizontal casing, forming a combustion-chamber, extending rearwardly from the fire-pot and having an outlet, of the horizontal burner having spaced air-channels opening over the fire-pot, an apertured partition dividing

the combustion-chamber above the burner and in rear of the fire-pot, and through which aperture the products of combustion pass to the outlet, and the jacket surrounding the fire-pot, open at its lower end to receive the air and connected with the burner to supply its channels with heated air, substantially as set forth.

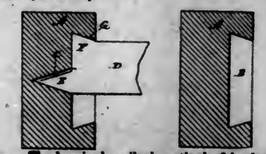
3. In a stove, the combination, with an inner and an outer cylinder, a fire-pot within the inner cylinder, an oblong casing supported above said fire-pot, extending horizontally beyond the same and forming the combustion-chamber, and a burner horizontally supported within the said combustion-chamber at one side of the fire-pot, provided with conducting-channels extending into the fire-pot and an aperture in the upper face, of an apertured partition dividing the combustion-chamber into two compartments, a jacket surrounding the fire-pot, an air-tube connected with said jacket and burner, a fire-tube provided with a ring surrounding the opening in the burner and passing downward within the air-tube to a connection with the space intervening the inner and outer casing, and means, substantially as shown and described, for introducing air between the jacket and the burner, as and for the purpose specified, whereby hot air is supplied to the products of combustion within the fire-pot and the escaping carbonic-oxide gas is consumed, as set forth.

4. In a stove constructed substantially as herein shown and described, the combination, with a fire-pot, and a casing supported above said fire-pot, extending beyond one side of the same and forming the combustion-chamber, of a burner supported in the said combustion-chamber, having tubular channels projected from the ends adjacent to the fire-pot and leading into the fire-pot, and a centrally-apertured partition resting upon said burner and the walls of the casing, dividing the chamber into two sections, and means for supplying air to said burner and conducting the products of combustion from the fire-pot, substantially as and for the purpose specified.



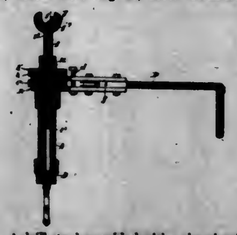
412,506. SPRING BED-BOTTOM. ANTHONY HUBER, New York, N. Y. Filed Sept. 19, 1888. Serial No. 285,790. (No model.)

Claim.—A reversible spring bed-bottom composed, as herein described, of a rectangular frame, metallic cross-strips, and substantially double-cone springs, wherein the said double-cone springs are each really made of two separate single-cone springs placed apex to apex on opposite sides of the said metallic cross-strips, and the apices of the opposite springs rigidly but detachably fastened to each other and to the interposed metallic strips by bolts, as and for the purpose specified.



412,507. NON-CONDUCTING LINING. OLIVER P. HUBBARD, Chicago, Ill., assignor to James P. Hunt, same place. Filed May 31, 1888. Serial No. 312,767. (No model.)

Claim.—1. As an improved article of manufacture, a series of cell-slices each consisting of a number of independent cells united at their contiguous external surfaces, arranged between and hermetically sealed by series of flat separating-plates, and the whole inclosed in and hermetically sealed by an outer covering forming a non-conducting block or section, substantially as set forth.



2. As an improved article of manufacture, the described non-conducting block or section, consisting of an outer covering of felt paper or analogous material and inner alternate layers of flat plates of straw-board or analogous paper-board coated with silicate of soda or analogous adhesive substance, and cell-slices of similar material, each slice consisting of a number of independent cells united together at their contiguous external surfaces by the said water-proof adhesive substance, and hermetically sealed by the said coated plates, the outer covering being coated at all points of contact with the inner series of plates and cell-slices with the said water-proof adhesive substance, substantially as set forth.

412,508. METHOD OF BORING UNDERCUT HOLES IN METAL. HENRY JAMES, New Haven, Conn. Filed July 15, 1889. Serial No. 317,583. (No model.)

Claim.—The herein-described method of boring holes undercut or of gradually-increasing diameter, consisting in first forming a cavity in the center of the surface where the hole is to be formed, the said cavity gradually diminishing in diameter corresponding to the increase in diameter required for the hole to be cut, then introducing the cutter so that one side may work upon the surface of the said cavity as a guide, while the cutter from the other side will operate upon the surface, the said cavity serving to force the metal radially against the cutter as the depth of the cut advances, substantially as described.

412,509. RATCHET-DRILL. GEORGE JOHNS and JOHN L. JOHNS, Chattanooga, Tenn. Filed Aug. 20, 1889. Serial No. 321,782. (No model.)

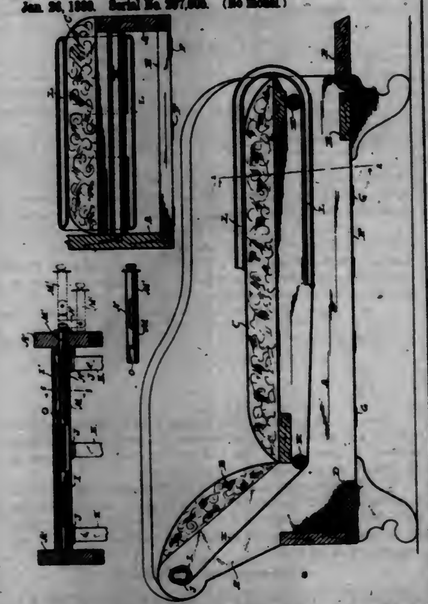
Claim.—1. A drill-stock provided with a chamber in its upper end, the walls of which are plain, in combination with a removable feed-screw carrying a nut, the hub of which is adapted to fit within said chamber, substantially as set forth.

2. A ratchet-drill stock enlarged at its upper end to form a chamber, in combination with a removable feed-screw having a nut provided with ratchet-teeth, said nut having an extended hub adapted to fit within the chamber, substantially as set forth.

3. A ratchet-drill stock provided with a chamber at its upper end, in combination with a removable feed-screw and a nut carrying reversely-arranged ratchet-teeth, and provided with an extended hub on each side of said ratchet-teeth, substantially as set forth.

4. A feed-screw for ratchet-drills, provided with a squared portion at each end, in combination with a dog having a bifurcated portion adapted to be secured on either end of said screw, substantially as set forth.

5. A ratchet-drill stock enlarged at the upper end to form a chamber and provided with the usual fixed ratchet-wheel, in combination with a feed-screw, a nut on said screw provided with ratchet-teeth and with an extended hub, a handle sleeved on the drill-stock, and a pawl having an extended face adapted to engage the ratchets on the stock and feed-screw, substantially as set forth.



6. In combination with a ratchet-drill stock, a reversible feed-screw having a cone point or center at each end, a nut provided with reversely-arranged ratchets, a handle sleeved on the drill-stock, a pawl having an extended face carried by the handle, and a second pawl, also mounted on the handle and normally held out of contact with the upper of the reverse ratchets on the feed-nut, substantially as set forth.

7. The combination, with a ratchet-drill stock and a handle sleeved thereon, of a pawl pivoted within the handle and having an extended face, a feed-screw, a nut provided with reversely-arranged ratchet-teeth, a pawl mounted on a vertical pivot in the handle, and a spring for holding said pawl normally out of contact with the ratchet on the feed-nut, substantially as set forth.

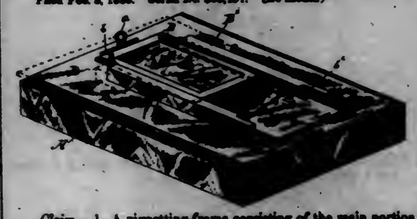
8. In combination with a ratchet-drill stock having a chamber at its upper end, a handle sleeved to said stock, a spring-actuated pawl with an extended face carried by the handle, a feed-screw, a nut provided with reverse ratchets and with an extended hub, a pawl-lever pivoted to the top of the handle and having an extended perforated arm, and a spring-actuated bolt passing through a perforation in the handle, substantially as described.

9. In combination with the stock A, having ratchet C, and provided with the chamber K, the handle D, sleeved to said stock, the spring-actuated pawls E F, pivoted on said handle, the nut H, having extended hubs and carrying the reversely-arranged ratchets *h h'*, and the reversible feed-screw I, having a cone point or center at each end, substantially as described.

412,510. LOUNGE. HERMANN KAUFMANN, Milwaukee, Wis. Filed Jan. 26, 1889. Serial No. 297,603. (No model.)

Claim.—1. The combination of a lounge or analogous piece of furniture, a spindle journaled in the frame of the device, a blanket or analogous covering normally supported beneath the furniture, and flexible connections uniting the spindle and covering, whereby the latter may be drawn out by hand and returned to its normal position by rotation of said spindle, substantially as set forth.

2. The combination of a lounge or analogous piece of furniture, a hollow spindle journaled in the frame of the device, a blanket or analogous covering normally supported beneath the furniture, flexible connections uniting the spindle and covering, and a jointed crank telescopically arranged with relation to said hollow spindle, substantially as set forth.



3. The combination, with a lounge or analogous piece of furniture, of a hollow spindle journaled in the frame of the device and provided with a radial extension, a blanket or analogous covering flexibly connected to the spindle, and a jointed crank loosely arranged in said spindle and provided with a lug that engages the radial extension thereof, substantially as set forth.

4. The combination, with a lounge or analogous piece of furniture, of a spindle journaled in the frame of the device, a blanket or analogous covering flexibly connected to the spindle, and rollers journaled in said lounge to facilitate the movement of the covering, substantially as set forth.

5. The combination of a lounge or analogous piece of furniture, a series of tapes secured to the frame of the device, a spindle journaled in said frame, a blanket or analogous covering normally supported on the tapes, and flexible connections uniting the spindle and covering, substantially as set forth.

6. The combination, with a lounge or analogous piece of furniture, of a spindle journaled in the frame of the device, a blanket or analogous covering flexibly connected to the spindle, and a door connected to the foot end of said frame, substantially as set forth.

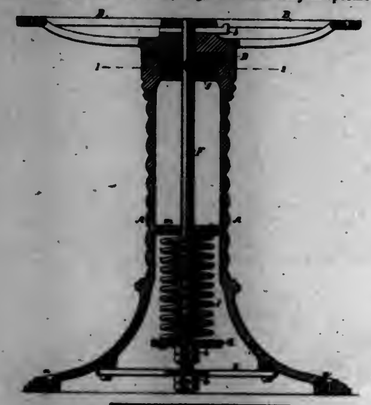
412,511. VIGNETTING-FRAME. JOHN H. KELLER, Kokomo, Ind. Filed Feb. 2, 1889. Serial No. 298,157. (No model.)

Claim.—1. A vignetting-frame consisting of the main portion B, provided with a central aperture, the slides B' on each side thereof, having the two sets of grooves *b' b²* formed therein, the sliding part C, mounted in one set of grooves, and the shade E, mounted in the other set, substantially as set forth.

2. The combination of the printing-frame A, the vignetting-frame B, provided with the transverse slot *b* in each end thereof, the set-screws *a*, one extending through each of said slots into said printing-frame, and the sliding part C, mounted in slides over an aperture in said vignetting-frame, substantially as set forth.

412,512. BUTTON OR ORNAMENT. FRANK KERSHAW, Chicago, Ill., assignor of one-half to J. J. Allpoter, same place. Filed Dec. 3, 1888. Serial No. 292,050. (No model.)

Claim.—1. The combination of the base-plate C, stem D, and disk E with the removable crown A and indicating-card H, substantially as shown and described.



2. The combination of a base-plate C, stem D, disk E, stem G, and crown A, removably secured to the stem G, substantially as shown and described.

412,513. REVOLVING CHAIR. FRANCIS D. KRAMER and GEORGE LOUIS, Philadelphia, Pa. Filed Nov. 15, 1888. Serial No. 290,919. (No model.)

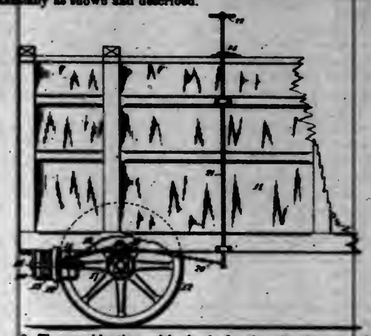
Claim.—1. The combination of the hollow standard having an internal bearing, the seat-rod carried within the standard and having a collar, a spring interposed between said collar and the bearing in the standard and serving to depress the rod, and a seat-frame and rigid friction-disk carried by the upper end of the rod, said friction-disk being seated upon the upper end of the standard and held in frictional contact therewith by the downward pressure of the spring, substantially as specified.

2. The combination of the hollow standard having an internal bearing, the seat-rod carried within the standard and having a collar, a spring interposed between said collar and the bearing in the standard and serving to depress the rod, and a seat-frame and rigid friction-disk independent of each other and independently secured to the upper end of the seat-rod, said friction-disk being interposed between the seat-frame and the upper end of the standard and being held in frictional contact with the latter by the downward pressure of the spring, all substantially as specified.

3. The combination of the hollow standard having an internal bearing, the seat-rod carried within the standard and having a collar, a spring interposed between said collar and the bearing in the standard and serving to depress the rod, a seat-frame detachably secured to the upper end of the rod, and a rigid friction-disk permanently secured to said rod, interposed between the seat-frame and the standard, and held in frictional contact with the upper end of said standard by the downward pressure of the spring, all substantially as specified.

412,514. CLASP. FRANCOIS LAMBERT, New York, N. Y. Filed Feb. 1, 1889. Serial No. 298,282. (No model.)

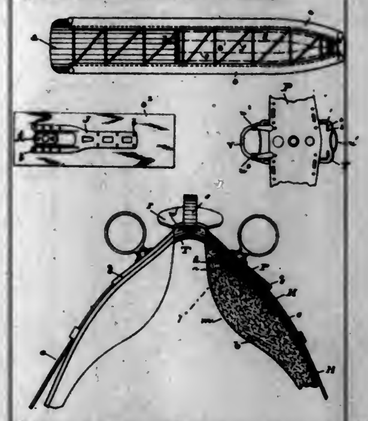
Claim.—1. In a clasp, the combination, with a main plate provided with a stud having a lip or projection, of an outer plate hinged to the main plate and provided with a catch, which has a laterally-ranging notch and engages the stud-lip by a lateral movement, substantially as herein set forth.



2. In a clasp, the combination, with a main plate provided with a stud having a lip or projection, of an outer plate having a catch adapted to engage the lip-stud and hinged to the main plate by a spiral or coiled spring, which normally opens the clasp when the catch is disengaged from the stud, substantially as herein set forth.

3. In a clasp, the combination, with a main plate provided with a stud having a lip or projection, of an outer plate hinged to the main plate and having a catch provided with a laterally-ranging notch and adapted to engage the stud by a lateral movement and projecting at the side of the stud when the clasp is closed, substantially as shown and described, whereby a loop or other object drawing on the stud when the clasp is closed will also draw on the catch to hold it to the stud, as set forth.

4. The combination, in a clasp, of a main plate A, provided with a stud D, having a lip d', and an outer plate B, hinged to the plate A by a spiral or coiled torsion-spring C, and provided with a catch E, adapted to lock with the stud-lip d', substantially as described, for the purposes set forth.

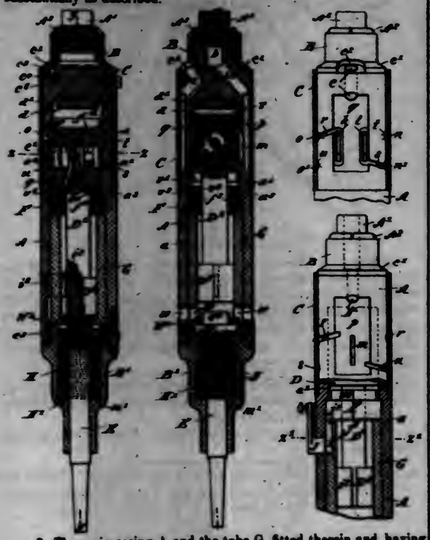


412,515. BRAKE FOR THRASHING-MACHINES. JOHN W. LEFEVRE and LORENZO D. YOUNG, Jr., Toledo, Iowa. Filed June 26, 1889. Serial No. 315,637. (No model.)

Claim.—1. The combination, with the body of a vehicle, the axle 17, pulley 18, pivoted upon the axle, and the brackets 10, secured to the under side of the vehicle-body at each end, of a brake-beam 13, confined at each end in the brackets and sliding freely within the same, said brake-beam being provided at each end with the brake-shoes 14, the link-rods 19, secured to the brake-beam at suitable points and connected at their opposing ends, the chain 20, connected to the link-arms passing over the pulley 18, and a vertical brake-rod 21, journaled upon the side of the body and provided with a pawl-and-ratchet attachment, said brake-rod being connected at its lower end to the chain 20, substantially as shown and described.

2. The combination, with the body of a thrashing-machine, a brake-rod journaled upon one side of the same, provided with a pawl-and-ratchet attachment, brackets secured to the bottom—one near each side—at the rear of the axle of the machine, and a pulley pivoted upon the said axle, of a bolt passing through the brackets, a brake-beam provided with brake-shoes adapted for lateral movement in the bracket upon the said bolts, a spring coiled around each bolt, contacting with the bracket and the beam, links projected from the forward face of the brake-beam, and a chain secured to the said links at one end, passing over the said pulley and attached to the brake-rod at the other end, substantially as shown and described.

412,516. HARNESS-SADDLE. HUGO LEHR, Baltimore, Md. Filed May 23, 1889. Serial No. 312,431. (No model.)



Claim.—1. A harness-saddle having a pad provided with the stuffing b and cover c, and a pad-spreader in separate lower and upper sections c' c^2, placed end to end, and the latter section having the inside tree-plate J and terret-nut k attached to it.

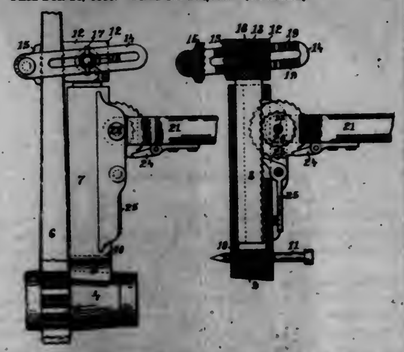
2. A harness-saddle having a checkrein-hook s and a crupper-loop v, and below these a finishing-plate T, having holes at each side and a wire passed through said holes and forming a loop w, which fits the said hook, and having its ends secured tightly about the said crupper-loop, as set forth.

412,517. PNEUMATIC TOOL. JAMES S. MACOUN, New York, N. Y., FRANK H. MARSH, Newark, N. J., and GEORGE H. WILLIAMS, New York, N. Y., assignors to the American Pneumatic Tool Company, of New York. Filed Jan. 3, 1889. Serial No. 295,293. (No model.)

Claim.—1. The piston having a transverse slide-valve fitted therein and formed with passages f g, leading from the valve-chamber to the upper and lower ends of the piston, respectively, the ends of the piston being capped to shorten the said passages f g, and yet retain sufficient length of exterior surface to prevent escape or blowing through of air at the contact of the piston with the casing, substantially as described.

2. The main casing in one piece, containing tube G and washer F, in combination with the piston D, having shank D' and head D^2, substantially as described.

3. The main casing A and the tube G, fitted therein and having corresponding openings w, in combination with the washer F and piston having shank D' and head D^2, substantially as described.



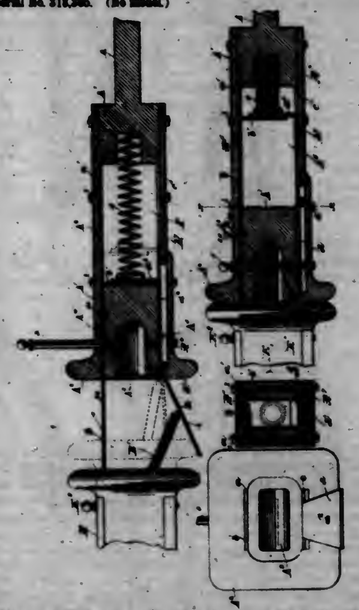
4. The pneumatic tool herein shown and described, having a reciprocating piston and slide-valve carried by the piston, in combination with the rotating valve B, applied to the end of the main casing and formed with a flange c', having an opening c^2 formed therein, substantially as and for the purposes set forth.

5. The main casing A and tube G, having flange w', in combination with the spindle E, having flange e^2 and projection e^3, substantially as described.

6. The piston or striker formed with a slot, the casing having a corresponding slot, and the tube G, in combination with a spline fitted in the tube and entering both slots for aligning the ports of the striker with the ports of the main casing, substantially as described.

7. The piston or striker formed with a valve-chamber and with passages h i j and vertical passages f g, the latter being of greater area than the passage f, in combination with the slide-valve having the ring e, which partially closes the passage g at induction and fully opens it for eduction, substantially as described.

412,518. POWER-JACK. GEORGE W. MATHEWSON, Coventry, R. I. Filed Dec. 26, 1888. Serial No. 294,616. (No model.)



Claim.—1. The combination, in a power-jack, of a head provided with the bolt 16, clamp-nuts 17, the disk 18, links 14, and clamp 15, constructed to operate as and for the purpose described.

2. The combination, with the head of a power-jack provided with the bolt 16 and clamp-nuts 17, of the ribbed disk 18, the grooved links 14, and the clamp 15, as described.

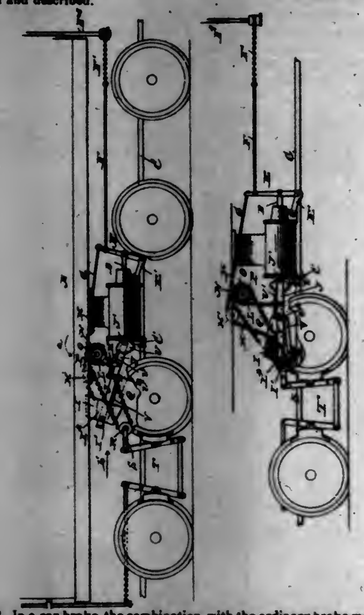
3. A power-jack consisting of the standard 7, the rack-bar 8, provided with saw-tooth-sectioned teeth and with the head 12, the pinion 20, the ratchet-wheel 23, the lever 21, the pawl 24, connected with the lever 21, and the spring-pressed stop-pawl 25, pivoted in the standard 7, constructed to engage with the saw-tooth-sectioned rack of the rack-bar, as described.

4. In a power-jack, the combination, with the standard 7, provided with the concaved end 9, the rack-bar 8, provided with the head 12, the pinion 20, ratchet-wheel 23, the lever 21, pawl 24, and stop-pawl 25, of the bolt 16, clamp-nuts 17, disk 18, links 14, and clamps 15, constructed to extract the spokes from the hub, as described.

412,519. CAR-COUPLING. ROBERT MATHESON, Oxford, County of Cumberland, Nova Scotia, Canada, assignor of one-half to Rufus Wood, Allan Haigh, and John Robb, all of same place. Filed July 23, 1889. Serial No. 318,305. (No model.)

Claim.—1. In a car-coupling, the draw-bar and its draw-head, combined with a movable buffer and a pivoted sliding link-lifter operated thereby, substantially as described.

2. The draw-bar and its draw-head, combined with a movable buffer b and a movable plate c^3, having a hinged link-lifter d, substantially as described.



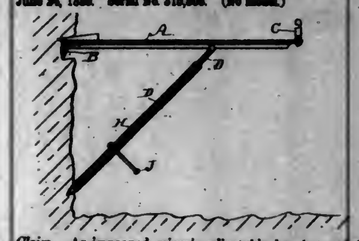
3. The draw-bar and its draw-head A', having a link-receiving recess A^3, a flange A^5, and openings a and c above and below the said recess A^3, and the movable buffer b in the said opening a, combined with the link-lifter in the said opening c below the said recess A^3, the lower side of the opening being shaped to allow the said link-lifter to drop down at its free end below a horizontal plane when the same is in its outermost position, and a spring to keep the buffer and link-lifter normally in their outermost positions, substantially as described.

4. The draw-bar and its draw-head A', having a link-receiving recess A^3, and a vertical passage intercepting the said recess for a coupling-pin, combined with a movable buffer located above the said recess and a link-lifter located below the said recess, the said buffer being provided with a hole which registers with the said vertical passage when the said buffer is in its innermost position only, substantially as described.

412,520. CAR-BRAKE. FREDERICK MILLER, Johnstown, and GEO. GREGORY, Braddock, Pa.; said Miller assignor to said Gregory. Filed May 14, 1889. Serial No. 310,899. (No model.)

Claim.—1. In a car-brake, the combination of a pivoted lever connected to one of the brake-levers, a weight pivoted on the said pivoted lever, and means, actuated by the said weight, for locking the lever in position, substantially as and for the purpose set forth.

2. In a car-brake, the combination, with a lever and a weight held on the free end of the said lever, of a chain connected with the said weight and under the control of the operator to support the weight when the brakes are off, a second chain connected at one end with the said lever, a double pulley on the periphery of which the other end of the said second chain is secured, and a third chain held on the said double pulley and connected with the brake-lever, substantially as shown and described.



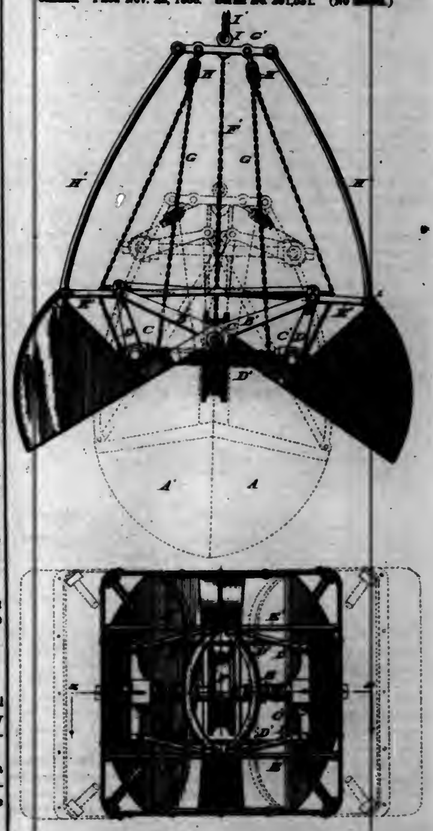
3. In a car-brake, the combination, with the ordinary brake mechanism, of a chain connected with one of the brake-levers of the said brake mechanism, a double pulley on which winds the said chain, a second chain held on the said double pulley, and a weighted lever connected with the said second chain, substantially as shown and described.

4. In a car-brake, the combination, with the ordinary brake mechanism, of a chain connected with one of the brake-levers of the said brake mechanism, a double pulley on which winds the said chain, a second chain held on the said double pulley, a weighted lever connected with the said second chain, and a locking device to hold the said lever in place when the brakes are on, substantially as shown and described.

5. In a car-brake, the combination, with a lever and a weight pivoted on the outer end of the said lever, of a fixed segmental ratchet held on the pivot of said lever and a pawl adapted to engage the said fixed segmental ratchet and actuated by the said weight, substantially as shown and described.

6. In a car-brake, the combination, with a lever and a weight pivoted on the outer end of the said lever, of fixed segmental ratchets held on the pivot of said lever, a pawl adapted to engage the said fixed segmental ratchets and actuated by the said weight, a second lever pivoted on the said first-named lever and connected with the said pawl, and a link pivotally connecting the weight with the said lever, substantially as shown and described.

412,522. MINER'S GRIP OR BRACKET FOR SUPPORTING COAL-DRILLING MACHINES. ANDREW T. MOATE, Pleasantville, Iowa, assignor to the Black Diamond Mining Tool Company, same place. Filed June 24, 1889. Serial No. 315,209. (No model.)

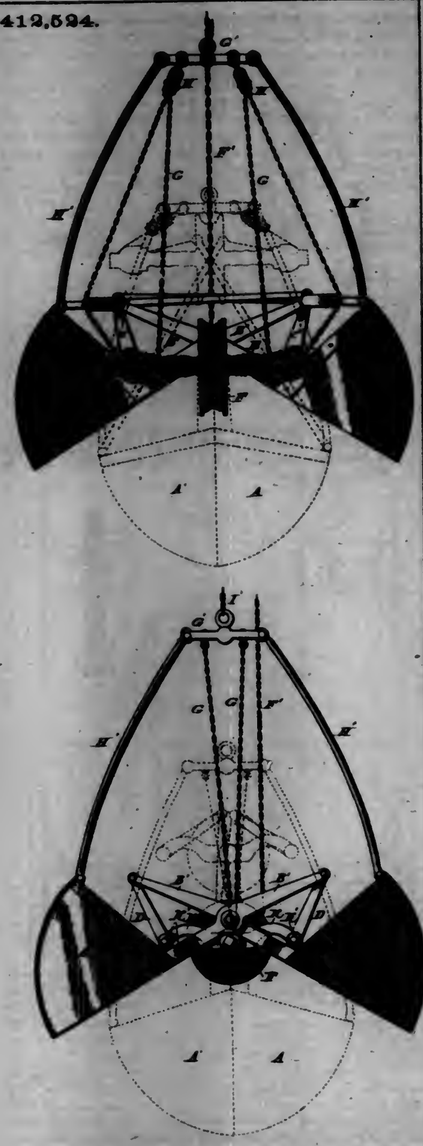


Claim.—An improved miner's adjustable bracket and drill-support comprising a straight bar having a hook at one end adapted to be fixed in a perpendicular wall, and a swiveled drill-support at the other end, a screw-threaded bar hinged to the straight bar near the drill-support, a screw-threaded sleeve fitted to the hinged bar, and means for rotating the sleeve on the hinged bar, in the manner set forth, for the purposes stated.

412,523. ROLLED RYE. EDWARD B. MOWER, Cedar Rapids, Iowa, assignor to Douglas Brothers & Mower, same place. Filed Mar. 28, 1889. Serial No. 305,170. (No specimens.)

Claim.—As a new article of manufacture, rolled rye, substantially as set forth.

412,524. DEVICE FOR EXCAVATING COAL, &c. THOMAS MCBRIDE, Philadelphia, Pa., and RASMUSSEN FISHER, Kinmartine, Ontario, Canada. Filed Nov. 22, 1888. Serial No. 291,831. (No model.)



412,521. SCALE FOR TYPE-WRITING MACHINES. WALTER P. MILLER, Denver, Colo. Filed June 3, 1889. Serial No. 312,455. (No model.)

Claim.—1. A scale for type-writers, provided with the usual graduations and with an additional mark or sign opposite every fourth graduation, dividing the scale into divisions of three graduations each, substantially as and for the purpose set forth.

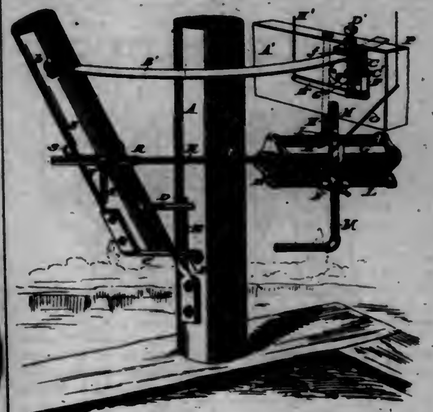
2. The combination, with a type-writer, of a carriage having a pointer, a scale having the usual graduations, and a mark or sign opposite every fourth graduation, substantially as and for the purpose set forth.

412,524.

Claim.—1. In an excavating device of the character described, the scoops provided with the lever-arms crossed and pivoted together, as described, the upper ends of said levers being pivoted to one end of toggle-levers, the other end of said toggle-levers being pivoted to the frame which supports the chain-operating drum.

2. In an excavating device of the character described, the chain-operating drum mounted in suitable bearings in end bars, said bars being connected to the arms or levers at the scoops by toggle-levers, whereby the raising and lowering of the drum operates to open and close the scoops, as set forth.

3. In an excavating device of the character described, the combination, with the winding-drum, the winding-wheel located thereon, and the operating-chains, of the scoops, the crossed levers carrying the same, the toggle-levers connecting with the crossed levers and with the edges of the scoops, the curved arms pivotally connected to the said edges of the scoops, and the connecting-bar to which the upper ends of said arms are pivotally connected, whereby the scoops may be lowered or elevated and opened or closed automatically, substantially as specified.



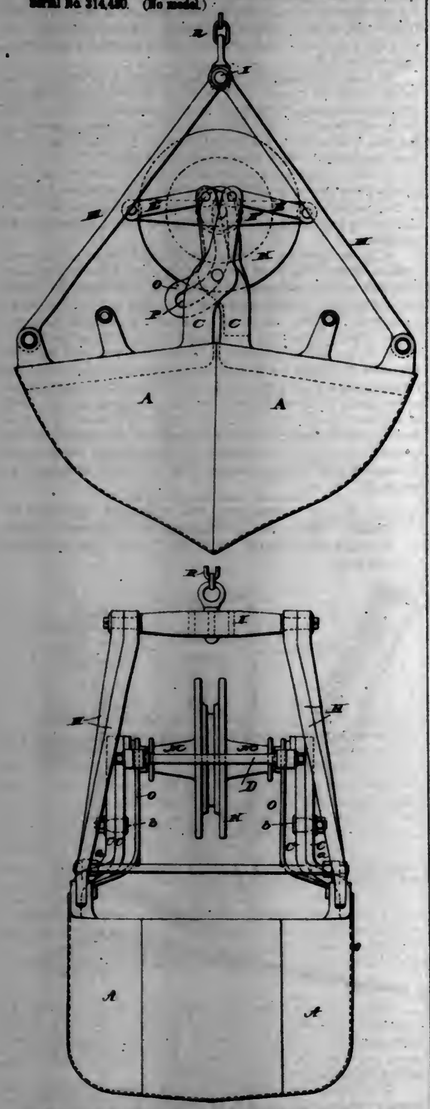
4. In an excavating device of the character described, the combination, with the crossed levers fulcrumed at their intersections and carrying the scoops, of the toggle-levers connecting the said crossed levers with the shaft of the winding-drum, the cross-bars connecting the ends of the scoops being curved to permit the drum to settle well down between the scoops, substantially as specified.

5. In an excavating device of the character described, the combination, with the scoops and the system of operating levers and chains, of the cross-bars having a portion thereof bent, as described, to permit the winding-drum to settle well between the scoops, substantially as specified.

6. In an excavating device of the character described, the combination of a winding-drum having spiral grooves on its periphery near each end, a winding-wheel mounted on said drum, the chains adapted to wind on and unwind from the drums and winding-wheel, respectively, and the scoops, crossed levers, and connecting toggle-levers, whereby the scoops are operated, substantially as specified.

7. In an excavating device, the scoops A and A', provided with the levers E', pivoted together, in combination with the levers D, the connecting-bars E, to which said bars D are hinged, the scoops at the lower ends of the levers E', the rods H' H', connecting the outer ends of the bars E to the top bar G', the chains G G, connected to the drum E, passed through the suspended pulleys H and secured at their lower ends to the ends of the shaft of the winding-drum, and the chain F', connecting the winding-drum with the top bar G', substantially as specified.

412,525. APPARATUS FOR OPERATING DERRICKS OR CRANES. THOMAS MCBRIDE, Philadelphia, Pa., and RASMUSSEN FISHER, Kinmartine, Ontario, Canada. Filed May 22, 1889. Serial No. 311,705. (No model.)

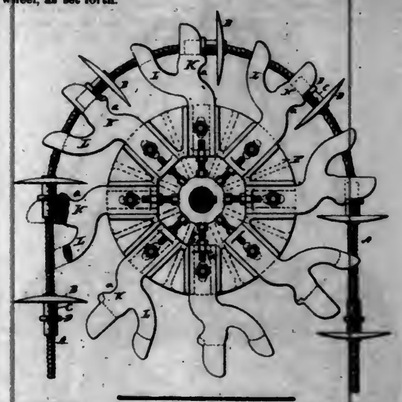


Claim.—1. In a device for swinging derricks, the cylinder G, hung on pivots so as to have a vertical movement and supported by a bar adapted to turn in its support to admit of a horizontal movement, in combination with the piston-rod and means for connecting it with the boom of the derrick, as set forth.

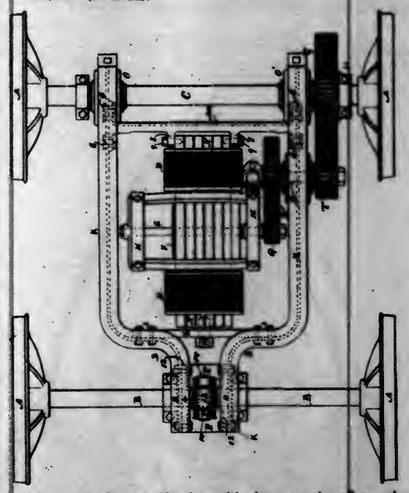
2. In a device for swinging the booms of derricks laterally, the boom B, pivoted to the mast A, as described, the piston-rod K, having a rack at its forward end gearing with a segmental rack on the boom, and a cylinder in which the piston-rod is moved by steam, water, or compressed air, as set forth.

3. In devices for swinging the booms of derricks, a cylinder hung in pivotal bearings, the piston-rod of said cylinder being connected to the boom, in combination with a brake or snubbing device substantially such as described, whereby the derrick is under the full control of the operator at all times, as set forth.

4. In a device of the character described, the curved bar B', secured at one end to the boom B, the other end of said bar being passed through slots in the hanger C, and supporting-bar A', in combination with the brake-block *f*, lever E', and snubbing-bar *g*, as set forth.



412,526. EXCAVATOR. THOMAS McBRIDE, Philadelphia, Pa., and BENJAMIN FISHER, Kincardine, Ontario, Canada. Filed June 15, 1889. Serial No. 314,480. (No model.)



Claim.—In an excavating device of the character described, the chain-operating drum mounted in suitable bearings in a frame, said frame being connected to the arms or levers of the scoops by toggle-levers, and segmentally-slotted guide-bars adapted to receive the axis of the winding-drum, whereby the drum is centrally guided in its rising and falling motion to open and close the scoops, as set forth.

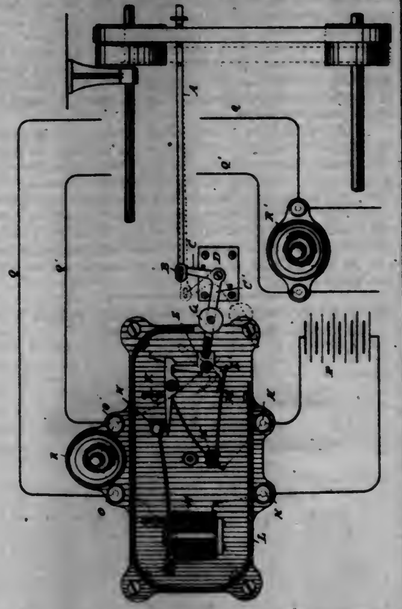
412,527. EXPANSIBLE WHEEL FOR ENDLESS CARRIERS, &c. THOMAS McBRIDE, Philadelphia, Pa., and BENJAMIN FISHER, Kincardine, Ontario, Canada. Original application filed Mar. 5, 1888, Serial No. 266,106. Divided and this application filed July 23, 1888. Renewed Aug. 20, 1889. Serial No. 320,902. (No model.)

Claim.—A wheel for endless conveyors having adjustable bifurcated arms, said arms being provided with bifurcated extensions to support the cable between the carrying-disks as it passes around said wheel, as set forth.

412,528. ELECTRIC MOTOR FOR RAILWAY-CARS. WILLIAM M. MCDOUGALL, East Orange, N. J. Filed May 23, 1889. Serial No. 311,813. (No model.)

Claim.—1. The combination, with the two pairs of car-wheels and their axles and an electric motor, of a frame formed of two bars K K, bent at 2 3, so as to come together, or nearly so, the electric motor being secured between the said bars, and two bearings O on one axle at one end of the frame and one bearing on the other axle and at the other end of the frame, substantially as specified.

2. The combination, with an electric motor having a frame for supporting the field-magnets and the armature-shaft, of the main frame composed of bars K and cross-bars L M, and the bolts 9 for connecting the frame of the electric motor at one end to the cross-bar M, and the bolt 10 for connecting the frame of the electric motor to the cross-bar L at the other end, substantially as set forth.



3. The frame for receiving the electric motor and connecting the same to the axles of the railway-car, consisting of the bars K, with the bends 2 and 3 and the straight portions 4, the cross-bars L and M, bolted to the bars K, bearings O O' for connecting the frame K to the axle C, and single central bearing P for connecting the straight portions 4 of the frame K to the axle B, substantially as set forth.

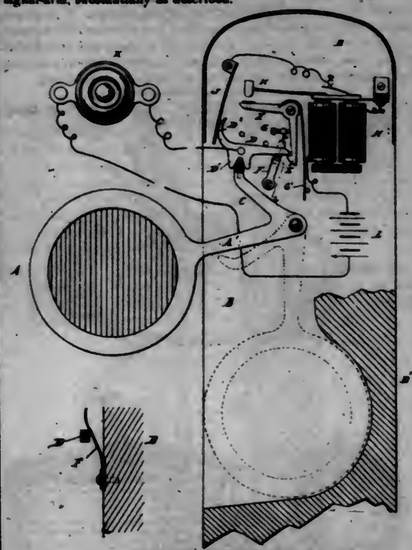
4. The combination, with an electric car-motor and its frame, of the main frame K, composed of bars bent at 2 and 3, and having parallel portions 4, the cross-bars L M, to which the electric-motor frame is bolted, the bearings O O', connecting the frame K to the axle C, and a single central bearing P, connecting the frame K to the axle B, substantially as set forth.

5. The combination, with the frame K and car-axles B and C, of the bearings O O', connecting the frame K to the axle C, the single central bearing P, connecting such frame to the axle B, the pinions Q and T, and gears R and U for connecting the armature-shaft to the axle C and the counter-shaft S, supported by the frame K, and carrying the wheel R and pinion T, substantially as specified.

6. The combination, with the electric motor and the car-axles B and C, of the frame composed of the bars K, having bearings O O' at their ends for the axle C, and the single bearing P upon the axle B, and a yielding connection between the central bearing and the frame to allow the axle B to change its position in relation to the axle C without straining or injuring the frame of the electric motor, substantially as set forth.

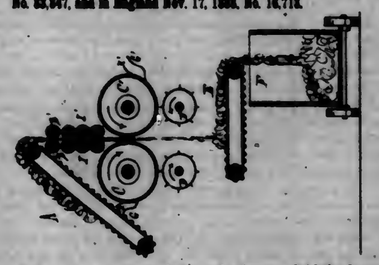
412,529. ELECTRIC MOTION-CONTROLLER. GUSTAVE S. HILL, New York, N. Y. Filed Aug. 28, 1888. Serial No. 284,018. (No model.)

Claim.—1. In an electric machinery controller, the combination, with a gear-coupler, as specified, of a reacting device to operate the gear-coupler, a catch to restrain the gear-coupler, a vibratory hammer to trip the catch, and electro-magnetic devices to operate the hammer, substantially as described.



2. In a machinery controller, the combination, with a gear-coupler, as specified, of an arm to operate the gear-coupler, a reacting device to work the said arm, a forked lever to engage said arm, a catch to engage the forked lever, and a catch-tripping device, substantially as described.

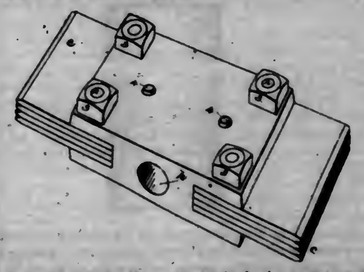
3. The combination, with a gear-coupler, of a reacting device, a pin-and-slot or equivalent loose operating connection between the gear-coupler and the reacting device, a catch to restrain the gear-coupler, and a catch-tripping device, substantially as described.



412,530. ELECTRIC SIGNAL-CONTROLLER. GUSTAVE S. HILL, New York, N. Y. Filed Aug. 28, 1888. Serial No. 284,019. (No model.)

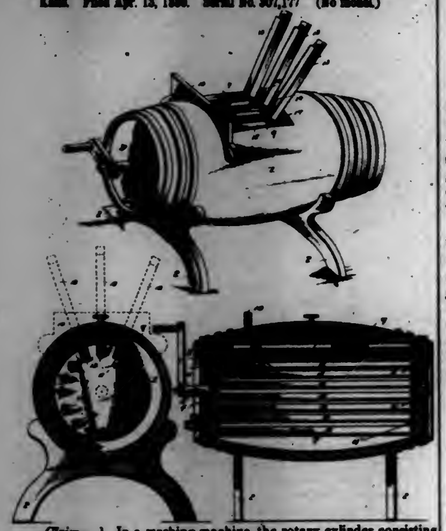
Claim.—1. In an electric signal-controller, the combination, with a self-acting signal, of a catch to restrain the signal, a vibratory hammer to trip the catch, an electro-magnet and intermittent circuit-breaker to vibrate the hammer, and a circuit-controller included in the circuit with the electro-magnetic hammer-vibrating devices, the said circuit-controller being automatically closed by the setting of the signal for operation and opened by the operation of the signal, substantially as described.

2. In an electric signal-controller, the combination, with a self-acting signal having an arm, of a two-armed lever pivoted to a fixed point and having a forked arm to engage the signal-arm, and a self-acting catch to engage the other arm of the lever, the arrangement being such that in setting the signal for operation the signal-arm strikes one prong of the fork and throws the lever into engagement with the catch and the other prong of the fork then restrains the signal-arm, substantially as described.



412,531. APPARATUS FOR REMOVING BURRS AND THISTLES FROM WOOL AND SIMILAR FIBERS. BENOIST HOUVILLET, Wignehies, France. Filed May 25, 1889. Serial No. 312,167. (No model.) Patented in France Oct. 19, 1886, No. 183,686; in Belgium Nov. 6, 1886, No. 73,947, and in England Nov. 17, 1886, No. 16,713.

Claim.—In an apparatus for removing burrs and thistles from wool and similar fibers, the combination and arrangement of the vertically-disposed carding, drawing, crushing, and doffing rollers with the knives H H', the receptacles O O', and the endless traveling apron E, all substantially as hereinbefore described and shown.



412,532. BUSH-HAMMER. LUTHER M. NUTTING, Concord, N. H., assignor of one-half to Henry W. Hayden, same place. Filed Mar. 12, 1888. Serial No. 266,813. (No model.)

Claim.—In a bush-hammer, the head *c*, having a cutter-receiving slot at one or both ends, cutters having a groove 5 in their bases placed

in the slots, and bolts 2, passed through the said head and cutters for holding the cutters in position, combined with the hardened-steel gib *b*, placed in the cutter-receiving slot in the direction of its length, against which the bases of the cutters bear, and provided with a groove to register with the groove 6, and the key 4, interposed between the gib *b* and the cutters in the said registering grooves to prevent lateral displacement of the gib and cutters, substantially as described.

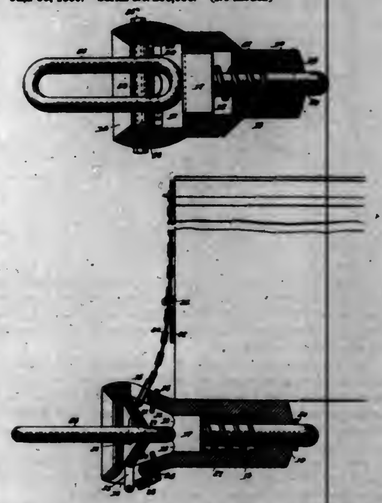
412,533. WASHING-MACHINE. NORMAN D. OLIPHANT, Meade, Kans. Filed Apr. 13, 1889. Serial No. 307,177. (No model.)

Claim.—1. In a washing-machine, the rotary cylinder consisting of the heads, the longitudinal continuous bars fixed thereto, and the sectional bars, said sectional bars having members which are fixed to the heads of the cylinder and other members which are hinged to the fixed members, said hinged members being confined at their free ends, when they lie substantially parallel with the axis of the cylinder, by suitable fastening devices, whereby the series of sectional bars are adapted to provide an opening for the introduction or removal of fabrics when they are raised, and to form a part of the cylinder when closed and locked in position, substantially as described.

2. In a washing-machine, the rotary cylinder consisting of the heads, the continuous longitudinal bars fixed thereto, and the sectional longitudinal bars having the end members thereof likewise fixed to said heads, the middle member of each sectional bar being hinged to one of the end members, while the unconfined end of said middle member is adapted to be confined in line with the two end members of said bar by a sliding sleeve which fits over the meeting lapped ends of the middle and end members, substantially as and for the purpose described.

412,534. PRESERVING-VESSEL. ADOLF OTTO, Neubukow, Germany. Filed Dec. 5, 1888. Serial No. 292,701. (No model.)

Claim.—As an improved article of manufacture, a preserving-vessel consisting of two parts adapted to telescope together, with a gasket between them, one section having a flaring mouth to admit the gasket, and an adjustable vent-valve on one of the parts to facilitate the union and separation of the parts, as set forth.



412,535. BIT-HOLDER FOR BRACES. HOMER H. PARKER, Winchendon, Mass., assignor to William M. Caldwell, Brooklyn, N. Y. Filed Oct. 15, 1888. Serial No. 288,107. (No model.)

Claim.—1. The combination, in a bit-holder, of the cylindrical head having longitudinal recesses in its periphery, a jaw mounted within each recess to rock, without longitudinal movement, upon a transverse pivotal support, so that one or other of its ends shall necessarily project beyond said periphery, and a sleeve fitted to move longitudinally upon the head into engagement with either projecting end of the jaw to force said end inward, substantially in the manner and for the purpose herein set forth.

2. The combination, in a bit-holder, of the cylindrical head having longitudinal recesses in its periphery, an extended jaw fitted in each recess to rock without longitudinal movement upon a transverse pivotal support, so that one or other of its ends shall necessarily project beyond the periphery, and having a screw-thread projecting from its outer face over its pivotal bearing, and a sleeve encircling the head and formed with an internal thread to engage the thread on each pivoted jaw and be thereby carried, as it revolves thereon, longitudinally over the jaws and head, substantially in the manner and for the purpose herein set forth.

412,536. CAR-COUPLING. FRANK FARNER, Hamburg, Pa. Filed Jan. 30, 1889. Serial No. 298,060. (No model.)

Claim.—1. The combination, with a draw-head provided with a link-opening, of an upper and a lower jaw pivoted in the said draw-head contiguous to the link-opening, said jaws having their approaching surfaces beveled in opposite directions and recessed at each side of the center, substantially as shown and described.

2. The combination, with a draw-head having a link-opening, of an upper and a lower jaw pivoted in said draw-head contiguous to the link-opening, having their contiguous edges beveled in opposite directions and provided with a recess at each side of the center, and a lip integral with one jaw capable of engaging with a lug integral with the other jaw, all combined for operation substantially as shown and described.

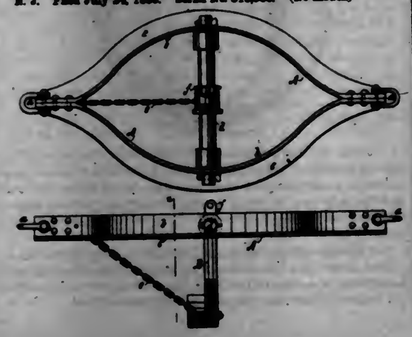
3. The combination, with a draw-head provided with a link-opening, of an upper and a lower jaw pivoted in the said draw-head contiguous to the link-opening, having their free or contiguous edges beveled in opposite directions and provided with a recess at each side of the center, a spring attached to the lower jaw and to the draw-head, and a chain secured to the upper jaw and leading out through the draw-head, all combined for operation substantially as shown and described.

4. The combination, with a draw-head provided with a link-opening, an upper and a lower jaw pivoted in the said draw-head contiguous to the link-opening and having their free or contiguous edges beveled in opposite directions, and also having a semicircular recess at each side of the center, of a lip integral with the outer face of the said jaws at opposite sides engaging with a lug upon the opposite jaw, a spring attached to the draw-head and to the lower jaw, and a link projecting outward from the draw-head secured to the upper jaw, all combined for operation substantially as shown and described.

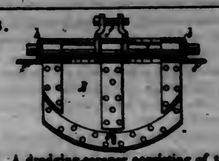
5. The combination, with a draw-head having a link-opening and an upper and a lower jaw pivoted in the said draw-head contiguous to the link-opening, having their free or contiguous edges beveled in opposite directions and provided with recesses at each side of the center, and a lip integral with each jaw adapted to engage with the opposite jaw, of a sliding spring-actuated buffer-lock provided with a series of transverse grooves or channels upon its outer face, a spring connecting the lower jaw and the draw-head, and means for limiting the movement of the said jaws, substantially as shown and described.

6. The combination, with a draw-head having a link-opening and an upper and a lower jaw pivoted to the draw-head contiguous to the link-opening, the contiguous or free edges of which jaws are recessed at each side of the center and beveled in opposite directions, of a lip attached to opposite sides of each jaw engaging with lugs upon the opposite jaw, stop-pins passed through the draw-head at top and bottom to the rear of the jaws, a spring connecting the lower stop-pin of the lower jaw, and a link projected from the rear surface of the upper jaw, all combined for operation substantially as shown and described.

7. The combination, with a draw-head having a link-opening and an upper and a lower jaw pivoted in the draw-head contiguous to the link-opening, the contiguous or free edges of which jaws are recessed at each side of the center and beveled in opposite directions, of a lip attached to opposite sides of each jaw engaging with lugs upon the opposite jaw, stop-pins passed through the draw-head at top and bottom to the rear of the jaws, a spring connecting the lower stop-pin of the lower jaw, and a link projected from the rear surface of the upper jaw, a spring-actuated buffer-block held to slide in the said draw-head to the rear of the jaws and provided with a series of transverse grooves or channels in the forward face, substantially as shown and described.



412,537. DRAWER-PULL. DAVID H. PLIMER, Waterbury, Conn. Filed Aug. 12, 1889. Serial No. 320,670. (No model.)



Claim.—1. The combination, with the plate and handle, of the eyes and their threaded shanks, and sleeves or bands held firmly upon the shanks at the back of the plate, substantially as and for the purpose set forth.

2. The combination, with the plate and handle, of the eyes and their threaded shanks, a sleeve or band around each shank having a flange at one end at the back of the plate and held firmly upon the shank, substantially as and for the purposes set forth.

412,538. DREDGING-SCRAPER. THOMAS POTTER, Jersey City, N. J. Filed July 24, 1889. Serial No. 318,508. (No model.)

412,538.

Claim.—1. A dredging-scraper consisting of the combination of the elliptical frame and the scoop B, hinged thereto, substantially as and for the purpose described.

2. A dredging-scraper consisting of the combination of the elliptical frame A, made of angle-iron, having on each side the vertical section *b* and the horizontal section *c*, and the scoop B, hinged to the vertical sections *b b* of the frame, the outer edges of the horizontal sections constituting the outermost portion of the frame, substantially as and for the purpose described.

412,539. REVOLVING DRIER FOR DESICCATING BREWERS' GRAINS, &c. WILLIAM P. PRESTON, FRANK J. HUBNER, and JAMES J. KELLEY, New York, N. Y.; said Kelley assignor to said Preston and Hubner. Filed Dec. 13, 1888. Serial No. 293,053. (No model.)

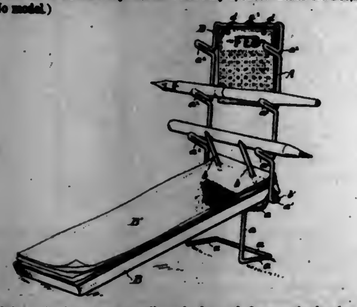
Claim.—1. The combination, in a drying apparatus, of a furnace, a revolving drying-chamber formed with longitudinal compartments or recesses opening and radiating from its axial center, external hot-air flues placed between said compartments to extend the length of said drying-chamber and communicate mediately therewith at one end and with the furnace at the other, a hopper communicating with the end of the drying-chamber at which the hot air enters the same, and a discharge-flue and a discharge-spout communicating with the opposite end of said chamber, substantially in the manner and for the purpose herein set forth.

2. The combination, in a drying apparatus, with a revolving drying-chamber formed with longitudinal compartments opening or radiating from its axial center, of longitudinal flues constituting the partitions between said radial compartments and which are made to extend outwardly beyond the same, a closed outer chamber formed at each end of the drying chamber and into which said longitudinal flues open, a furnace connected with one of said end chambers, a flue connecting the opposite end chamber with the compartments of the revolving drying-chamber through peripheral ports in the proximate end of the latter, a hopper communicating with the same peripheral ports, a discharge-spout and a discharge-flue both communicating with said compartments through peripheral ports therein at the opposite end of the drying-chamber, and stationary bands covering and closing the peripheral ports at each end of the drying-chamber when they are not in register with the hopper, the discharge-spout, or the discharge-flue, all substantially in the manner and for the purpose herein set forth.

3. The combination, in a grain-drying apparatus, of the revolving cylinder having peripheral ports in its ends, diametrically-divided apertured bands inclosing said ends and covering said ports, bolts passing through lateral lugs or flanges in the divisions of the band to unite them, and spiral springs encircling the bolts to permit an automatic expansion of the divided bands, substantially in the manner and for the purpose herein set forth.

4. The combination, in a grain-drying apparatus, of the revolving cylinder having peripheral ports in its ends, diametrically-divided apertured bands inclosing said ends and covering said ports, suspension-bolts by which said bands are upheld, and spiral springs encircling the bolts to permit of an independent play of the bands thereon, substantially in the manner and for the purpose herein set forth.

412,540. CORN-PLANTER ATTACHMENT. WALTER PRICE, Lyons, Nebr. Filed July 12, 1889. Serial No. 317,276. (No model.)



Claim.—1. In devices of the class described, the combination, with a compound or jointed bar adapted for attachment to a planter-runner, of a breaking-pin passed through the bar and resisting flexure of its joint, substantially as set forth.

2. In devices of the class described, the combination, with a bar adapted for attachment to a planter-runner to project into the path thereof in advance of the runner, of a ball fixed to the lower end of said bar, whereby the bar is prevented from piercing and accumulating stalks and the like.

3. In devices of the class described the combination of the bars A A', united at their lower ends and provided, respectively, with the slots I and J, and the squared bolt D, substantially as set forth.

4. The combination, with the bars A A', slotted as described, and the bolt passing through the slots, of the bar B, pivoted between the lower ends of the bars first named and terminating in the ball H, and the breaking-pin passing through the three bars and resisting the rotation of the bar B upon its pivot, substantially as set forth.

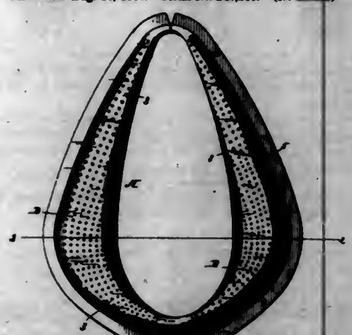
412,541. COMBINED PENCIL-RACK AND TABLET-HOLDER. BENJAMIN PRESSER, Philadelphia, Pa. Filed July 1, 1889. Serial No. 316,302. (No model.)

Claim.—1. A pen or pencil rack formed from a single piece of wire or the like bent to form a base or support *a*, to retain the rack in an upright position, and one or more sets of rests a^2 a^3, formed by doubling the wire upon itself nearly at right angles with the frame A, and its meeting ends hooked, soldered, or otherwise suitably joined together, as described, and for the purposes set forth.

2. The combined pen or pencil rack and tablet-holder described, consisting of a single piece of wire bent to form a base or support *a*, to retain the rack in an upright position, small loops or eyes *a' a'*, one or more sets of pencil-rests a^2 a^3, and their ends hooked, soldered, or otherwise suitably joined together, a tablet-base B, provided with pins *b b*, bent, respectively, to an L shape, one end of each pin extending laterally beneath said base, secured thereto, projecting beyond the side thereof, and engaging an eye *a'* in the rack A, and the other ends respectively extending through and above said base and adapted to hold a tablet, scratch-book, or the like, as set forth.

3. In a pen or pencil rack and tablet-holder, the following elements in combination: the rack A, formed from a single piece of wire bent to the form described, a tablet-holder B, provided with pins *b b*, a tablet, scratch-book, or the like B', and a card, calendar, or the like D, suspended from the rack in a convenient manner, as described, and for the purposes set forth.

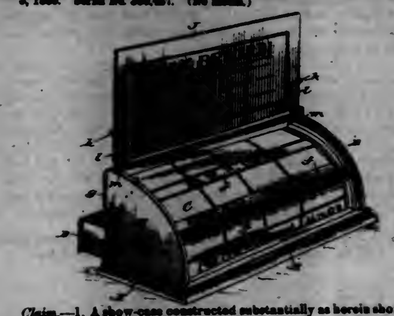
412,542. SELF-CLOSING FAUCET. LEWIS J. ROSE, Indianapolis, Ind. Filed May 20, 1889. Serial No. 311,492. (No model.)



Claim.—1. In a faucet, the combination of the cylinder having two interior compartments divided by an open transverse partition having a valve-seat thereon, an inlet-port leading to one of said compartments and an outlet-port leading from the other compartment, the valve-stem mounted in the cylinder, the disk-valve secured to the valve-stem and arranged to close the opening in the partition and to open toward the inlet-port, the piston secured to the valve-stem above the outlet-port, said piston being provided with perforations *r* and *t*, and the valve arranged to slide on the valve-stem and to close the perforations *r*, all arranged to co-operate substantially as and for the purpose specified.

2. In a faucet, the combination of the cylinder having two interior compartments divided by an open partition having a valve-seat thereon, an inlet-port leading to one of said compartments and an outlet-port leading from the other compartment, the valve-stem mounted in the cylinder, the disk-valve secured to the valve-stem and arranged to close the opening in the partition and to open toward the inlet-port, and the open disk mounted on the valve-stem, adapted to cover the outlet-port with its edge, and arranged relatively to the valve so that the disk is slid over the outlet by the closing of the valve, all substantially as set forth.

3. In a faucet, the cylinder having two interior compartments divided by an open transverse partition having a valve-seat thereon, an inlet-port leading to one compartment and an outlet-port leading from the other compartment, the valve-stem mounted in the cylinder, the valve secured to the valve-stem and arranged to close the opening in the partition and to open toward the inlet-port, the piston secured to the valve-stem above the outlet-port, said piston having perforations through which water may pass from one side to the other, and the open disk mounted loosely on the valve-stem, between the piston and the valve, so as to permit the stem to slide through the disk, all combined and arranged to co-operate substantially as specified, whereby the first movement of the valve in closing is checked by the piston, and the continued movement of the valve is further checked by the closing of the outlet-port by the disk, as set forth.



412,543. HORSE-COLLAR. JESSE W. RIDENOUR, Mechanicsburg, Pa. Filed Aug. 16, 1887. Serial No. 247,263. (No model.)

Claim.—1. The herein-described horse-collar, the covering for the bearing-surface of the afterwale, which is perforated, and a lining of absorbent material secured directly in contact with the interior of said covering, whereby the sweat is absorbed and the grit and dust prevented from entering the interior of the collar, substantially as described.

2. The herein-described horse-collar, the covering for the bearing-surface of the afterwale, which is provided with conical perforations, and a lining of an absorbent material secured directly in contact with the interior of said covering, substantially as described.

412,544. SHOW-CASE. WILLIAM C. ROSS, Gurney, Ill. Filed May 3, 1889. Serial No. 309,627. (No model.)

Claim.—1. A show-case constructed substantially as herein shown and described, the same consisting of a main frame having a sloping glass front, in combination with an inner triangular frame pivoted at the angle near the base of the main frame and provided with supports for goods and adapted to swing back out of the main frame, substantially as and for the purposes set forth.

2. The main frame having triangular end pieces and sloping glass front, in combination with an inner triangular frame having a curved support provided with ledges to retain the goods, the inner frame being pivoted at the angle near the base of the main frame and adapted to be swung out from the main frame, substantially as and for the purpose set forth.

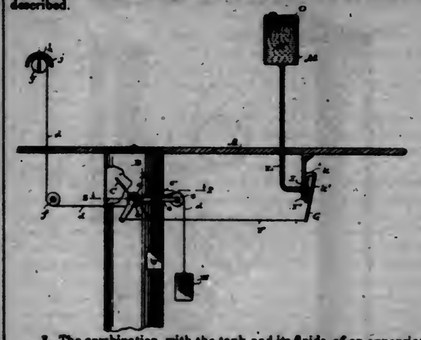
3. The main casing provided with a spring-arm A, rising from the base A of the main frame, in combination with the inner triangular frame pivoted at the angles near the base of the main frame, so as to be adapted to swing out from said main frame against the spring-arm A, substantially as and for the purposes set forth.

4. The main casing provided with a gong or bell, and the inner pivoted frame provided with a hammer arranged to cause the gong to be struck on the pivoted frame is opened, substantially as described.

412,545. PROCESS OF MAKING ARTIFICIAL MUSK. RUD. SCHMAWIN and HERMANN HEPNER, Frankfort-on-the-Main, Germany. Filed Feb. 11, 1889. Serial No. 299,207. (No specimens.)

Claim.—The herein-described process of making an oil adapted to be used as a substitute for musk, which consists in digesting a mixture of metaxylol and isobutylalcohol with chloride of zinc, in nitrating the resulting hydrocarbon, and in separating the oil therefrom by dissolving out extraneous matter, substantially as herein set forth.

412,546. TRIMMING FOR THE EDGES OF FABRICS. ROBERT W. SCOTT, Philadelphia, Pa. Filed June 14, 1888. Serial No. 277,089. (No specimens.)



Claim.—The within-described border or trimming for the edges of fabrics, the same consisting of a strip comprising a straight inner bar lying close to but beyond the edge of the fabric, an outer scalloped or ornamental edging, and spaced cross bars or pillars connecting said inner bar to the outer portion of the strip, with overedge or crochet stitches, whereby the inner bar of the strip is confined to the edge of the fabric, substantially as specified.

412,547. TEMPERATURE-REGULATOR. LEWIS SHERMAN, Milwaukee, Wis. Filed May 24, 1888. Serial No. 274,005. (No model.)

Claim.—1. In a temperature-regulator, the combination, with a damper, of a tank containing a non-volatile fluid and a superimposed volatile fluid, a diaphragm and a fluid-piston leading from the tank, and means connecting the diaphragm with the damper, whereby the damper is operated by the vaporization and condensation of the volatile fluid.

2. The combination, with a suitable receptacle containing a volatile fluid and a practically non-volatile fluid supporting the first-named fluid, of an expansion-chamber and a tube connecting said receptacle and chamber, a lever operated by said expansion-chamber, and a valve operating mechanism operated by said lever, substantially as described.

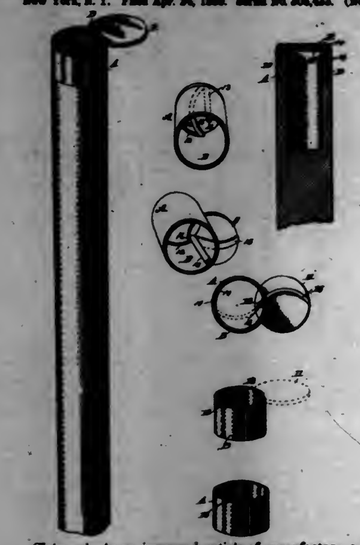
3. The combination, with the tank and its fluids, of an expansion-chamber and its lever operated thereby, a valve and its lever, two weights, one of which is adapted to slide on the valve-lever, and a cord operated in one direction by the other weight and in the other direction by hand to adjust the first-named weight, substantially as set forth.

4. The combination, with a valve and poised lever, of an expansion-chamber connected with said lever, said expansion-chamber containing a non-volatile fluid and a volatile fluid superimposed on the non-volatile fluid, substantially as described, the whole being so arranged that the poised lever will tend to open the valve, while the vapor tension of the volatile fluid will tend to close it, as set forth.

412,548. SURFACING AND POLISHING MACHINE. JOHN H. SNOWDEN, Chicago, Ill., assignor of one-half to Charles B. Kelley, same place. Filed May 20, 1889. Serial No. 311,442. (No model.)

Claim.—1. In the polishing-machine shown and described, the combination of the polisher F', having a central aperture, hollow shaft B, and head F secured thereto, and having the side channel C, the miter-gear P, miter-gear P', having the hub H and set-screws Z Z, and the means shown and described for maintaining a yielding pressure and for feeding forward said polisher, substantially as and for the purpose set forth.

2. The combination of the open-bottom case E, water-chamber D, terminating in its upper part in a stem-handle formed of the tubular parts A A', screwed together and having a water-inlet G, coil-spring S, hollow shaft B, having the side channel C, shell-couplings *a a*, thumb-screw O, miter-gear P', having the hub H sleeved on shaft B, miter-gear P, secured on shaft L, polishing-wheel F, and polisher F', having the central vertical aperture *i*, all arranged substantially as and for the purpose set forth.

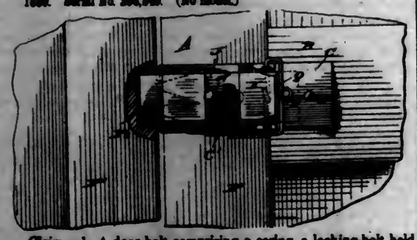


3. In the surfacing and polishing machine shown and described, the combination of the rotating polisher, having a central orifice for admitting water through it to its work, the open-bottom case for inclosing said polisher and adapted to rest upon the work being polished, the hollow shaft B, having the head F secured to the polisher, and having the side channel C, and adapted to rotate and feed forward the said polisher, and the water-chamber D and its upwardly-extending stem-handle A A', substantially as and for the purpose set forth.

412,549. POUNCET FOR FRENCH STAMPING. CHARLES H. RUSH, Baltimore, Md. Filed Sept. 27, 1888. Serial No. 286,580. (No model.)

Claim.—A box for applying dry coloring-powder to paper, having a top cover *b*, a bottom *c*, provided with a hole *c*, covered on the inside with fine gauze and a felt face *d* on the exterior of the bottom, all substantially as and for the purpose set forth.

412,550. SWING-COVER FOR RECEPTACLES. EDGAR B. SMITH, New York, N. Y. Filed Apr. 24, 1889. Serial No. 308,433. (No model.)

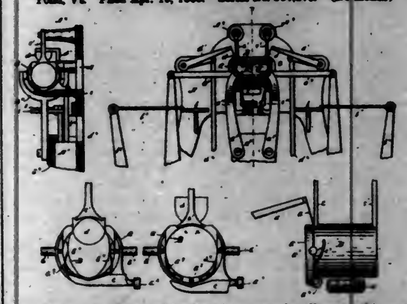


Claim.—1. As an improved article of manufacture, a cover for receptacles, consisting of an inner ring provided with a recess in its upper edge, extending partially around the same, an outer ring loosely mounted upon the inner ring and provided with a short recess in its upper edge, a lid or disk pivoted to the inner ring to slide loosely over both rings, and a segmental rib secured to the under face of the lid or disk, traveling in the recess of the inner ring and secured within the recess of the outer ring, substantially as shown and described.

2. As an improved article of manufacture, a cover for receptacles, consisting of an inner band or ring provided with a recessed upper edge, a lid or disk pivoted to the said ring, an outer ring or band loosely mounted upon the inner ring, a segmental rib integral with the under face of the lid or disk, extending from its pivotal point to the periphery at the opposite side, said rib being adapted to slide in the recess of the inner ring and in the recess in the outer ring, substantially as and for the purpose specified.

3. In a sliding cover for vessels, the combination, with a body consisting of an inner ring having a recess in its upper edge extending partially around the same, and an outer ring held to slide upon the inner ring and provided with a short recess in its upper edge, of a lid or disk pivoted to the inner face of the inner ring near one end wall of the recess therein, a segmental rib secured to the under face of the lid or disk, extending from the pivotal point of said disk or lid to the periphery at the opposite side, said rib being made to pass through the recess in each of the two rings, substantially as and for the purpose specified.

412,551. BOLT. JOHN H. SLATER, Stanton, Nebr. Filed Jan. 19, 1889. Serial No. 296,949. (No model.)



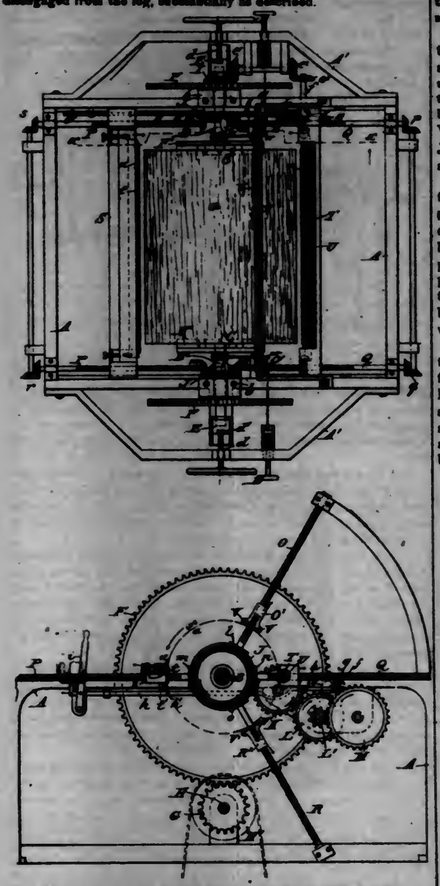
Claim.—1. A door-bolt comprising a casing, a locking-bolt held to slide in the said casing, and a bail pivoted on the said casing and adapted to engage the rear end of the bolt when the latter is moved outward, substantially as shown and described.

2. In a door-bolt, a casing provided with a back plate having a longitudinal slot, and bridges secured on the said back plate, in combination with a locking-bolt held to slide in the said bridges on the back plate, a bail pivoted on the rear bridge and adapted to be passed over the rear end of the said locking-bolt when the latter is in an outermost position, and a knob held on the said back plate and engaging with its inner end the longitudinal slot in the said back plate, substantially as shown and described.

3. In a door-bolt, a casing provided with a back plate having a longitudinal slot and a right-angular extension provided with teeth or prongs in line with the back plate, and bridges secured on the said back plate, in combination with a locking-bolt held to slide in the said bridges on the back plate, a bail pivoted on the rear bridge and adapted to be passed over the rear end of the said locking-bolt when the latter is in an outermost position, a knob held on the said back plate and engaging with its inner projecting end the said slot in the back plate, and a lined keeper into which is adapted to pass the front end of the said locking-bolt, substantially as shown and described.

412,552. CAN-HEADING MACHINE. CHARLES W. SLEEPER, Island Pond, Vt. Filed Apr. 19, 1888. Serial No. 307,573. (No model.)

Claim.—1. The combination, in a can-heading machine, of a chuck to hold a can-head, having a removable semicircular piece fitted in a recess in the chuck and to the outside diameter of the can-head, two trunnions to support the chuck, and with a guide-roller a^9, with a guide a^{12}, to engage the said guide-roller, and means for supporting the chuck by its trunnions, and means for moving the chuck in the guide a^{12}, substantially as described, and for the purpose set forth.



2. In a can-heading machine, a chuck, substantially as described, to hold a can-head, combined with a carrier a^3, to support the chuck by its trunnions, and with means for moving the carrier and chuck both vertically and horizontally, and with a guide a^{12}, to engage and act upon the roller a^9, (carried by the chuck-eccentric to its trunnions,) to cause the chuck to turn upon its trunnions from a horizontal to a vertical position as the carrier rises, substantially as described, and for the purpose set forth.

3. In a can-heading machine, a chuck, substantially as described, a carrier a^3, to support the said chuck by its trunnions, the guide a^{12}, arranged to engage the roller a^9, carried by the chuck, and cause the said chuck to turn upon its trunnions as the carrier rises, and means for moving the carrier and the chuck both vertically and horizontally, combined with a rest c and fingers d' d', substantially as described, to support a can-body, and with two spring-fingers a^{14} a^{14}, carried by the chuck and arranged to press upon and slightly flatten the can-body as the carrier rises, and with a shield d, to enter between the can-head and the can-body to prevent their edges from striking each other, and with means, substantially as described, for raising and lowering the said shield, substantially as described, and for the purpose set forth.

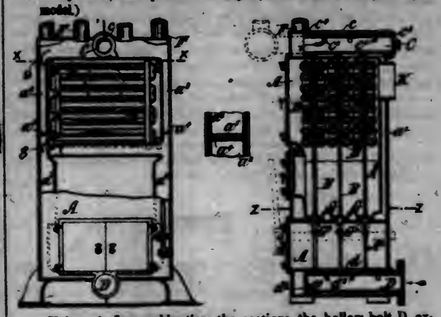
4. In a can-heading machine, the chuck a, carried by the carrier a^3, and means, substantially as described, for moving the chuck and the carrier both vertically and horizontally, the guide a^{12}, to engage the roller a^9, carried by the chuck, and cause the said chuck to turn upon its trunnions from a horizontal to a vertical position as the carrier rises, combined with a table b, (upon which the can-heads are placed,) so arranged as to be in the plane of the chuck a when the said chuck is in its lowest position, and with a finger b', to push the can-heads from the table into the chuck, and means, substantially as described, for moving the fingers b', substantially as described, and for the purpose set forth.

412,553. ROTARY VENEER OR LUMBER CUTTING MACHINE. HERMAN S. SMITH, Geneva, N. Y. Filed Nov. 2, 1888. Serial No. 289,891. (No model.)

Claim.—1. In a veneer and lumber cutting machine, in combination with the spindle B, the chuck or dog on the end thereof, and a supplemental chuck consisting of a sleeved disk feathered upon the spindle and having arms carrying knives that engage the log, a bifurcated lever fulcrumed on the main frame of the machine engaging the supplemental dog and acted upon by a movable part of the machinery, so that at the proper instant the supplemental dog may be disengaged from the log, substantially as described.

2. In a veneer and lumber cutting machine, the combination, with the spindle B, carrying on its inner end a dog or chuck, of means for imparting thereto an endwise movement for the purpose of driving the chuck into the log or disengaging it therefrom, consisting of a box E, loosely engaged by the outer end of the spindle, which is provided with collars located inside of the box, and the screw-shaft d, having the collar d' located loosely within the box E, said screw-shaft being provided with an operating hand-wheel B, substantially as described.

3. In a veneer and lumber cutting machine, the combination of the series of four feed-screws O, P, Q, and R at one end of the machine and a similar series of feed-screws at the other end of the machine, said feed-screws being arranged substantially as described, the gears J, engaging pinions on said feed-screws, the spindles B and B', the driving-gears thereupon, and the connecting-gearing between the driving-gears and the gear J at one end of the machine and between the feed-screws at one end and those at the other end of the machine, substantially as described.



4. In a veneer and lumber cutting machine, the combination of the four feed-screws O P Q R at one end of the machine and the four feed-screws O P Q R at the other end of the machine, said feed-screws P and Q being horizontal and said feed-screws O and R being inclined upward and downward, the head-block having the knife and pressure-roller and carried by the feed-screws P P, the upper pressure-rollers carried by feed-screws O O, the lower pressure-rollers carried by feed-screws R R, the dividing-roller carried by the feed-screws Q Q, the gears J J, engaging pinions on the several feed-screws, and the actuating mechanism whereby said gears J J are rotated in one direction to feed the cutter, dividing-roller, and pressure-rollers against the log or in another direction to cause them to recede from the log, substantially as described.

5. In a veneer and lumber cutting machine, the combination of the four feed-screws O P Q R at one end of the machine and a like number at the other end, the head-block S, having knife t and roller u and actuated by feed-screws P P, the dividing-roller T, actuated by the feed-screws U U, the upper pressure-rollers V V, journaled in boxes O' O', actuated by the feed-screws O O, the lower feed-screws V' V', journaled in boxes R' R', actuated by the feed-screws R R, the gears J J, connecting pinions on the several feed-screws, and actuating mechanism for said gears, substantially as described.

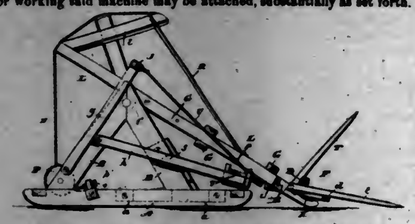
6. The combination of the spindle B, the driving-gears thereon, the double gear J, loosely mounted thereon, a feeding mechanism consisting of feed-screws having pinions engaged by the bevel-face of said double gear, the gear I, feathered upon spindle B, a shaft c, carrying beveled pinions c' and c^2, said pinion c' engaging the gear I, and said pinion c^2 engaging the pinion c^3 on the movable shaft f, carrying the pinion g, and the train of gears K, L, L', and M, said gear K engaging the flat face of the double gear J, all arranged so that the pinion g may be caused to engage the gear M or the gear L, so that the feeding devices may move in one direction or the other, substantially as described.

7. In a veneer and lumber cutting machine, the combination of the feed-screws having pinions thereon, the gears J, engaging said feed-screws, the spindles B and B', carrying the dogs that engage the log, the driving-gears on said spindles, the connecting-gearing between said spindles and the gears J, and the rod A, connected to the movable shaft f, carrying transfer-pinion g, said rod A having the leg k', adapted to come into contact with a lug on the bottom of the head-block, substantially as and for the purpose described.

412,554. SECTIONAL WATER-HEATER. JOHN G. SMITH, Montreal, Quebec, Canada, assignor to Henry Whittaker Garth and John Henry Garth, same place. Filed May 31, 1888. Serial No. 311,851. (No model.)

Claim.—1. In combination, the sections, the hollow bolt D, extending transversely of and partially across the sections, said sections being independent and separated from each other, said bolt having openings in its sides communicating with the separate sections, the said bolt having also an inlet-opening at its outer end and an opening at its inner end communicating with the front section, whereby the water entering the outer end of the hollow bolt will pass through the side openings to the sections, and also through the end opening to the front section, substantially as described.

2. In a hot-water boiler, the combination, with a series of vertical sections cast separate from each other, of hollow bolts or tubes passing transversely through said sections at top and bottom and serving to secure same firmly together, such hollow bolts or tubes having also perforations or openings in communication with each of said vertical sections, diaphragms or checks serving to divide each of said sections into upper and lower compartments or chambers, a coil of pipes for each section in communication with both chambers thereof, and suitable flow-pipes, substantially as and for the purpose specified.

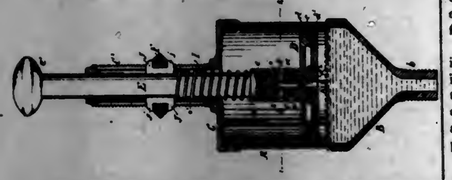


3. The combination, with the vertical sections having the ribs or projections d, of the hollow bolts securing said sections together and having perforations at each side of said ribs or projections, for the purpose set forth.

4. The combination, with the vertical cast sections and with the hollow bolts for securing the same together, of the loose nuts c^4 d^3, contained within the front section, into which the ends of said hollow bolts are screwed, substantially as specified.

5. A cast-section for a hot-water boiler, having the diaphragm or check c^4, with perforation c^3, for the purpose described.

412,555. HAY-STACKING MACHINE. ROBERT J. SMITH, Onawa, Iowa. Filed July 1, 1887. Serial No. 243,193. (Model.)



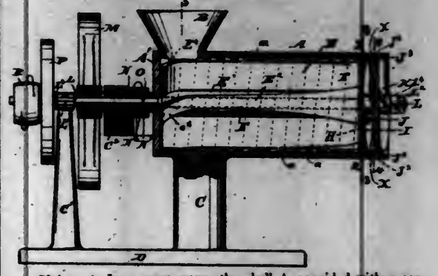
Claim.—1. In a hay-stacking machine, the combination, with two A-braces and a lever-frame provided with extension-arms, knees adjustably attached to said extension-arms, a fork attached to said knees, and a brace erected upon the front end of said lever-frame, of a roller with a pulley at one end, a rope extending from said roller to the point of the brace erected upon the front end of said lever-frame, and a rope attached to the pulley on the end of said roller passing between two smaller pulleys, to the free end of which rope the horse or other power for working said machine may be attached, substantially as set forth.

2. The hay-stacking machine having the base-frame provided with the A-braces B, the lever-frame pivoted intermediate its ends between the said braces and having the upwardly-projecting brace *l* at its inner end, the fork at the outer end of the said lever-frame, the rods R, attached to the lever-frame and to the brace *l*, the drum mounted on the base-frame, the pulley also on said base-frame, the rope H, connecting the drum to the inner end of the lever-frame and the brace *l* thereof, and the operating-rope *c*, attached to the drum and passing around the pulley, substantially as described.

3. In a hay-stacking machine, the combination, with two A-braces and a lever-frame having extension-arms, adjustable knees attached to said extension-arms, a fork attached to said knees, said fork having two rows of teeth securely set at an acute angle to each other, a brace erected upon the front end of the lever-frame, a rope attached to the point of said brace, the other end of which rope is attached to said roller, a pulley on one end of said roller of sufficient size to equalize the power lost on the lever-frame, and a rope attached to said pulley and passing back between two small pulleys, of a hinge-latch or hook attached to the braces in the bottom of the machine, said latch being adapted to be worked by means of a cord, substantially as set forth.

412,556. GREASE-CUP. JOHN H. SORDEN, Philadelphia, Pa. Filed June 7, 1889. Serial No. 313,421. (No model.)

Claim.—1. The combination, in a grease-cup, of the casing, the plunger, with an air-valve and stem, with screw mechanism, substantially as described, whereby the pressure may be regulated independently of the valve-stem, substantially as specified.



2. The combination, in a grease-cup, of the body A and the plunger D, having a spindle in which are valve-openings, with a stem also having valve-openings in line with the valve-openings of the plunger, so that on turning the valve-stem air communication will be established between the space above and the space below the piston, substantially as described.

3. The combination, in a grease-cup, of the body A, the plunger D, having a valve-opening, and a stem also having a valve-opening in line with that of the plunger, with a cap on the casing having a screw-threaded extension, a nut adapted to said screw-threaded extension, and a spring between the nut and plunger, so that a varied pressure can be obtained, substantially as described.

4. The combination, in an oil-cup, of the plunger having a spindle and valve-opening therein, with a stem having a sleeve provided with a valve-opening, said sleeve being slotted, and a pin on the plunger adapted to said slot, so that the turning movement of the stem will be limited to cut off and establish communication between the space above and air-space below the plunger, substantially as described.

5. The combination, in a grease-cup for lubricating purposes, of the casing A, having a cap C, slotted extension C' thereon, screw-threads on said extension, a nut adapted to said screw-threads, and blocks J J, with a plunger D, the stem E, and a spring between the blocks and a shoulder on the plunger, substantially as and for the purpose described.

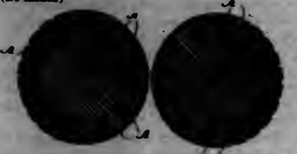
412,557. MEAT-CUTTER. GRANVILLE H. STILLMAN, Cincinnati, Ohio, assignor to the Murray Iron Works Company, of Iowa. Filed May 4, 1889. Serial No. 309,630. (No model.)

Claim.—1. In a meat-cutter, the shell A, provided with a conveyer having radial wings lying for part of their length parallel to the shaft L and for part of their length—namely, that portion which is under the hopper—obliquely to the axis of the shell A, the shell A being provided with threads *a*, and the hopper provided with preliminary cutting-knife B', substantially as and for the purposes specified.

2. In a cutter, the shell A, provided with comb J, having apertures J', and the propeller-knife I, having inclined blades provided with cutting-edges on the one hand and projections or flanges i^4 on the other, these projections or flanges bearing against the said comb J, substantially as and for the purposes specified.

3. In a meat-cutter, the shell A and the longitudinal adjustable comb, and the rotating cutting-knife K, provided with curved edges located on the outer side of said comb and rotated by shaft L, and the rotating knife I, also rotated by shaft L, provided with projections i^4, and at the other end provided with the curved cutting-edges bearing against the cutting-plate H, substantially as and for the purposes specified.

4. In a meat-cutter, the shell A and the longitudinal adjustable comb, and the rotating cutting-knife K, provided with curved edges located on the outer side of said comb and rotated by shaft L, and the rotating knife I, also rotated by shaft L, provided with the curved cutting-edges bearing against the cutting-plate, substantially as and for the purposes specified.

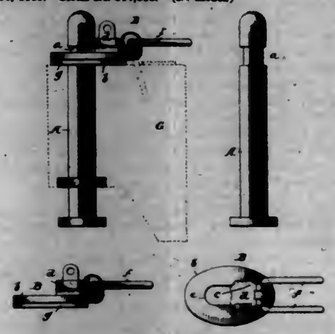


5. In a shell A, the longitudinal adjustable comb having openings, and the exterior rotating knife K, and the interior knife I, having inclined blades, and the comb having apertures narrowing toward their exit for enabling the mass of meat compressed through the apertures by means of knife I to be compacted as it issues from said apertures to the exterior cutting-knife K, substantially as and for the purposes specified.

6. In a meat-cutting device, the shell A, provided interiorly with a series of inclined threads having smooth surfaces, and the conveyer E, rotating within the shell and provided with wings E^3 in conjunction with said threads, the grooves or corrugations between the projections or wings E^3 narrowing as they approach the discharging end of the conveyer, and plate H, fixed to the conveyer and rotated therewith, the knife I, having inclined blades whose cutting-surfaces bear against the comb J, said comb J having apertures J', and the knife K outside of the comb and having its cutting-surface in contact with the exterior surface of the comb, the knives K and I being rotated by shaft L independent of and in the opposite direction to the rotation of the conveyer, substantially as and for the purposes specified.

7. In a meat-cutting device, the shell A, provided interiorly with a series of inclined threads having smooth surfaces, and the conveyer E, rotating within the shell and provided with wings E^3 in conjunction with said threads, the grooves or corrugations between the projections or wings E^3 narrowing as they approach the discharging end of the conveyer, and plate H, fixed to the conveyer and rotated therewith, the knife I, having inclined blades whose cutting-surfaces bear against the plate H, the comb J, having apertures J', and the knife K outside of the comb and having its cutting-surface in contact with the exterior surface of the comb, the knives K and I being rotated by shaft L independent of and in the opposite direction to the rotation of the conveyer, and a preliminary cutting-knife B', located at the junction of the hopper and the shell, substantially as and for the purposes specified.

8. In a cutter, the shell A, having a rotating knife-plate H, a propeller-knife I, having inclined blades whose cutting-edges bear against the cutting-plate H, and a comb J, adjustable longitudinally in said shell, having apertures J', and the rear end of the blades of knife I moving in close proximity to the said comb, substantially as and for the purposes specified.



412,558. SURFACE FOR GRINDING AND CRUSHING. AMOS P. STRYKER, New Brunswick, N. J. Filed Feb. 18, 1889. Serial No. 300,261. (No model.)

Claim.—1. The grinding-rolls for crushing or grinding ore and hard substances, composed of pieces of steel or similar hard metal in juxtaposition with each other, and united with a body of cast metal to prevent the formation of peripheral grooves, substantially as set forth.

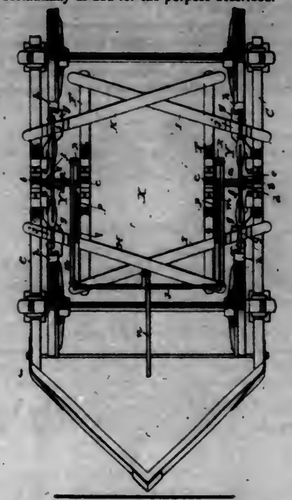
2. The grinding-surface for crushing or grinding apparatus, composed of pieces of steel set closely together and held firmly in place by the inner surfaces being fused with and by the cast-iron in contact with them, substantially as specified.

412,559. GRIP-LOCK. JOHN STEPHENSON, New York, N. Y. Filed July 18, 1889. Serial No. 317,893. (No model.)

Claim.—1. A grip-lock with its plate having a hole of diameter and form adapted to a grip-carrier post, with a groove to receive the lock-plate and prevent the grip-machine from rising on the post, substantially as and for the purpose described.

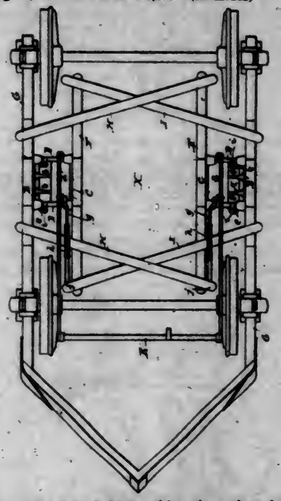
2. A grip-lock with its plate having on its upper side a hinged flap adapted to be raised up to permit the lock being placed over the head and in the groove of the grip-post and there retained by said hinged flap, substantially as and for the purpose described.

3. A grip-post lock with a hinged flap on its upper surface and its hinge-pin extended both ways, with its ends drooping and forming a yoke adapted to fall astride the neck of the grip-machine, substantially as and for the purpose described.



4. A grip-lock with its plate adapted to a grip-post holding the socket of a cable-grip machine, the under side of the lock-plate faced with leather or similar noiseless substance, substantially as and for the purpose described.

412,560. WHEEL-BRAKE. JOHN STEPHENSON, New York, N. Y. Filed Aug. 10, 1889. Serial No. 320,269. (No model.)

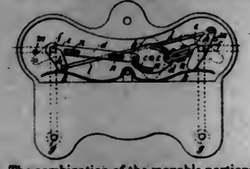


Claim.—1. A car-wheel brake adapted to a car-truck, having crossed rails passing the wheel-treads diagonally, and the shoe-bars sliding through diagonal keepers secured to the diagonal crossed rails, substantially as and for the purpose described.

2. A car-wheel brake adapted to a car-truck, the brake mechanism attached to the truck-sills, cheek-sills, and diagonal crossed rails, and the operating-lever of the brake located at the car-front, as and for the purpose described.

3. A car-wheel brake on a truck with its diagonal cross-rails supporting shoe-bars, each shoe-bar carrying at one end a brake-shoe, with mechanism adapted to force the shoe against the car-wheel and again release the shoe by a rock-shaft-arm recoil-rod shouldered against a spiral spring, the rod continuing through the loose end of the cross-rail against which the recoil-spring abuts, whereby after being crushed the spring recoils and restores the brake to its inactive position, substantially as and for the purpose described.

412,561. TRACK-BRAKE. JOHN STEPHENSON, New York, N. Y. Filed Aug. 12, 1889. Serial No. 320,453. (No model.)

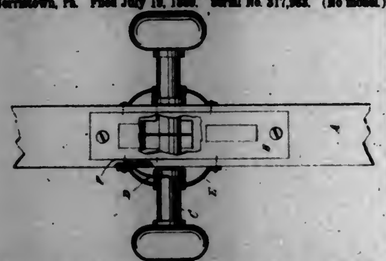


Claim.—1. A car-track brake with a shoe adapted to be lifted and depressed by connections with rock-shafts whose outer ends are journaled in housings connected to truck-sills that are sustained by pendants integral to the axle-box shells, the truck-sills carrying the ends of crossed bars, which crossed bars carry the inner cheek-sills, and the cheek-sills supporting the housings for the inner end of the rock-shafts, substantially as and for the purpose described.

2. A track-brake in two sections, each of which sections occupies a wall or four-sided inclosure at one of the sides of a car-truck having a central six-sided grip-well, with four of its sides formed by the two crossed rails, with their four ends connected with the side sills of the truck, and also forming the four end walls of two track-brake wells whose sides are inclosed by the two truck-sills and the two cheek-sills, the ends of the latter carried by the ends of the crossed rails, substantially as described.

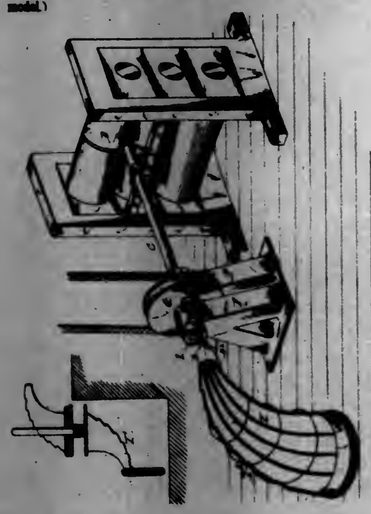
3. A track-brake located in a car-truck, with a six-sided grip-well having two of the well-sides formed by the two cheek-sills par-

allel with the two truck-sills and each of the four sills supporting parts of the mechanism of a track-brake, the other four sides of the well being formed by the two composite cross-rails, substantially as and for the purpose described.



412,562. LETTER-FILE. WILHELM SEIBT, Leipsic, Germany. Filed Jan. 29, 1889. Serial No. 297,928. (No model.) Patented in Germany Aug. 10, 1886, No. 47,147; in England Nov. 14, 1886, No. 14,565; in Switzerland Nov. 31, 1886, No. 176, and in Austria-Hungary Feb. 15, 1888.

Claim.—1. The combination of the movable portions of the filing-wires of a letter-file with mechanism adapted to be operated by a key to lock the said wires in their closed positions, all substantially as described.



2. The combination of the movable portions of the curved filing-wires of a letter-file and crank-levers carrying said movable parts with mechanism adapted to be operated by a key to lock the said wires in their closed positions, all substantially as described.

412,563. ELECTRICAL DOOR-ALARM. DANIEL H. STRESSER, Norristown, Pa. Filed July 19, 1889. Serial No. 317,963. (No model.)

Claim.—The combination, with a door, its lock having operating-knob and an escutcheon E, of the electric alarm and battery, the contact-plate F, secured to the door under the escutcheon and in the circuit of the battery, and the switch-arm D, secured to the knob-shank and also concealed by the escutcheon, substantially as set forth.

412,564. MACHINE FOR COILING WIRE RODS. FRANK G. TALLMAN, Beaver Falls, Pa. Filed Mar. 5, 1889. Serial No. 301,908. (No model.)

Claim.—1. The combination, with a set of rolls, of a curved and revolving guide-pipe placed at the delivery end of the said pipe or guide and on a line therewith, whereby the rod as it emerges from the revolving guide is formed into loops, as set forth.

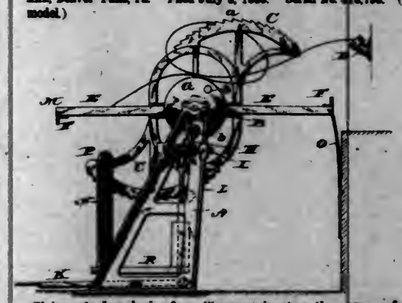
2. In a device for coiling metal rods as they emerge from the rolls, a revolving horizontal pipe or tube communicating with the guide which conducts the rods from the rolls, said pipe being curved or bent at its outer end so as to describe a circle and form the rods into loops or spirals while in their aerial flight, and a standard or supporting device for arresting and retaining the coils.

3. In a device for coiling metal rods as they emerge from the rolls, a horizontal revolving guide-tube having its outer end curved or bent, as described, to form the rods into spirals while in their aerial flight, in combination with a curved or horn-shaped standard to catch and retain said coils.

4. The revolving curved guide, in combination with a movable support having the standards mounted thereon, substantially as described, whereby the same may be successively filled and discharged, as set forth.

5. The revolving curved guide-pipe provided with the removable end, substantially as and for the purpose set forth.

6. The horn-shaped holder or arrester arranged in relation to the forming-rolls, substantially as described, whereby the same is adapted to receive a rod in process of coiling, and constructed with its point or apex to receive the rod as it is coiled and being enlarged as it recedes toward its base, as set forth.



7. The cone or horn shaped holder or arrester arranged to receive a rod in process of being coiled, provided with a hooked, saw-tooth, or notched back, and with its point or apex to receive the rod as it is coiled, and said holder being enlarged as it recedes from the apex to its base, and with said base arranged at right angles (more or less) with the line of direction of its apex, as set forth.

8. The combination, with a traveling carrier, of the holders or standards arranged thereon, substantially as described.

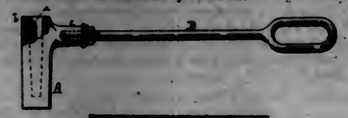
9. The combination, with a traveling carrier, of the holders or standards arranged thereon, and a feeder-wall for removing the coils from the holders, as set forth.

10. The combination of a revolving bent pipe to form the rod into coils, the rolls for feeding the same to the pipe, a holder or standard to receive the coils, and a device for engaging the coils and removing them from the standard, as set forth.

412,565. DEVICE FOR COILING METAL RODS. FRANK G. TALLMAN, Beaver Falls, Pa. Filed July 6, 1889. Serial No. 316,793. (No model.)

Claim.—1. In a device for coiling metal rods as they emerge from the rolls, the horn-shaped revolible catchers or holders, provided with a serrated back, in combination with a revolible frame for drawing the rear end of the rod from the guide-tube, as set forth.

2. In a device for coiling metal rods as they emerge from the rolls, the catchers or standards C, and frame E, mounted on a suitable shaft, in combination with the disk, bolt, bar, and treadle, as set forth.



3. In a device for coiling metal rods as the emerge from the rolls, the frame, and catchers or standards revolubly mounted in the supports A, and a spring-brake adapted to impinge against the end of the frame to arrest its motion, as set forth.

4. In a device for coiling metal rods as they emerge from the rolls, the horn-shaped standards or catchers C C, mounted on a central axis and adapted to be rotated around the same, in combination with the resting or stop plate.

412,566. MOLD FOR INGOTS. HENRY C. TALLMAN, Cranston, assignor to Charles F. Irons, Providence, R. I. Filed May 31, 1888. Serial No. 273,796. (No model.)

Claim.—1. The combination of the mold A, having the matrix *a*, the hub *c*, the handle B, screwed into said hub, and the check-nut *d*, substantially as specified.

2. The improved ingot-mold A herein described, having the matrix *a*, the crucible-notch *b*, the hub *c*, the handle B, screwed into said hub, and the check-nut *d*, substantially as shown.

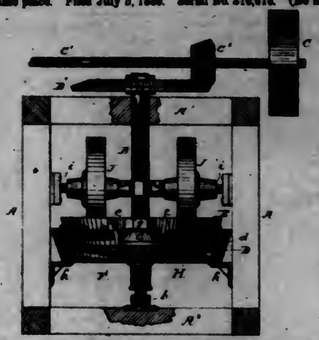
412,567. GOVERNOR FOR ELECTRIC GENERATORS. PATRICK J. TRACY, Racine, Wis. Filed Nov. 9, 1888. Serial No. 289,981. (No model.)

Claim.—1. The combination, with an electric generator, of an electro-magnet and other electrically-actuated devices arranged in parallel circuit, a balanced beam connected at one end to the generator, and an armature suspended from the other end of the beam to come in the attractive field of the electro-magnet, and be attracted in proportion as surplus energy manifests itself in said magnet, whereby the generation of the electric current is automatically regulated in case any one or all of said electrically-actuated devices beyond the magnet-loop are cut out of circuit, substantially as set forth.

2. In an electric governor, a pivoted beam mechanism actuated by an electric current to automatically regulate said current or its production, in combination with a spring-latch for retaining the beam in position to discontinue said current, and an electro-magnet arranged to disengage said latch and beam, substantially as set forth.

3. In an electric governor, a pivoted beam connected to an electric generator, a magnet electrically connected to said generator, an armature suspended from the beam to come in the attractive field of the magnet, a weight arranged on the beam, and a tension-spring connected to said beam to have its power inverse to that of the weight, substantially as set forth.

4. In an electric governor, a pivoted beam mechanism connected to an electric generator, a magnet electrically connected to said generator, an armature suspended from the beam to come in the attractive field of the magnet, and an auxiliary electro-magnet arranged to attract the beam, substantially as set forth.

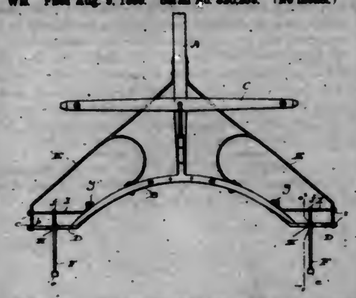


5. In an electric governor, a pivoted beam connected to an electric generator, a magnet electrically connected to said generator, and an armature suspended from the beam to come in the attractive field of the magnet, in combination with an adjustable regulator for said beam, a spring-latch for retaining the beam in position to discontinue the current, an electro-magnet arranged to attract said latch, an air-chamber, and a piston arranged within the air-chamber and having a rod-connection with the beam, substantially as set forth.

6. In an electric governor, a pivoted beam provided with a stud, a segment-arm adjustably secured to the stud, an armature connected to the segment, and an electro-magnet arranged to attract the armature, substantially as set forth.

7. In an electric governor, the combination of an electrically-controlled and pivoted beam, a main battery, an auxiliary battery, opposing spring contact-points connected to the batteries, and a flexible connection uniting the beam with one of said contact-points, the latter being arranged in the path of the adjacent end of said beam, substantially as set forth.

8. The combination, with an electric generator and parallel circuit, of an electro-magnet in the circuit, a vertical standard, a beam pivotally secured thereto and connected to the generator, an armature suspended from the beam to come in the attractive field of the electro-magnet, a weight arranged on the beam, and a tension-spring connected to said beam to have its power inverse to that of the weight, substantially as set forth.



412,568. ORE-CRUSHER. JAMES A. VAUGHN and CALVIN W. VAUGHN, Cuyahoga Falls, Ohio, assignors to Turner, Vaughn & Taylor, same place. Filed July 5, 1889. Serial No. 316,616. (No model.)

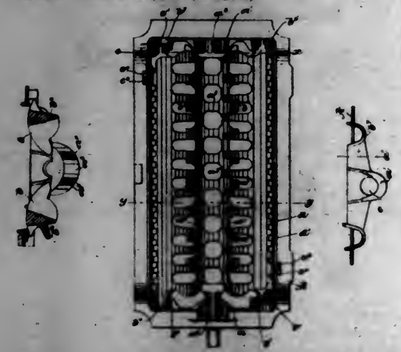
Claim.—1. In a mill of the class designated, the combination of the disk, with its annular ridge, the removable bed arranged to rest against said ridge, the conical sleeve arranged to meet the inner edge of said bed, and means, as a nut, to force said sleeve against said bed, all constructed and arranged substantially as shown, and for the purpose specified.

2. In a mill of the kind designated, the combination, with the revolible grinding-bed and rim having side openings, of a pan disposed beneath said bed and rim, having upwardly-sloping center and sides forming an annular channel to receive the material which escapes through said openings, all constructed and arranged substantially as shown and described.

412,569. VEHICLE-TONGUE. GERARD H. VOLLRARDT, Milwaukee, Wis. Filed Aug. 9, 1889. Serial No. 320,268. (No model.)

Claim.—1. A vehicle-pole, circle-bar, and braces, in combination with lateral arms uniting the opposing ends of the circle-bar and braces, longitudinal links adjustable on the arms, and rods extended from said circle-bar through the forward portion of the links and connected to the braces, substantially as set forth.

2. A vehicle-pole, circle-bar, and braces, in combination with lateral arms wedge-shaped in cross-section, arranged to unite the opposing ends of the circle-bar and braces, longitudinal links provided with wedge-shaped openings for engagement with the arms, but of greater depth than the latter, and set-screws for clamping the links in any position to which they may be adjusted on said arms, substantially as set forth.



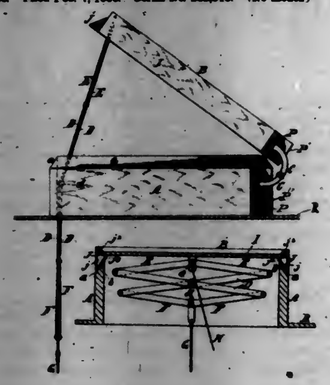
3. A vehicle-pole, circle-bar, and braces, in combination with lateral arms wedge-shaped in cross-section, arranged to unite the opposing ends of the circle-bar and braces, longitudinal links provided with wedge-shaped openings for engagement with the arms, set-screws for clamping the links in any position to which they may be adjusted on

said arms, and rods extended from said circle-bar through the forward portion of said links and connected to the braces, substantially as set forth.

4. A vehicle-pole, circle-bar, and braces, in combination with lateral arms uniting the opposing ends of the circle-bar and braces, longitudinal links adjustable on the arms, and rods extended from said circle-bar through the forward portion of the links to connect with the braces, and provided with eyes for stay chains or straps, substantially as set forth.

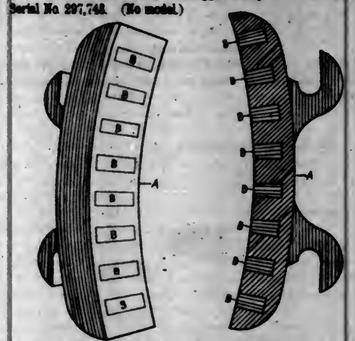
5. A vehicle-pole, circle-bar, and braces, in combination with the lateral arms D, uniting the opposing ends of the circle-bar and braces, the links F, adjustable on the arms, the set-screws H, engaged by the links, and the bushings G, inserted between said arms and screws, substantially as set forth.

412,570. **GRATE.** GEORGE W. WALKER, Malden, Mass. Filed Jan. 10, 1889. Serial No. 296,013. (No model.)



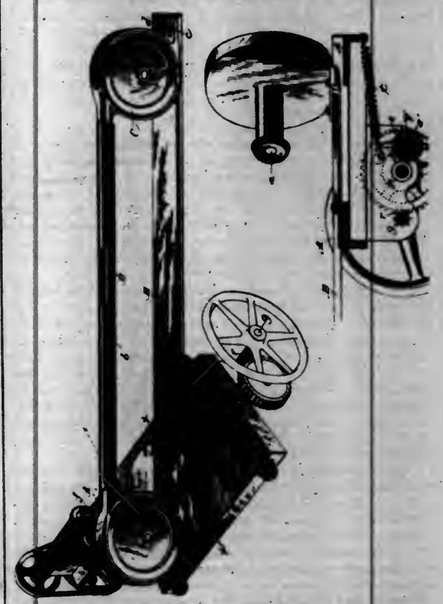
Claim.—1. The combination, with the bed-plate provided with a bearing having a slot, as c^2, of a rocking grate consisting of the central section and side bars, and a locking projection on one or both of said side bars below the journals of the said side bars, the said locking projection being passed through the said slot and located below the bearing of the grate-bar journals out of line with the said slot when the side bar is in operative position and capable of being rocked, substantially as described.

2. The combination, with the bed-plate, of the grate consisting of the central section provided with projections, and independent rocking side bars having fingers co-operating with the projections of the central section, and provided with a limiting projection on its rear side to co-operate with the bed-plate, substantially as described.



3. The herein-described side bar, consisting of the deep longitudinal web b^2, provided with journals at its ends and with a locking-finger c', and fingers connected to side of the said web and made at their junction with the web of a depth substantially equal to the width of the web, and having their upper surface made substantially in the arc of a circle, substantially as and for the purpose specified.

412,571. **SCUTTLE-LIGHT.** JOHN WEBB, Cincinnati, Ohio, assignor of two-thirds to Joseph H. Bostain and Valentine Bostain, both of same place. Filed Feb. 7, 1888. Serial No. 263,315. (No model.)



Claim.—The combination of a scuttle-box, top hinged thereto, bent levers D D, fulcrumed to the box, and toggle-arms E E and F F, substantially as and for the purposes specified.

412,572. **RAILWAY-BRAKE SHOE.** RICHARD F. WEALES, CHARLES W. CASE, and ARTHUR O. GARDNER, Hannibal, Mo., assignors of two-fifths to Erwin C. Case and William W. Driggs, same place. Filed Jan. 7, 1889. Serial No. 297,748. (No model.)

Claim.—As an improved article of manufacture, a railway-brake shoe composed of an iron or steel body filled with lead and antimony, substantially as described.

412,573. **EMBROIDERY-CUTTING MACHINE.** CHARLES WHITE, Baltimore, Md., assignor to Friedenwald Brothers, same place. Filed Oct. 20, 1888. Serial No. 288,642. (No model.)

Claim.—1. In combination, a suitable base, an endless cutting-band, the drums therefor, and the support B, said support being arranged below the drums and having a groove directly in line with the peripheries of the drums, substantially as described.

2. In combination, a suitable base, an endless cutting-band, the drums therefor, the support B, below the drums, having a groove directly in line with their lower peripheries, and a tube extending between the upper peripheries of the drums and receiving the endless band, substantially as described.

3. In combination, a base A, an endless band suitably supported having a cutting-edge, a support B, having a grooved edge for covering said band, a guide for directing the material, and an adjustable plate for the band in line with the guiding device, whereby the cutting-edge of the band may be exposed to a greater or less extent, substantially as described.

4. In combination, a base A, an endless cutting-band, a support B, grooved to conceal the same, and a plate having a groove of less depth than that of the plate B, whereby the cutting-edge is exposed, and a guiding device for directing the material to said cutting-edge, substantially as described.

5. In combination, the base A, an endless cutting-band, a support B, grooved to cover said band, supporting-drums at each end of said support, one of said drums being adjustable, and a tube between the drums in line with the upper peripheries, substantially as described.

6. In combination, the cutting-tool, means for supporting and means for driving the same, a guide-bar *n*, and a pressure-plate *m*, supported by said bar, said plate having its forward end raised and its other end near the cutter depressed to bear upon the goods, substantially as described.

7. In combination, a base, an endless cutting-band, a support B, having a groove on its edge in which the band travels, means for supporting said band, and adjustable plate A, having a groove corresponding to the groove in the support B, but of less depth, whereby the edge of the cutter is exposed in its travel a distance equal to the width of the adjustable plate, and means for adjusting said plate.

8. In combination, a base A, a support B, arranged at an angle thereto, a groove in its edge, an adjustable plate fitting a recess in said support B, said adjustable plate also having a groove in its edge in line with the groove in the plate B, but of less depth, whereby the cutting-edge is exposed at this point, supporting-drums for the band, one of said drums being adjustable, a tubular covering between the drums for the band in its return movement, means for driving said band, means for directing the material to the cutting-edge, consisting of the pressure-plate, a vertical shoulder and a guide for the plain portion and feed-rollers for drawing upon the plain cut portion of the fabric, and means for driving said rolls, substantially as described.

9. In combination with an endless cutting-band, means for directing the material to the cutting-edge, feed-rollers for receiving and drawing upon the plain cut portion, consisting of the revolving roll *p*, and the roll *q*, mounted eccentrically upon the rocking shaft, and means for moving the shaft, substantially as described.

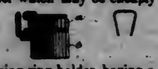
10. In combination, the base, the endless cutting-band, the drums, and the support B, for the drums, having a groove, the said band being arranged with its front cutting-edge within the groove and back of the front edge of the support, said support being recessed at one point to expose the cutting-edge, substantially as described.

412,574. **TRAVELER-CLEARER FOR SPINNING-MACHINES.** ARTHUR F. WHITIN, Whitinsville, Mass., assignor to the Whitinsville Spinning Ring Company, same place. Filed Mar. 26, 1888. Serial No. 268,117. (No model.)

Claim.—1. A ring-holder and means, substantially as described, for holding it to the rail, combined with a traveler-clearer adjustably attached to or connected with it by means independent of the means employed for securing said holder in place, substantially as described.

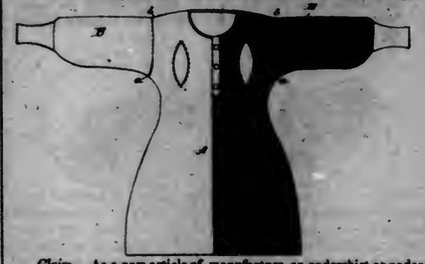
2. A spinning-ring holder and means, substantially as described, for holding it to the rail, combined with a traveler-clearer pivotally connected to the holder by means independent of the means employed for securing said holder in place, substantially as described.

3. A ring, a ring-holder, and means, substantially as described, for holding it to the rail, and a traveler-clearer connected to the said holder, the said clearer consisting of a piece of material bent or shaped to form a base or foot and an upright portion, and means independent of the means employed for securing said holder in place to connect the base or foot to the holder, leaving the vertical part of the clearer extended upwardly near the ring, substantially as described.



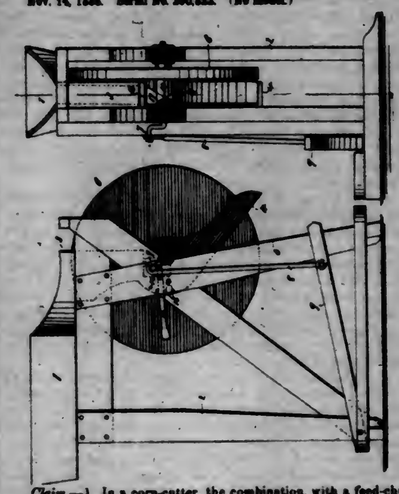
412,575. **TRAVELER-CLEARER FOR RING-SPINNING FRAMES.** ARTHUR F. WHITIN, Whitinsville, Mass., assignor to the Whitinsville Spinning Ring Company, same place. Filed Mar. 26, 1888. Serial No. 268,118. (No model.)

Claim.—A spinning-ring holder having a notch or recess, and a traveler-clearer composed of a strip of metal bent to form a spring-foot and held in position in said notch or recess, substantially as described.



412,576. **TRAVELER-CLEARER FOR RING-SPINNING FRAMES.** ARTHUR F. WHITIN, Whitinsville, Mass., assignor to the Whitinsville Spinning Ring Company, same place. Filed Mar. 26, 1888. Serial No. 268,119. (No model.)

Brief.—The object of the invention is to provide a spinning-ring holder with a traveler which may be cheaply made and efficient.



Claim.—A spinning-ring holder having a socket or recess, combined with a traveler-clearer having a foot or base to enter the said socket or recess and made adjustable on the said holder, substantially as described.

412,577. **KNITTED UNDERSHIRT.** FRANK WILCOXS, San Francisco, Cal., assignor, by mesne assignments, to the Wilcomb Knitting Machine Company, Jersey City, N. J. Filed Jan. 22, 1887. Serial No. 225,188. (No specimens.) Patented in Canada Jan. 14, 1889, No. 30,574.

Claim.—As a new article of manufacture, an undershirt or undervest the body of which is formed of shaped tubular knitted fabric terminating at its upper part in front and rear flaps stitched on their upper edges and having a neck-opening, and sleeves formed of shaped tubular knitted fabric secured to the edges of the armholes, as set forth.

412,578. **CORN-CUTTER.** HARRY WELLIN, New Boston, Ill. Filed Nov. 14, 1888. Serial No. 290,832. (No model.)

Claim.—1. In a corn-cutter, the combination, with a feed-chute, of a vertical wheel and segmental cutters having oppositely-inclined cutting-edges and secured to the side of the wheel below the lower end of the chute and on opposite sides of the axis of the said wheel, substantially as described.

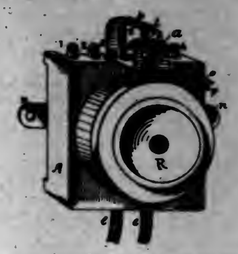
2. In a corn-cutter, the combination, with a receptacle provided with a vertical feed-chute, of a vertical wheel, a series of segmental cutters having oppositely-inclined or spiral cutting-edges and secured to the side of the wheel below the lower end of the chute and on opposite sides of the axis of the said wheel, and an adjustable gage extending across the lower end of the chute, substantially as herein shown and described.

3. In a corn-cutter, the feed-chute 3, the vertical wheel 6, with cutters 10, having an inclined cutting-edge 11 projecting beneath the chute 3, and the gage consisting of a lever-arm 12, pivoted to frame 2, and having an arm 13 at right angles thereto and extending across the lower end of chute 3, and adjusting-pin 15, adapted to enter one of a series of holes 14 in the frame, substantially as shown and described.

4. A cutter consisting of receptacle 1, with feed-chute 3 and discharge-chute 4, a vertical wheel 6, having crank-shaft 7, treadle 9, connecting-rod 8, and the cutters 10, with an inclined cutting-edge 11 projecting beneath the chute 3, and a gage consisting of lever-arm 12, pivoted to a frame 2, and having an arm 13 at right angles thereto and extending across the lower end of chute 3, with the adjusting-pin 15, adapted to enter one of the series of holes 14 in frame 2, substantially as shown and described.

412,579. MICROPHONIC TRANSMITTER. BRUNO ABDANK-ABAKANOWIN, Paris, France, assignor to the American Bell Telephone Company, Boston, Mass. Filed Feb. 20, 1888. Serial No. 300,543. (No model.) Patented in France Feb. 26, 1888, No. 189,018, and in Austria-Hungary Apr. 16, 1888, No. 6,633.

Claim.—1. In a telephone-transmitter, the combination of a contact-piece carried in a horizontal plane by a vibratory diaphragm and across the central portion thereof, a number of movable disk-formed carbon contact-pieces abutting by the force of gravity peripherally against the diaphragm contact-plate, the said disks being on edge and separated from each other by a non-conducting partitioned frame, as described, and being mounted upon a suitable conducting-support, through which the current traversing the circuit reaches the carbon disks, whereby a multiplicity of variable-resistance contacts may be provided, and whereby the movable contact pieces may remain untrammeled by connecting-wires, substantially as described.



2. In a microphonic telephone-transmitter, the combination, substantially as hereinbefore described, of a vibratory diaphragm carrying at its center a conducting-plate, a conducting inclined surface mounted in the rear of the said diaphragm, a series of disk-formed freely-movable carbon contact-pieces placed on edge between the diaphragm-plate and the inclined support and adjusted to make permanent but variable contact with the said diaphragm-plate by means of the inclined rear support on which they rest, and a comb-like frame for the said movable carbon disks, separating the said disks from each other and acting to dampen or retard their movement, whereby a series of variable-resistance contacts may be arranged both in series and multiple arc and vibrated by the same diaphragm at a point near the center thereof.

3. In a microphonic transmitter, a series of carbon disk-formed freely-movable contact-pieces, a conducting-support therefor comprising two parts divided electrically from each other and each supporting on edge a part of the entire number of said carbon disks, and a diaphragm-electrode in contact with all of the said disks, whereby they are held in place, the whole being adapted to be included in an electrical circuit, whereby a continuous circuit including a number of resistance-contacts variable by the movements of said diaphragm and arranged in multiple series is constituted between the two insulated parts of the conducting-support, substantially as and for the purposes specified.

4. A telephone-transmitter comprising a series of freely-movable disk-formed contact-pieces of carbon, an inclined-plane conducting-surface consisting of two parts electrically insulated from each other, forming a rear support for the said disks, the said insulated parts each supporting a fractional number of said disks, and a vibratory diaphragm and electrode, with which the peripheries of the said carbon disks are in permanent contact by the influence of gravity, the said electrode forming a conducting bridge-piece, whereby an electrical circuit including a series of variable contacts is constituted between the two members of the inclined rear support, substantially as described.

5. The combination, in a telephone-transmitter, of a conducting contact-surface carried by a vibratory diaphragm, a rear conducting-surface inclined at an angle to the plane of the said diaphragm, a series of carbon disks constituting freely-movable contact-pieces supported peripherally upon the said inclined rear conducting-surface and caused thereby to abut against the diaphragm conducting-surface, the point of contact therewith being at or below the horizontal plane of their centers, the said disks being connected with an electrical circuit only by means of or through one or both of their supports, whereby their freedom of movement is unimpaired, and whereby they are enabled to rotate and to continually bring new points of contact into action, substantially as described.

412,580. TELEPHONE-STATION APPARATUS. BRUNO ABDANK-ABAKANOWIN, Paris, France, assignor to the American Bell Telephone Company, Boston, Mass. Filed Feb. 20, 1888. Serial No. 300,549. (No model.) Patented in France Feb. 26, 1888, No. 189,018, and in Austria-Hungary Apr. 16, 1888, No. 6,633.

Claim.—1. The combination, in a telephone-station apparatus, of a microphonic transmitter in which the variable-resistance contacts are formed by the interposition of a number of carbon disks placed on edge between an inclined rear surface of carbon and a plate of carbon carried upon the diaphragm, a non-conducting case for the working parts of the said transmitter, comprising non-conducting partitions integral with or centrally mounted within the said case and interposed between the several adjacent carbon disks, a perforated bifurcated plate serving as a telephone-holder mounted centrally on the upper edge of the non-conducting case, a portable telephone-receiver having a watch-stem suspending-rod adapted to engage with the said perforated plate, whereby the said telephone may be hung upon its holder in front of the transmitter, a circuit-changing switch also mounted upon the upper edge of the said non-conducting case, actuated automatically in one direction by a spring when the receiver is removed and actuated in the other direction by the operation of the suspending-stem of the said receiver when replaced, the said stem acting as a lever in opposition to the said spring, as and for the purpose specified.

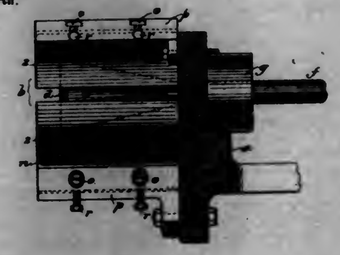
2. The combination, in a telephone-station outfit, of a microphone-transmitter consisting of a vibratory diaphragm carrying or forming a conducting-plate, an inclined plane of conducting material in the rear thereof, and a series of carbon disk-formed movable contact-pieces making variable-resistance contact with the diaphragm and rear plates, a mold, frame, or base of non-conducting material recessed in front to serve as the diaphragm-seat and vocalizing-chamber, provided centrally with partitions for interposition between the several carbon disks and channeled on the rear side for the reception of a calling-key and electrical connections, a calling-key with normal and battery contacts mounted in one of the said lateral channels on the rear side of said frame and projecting therefrom, a circuit-changing switch comprising a line-spring, a telephone-contact, and an alarm-branch contact, serving also as a telephone-holder, secured to the upper edge of the non-conducting frame, and a portable telephone-receiver in circuit with the said microphone-transmitter provided with a watch-stem suspending-rod adapted to be engaged by the telephone-holder when placed thereon and thereupon to disengage the line-spring from the telephone-contact and to transfer the circuit thereof through its own substance to the signal-branch contact, the telephone-receiver being hung in front of the transmitter-diaphragm, substantially as described.

3. As a new article of manufacture, the homogeneous case, frame, or base for a compound telephonic apparatus described herein, consisting of a block of hard rubber, vulcanized fiber, or like non-conducting material partitioned centrally for the reception and mutual insulation of the several movable microphonic contact-pieces, and provided with a shouldered recess at its front side, serving as the diaphragm-seat and vocalizing-chamber, and with suitable channels and recesses cut or pressed into its substance at its rear side for the reception and protection of the calling-key and electrical connections and terminals, substantially as described.

4. In a compound telephone-station outfit, the combination of a main electric circuit, a call-signal branch circuit therefor normally completing the same and including a slotted plate forming a holder for the receiving-telephone when not in use, a spring calling-key, the back or resting contact thereof, and a call-bell magnet, a normally open or discontinuous telephone branch including a multiple-contact microphone, a receiving-telephone, and a transmitter-battery, the said battery being also connected with the front contact of the calling-key, a circuit-changing switch for transferring the main line from either branch to the other as required and for closing the circuit of the battery through the transmitter, operated automatically in one direction and actuated by the suspending-stem of the telephone-receiver used as a lever in the other, and comprising a contact-spring constituting the automatically-actuating main-line terminal, an insulated contact-post forming the terminal of the telephone branch normally out of contact with the said main-line spring, but connecting therewith when the receiver is removed for use, thereby closing the said branch to line, and the slotted receiver-holding plate forming the terminal of the call-signal branch circuit and normally connected with the said main-line spring through the substance of the suspending-stem of the receiver, the said stem being interposed between the said plate and the line-spring, uniting them electrically and raising the latter from the telephone-branch terminal post when the receiver is hung upon its holder, substantially as described.

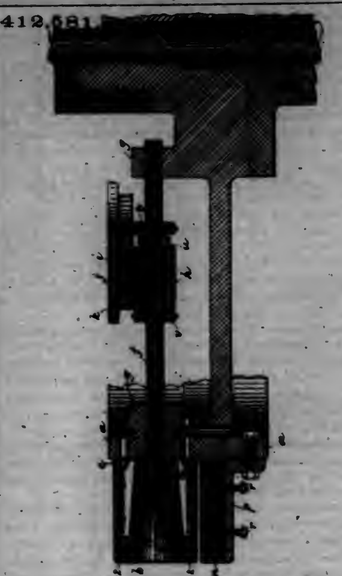
5. The combination, in a telephone-station apparatus and in a concrete organization of the several instrumentalities thereof, of a non-conducting matrix forming a frame or base for the entire instrument, a multiple-contact microphonic transmitter mounted in the front and center of said matrix, a calling-key with front and back contacts, together with electrical connections recessed in channels cut in the back of said matrix, a circuit-changing switch constituting a rest or holder for the receiving-telephone mounted on the upper edge of the said matrix and projecting over the front side thereof, and a watch-formed telephone-receiver having a metal suspending-stem and adapted to be hung thereby, when not in use, in the said telephone-holder and in front of the transmitter, the said stem being adapted to actuate the said switch in one direction and forming when in place a portion of one of the circuits controlled thereby.

6. The combination, in a telephone-station apparatus, with a receiving-telephone having a metal suspending-stem formed, as shown and described therein, with an enlargement at its central part, of a circuit-changing switch controlling the circuits of said apparatus, and consisting of the angle-plate *a*, perforated and slotted to receive and lock the telephone suspending-stem and to serve as a rest or holder therefor and forming the terminal of a given branch circuit, the insulated post or fixed contact *c*, forming the terminal of a second branch circuit, and the spring *b*, fixed at one end, having its free end in line with and overhanging the said fixed post and the slot of the angle-plate, the said spring being the terminal of a main circuit and being adapted to press, when the telephone is not suspended in place, upon the said insulated post and to be elevated and disconnected therefrom by the telephone suspending-stem acting as a lever and to connect through the substance thereof with the slotted plate when the telephone is suspended from the said plate, substantially as and for the purposes described.



412,581. MANDREL FOR CAN-MACHINES. EDWIN R. ASHELL, Boston, assignor of one-half to E. P. Welch, Cambridge, Mass. Filed Jan. 29, 1889. Serial No. 298,007. (No model.)

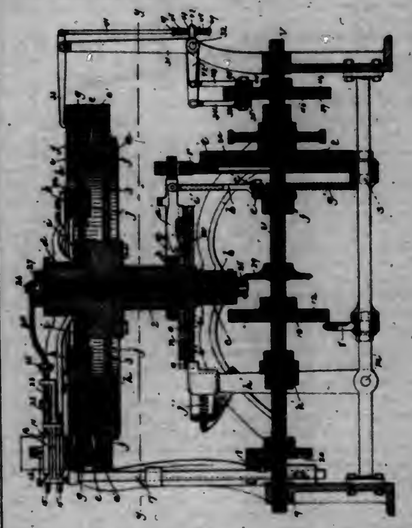
Claim.—1. The combination, with the supporting-carrier *a*, of the mandrel-sections 2, recessed or formed hollow between their inner and outer walls to provide housing-cavities, the springs *c*, attached to said carrier and to the said sections in the housing recesses or cavities of the latter, separated clamping-jaws outside of said mandrel-sections, and means for expanding the mandrel to clamp a can-body between said mandrel and jaws, substantially as set forth.



2. The combination, with the expansible mandrel, of the external jaws and means for adjusting said jaws with relation to the periphery of the mandrel, and for positively holding them at any position to which they may be adjusted.

3. The combination, with the expansible mandrel, of the tangentially-adjustable jaws *m m*, as set forth.

4. The combination, with the expansible mandrel, of the adjustable jaws *m m*, arranged to co-operate with one side of the mandrel, and the jaw *n*, arranged to co-operate with the opposite side thereof, as set forth.



412,581.

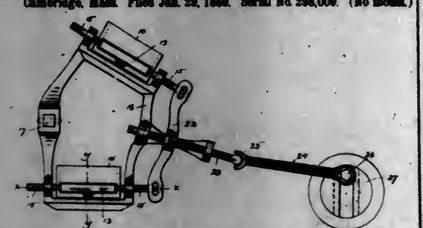
5. The combination of the sectional mandrel, the external jaws, the wedge interposed between the sections of the mandrel as a means for expanding the same against the jaws, a rod attached to said wedge, a sleeve *h* on said rod, a cam adapted to positively reciprocate said sleeve, and a yielding connection between said sleeve and rod, as set forth.

412,582. CAN-SOLDERING MACHINE. EDWIN R. ASHELL, Boston, assignor of one-half to E. P. Welch, Cambridge, Mass. Filed Jan. 29, 1889. Serial No. 298,008. (No model.)

Claim.—1. The combination, with the step-by-step-rotated turret and its mandrels and jaws, of the continuously-rotated shaft within the hub of the turret, the yoke or frame located over the turret, the soldering-iron holders fitted to slide in guides in said frame and provided with irons or slugs, and the pitmen connected at one end with

an eccentric wrist-pin on said shaft, and intermediate devices, substantially as described, connecting said pitman with the iron-holders, whereby the latter are reciprocated, as set forth.

2. The combination of the rotary mandrel-carrying turret having a hub journaled in suitable bearings, a wheel *n*, affixed to said hub and having a series of notches or slots *o*, an arm *q*, mounted to oscillate horizontally on said hub, means for oscillating said arm, the dog *s'*, pivoted to said arm and formed to engage the slots of the wheel *n*, and means for vertically reciprocating said dog, whereby the latter is caused to engage the wheel *n* and rotate the turret during the forward horizontal movement of the arm *q* and disengaged from the wheel during the backward movement of said arm, as set forth.



3. The combination, with the rotary mandrel-carrying turret having a hub journaled in suitable bearings, of the wheel *n*, rigid with said hub and provided with the slots or notches *o* and *i'*, the oscillating arm *q*, provided with the pivoted dog *s'*, adapted to engage the slots or notches *o*, the spring-pressed locking-lever *K'*, arranged to engage the said slots or notches *i'*, and a cam for disengaging said lever from said slots or notches, as set forth.

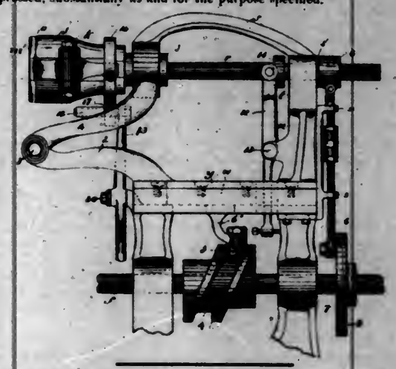
4. The combination of the rotary turret and its mandrels and jaws, means for rotating said turret step by step, the ejecting or can-body-removing dog to which the mandrels are successively presented, the lever 31, supporting said dog, means for oscillating said lever to give the dog a longitudinal motion, a pivoted lever 42, connected by a rod 41 to one end of the dog 33, and means for oscillating the lever 42, whereby said dog is raised and lowered, as set forth.

5. The combination, with the intermittingly-rotating turret and its mandrels, of the can-removing dog 33, the levers 31 and 42, means for operating said levers, and the rod 41, having the collars 47 and 49 and springs 48, as set forth.

6. The combination, with the intermittingly-rotated turret and its mandrels, of the continuously-rotated shaft within the hub of the turret, an eccentric wrist-pin carried by said shaft, the yoke or frame located over the turret, the soldering-iron holders fitted to slide in guides in said frame, a jointed rod connecting said holders with said wrist-pin, and means for lifting said holders when the turret is to be rotated, as set forth.

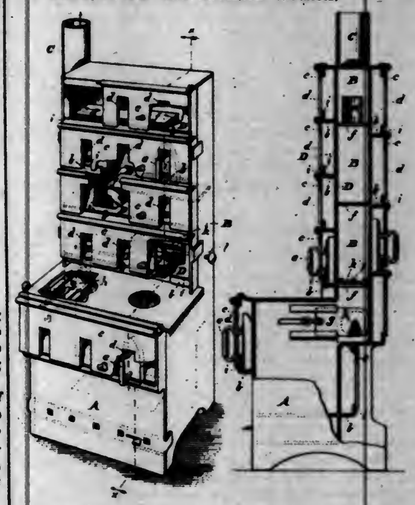
412,583. SOLDERING APPARATUS FOR CAN-SOLDERING MACHINES. Edwin R. Abbell, Boston, assignor of one-half to E. R. Welch, Cambridge, Mass. Filed Jan. 29, 1889. Serial No. 298,009. (No model.)

Claim.—1. The combination of a holder having an iron-receiving slot or aperture, a slug or iron placed loosely in said slot, a frame having guides in which said holder is adapted to reciprocate, means for reciprocating said holder in the frame, and a can-blank-supporting mandrel to which the iron is presented by its holder, as set forth.



2. The combination of the frame or support 16, a plurality of holders 14, adapted to slide in guides in said frame, the slugs or irons 13, loosely inserted in said holders, the cross-head 22, connected to said holders and provided with the rod 23, and means for reciprocating said rod and thereby simultaneously reciprocating the holders 14, and a plurality of can-blank-holding mandrels to which the irons are presented by said holders, as set forth.

412,584. CAN-HEADING MACHINE. Edwin R. Abbell, Boston, assignor of one-half to E. R. Welch, Cambridge, Mass. Filed Feb. 18, 1889. Serial No. 300,247. (No model.)

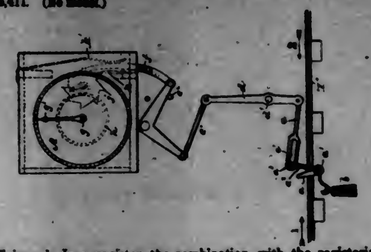


Claim.—1. In a can-heading machine, the combination of a can-head holder or carrier provided with means for clamping and releasing a can-head, a reciprocating slide, to which said carrier is pivotally connected, and means for rocking the head or carrier on its pivotal connection with the slide, whereby the can-head is tipped while being applied to the can-body, as set forth.

2. In a can-heading machine, the combination of a can-head holder or carrier provided with means for clamping and releasing a can-head, a reciprocating slide, to which said carrier is pivotally connected, a rod *r*, connected to said carrier, and means whereby said rod is alternately raised and depressed to tip the carrier and the can-head held thereby, as set forth.

3. The combination of a can-head holder or carrier having a head-receiving cavity, intermittently opening and closing jaws in said holder formed to bear on the edge of a can-head flange therein, a spring-projected plunger in said holder having a rod *r*, a pivoted yoke or frame supporting said holder, jaws, and rod; a slide *w*, to which said frame is pivotally connected, means for reciprocating said slide with the holder and rod thereon, a lever 12, pivoted to a support on said slide and arranged to be moved by contact with a fixed stop during the backward movement of the holder, and thereby retract the rod *r* and its plunger, a rotating cam 7, and a connecting-rod 6, engaged at one end with said cam and at the other end with a sliding collar on the rod *r*, whereby said rod is alternately raised and depressed, substantially as and for the purpose specified.

412,585. SAD-IRON HEATER. David E. Bangs, Medford, Mass. Filed May 31, 1889. Serial No. 312,792. (No model.)

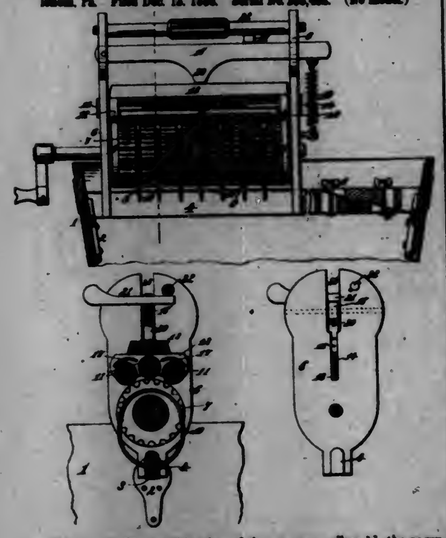


Claim.—1. The sad-iron heater consisting of the fire box having the central flue and front and rear receiving-chambers, said central flue having compartment-chambers opening alternately at opposite ends, and the slotted doors hinged at the open sides of the receiving-chambers, substantially as set forth.

2. The sad-iron heater consisting of the compartment or subdivided central flue, the front and rear walls of which are provided with shelves having at their forward or outer edges guard-flanges, and the drop slotted doors hinged at their upper edges to the top edges of said shelves, substantially as set forth.

3. The sad-iron heater consisting of the fire-box having the central flue, the front and rear receiving-chambers, said central flue having compartment-chambers opening alternately at opposite ends, the slotted doors hinged at their upper edges and at the open sides of said receiving-chambers, and the transverse horizontal partitions or guides, one having a damper closing the opening of the bottom one of said compartment-chambers, substantially as set forth.

412,586. REGISTERING AND INDICATING DEVICE FOR MINES. William F. Bath, Wardner, Idaho. Filed July 2, 1888. Serial No. 316,411. (No model.)

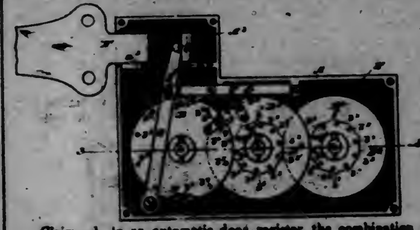


Claim.—1. In a register, the combination, with the registering mechanism proper, of a hoisting-drum and a cord and weight connected and adapted to move therewith, said weight having its path in proximity to and adapted to engage and operate a part connected with the registering mechanism, substantially as set forth.

2. In a combined register and indicator, the combination, with the register proper, of a hoisting-drum, a cord and weight connected and adapted to move therewith, said weight engaging a part connected with the registering mechanism, and a scale situated by the path of the weight, substantially as set forth.

3. In a registering mechanism, the combination, with the register proper, of a reciprocating and oscillating bar or dog *f*, a lever *e*, carrying the same, a rock-shaft *d'*, adapted to be rocked by the movement of the object to be registered, an arm d^3 on said shaft and provided with a pin e^3, a connecting rod or link *c*, having a slot engaged by said pin, and connections between said lever *e* and link, substantially as set forth.

412,587. WASHING-MACHINE. James G. Brasher, South Bethlehem, Pa. Filed Dec. 13, 1888. Serial No. 293,492. (No model.)



Claim.—1. The combination of the pressure-rollers 11, the corrugated roller 7, located beneath the pressure-rollers, the standards having vertical slots 15, terminating at their lower ends above the journals of the corrugated roller, the elastic cushions 16, arranged at and supported by the lower ends of the said slots, the horizontal bar 18, having pendent end blocks 12, supporting the pressure-rollers and provided with horizontally-projecting tongues 14, extending into the slots and resting and adapted to slide on the elastic cushions, substantially as and for the purposes described.

2. The combination of the standards 6, having vertical slots 15, the corrugated roller 7, the pressure-rollers 11, located above and resting upon the uppermost side of the corrugated roller and having supports projecting into the said vertical slots, and the series of concave-convex strips 17, extending, respectively, over the entire length of the outer pressure-rollers, substantially as described.

3. The combination of the standards 6, having the vertical slots 15, the corrugated roller 7, the pressure-rollers 11, located above and resting upon the uppermost side of the corrugated roller, the horizontal bar 18 above the pressure-rollers, having pendent end blocks 12 supporting the latter and provided with horizontal tongues 14, extending into said vertical slots, and the series of concavo-convex strips 17, supported at their ends by the pendent blocks and extending over the entire length of the outer pressure-rollers, substantially as described.

412,588. AUTOMATIC DOOR-REGISTER. Charles W. Bent, Chicago, Ill. Filed July 13, 1888. Serial No. 279,894. (No model.)

Claim.—1. In an automatic door-register, the combination of suitable registering-disks with latch-bar F, flexible arm G, and reciprocable bar C, spring E, and dog *c*, for actuating the registering-disks, as and for the purpose specified.

2. The combination, with registering-disks, of the reciprocable bar C, pivoted dog *c*, spring E, with arm G, and the inclined bearing-surface *d'*, for actuating arm G, as and for the purpose specified.

3. The combination, with registering-disks, of the rigidly-fixed latch-bar F, with arm G, and inclined bearing-surface *d'*, for actuating the registering-disks, as and for the purpose set forth.

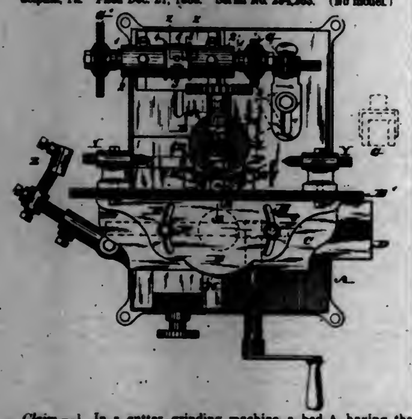
4. In an automatic door-register, a fixed latch-bar F, provided with a recess and inclined end surface, in combination with a transmitting member flexible laterally, having a lug *g*, and with an inclined bearing-surface *d'*, upon which the arm G works, all parts adapted to co-operate to actuate the registering-disks, substantially as set forth.

5. In an automatic door-register, the combination, with one or more registering-disks, of a latch-bar, as F, the flexible arm G, and a tripping device—such as bearing-surface *d'*—for engaging and disengaging said latch-bar and arm, so as to impart motion to the registering-disks, substantially as and for the purpose set forth.

6. In an automatic door-register, the combination, with a latch-bar, of one or more registering-disks, mechanism operated by said latch to actuate the disks comprising a reciprocable spring-rod, the movement of which actuates the disks, and a tripping device to release said mechanism and latch when the door is opened, substantially as described.

7. In an automatic door-register, the combination, with actuating mechanism, of two or more axially-movable overlapping indicator members having concentric laterally-projecting hubs or portions smaller than the same, said hub being provided with a peripheral series of projections fitting against the periphery of an adjoining member to normally look the same, a concentric series of lateral projections on each hub, and fixed toes projecting radially from the periphery of the members and adapted to consecutively engage the lateral projections of an adjoining member, said members being provided with peripheral recesses in proximity to the toes, for the purpose set forth.

8. The combination, with actuating mechanism, of a pair of rotatable indicator members, each cast integral and consisting of a disk having the indicating characters on one side and a concentric hub or portion on the other side smaller than the disk, and having a peripheral series of concaved projections fitting against the periphery of the adjoining disk to normally look the same, a series of lateral projections on the side of the hub, and a toe projecting radially from the periphery of the disk to engage the lateral projections of the next adjoining member, said disk being provided with a peripheral recess beneath the toe, for the purpose set forth.



9. In an automatic door-register, the combination, with a reciprocable bar carrying a pawl, of a rotatory indicator-disk having a concentric series of lateral projections adapted to be engaged by said pawl and thereby rotate the disk, a toe projecting radially from the periphery of the disk and provided with a peripheral recess beneath the same, and another rotatory indicator-disk having a lateral concentric hub on one side of less diameter than the disk, said hub being provided with a peripheral series of radial projections engaging the periphery of and normally locking said first-mentioned disk, and a series of lateral projections on the side of said hub engaged by said toe, for the purpose set forth.

10. The combination of a car-door provided with a fixed and rigid latch-bar F, suitable indicator members, and intermediate mechanism—such as flexible arm G and spring-bar C—by which the direct thrust or pull of the latch-bar is transmitted thereto to operate the same, as specified.

11. In an automatic door-register, the combination, with the latch, of one or more registering-disks, intermediate mechanism, substantially as described, operated by said latch when the door is opened or closed to actuate the disks, and a tripping device—such as an inclined bearing-surface—to disengage said mechanism and latch when the door is opened, substantially as described.

12. In an automatic door-register, the combination, with a latch, of one or more registering-disks, a reciprocable spring-rod carrying a pawl to rotate said disks, said rod being operated by said latch when the door is opened or closed, and means for releasing said latch from the rod when the door is opened, substantially as described.

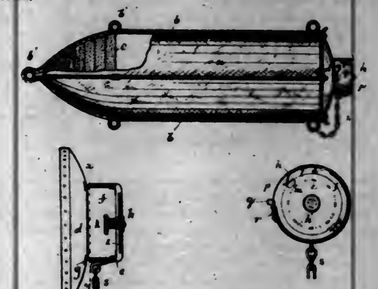
412,589. CUTTER-GRINDING MACHINE. ADAM BENDER, Philadelphia, Pa. Filed Dec. 21, 1888. Serial No. 294,263. (No model.)

Claim.—1. In a cutter-grinding machine, a bed A, having the movable support D thereon, the table C, movable on said support, and the carriage B, pivotally mounted on said table, the graduated plate H, secured to the center of the side of the carriage B, and the index-finger J, the latter being curvilinear drawn from the axis of the said carriage, said parts being combined substantially as described.

2. A tool carrier or holder, in combination with a plate to which said carrier or holder is pivoted, a rock-shaft in the heel end of said carrier or holder, and a screw fitted to said plate and engaging with said rock-shaft, substantially as described.

3. In a cutter-grinding machine, a carriage with upright portion, an upright frame with ears, a plate with ears, pivotal screws connecting said ears of plate and upright, and a carrier with holder connected with said plate, said parts being combined substantially as described.

4. In a cutter-grinding mechanism, a carriage, an upright plate secured to said carriage, a plate pivotally connected with said upright plate, a rocking shaft journaled in said pivoted plate and having a screw-threaded opening, a screw-bolt swiveled in said upright plate and working in said opening in the shaft, and a carrier with holder secured to said pivoted plate, said parts being combined substantially as described.

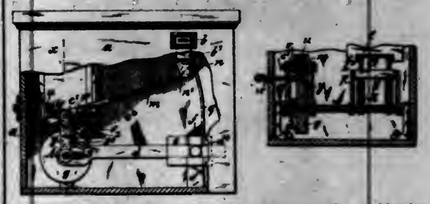


5. In a cutter-machine, a rotary shaft with grinding-wheel thereon, a pulley mounted on said shaft between the bearings thereof and having shoulders 5, a beveled collar encircling the shaft adjacent to said shoulders and bearings, and a screw working in the pulley with its point bearing against the beveled face of the collar, substantially as and for the purpose set forth.

412,590. OIL-DISTRIBUTER FOR VESSELS. NICOLAI C. RUUD, Christiania, Norway. Filed Apr. 19, 1889. Serial No. 307,842. (No model.)

Claim.—1. In an oil-distributer for vessels, a bag of water-tight material, being closed at one end and having this end filled with floatage material, while its other end is provided with a metallic head having an adjustable valve with suitable means for regulating the discharge of oil when the bag is floating on the water.

2. The combination, with an oil-distributer for vessels, with a bag of canvas or similar water-tight material for containing oil, the head *d*, and the cover *h*, provided with a set of holes *K*, of an adjustable valve *i*, with holes *i'*, corresponding with the holes in the cover *h*.



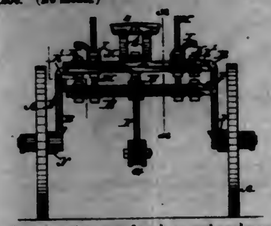
3. In an oil-distributing device for vessels, an adjustable valve for discharging the oil through the lower end of the oil-bag, consisting of the cap A, fitting over the spout *c* and secured to the same by the boss *r* or equivalent means, a revolvable disk *i*, mounted on the inside of the cover and provided with holes *i'* corresponding with holes *k* in the cover, a handle *k* for turning said disk, and means for holding the said disk in its different positions, all substantially as specified and shown.

4. In an oil-distributer for vessels, the combination, with the head *d*, having an opening surrounded by a spout *c*, of a cap *h*, for closing said spout and provided with a pocket h^3, in which are holes *K*, and valve *i*, for closing and regulating said holes *K*, substantially as and for the purposes hereinbefore set forth.

5. A floating oil-distributer for vessels, substantially consisting of the following parts: a water-tight bag made of canvas or similar material, having a substantially-cylindrical shape, being pointed at the upper end, and strengthened by means of binding-ropes provided on several places with loops to which the holding-ropes may be tied, the bag being in the upper pointed end filled with floatage material—such as cork—and of an adjustable valve fixed in a metallic head closing the lower end of the bag, the valve being separated from the interior of the bag by means of a perforated plate, between which and the valve hemp or similar material may be placed to lessen the outflow of the oil, substantially as shown and for purposes as specified.

412,591. AUTOMATIC VENDER FOR TICKETS, CARDS, &c. CHARLES H. BINGHAM, Utrecht, Holland, assignor to the Simplex Automatic Machine Company, London, England. Filed Oct. 3, 1888. Serial No. 287,055. (No model.)

Claim.—1. In an automatic vending apparatus, the combination of the doubly-forked part *y*, arranged on the spindle A, and carrying at its upper end the bolt *c'*, lever *m*, with its coin-receptacle and pin or stud *v'*, and the pawl *v*, the latter being held out of engagement with the disk *g* by the pin *v'* until the lever *m* is depressed by the insertion of a coin, substantially as shown and described.



2. In an automatic vending apparatus, the lever *m*, provided at one end with the bottomless receptacle or coin-box *n*, adapted to move close to and parallel with a strip of sheet metal or other material formed so as to correspond with the curve described by the said lever and coin-box, in combination with said strip, the doubly-forked part *y*, the spindle A carrying part *y*, the slide *d*, and guide *f*, as and for the purposes set forth.

3. In an automatic vending apparatus, the combination of the coin-box *n*, the doubly-forked part *y*, the double-armed lever *m*, carrying the coin-box *n* and the strip of sheet metal *q*, which, when the parts are in normal position, will retain the coin in the coin-box, the slide *d*, guide *f*, and the knob *w*, whereby the lever *m* may be caused to recede with its coin-box *n* from the metallic strip *q*, so that the coin can fall into the guide *f*, substantially as shown and described.

4. In an automatic vending apparatus, the delivery device consisting of the receptacle B, having opening N, and elastic piece E, the rectangular piece C, arranged beneath the receptacle B, and having a slot C, and the delivery-arms mounted on the spindle A, said arms provided with tips L, adapted to move in the slot C and come in contact with the lowest flat object in the receptacle B to deliver the same, substantially as shown and described.

5. In an automatic vending apparatus, the device for ejecting the articles for sale, consisting of a cross-bar G, supported by the spindle A and two one-armed levers F, and carrying two tubes H, in which pistons I, having tips L and helical springs K, are arranged, so as to continuously press the tips L upward against the lower card or other object in the box B, which said object is pushed outward according to the movement communicated to the spindle A, substantially as and for the purpose set forth, and shown on the drawings.

412,592. RUNNING-GEAR FOR PLOWS. GEORGE C. BRAINERD, South Vineland, N. J. Filed July 2, 1887. Renewed Sept. 7, 1889. Serial No. 323,256. (No model.)

Claim.—1. An adjustable gear for plows and analogous devices, consisting of the body or frame B, composed of two sections, each having a single standard with axles, the standards extending upward and having U-shaped branches, the latter being slotted and adapted to slide upon each other, and fastening devices for said sections, substantially as described.

2. The combination of the frame B, composed of sectional parts having recessed standards and slotted branches, with the plow-supports E, having shoulders P, the screw-bolts H H, and handled nuts I I, substantially as and for the purpose set forth.

3. The frame B, consisting of sectional parts, each having standards and slotted branches, in combination with braces N, having slotted parts, and means, substantially as described, for securing said parts, all combined substantially as and for the purpose set forth.

412,593. PICTURE-NAIL. WARREN M. BENEDICT, Auburn, N. Y. Filed May 20, 1889. Serial No. 312,009. (No model.)

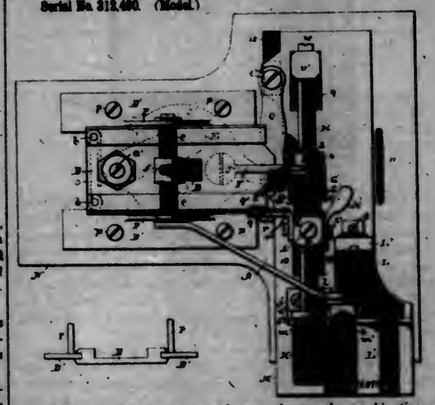
Claim.—1. A picture-nail provided with an elastic head enlarged from each end, substantially as described.

2. A picture-nail provided with a head consisting of a spiral coil separate from the main body of the nail, said main body being reduced at one end, forming a penetrating-point, substantially as described.

3. A picture-nail whose main body is provided with an elastic head movable thereon, substantially as described.

4. A picture-nail consisting of a main body provided with a head formed of coiled elastic material surrounding said main body, said head being secured to said main body at the extremity next adjacent to its point, substantially as described.

5. A picture-nail consisting of a main body provided with a head formed of spiral elastic material extending longitudinally of said main body and retained thereon at one point by frictional contact, substantially as described.



6. A picture-nail provided with an elastic head consisting of a spiral coil surrounding the main body of the nail, the outer extremity of said coil having a greater diameter than the inner end, substantially as described.

412,594. SIDING OR CLAPBOARD MARKER. JOHN T. BROOME, Sioux City, Iowa. Filed Apr. 20, 1889. Serial No. 308,016. (No model.)

Claim.—The siding or board marker consisting of the box frame or closure having at its ends arms standing at right angles to the length of said box-frame or closure, the marking-knife arranged in said closure and provided with a handle, said marking-blade having ends projecting through slots in said closure adapted to allow the marking-blade to have longitudinal and inward movement, the springs connecting at their outer ends to said studs and having their inner ends connected about centrally to said closure, and the semi-elliptic spring centrally secured to said closure and bearing near its ends upon said studs, securing the marking-blade in a withdrawn position, substantially as set forth.

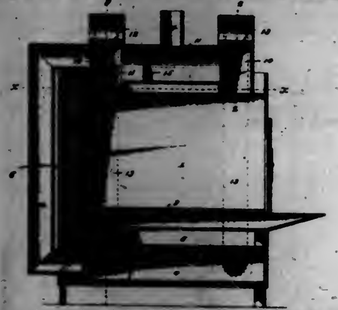
412,595. SEWING-MACHINE ATTACHMENT FOR OVERCASTING THE EDGES OF FABRICS. BOGERS DUNN, Kansas City, Mo., assignor of one-half to John S. Gardner, same place. Filed May 20, 1889. Serial No. 312,490. (Model.)

Claim.—1. In a sewing-machine attachment, the combination of the rotary shaft carrying a feed-roll, the cam loosely mounted on said shaft and carrying a pawl to engage a ratchet on the shaft, and the sliding frame connected to the needle-bar and provided with an arm to engage and operate the said cam, substantially as specified.

2. The combination, with the shaft carrying a feed-roll, of a cam loosely mounted on the shaft and having a pawl-and-ratchet connection therewith, the adjustable arm pivoted to a slotted sector and provided with a set-screw, said cam being provided with a check-pin to, engage the adjustable arm, and the sliding frame provided with an arm to engage and operate the cam, substantially as specified.

3. The combination, with the shaft carrying a feed-roll and provided at the opposite end with a ball socket ed in a suitable post, and the tension-spring bearing on an intermediate point of said shaft, of the spring-actuated pressing-fingers arranged adjacent to the feed-roll and provided with a lateral strip or arm which extends under and is engaged by the said shaft, substantially as specified.

4. The combination, with a rotary feed-roll, mounted loosely on its shaft and the sliding frame connected to the needle-bar and adapted to be reciprocated thereby, of the cam-plate provided with a cam-slot having diverging arms and registering with a guide-slot in a stationary plate, said cam-plate being connected to the feed-roll, and the operating-arm carried by the sliding frame and provided with a pin to engage the registering slots, substantially as specified.

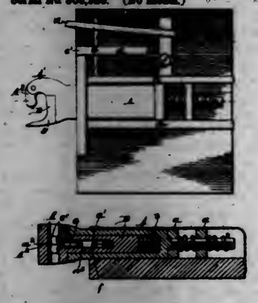


5. The combination, with a rotary feed-roll sliding on its shaft and the sliding frame connected to the needle-bar and adapted to be reciprocated thereby, of the cam-plate connected to the feed-roll and provided with a cam-slot which registers with a guide-slot in a stationary plate, the operating-arm carrying a pin to engage the registering slots, and the spring carried by the sliding plate and having engagement with the operating-arm to cause its pin to normally lie in the center of the guide-slot, substantially as specified.

6. The combination, with a feed-roll having a lateral movement on its shaft and the sliding plate provided with lugs to engage a peripheral groove in the said roll, of the cam-plate connected to the said sliding plate by a link having a set-screw to engage a curved slot in the cam-plate, whereby the throw of the sliding plate may be adjusted, and the sliding frame carrying an operating-arm which engages a cam-slot in the cam-plate, whereby the latter is oscillated, substantially as and for the purpose specified.

7. The combination, with a rotary shaft carrying a feed-roll having a spline-and-groove connection therewith and the sliding plate carrying adjustable pressing-fingers and connected to the said feed-roll, of the sliding frame connected to the needle-bar and carrying an operating-arm, and the cam-plate connected to the said sliding plate and

adapted to be engaged by the said operating-arm, the sliding frame being further provided with an arm to engage a loose cam having a pawl-and-ratchet connection with the rotary shaft, substantially as specified.

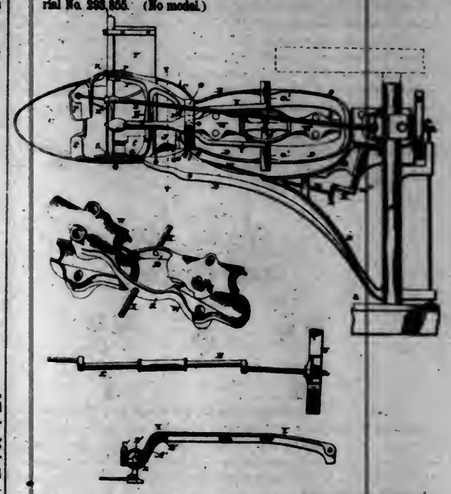


412,596. HOT-AIR HEATING-STOVE. SIMON D. BURLINGAME, Reading, Mich. Filed June 26, 1889. Serial No. 315,919. (No model.)

Claim.—1. In a hot-air heating-stove, substantially as described, the combination of a combustion-chamber, an exterior vertical shell concentric with and equidistant from the combustion-chamber throughout its length, the upper and lower ends of said shell being open, a low chamber arranged beneath the combustion-chamber within the vertical shell, the high chambers, and the vertical up and down flues arranged exteriorly of the vertical exterior shell and having the elbows at their ends, which enter the high and low chambers, for the purpose set forth, substantially as specified.

2. In a hot-air heating-stove, the combination of a combustion-chamber, a high chamber communicating therewith, another high chamber isolated from communication with the combustion-chamber, a longitudinal chamber intermediate of both high chambers and having a damper located therein between the smoke-receiving high chamber and the smoke-outlet opening, a low chamber located beneath the combustion-chamber, an exterior case surrounding the combustion and low chambers, and the down and up flues located exteriorly of the inclosing-case and communicating with the high and low chambers, substantially as and for the purpose described.

412,597. CAR-COUPLING. PETER CAMPBELL, Carrolltown, Pa. Filed Apr. 12, 1889. Serial No. 306,989. (No model.)



Claim.—1. The car-coupling having at one end of the buffer or draw-bar a hinged or pivoted leaf or hook having an arm standing proximately at right angles to said leaf or hook, in combination with the spring-pressed follower actuating said leaf or hook through said arm, substantially as set forth.

2. The combination of the draw-bar or buffer having the hinged or pivoted leaf or hook having an arm extending about at right angles to said hook or leaf, the spring-pressed follower having at one end, at one side, a forward projection or extension, and the holding-pin and its lever, said pin engaging the follower, substantially as set forth.

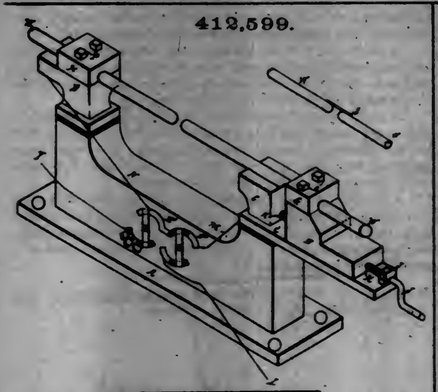
3. The car-coupling having the draw-bar or buffer provided with a hinged leaf or hook having an arm standing at right angles to said hook, in combination with the follower having at its forward end a projection or extension and at one side a rib or guide sliding in a groove in the draw-head, together with means to hold said follower in position, said follower actuating said leaf through its said arm, substantially as set forth.

412,598. MOWING-MACHINE. OSCAR CRANE, Rutland, Ohio, assignor of one-half to H. D. Holt, same place. Filed Dec. 17, 1888. Serial No. 293,955. (No model.)

Claim.—1. In a mower, the combination of the axle, the stationary frame B, secured thereto, the pivoted frame D, and the shoe with the operating-shaft, which extends through the frame D and is provided with two cranks near its center, which extend in a line with each other, the driving-pinion on the rear end of the shaft, the vibrating box applied to the cranked portion of the shaft and provided with pivots, the operating-lever connected at its rear end to the box, and the cutter connected at its inner end to the lever, substantially as shown.

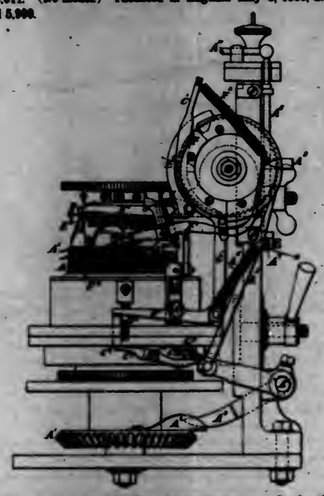
2. In a mower, the combination of the axle, the stationary frame B, secured thereto, the pivoted frame D, and the shoe with the operating-shaft, which extends through the frames and is provided with two cranks which extend in a line with each other, the driving-pinion applied to the rear end of the shaft, the box formed of two parts which have their opposite ends to catch above and below the two cranks, and each part provided with a pivot, the operating-lever having its rear end pronged, so as to make connection with the two parts of the box, and the cutter connected to the front end of the lever, substantially as described.

3. The combination of the shoe, the two separate castings P Q, provided with journals R S, and the frame D, provided at its front end with the two arms F G and journaled upon the two castings, substantially as set forth.



4. The combination of the shoe, the casting Q, provided with the bearing S, having a slot through one side, with the frame D, provided with the extension-arm G, having an opening formed therein to fit upon the journal S, the extension or arm being cut away upon one side, so that the cutter can be removed and replaced sidewise, substantially as specified.

5. The combination of the axle, the frame B, secured thereto, the pivoted frame D, and the shoe loosely connected to the front end of the frame D with the driving-shaft provided with two cranks, which extend through the frame D, and upon which the frame turns, the box W, provided with pivots and placed upon the cranked portion of the shaft, the curved connection J, secured at its outer end to the frame B and having the driving-shaft to extend through its inner end, and the forked operating-lever connected to the box at its rear end and the cutter, the frame D being provided at its front end with the braces H I and the arms F G, and the shoe with the castings P Q, having the journals R S, substantially as shown.



412,599. PROCESS OF ELECTRIC WELDING. CHARLES L. COFFIN, Detroit, Mich. Filed Apr. 24, 1888. Serial No. 308,415. (No model.)

Claim.—The herein-described process of welding together two metal rods or bars, the same consisting in placing the articles to be welded in an electric circuit, closing said circuit, then breaking the circuit between the articles to be welded, whereby the voltaic arc is formed at the point of the weld, pressing the articles together and holding them permanently in contact after the ends or edges have reached a welding heat, and passing heating-currents through the articles while so pressed and held until they are welded one to the other, substantially as described.

412,599.

412,600. CIRCULAR RIB KNITTING MACHINE. JOHN H. COOPER and GEORGE ELLIOT, Leicester, England. Filed Feb. 12, 1889. Serial No. 299,611. (No model.) Patented in England May 3, 1888, Nos. 6,908 and 6,909.

Claim.—1. The combination, substantially as set forth, of the circular revolving heads of frame and machine needles, the clearing and knocking-over cams, the notched wheel for lifting when in action some only of the frame-needles, the push-back blade, which can be made to descend between the frame and machine needle heads, the levers for putting these cams and the push-back blade in and out of action, the cams for acting on these levers, the cam-shaft and ratchet-wheel upon it, the pawl giving a step-by-step revolving motion to the ratchet-wheel, the lever carrying the pawl, and the cam on the revolving frame-head to rock this lever.

2. The combination, substantially as set forth, of the circular revolving heads of frame and machine needles, the clearing and knocking-over cams, the notched wheel for lifting when in action some only of the frame-needles, the push-back blade, which can be made to descend between the frame and the machine needles, the cam-shaft, means for giving it a step-by-step revolving motion when a welt is to be formed, and the cams carried by this shaft, one cam to draw back the point of the clearance or knocking-over cam of the frame-needles for one course, one cam to somewhat draw back the cam for knocking over work on the machine or rib needles for one course and then to draw it back entirely out of action until a welt is completed, one cam to draw back and put out of action the cam by which the machine-needles are thrust forward, and one cam to raise and lower the push-back blade.

3. In combination with the circular heads of frame and machine needles of a rib circular-knitting machine, a push-back blade which can be made to descend between the frame and machine needle heads and bear upon the work at times when the machine-needles are left out of work with loops of work hanging upon them, and means for actuating the push-back blade.

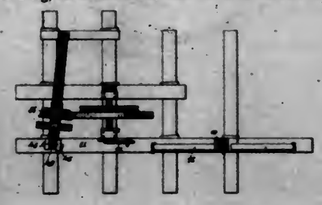
4. The combination, substantially as set forth, of the circular revolving heads of frame and machine needles, means for actuating them, the cam-axis, cams on the cam-axis, a push-back blade actuated by one of the cams, the clearing and knock-over cams, connections between these cams and cams on the cam-axis, the toothed wheel on the cam-axis, the driving-pawl engaging therewith, means for actuating the pawl, the arm engaging with the pawl to hold it out of engagement with the wheel, the vertical axis to which the arm is secured, and the second arm on the vertical axis, which engages with one of the cams, for the purpose specified.

5. The combination, substantially as set forth, of the circular revolving heads of frame and machine needles, means for actuating them, the pattern-wheel, its shaft, the toothed wheel thereon, which is provided with a guard *e* around part of its circumference, the pawls *a* and *b*, engaging with the toothed wheel, and one of which rides on the guard during a part of the revolution of the wheel, and means for actuating the pawls.

6. In a circular-knitting machine, the combination, substantially as set forth, of the spring-actuated clearing-cam C^3, the lever C^5, connected therewith, the lever C', the plunger C^6, interposed between the levers C' and C^5, the cam C, having a recess into which a projection on the lever C' enters, and means for actuating the cam C.

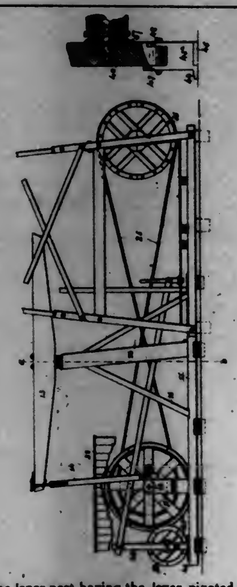
412,601. INKSTAND. JOHN R. COOPER, Rochester, N. Y. Filed May 31, 1889. Serial No. 311,939. (No model.)

Claim.—1. The combination, with an ink-reservoir provided with a filling opening closed by a removable stopper and mounted upon a rigid supporting-stand, of the flexible ink-holder at the base of the reservoir, and having the pen-dip mouth-piece by its minute outflow-opening directly attached to the flexible ink-holder below the body of ink, whereby the pressure of the pen alone in the mouth-piece will, by the contracting of the flexible ink-holder, cause sufficient ink to gravitate into the pen-dip for filling the pen, the residue of ink upon the removal of the pressure and the resumption of a normal position of the parts returning to the ink-holder, substantially as described, and for the purpose herein set forth.



2. The combination, with the flexible ink-holder mounted upon a rigid stand, of the mouth-piece provided with the minute opening connected directly to the flexible ink-holder below the body of ink and having the inwardly-extending flange upon the open edge of the pen-filling mouth-piece for the prevention of an overflow of ink, substantially as described and herein set forth.

412,602. WELL-DRILLING RIG. GEORGE CORBETT, Bradford, Pa. Filed Oct. 4, 1888. Serial No. 287,131. (No model.)



Claim.—1. In a rig, the combination, with the main sill, the driving-shaft, and a walking-beam connected with said shaft, of a samson-post planted in said main sill, leaning beyond the perpendicular toward the drawing-shaft and supporting said walking-beam, substantially as and for the purposes set forth.

2. In a rig, the combination, with the main sill, the driving-shaft mounted thereon, and the walking-beam adapted to receive motion from said shaft at one end and to carry the drilling-rope at the other, of a samson-post supporting said beam and leaning beyond the perpendicular toward the drawing-shaft, and a brace between said post and sill, substantially as set forth.

3. In a rig, the combination, with the main sill and the sand-

412,602.

reel lever 49, of the lever-post having the lever pivoted thereto and the projections therefrom, and the pieces 46, as set forth.

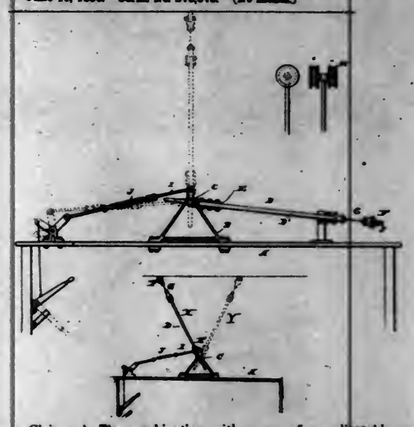
412,603. THILL-COUPLING. FRANCIS R. COX, Sandwich, Ill. Filed Aug. 13, 1888. Serial No. 282,602. (No model.)

Claim.—1. The combination, with a shackle having a draw-iron formed integral therewith and recessed upon its upper side, of a hook pivoted to said draw-iron, both ends thereof being bifurcated to embrace the draw-iron and co-operating with said recessed draw-iron to form a thill-pin bearing, and a thill or pole iron having a transverse pin or bolt which is adapted to be retained between the draw-iron and hook by a suitable retaining-nut bearing against the free end of said hook, the parts being constructed substantially as shown.

2. The combination, with a shackle having a forwardly-projecting draw-iron C and bolt D, said draw-iron having a recess *c* above the bolt, of a hook E, having bifurcated ends, the rear ends being pivoted to the draw-iron, and a nut *d*, adapted to bear upon the forward bifurcated ends of the hook to prevent movement of the same, substantially as shown, and for the purpose set forth.

412,604. SPONGE-CUP. HENRY CROSSON, Washington, D. C. Filed July 24, 1888. Serial No. 318,542. (No model.)

Claim.—1. As an article of manufacture, a cup having a sponge-receiving holder, a rim extending around outside of said holder, so as to be out of contact with a sponge therein and made higher than the portion of the cup between it and the holder, and one or more openings connecting the interior of the holder with the space between the latter and the rim, substantially as and for the purpose set forth.



2. As an article of manufacture, a cup having within it a series of fingers adapted to receive and hold a sponge out of contact with the cup edge, at their upper ends made separate and standing away from such edge, substantially as and for the purpose set forth.

3. As an article of manufacture, a cup having within it a series of sponge-holding fingers or projections extending upward and inward with their upper ends within and some distance from the edge of the cup, substantially as and for the purpose described.

4. As an article of manufacture, a sponge-holder consisting of a dish or cup having extending upwardly and inwardly within it a series of fingers adapted to engage and hold a sponge, such fingers being separated from each other and made tapering toward their upper ends, substantially as and for the purpose specified.

5. As an article of manufacture, a cup having extending upwardly from points within and below the level of its rim a series of fingers adapted to grasp and hold a sponge between them and having spaces between their sides for the passage of water, substantially as and for the purpose described.

412,605. ELECTRIC RAILWAY. LEO DAFT, Plainfield, N. J. Filed June 11, 1888. Serial No. 276,670. (No model.)

Claim.—1. The combination with a car, of an adjustable arm mounted on the top thereof and adapted to bear upward against and to make moving contact with an overhead conductor, and operating-connections within reach of the engineer, substantially as described.

2. The combination, with a car, of a support mounted on the top thereof, an arm one end of which is pivotally supported thereby, a contact device carried on and extending from the end of the arm, and manual connections to operate and hold the arm upward in contact with an overhead conductor, substantially as described.

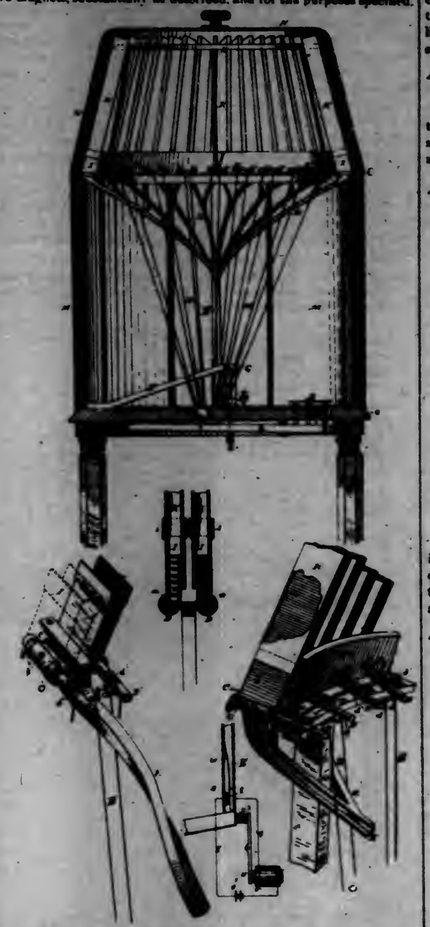
3. The combination, with a car, of an arm upon the roof thereof, an elastic connection between the arm and contact device and elastic connections with the arm, so that it may accommodate itself to the inequalities of the road or conductor, substantially as described.

4. The combination, with a trolley or brush bearing upward against a conducting-wire, and its supporting and carrying connections on top of the car, of a shifting or reversing mechanism therefor fitted within the car-roof, substantially as described.

5. The combination, with an overhead conductor and electrically-propelled vehicle, of a contact device adapted to travel along said conductor, a flexible resilient support carrying the contact device at one end and supported at the other, and a shifting or reversing mechanism for said support, substantially as described.

412,606. TYPE-SETTING MACHINE. LORENZO DOW, Boston, Mass., assignor to the American Type Setter Company, Portland, Me. Filed Nov. 13, 1885. Serial No. 182,771. (No model.)

Claim.—1. In type-setting machines of a curved or circular shape, the tubes or channels converging and twisted, substantially as described, and for the purposes specified.



2. In type-setting machines, the short fixed type-channels I, fitted at the upper end to receive and hold in position the removable channels K, substantially as described.

3. In type-setting machines, the base or ring, in combination with the twisted converging channels or tubes, substantially as described, and for the purposes set forth.

4. In type-setting machines, the channels, part of which are fixed and part removable, in combination with the rollers, substantially as described.

5. In type-setting machines, the ejecting-rollers, in combination with the actuating-rods and a key-board, substantially as described.

6. In type-setting machines, the rollers, in combination with electro-magnets, substantially as described, and for the purposes specified.

7. In type-setting machines, the combination of the rollers, the converging and twisted tubes or channels, and the pusher by which the type are made to advance in the stick, substantially as described, and for the purposes specified.

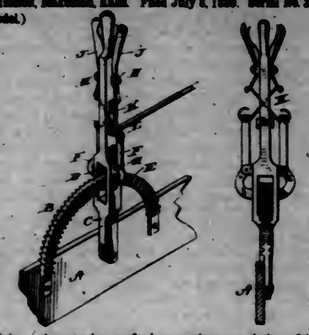
8. In type-setting machines, the rollers, in combination with the pin or stop and the coiled spring, substantially as described, and for the purposes described.

9. In type-setting machines, the base or ring, in combination with converging tubes or channels and pushers actuated by levers through the keys, substantially as described, and for the purposes specified.

10. In type-setting machines actuated as set forth, the pusher A A, the tube, with its spring, and the stick, in combination with the base or ring, the type-channels, and the rollers, substantially as described, and for the purposes described.

11. In type-setting machines, the universal bar or lever, in combination with the pusher, the converging channels, and the base or ring, and the type-channels, substantially as described, and for the purposes set forth.

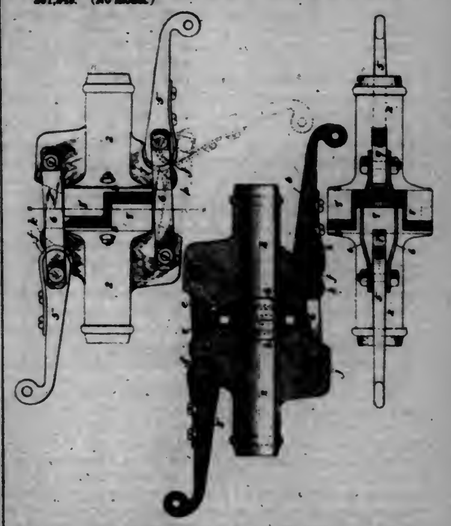
12. In type-setting machines, the circularly arranged type-channels, in combination with ejecting-rollers, substantially as described, and for the purposes set forth.



13. In type-setting machines, the combination of the ejecting-rollers in pairs with the type-channels above in pairs, and the conveyer-tube below, one of the said tubes coming between each pair of rollers and channels, substantially as and for the purposes set forth.

14. In a type-setting machine of the curved or circular form, the combination of the inclined type-channels with the ejecting-rollers and the converging and twisted tubes below, whereby the type when delivered from the channels above fall directly into the tubes below, substantially as described.

412,607. TREATING LAMP-WICKS. THOMAS DOLAN, Greenville, N. H. Filed Mar. 7, 1889. Serial No. 302,330. (No specimens.)



Claim.—The method of treating lamp-wicks composed of vegetable fiber, the same consisting in first saturating said wicks with a solution of vinegar and after drying further saturating and impregnating with chloride of zinc, substantially as set forth.

412,608. REVERSING-LEVER FOR LOCOMOTIVES. GEORGE W. RAYMOND, Nahant, Mass. Filed July 6, 1889. Serial No. 316,969. (No model.)

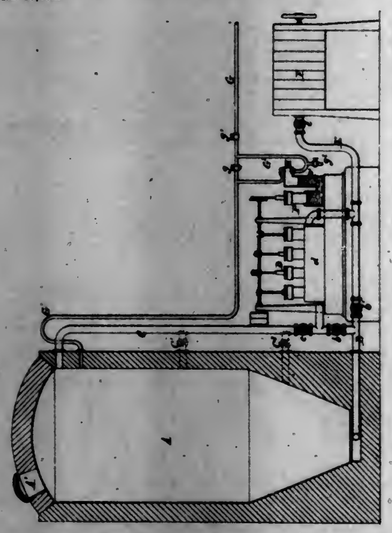
Claim.—As an attachment for locomotives, consisting of the rack having teeth on each side, the lever traveling on said rack, the detents pivoted to the lever for engaging the teeth of the rack, the levers pivoted to said rack, and the springs connecting the said levers and detents, all arranged and operating substantially as described.

412,609. STEAM-COUPLING. CHARLES A. HARRISON, Lynn, and ROBERT D. SUTHERLAND, Boston, Mass. Filed Nov. 19, 1888. Serial No. 291,349. (No model.)

Claim.—1. A coupling composed of two members, each having a concave seat, a metallic gasket permanently secured to it and provided with a flat outer surface to bear against the gasket of the other member, and a convex back formed to fit and move upon said seat, whereby said gaskets are enabled to tip independently and adjust themselves to the relative positions of the members, as set forth.

2. A coupling composed of members having concave seats, permanently-secured metallic gaskets having flat outer surfaces and convex backs fitted to move on said seats without disturbing the con-

tinuity of their bearing thereon, and levers for drawing said members together, substantially as described.



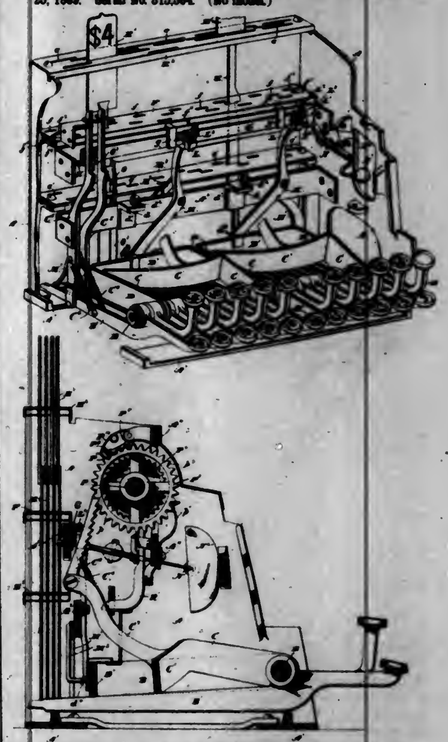
3. A coupling composed of members having concave seats, permanently-secured metallic gaskets having plane or flat outer surfaces, and convex backs fitted to move on said seats, external lugs 7, and yielding toggle-joints co-operating with said lugs, as set forth.

4. A coupling composed of members having concave seats, metallic gaskets fitted to tip or move on said seats, external lugs 7, links 6, pivoted to the body portions of the members, levers 5, pivoted to the free ends of said links and having the shorter and longer arms, and the springs or yielding terminals on said shorter arms, as set forth.

5. A coupling member having a concave seat *c*, a gasket formed with a convex back *b*, fitted to said seat and provided with a marginal flange *d*, and a retaining-ring secured to the body of the member outside of said flange, said ring being arranged to permit a tipping movement of the gasket-flange, as set forth.

6. A coupling composed of two members, each having a compressive toggle-joint and a seat for a like toggle-joint on the other member, each toggle-joint being composed of a link pivoted at one end to an ear on one of the coupling members, and a lever pivoted to the free end of the said link and having a longer outer arm and a shorter convex-ended inner arm, the bearing portion *k* of which is at the longitudinal center of said shorter arm, whereby, when the maximum pressure of the toggle-joint is attained, the parts thereof are substantially in line with each other, and are therefore in position to maintain said pressure and to be kept in operative position thereby, as set forth.

412,610. APPARATUS FOR APPLYING CHLORINE TO THE EXTRACTION OF GOLD FROM ORES. JAMES B. HANNAY, Cove Castle, Loch Long, County of Dumbarton, Scotland. Filed Apr. 17, 1889. Serial No. 307,582. (No model.) Patented in England Jan. 16, 1889, No. 841; in France Apr. 6, 1889, No. 197,279, and in Belgium Apr. 6, 1889, No. 86,732.



Claim.—1. In apparatus for applying chlorine to the extraction of gold from ores, the combination of a closed vessel to be charged with the ore-sludge to be treated, pumps for circulating the sludge through the said vessel, a pipe connecting the upper part of the said vessel with the suction-opening of the said pumps, a pipe connecting the lower part of the said vessel with the delivery-opening of the pumps, a pump for supplying chlorine gas under pressure into the said vessel, a pipe connecting the suction-opening of the said pump with a supply of chlorine gas, and a pipe connecting the discharge-opening of the said pump with the upper part of the said vessel, substantially as herein described.

2. In apparatus for applying chlorine to the extraction of gold from ores, the combination of a closed vessel to be charged with the ore-sludge to be treated, pumps for circulating the sludge through the said vessel, a pipe connecting the upper part of the said vessel with the suction-opening of the said pumps, a pipe connecting the lower part of the said vessel with the delivery of the pumps, a filter-press connected by a pipe to the discharge-opening of the circulating-pump for receiving the sludge after treatment in the said vessel, a pump for supplying chlorine gas under pressure into the said vessel, a pipe connecting the suction-opening of the said pump with a supply of chlorine gas, and a pipe connecting the discharge-opening of the said pump with the upper part of the said vessel, substantially as herein described.

3. The combination, with the chlorinating-vessel A, of circulating-pumps D, pipes B, provided with cocks *b b'*, connecting with the suction and delivery openings of the pumps, the pipe C, having cock *c*, and connecting with the suction-opening of the pumps and with the pipe B, a suitable filter-press F, and the pipe E, having cock *e*, and connected with the filter-press and with the pipe B, substantially as described.

4. The combination, with the chlorinating-vessel A, of a pump P, connected to a chlorine-supply by pipes G G³, shut-off cocks *g g'*, air-inlet cock *g³*, and pipe G', communicating with pipe G and with the chlorinating-vessel, substantially as and for the purposes described.

412,611. CASH REGISTER AND INDICATOR. ALFRED M. HARRISON, Dayton, assignor to John F. Pfeifer, Cincinnati, Ohio. Filed June 25, 1889. Serial No. 315,564. (No model.)

Claim.—1. In an indicating mechanism, in combination with a series of indicator-rods provided with locking-shoulders, the locking-plate for engaging such shoulders and a movable bar or piece adapted to move the locking-plate into and out of its rod-locking position, substantially as and for the purpose specified.

2. In an indicating apparatus, in combination with the shouldered rods and the locking-plate therefor, a movable bar and connections between such bar and the locking-plate, whereby the bar at opposite ends of its movement moves the plate in opposite directions, substantially as and for the purpose shown.

3. In an indicating apparatus, in combination with the shouldered rods and the locking-plate therefor, a movable bar, a spring drawing such bar in one direction, and suitable connections between the plate and the bar whereby the latter, as moved to put the spring under stress, moves the locking-plate out of operative position and on its return movement by the spring moves the plate into locking position, substantially as and for the purpose set forth.

4. In combination with the rod-locking plate, a movable bar, a spring forcing such bar in one direction, an arm on the bar, and shoulders on the plate adapted to be engaged by the arm on the bar as such bar approaches the opposite ends of its travel, substantially as and for the purpose described.

5. In combination with the movable bar provided with one or more arms, the rod-locking plate provided with a notch for each of the rod-arms and a spring forcing the bar in a direction to carry and hold the plate in rod-locking position, substantially as and for the purpose specified.

6. In combination with the bar provided with one or more arms, the indicator-rod-locking plate provided with one or more notches made wider than the arm or arms on the bar, a spring drawing the bar in one direction, and means for forcing it in the other direction, substantially as and for the purpose shown.

7. In combination with the indicator-rod-locking plate and the spring-retracted bar, connections between the plate and bar whereby the latter moves the former as it approaches the ends of its movement in opposite directions, a pawl on the bar, and a lever adapted to engage such pawl, so as to force the bar over against the stress of the spring and then let it fly back again, substantially as and for the purpose set forth.

8. In combination with the spring-retracted bar having one or more arms, the indicator-rod-locking plate having one or more notches for the arm or arms on the bar, a pawl on the bar, and a lever to engage such pawl, substantially as and for the purpose described.

9. In combination with the indicator-rod-locking plate and the bar for moving the same, connections between the bar and plate whereby the former as it is moved in opposite directions reciprocates the plate, a spring for moving the bar in one direction, an adjustable pawl on the bar, and a lever to engage such pawl, substantially as and for the purpose specified.

10. In combination with the drawer or till lock, the spring-retracted bar, means for moving the bar against the stress of the spring, a lever connected with the lock, and means on the bar for moving the lever, substantially as and for the purpose shown.

11. In combination with the drawer or till lock and the lever connected therewith, the spring-retracted bar and an adjustable piece on such bar for engaging the lever to cause the lock to be tripped, substantially as and for the purpose set forth.

12. In an indicating apparatus, in combination with the bar for moving the indicator-rod-locking plate into and out of locking position, an alarm-sounding mechanism and means carried by the bar for causing such mechanism to sound an alarm, substantially as and for the purpose described.

13. In an indicating apparatus, in combination with the shoulder-rods and the locking-plate therefor, the movable bar, connections between the same and the plate whereby the latter is moved into and out of locking position by the movements of the bar, an alarm-sounding mechanism, and means on the bar for actuating such mechanism as the bar moves the plate out of its locking position, substantially as and for the purpose specified.

14. In combination with the drawer or till lock and an alarm-sounding mechanism, a movable bar, connections between the same and both the lock and alarm-sounding mechanism whereby the lock is tripped and an alarm is caused to be sounded by movement of the bar, substantially as and for the purposes shown.

15. In combination with the series of indicator-rods and the locking device therefor, the till-lock and means for moving the same, and an alarm-sounding mechanism, the movable bar provided with means for tripping the rod-locking device, raising the till-lock, and actuating the alarm-sounding mechanism, substantially as and for the purpose set forth.

16. In combination with the indicator-rod-locking plate, the alarm-sounding mechanism, the till lock or bolt, and the lever connected therewith, the movable bar having means for moving the plate into rod-unlocking position, and also means for moving the bolt-lever and actuating the alarm-sounding mechanism, substantially as and for the purpose described.

17. In combination with the indicator-rod-locking plate having suitable shoulders for engagement by its actuating device, the drawer latch or bolt and means for raising the same, and the alarm-sounding mechanism, the movable bar having the arm to engage the shoulders on the rod-locking plate, a piece to engage the bolt-raising means, and a lug to actuate the alarm-sounding mechanism, substantially as and for the purpose specified.

18. In combination with the lever of the alarm-sounding mechanism, the movable bar having the lug to engage such lever as the bar moves in one direction and means for shifting the bar to take its lug out of line with the alarm-lever as the bar travels back again, substantially as and for the purpose shown.

19. In combination with the movable bar and a lever for moving the same in one direction, a pawl on the bar to be engaged by the lever, one or more pins on the bar, and switches to engage and guide the bar-pins along an elevated path as the bar travels back again and allow them to drop at the end of the backward travel of the bar, substantially as and for the purpose shown.

20. In an indicating apparatus, in combination with a series of keys and the levers moved through suitable connections with such keys, the reciprocating bar provided with pawls to be engaged by the levers as the latter swing in one direction, and with pins, a spring to retract the bar, and switches to engage and raise the pins and the bar as the bar is retracted, substantially as and for the purpose set forth.

21. In an indicating apparatus, in combination with the two series of keys and the frames engaging the keys of the respective series, the reciprocating bar provided with pawls and with the guide pins or studs, the two levers adapted to engage the pawls to move the bar in one direction, and the spring-switches guiding the pins and bar into and along an elevated path as the bar travels back, so as to carry the pawls clear of the tracks of the lever ends, substantially as and for the purpose described.

22. In an indicating apparatus, in combination with the series of shouldered indicator-rods and the reciprocating locking-plate therefor provided with one or more notches, the movable bar provided with one or more arms to engage the notch or notches in the locking-plate, and with guide-pins, a spring to retract the bar, pawls on the bar, swinging levers to engage the pawls, two series of keys, two frames adapted to be moved by any key in the respective series and to move one of the levers, and suitable switch devices to engage the bar-pins and cause them and the bar to travel in different paths as they move in opposite directions, substantially as and for the purpose specified.

23. In an indicating apparatus, in combination with the indicator-rods and keys for actuating them, levers for causing actuation of the indicator-rod-locking device and the alarm mechanism and levers adapted to be engaged by the keys and themselves engaging arms of the other levers, substantially as and for the purpose shown.

24. In an indicating apparatus, in combination with the separate sub-series of keys and the separate independent keys, a lever, and a swinging frame for each sub-series, each frame being adapted to be engaged by any key in the respective sub-series and itself engaging and actuating one of the levers, separate independent keys, levers adapted to be engaged thereby, and themselves engaging arms of the other levers, substantially as and for the purpose set forth.

25. In combination with the reciprocating bar, the stationary supporting bar or plate therefor having openings or slots, arms on the movable bar embracing the upper edge of the supporting-plate, and pins on the bar entering the plate-slots, spring-switches situated in such slots having the elevated portion, and the downwardly-inclined portion extending down into the track of the bar-pins, substantially as and for the purpose described.

26. In a cash register and indicator, in combination with the key-levers and the indicator-rods actuated thereby, registering mechanism operated by the different key-levers, means for locking the indicator-rods when elevated, an alarm mechanism, a movable piece for tripping such lock and actuating the alarm mechanism, levers for moving such piece, and swinging frames for actuating such levers engaged by the key-levers, substantially as and for the purpose specified.

27. In a registering mechanism, in combination with a toothed wheel, a movable brake having a nose to engage the wheel-teeth to lock the wheel, and a friction device for retaining the brake in its operative position, substantially as and for the purpose shown.

28. In a registering mechanism, in combination with a toothed wheel and the brake to engage the teeth of the wheel so as to lock the latter from turning, a friction-spring engaging such brake, adapted to retain it in engagement with the wheel-teeth until it is positively moved, substantially as and for the purpose set forth.

29. In a registering mechanism, in combination with a toothed wheel and a brake-lever having a nose to engage the teeth of the wheel, a friction-spring engaging the side of the lever, so as to retain it as moved into engagement with the wheel-teeth, while leaving it free to be positively moved out of engagement with such teeth, substantially as and for the purpose described.

30. In a registering mechanism, in combination with a toothed wheel, a swinging brake-pawl adapted to engage the teeth of the wheel so as to lock the latter, a slide connected with the pawl so as to move the same into and out of engagement with the wheel-teeth, and a friction device to retain the pawl as moved into or out of operative position, substantially as and for the purpose specified.

31. In a registering mechanism, in combination with a toothed register-wheel, the pivoted brake-pawl, the slide for actuating the same connected therewith, and the friction-spring engaging the side of the pawl, substantially as and for the purpose shown.

32. In a registering mechanism, in combination with a toothed register-wheel, the brake-pawl, the friction-spring engaging the same, and the pawl-actuating slide connected with the pawl and carrying two shoulders or bearings to be struck by a movable piece for actuating the slide, substantially as and for the purpose set forth.

33. In a registering mechanism, in combination with a toothed register-wheel, a key, and connecting devices between the key and wheel whereby the latter is turned as the key is moved, a movable piece actuated by the key, the brake-pawl adapted to engage the teeth on the wheel, a friction-spring engaging the pawl, and a slide connected with the pawl so as to actuate it, and provided with two bearings or shoulders to be struck by the movable key-actuated piece as the latter moves in opposite directions, substantially as and for the purpose described.

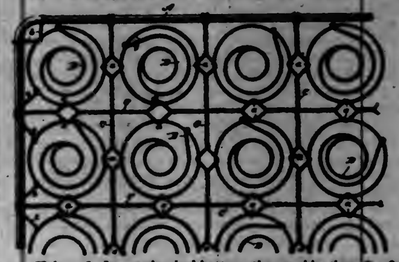
34. In a registering mechanism, in combination with a series of keys and a toothed register-wheel, connections between the wheel and the keys whereby the wheel is moved as any key is raised, a brake-pawl adapted to engage the teeth on the wheel, the friction-spring engaging the pawl, a swinging frame extending across above the keys, and a slide connected with the pawl, having bearings or shoulders arranged above and below the frame, substantially as and for the purpose specified.

35. In combination with a toothed register-wheel, a series of keys, and means for actuating the wheel as any key is moved, the brake-pawl, the friction-spring engaging the same, a swinging frame extending across the series of keys, and the slide connected with the pawl, having the adjustable bearing to be struck by the frame just as a key finishes its upward movement and a shoulder or bearing below the frame to be struck by the latter on its downward movement, substantially as and for the purpose shown.

36. In a registering mechanism, in combination with a toothed register-wheel, a series of keys, a frame adapted to be moved different distances by the different keys, and connections between such frame and the wheel whereby the latter is caused to turn by the rising of the frame, a second frame moving with any raised key, a brake-pawl to engage the wheel-teeth to lock the wheel from turning, a friction device to retain such pawl as moved into or out of engagement with the wheel-teeth, and a slide connected with the pawl, having the bearings to be engaged by the second frame arranged above and below such frame, substantially as and for the purpose set forth.

37. As a means for moving a toothed wheel or other device, in combination with a rocking piece and a pawl carried thereby, a spring engaging the pawl and rocking piece so as to be compressed or put under greater strain as the rocking piece is moved to actuate the pawl, substantially as and for the purpose specified.

38. As a means for turning a toothed register-wheel, a rocking piece, a pawl for engaging the teeth on the wheel, pivotally connected with the rocking piece so as to be moved to turn the wheel as the piece is rocked, and a spring bearing upon the pawl, attached to the rocking piece so as to be forced toward the pawl as the piece rocks to move the pawl forward, substantially as and for the purpose described.



39. In combination with a wheel having a tooth or projection and a second wheel having a series of teeth, a rocking-piece having an arm in the path of the tooth on the first wheel, a pawl pivotally connected with the rocking piece so as to be moved thereby and adapted as moved in one direction to engage the teeth on the second wheel and ride over the same as moved in the opposite direction, and a spring bearing upon the outer end of the pawl, attached to the rocking piece so as to be forced toward the pawl as the piece rocks, substantially as and for the purpose specified.

40. In combination with a wheel provided with a tooth or projection and a second wheel provided with a series of teeth, the rocking piece provided with the two arms, of which one is in the path of the tooth on the first wheel, a pawl pivoted to the other arm and engaging the teeth on the second wheel, and a spring bearing upon the pawl and attached to the rocking piece so as to be forced toward said pawl as the piece is rocked to cause the pawl to turn the second wheel, substantially as and for the purpose set forth.

41. In combination with a wheel provided with a tooth or projection and a second wheel provided with a series of teeth, a rocking piece having the two arms, one in the path of the tooth on the first wheel, a pawl pivoted to the other arm and having its nose for engaging the teeth on the second wheel, adapted as the pawl is drawn in toward the rocking piece to engage the wheel-teeth to turn the wheel and having its outer side inclined, a spring attached at one end to the rocking piece and projecting out over the pawl so as to be carried down toward the latter as the rocking piece is moved to draw the pawl inward and having its outer end, engaging the outer end of the pawl, hooked, substantially as and for the purpose described.

42. In a registering mechanism, the means for turning one register-wheel at each revolution of another, which consists of a tooth on one wheel, a series of teeth on the other wheel, a rocking piece having the two arms, the pawl on one of the arms having its upper side grooved, the spring engaging the groove in the pawl attached to the rocking piece so that it is forced down upon the pawl as the piece is rocked to draw the pawl inward and having its outer end hooked over the pawl end, substantially as and for the purpose specified.

412,612. SPRING BED-BOTTOM. HENRY H. HENRY, St. Louis, Mo. Filed May 21, 1889. Serial No. 311,530. (No model.)

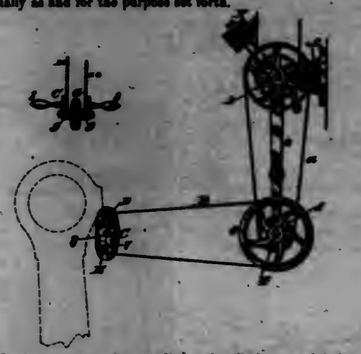
Claim.—1. In a spring bed-bottom, the combination of a frame A, bed-springs B, arranged in transverse and longitudinal rows within the said frame, and the longitudinal and transverse tie-wires C, extending entirely across the frame and securely fastened to the same at their ends, these tie-wires being arranged between the rows of springs, so as to intersect each other, and being constructed each of two strands of wire tightly twisted together, loops *a a* being formed by separating the strands of the tie, these loops receiving the end coils of the springs, as shown, whereby the entire bed of springs will be firmly connected together and to the frame, thereby preventing lateral movement of the springs in all directions, substantially as described.

2. The combination of a frame, springs arranged in rows within the frame, and the parallel intersecting tie-wires C, secured to said frame and composed of twisted wire strands, the ends *c c* of these tie-wires being wrapped around the frame and turned inwardly and secured to the top coils of the border springs, and loops *a a* being formed in the said tie-wires and connected to the top coils of the springs, whereby each spring is securely braced at four different points, substantially as described.

412,613. COLORING-MATTER. ALBERT HERRMANN, Höchst-on-the-Main, Germany, assignor to the Farbwerke, vormals Meister, Lucius & Brüning, same place. Filed Jan. 15, 1889. Serial No. 296,203. (Specimens.) Patented in Germany Aug. 16, 1885; in Belgium Sept. 3, 1888, No. 83,115; in France Sept. 5, 1888, No. 192,807, and in Italy Sept. 30, 1888, XLVII, 176.

Claim.—The process of making blue-green dye which consists in dissolving meta-amidotetralkyldiamidotriphenyl methane in a mineral acid, diazotizing by a nitrous acid or a nitrate, in the usual way, decomposing the diazo compound by boiling with water, precipitating by the addition of sodium sulphate and boiling the resulting oxy-leuco base with water until it becomes neutral, and sulphonating the same by heating with concentrated or fuming sulphuric acid, as set forth.

412,614. PREPARING COLORING-MATTER. ALBERT HERRMANN, Höchst-on-the-Main, Germany, assignor to the Farbwerke, vormals Meister, Lucius & Brüning, same place. Filed Jan. 15, 1889. Serial No. 296,202. (Specimens.) Patented in Belgium Sept. 3, 1888, No. 83,115; in France Sept. 5, 1888, No. 192,807, and in Italy Sept. 30, 1888, XLVII, 176.

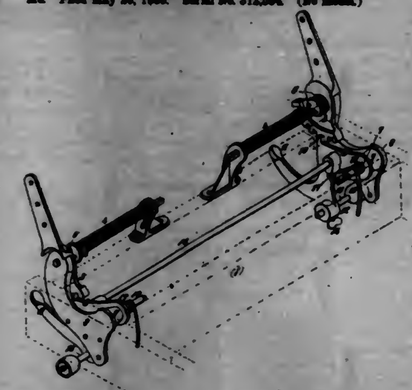


Claim.—The process of making fast blue-green color by dissolving meta-amidotetraethyldiamidotriphenyl methane in fuming sulphuric acid, heating the solution until a sample gives a clear mixture with cold ammonia, adding a soluble alkaline salt, as calcium or sodium oxide, oxidizing the leuco sulphonic compound thus obtained with a peroxide of lead or manganese, and precipitating the metallic base by dilute sulphonic acid, and filtering and evaporating to dryness the color solution, as set forth.

412,615. COLORING-MATTER. ALBERT HERRMANN, Höchst-on-the-Main, Germany, assignor to the Farbwerke, vormals Meister, Lucius & Brüning, same place. Filed Jan. 15, 1889. Serial No. 296,201. (Specimens.) Patented in Germany Aug. 16, 1888; in Belgium Sept. 3, 1888, No. 83,115; in France Sept. 5, 1888, No. 192,807, and in Italy Sept. 30, 1888, XLVII, 176.

Claim.—The new fast green-blue coloring-matter obtained, as described, from the etherized compounds of metaoxytetralkyldiamidotriphenyl methane or metamethoxy or metaethoxy tetralkyldiamidotriphenyl carbinol in the form of a copper-red powder of metallic luster, easily soluble in water, and giving, when so dissolved, a blue color which remains when soda-lye is added or when boiled with a solution of ammonia or soda, changes to violet only when boiled with soda-lye, and turns green on the addition of mineral acids, as set forth.

412,616. APPARATUS FOR GRINDING AND POLISHING METALS, &c. JOHN A. HEIS, Philadelphia, Pa. Filed Oct. 27, 1888. Serial No. 289,269. (No model.)



Claim.—1. An apparatus for grinding and polishing metal, consisting of a bracket with rotary shaft having pulleys thereon, balanced arms pivotally mounted on said shaft, a shaft journaled in the lower end of said arms and having pulleys thereon, a hand implement with rollers thereon, a belt connecting one of the bracket-shaft pulleys with one of the pulleys on the shaft in the lower end of the arms, and a grinding and polishing belt connecting one of the arm-shaft pulleys with the rollers of the hand implement, said parts being combined substantially as and for the purpose set forth.

2. In an apparatus for grinding and polishing metal, balanced arms mounted on a rotary shaft and having at their lower ends a rotary shaft with pulley carrying a grinding and polishing belt, substantially as and for the purpose set forth.

3. In an apparatus for grinding and polishing metal, a rotary shaft with pulley, a hand implement with yielding rollers, and a grinding and polishing belt connected with said pulley and rollers, said parts being combined substantially as and for the purpose set forth.

412,617. ATTACHMENT FOR CHAIRS. JOHN HOGAN, St. Louis, Mo. Filed May 20, 1889. Serial No. 312,094. (No model.)

Claim.—1. In an attachment for chairs, lounges, &c., the combination of the body portion, a back or rest, racks secured to the back or rest, levers pivoted to the body, extensions 11 and 12 on the levers, said extensions 11 being adapted to be pressed down to disengage the levers from the racks, and said extensions 12 being adapted to be pressed in to detach the parts, and rods 13, with heads 15, on the extensions 12, substantially as and for the purpose set forth.

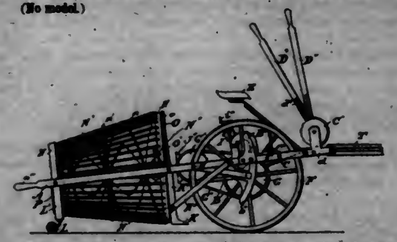
2. In an attachment for chairs, lounges, &c., the combination of the body, back or rest, racks secured to the back or rest, levers pivoted to the body and connected by a rod 16, set-screws 17 for holding the levers on the rod, pins 18, upon which the levers are mounted, and springs 19, one end of each of which bears against a fixed point and the other end against one of the levers, said levers having extensions adapted to be engaged by the hand or foot for releasing the racks, substantially as and for the purpose set forth.

3. In an attachment for chairs, lounges, &c., the combination of a body, back or rest, racks secured to the back or rest, plates 8, secured to the body and provided with cone-shaped projections 9, having pins 18, levers fitting over the pins 18, springs surrounding the pins 18, one end of each of said springs bearing against a fixed point and the other end against one of the levers and bearing against the levers, and extensions on said levers adapted to be engaged by the hand or foot for releasing the racks, substantially as and for the purpose set forth.

4. In an attachment for chairs, lounges, &c., the combination of a body, a back or rest, racks secured to the back or rest, levers pivoted to the body and engaging the racks, projections 12 on the levers, and adjustable rods 13 on the extensions, substantially as and for the purpose set forth.

5. In an attachment for chairs, lounges, &c., the combination of the body, back or rest, racks secured to the back or rest, levers pivoted to the body, a rod fitting in sockets in the levers, set-screws by which the levers are secured to the rod, and extensions on said levers for pressing them out of engagement with said racks, substantially as and for the purpose set forth.

412,618. PROCESS OF AND APPARATUS FOR PUNCHING AND FEEDING BLANKS. FREDERICK HOTZ, Cincinnati, Ohio. Filed July 22, 1889. Serial No. 318,276. (No model.)



Claim.—1. The process of punching blanks from a fed-in strip, consisting in first punching out the blank, then reinserting said blank into the strip, and then feeding the strip carrying the punched-out blank to a discharger, substantially as described.

2. In a blank-punching machine, the combination, with a reciprocating plunger carrying a punch and a discharger, of a die-plate for the fed-in strip provided with perforations beneath said punch and discharger, and a yielding follower beneath said punch for replacing the punched-out blanks into the strip, substantially as described.

3. In a blank-punching machine, the combination, with a reciprocating plunger carrying a punch and a discharger, of a die-plate for the fed-in strip provided with perforations beneath said punch and discharger, a yielding follower beneath said punch for replacing the punched-out blanks into the strip, and mechanism for feeding in the strip, substantially as described.

4. The combination and arrangement of the punch G, discharger H, die-plate I, provided with perforations *b c*, and tube J, provided with spring *d* and follower *e*, substantially as and for the purpose described.

412,619. POTATO DIGGER AND PICKER. HERBERT HOOPER, Port Perry, Ontario, Canada. Filed Feb. 9, 1889. Serial No. 299,282. (No model.)

Claim.—1. A potato-digger consisting of a bar-iron frame carrying a platform, the gearing, shoe, and a sifting-cage, and supported at the rear by a caster-wheel and near the front by wheels at an adjustable height, an axle journaled in levers having their rear end pivoted near the rear of the front portion of the frame and within the same, and having their segmental fronts attached to chains secured to chain-wheels upon a shaft carrying ratchet-wheels held by detents and operated by hand-levers, wheels journaled upon the axle and operated by ratchet-connections and adapted for lateral adjustment, a sprocket-wheel journaled upon the axle, a clutch feathered upon the axle and pressed into gear by a spring, and controlled by a shifting-fork controlled by an operating device, a shaft parallel to the axle and in the rear thereof, carrying a smaller sprocket-wheel and geared to the other sprocket-wheel by a pitch-chain, said shaft carrying a miter-wheel, the conical sifting-cage composed of rods connected by longitudinal wires or bars and having a shaft journaled longitudinally

upon the rear portion of the main frame and carrying a miter-wheel gearing in the miter-wheel upon the rear cross-shaft, said cage having internal Archimedean screw-blades and provided with shields at the front, rear, and on one side, and a shoe K, carried on a bracket K', secured to the frame in front of the cage, substantially as set forth.

2. In a potato-digger, the combination of the bar frame A A' A'', the longitudinal bars A'' being arched over the axle to allow the axle to rise above the level of the frame, and carrying a platform A''', the axle B, journaled in the levers B', the levers B, having segmental front ends b'', and having their rear ends pivoted at the rear of the front portion of the frame and to the inside thereof, and the upper end of each of the segments having the end of a chain secured thereto, the platform A''', secured upon the bars A'', a shaft D, journaled upon the front of the frame A, chain-wheels C', secured to said shaft, chains C, each having one end secured to one of the chain-wheels C' and the other to the segments b'' and passing over a friction-pulley C', ratchet-wheel D', secured upon the shaft D by set-screw and having a detent d' gearing into it, lever D'', pivoted upon the shaft by an oblong eye, and having a dog d'', adapted to engage the teeth of the ratchet-wheel, substantially as set forth.

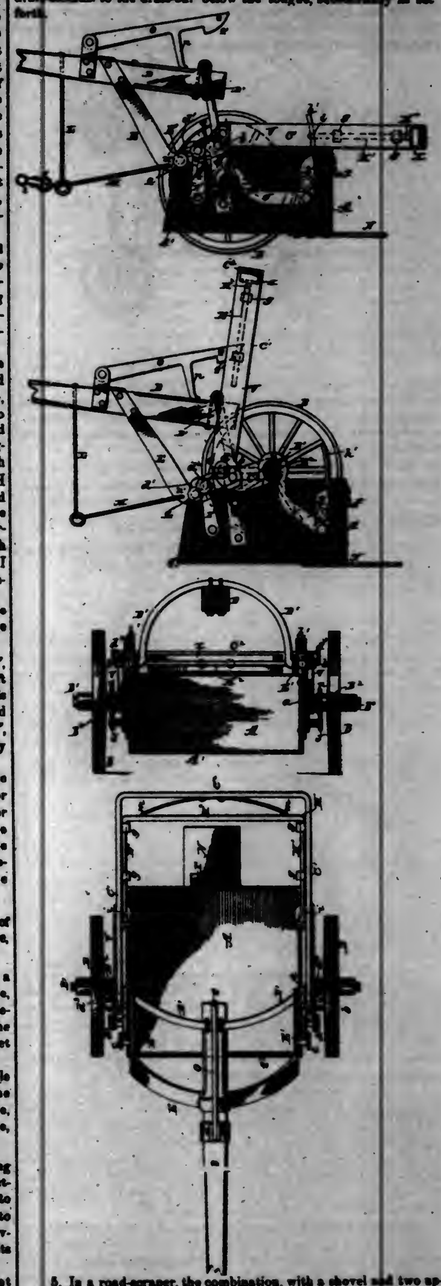
3. In a potato-digger, the combination of the frame A A' A'' and foot-board A''', the shaft D, journaled thereon, chain-wheels C', keyed to said shaft, ratchet-wheel D', secured upon one end of said shaft by set-screw, a lever D², pivoted to said shaft by an oblong eye, and having a dog d², adapted to engage the teeth of said ratchet-wheel d², a detent pivoted to said frame A and engaging the teeth of said ratchet-wheel and having a handle d³, substantially as set forth.

4. In a potato digger, the combination of the frame A A' A'', the levers B' and axle B, the wheels F, journaled upon said shaft, and connected therewith by a ratchet movement, the sprocket-wheel G, journaled upon said axle and provided with lateral teeth adapted to be engaged by a clutch, the clutch H, feathered to said axle and adapted to engage said sprocket-wheel and controlled by a shifting-fork, the spring H', held by a collar on said axle and adapted to push the clutch H' into gear, the shifting-fork I, engaging said clutch H and held at one end upon a rod, the rod or bolt I', holding one end of said fork and secured to the bars A'' parallel to the axle B, the bracket I'', secured to one of the bars A'' and having a hub or bearing i'', the flat bar I''', journaled in said bracket I'' and provided with handle i''', and adapted to bear with one edge on the shifting-fork I and press the same so as to push the clutch H out of gear, substantially as set forth.

5. In a potato-digger, the combination of the frame A A', the bracket K', braced by a brace K'' and carrying the shoe K, and the shoe K, secured to said bracket, substantially as set forth.

6. In a potato-digger, the combination of the frame A A' A'', the conical sifting-cage N, having open ends, mounted upon a shaft M, journaled upon said frame, and connected by gearing, said ends connected by longitudinal bars or wires n and held by a hoop n', and said cage provided with internal Archimedean screw-blades N' N'', and with an adjustable front shield O and side shield Q, substantially as set forth.

7. In a sifting-cage of a potato-digger, the combination of the central shaft M, the open ends N, connected by longitudinal bars or wires n, held by a hoop n', said ends varying in diameter, being larger in front and smaller at the rear, so as to give a conical shape, the Archimedean screw-blades N', extending through the cage, and the short screw-blades N'', the front shield O, held adjustably to the cross-bar of the frame by a slotted bar O', pivoted to said plate, and the side shield Q, secured to the frame, substantially as set forth.



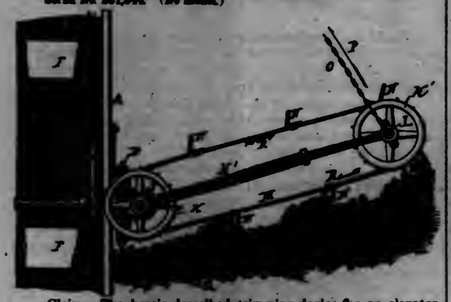
412,620. ROAD-SCRAPER. EDWARD HOUSE, Hunt, assignor of two-thirds to James C. Stubbs and John A. Johnson, both of Pierre, Dak. Filed June 13, 1888. Serial No. 276,975. (No model.)

Claim.—1. In a road-scraper, the combination, with a shovel, a lever carrying axle-spindles, wheels mounted on said spindles, a tongue, and a yoke connecting the tongue and shovel, of a bracket-arm secured to the tongue and having a lateral projection for limiting the upward movement of the front end of the shovel, substantially as set forth.

2. The combination, with a shovel, of a pair of wheels adjustable for height with respect to the shovel, a yoke pivotally secured to the shovel, a tongue having its rear end secured to the center of yoke, and bracket-arms secured to the tongue and to the ends of the yoke, substantially as set forth.

3. In a road-scraper, the combination, with a bent lever carrying axle-spindles, wheels mounted thereon, a tongue, and a yoke connecting the tongue with the shovel and bent lever, of a plate attached to the shovel, a sliding bolt secured to the bent lever and adapted to engage the plate, a bracket having a projection thereon, and a movable hook adapted to engage said projection when the shovel is in its depressed position, substantially as set forth.

4. In a road-scraper, the combination, with a shovel having a flat bottom and vertical sides, which are adapted to excavate soil, a lever having bent arms, stub-axles secured to these arms, and wheels mounted on the axles, of a tongue, a yoke secured to the rear end of the tongue, bracket-arms that support the tongue laterally, a depending draft-bar, stay-rods for the draft-bar, and means for attachment of draft-animals to the draft-bar below the tongue, substantially as set forth.



5. In a road-scraper, the combination, with a shovel and two up-

wardly-projecting curved and perforated locking-plates affixed to the opposite sides of the shovel, of a bent lever, each member or arm of which is bent downwardly at its forward end, wheels journaled on axles secured to the bent ends of said members or arms, and a bent sliding bar that is adapted to slide on the bent lever and engage with the perforations in the curved locking-plates, substantially as set forth.

6. In a road-scraper, the combination, with a shovel and a bent lever having two parallel links with bent ends and carrying two stub-axles and two wheels, of two hook-plates pivoted on the shovel-sides and adapted to hook over the axles or wheel-hubs, substantially as set forth.

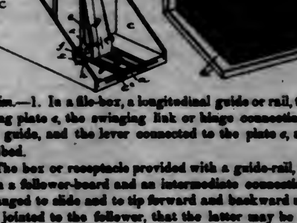
7. In a road-scraper, the combination, with a shovel having a flat bottom and upright side walls, all adapted to cut earth with their front edges, a tongue, bracket-plates, and an arched yoke provided with journal-ends, which serve as pivots on which the tongue vibrates vertically, of a bent rocking lever, a bent slide-bar, two curved locking-plates, with which the slide-bar can engage, two links, and two vertically-vibrating hooks connected by the links to the bent rocking lever and adapted to look fast to the bracket-arms of the tongue when the bent rocking lever is vibrated vertically, substantially as set forth.

412,621. TRIMMER OR GATHERER FOR COAL-ELEVATORS. LYMAN D. HOWARD, Brooklyn, N. Y., assignor to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed July 30, 1888. Serial No. 281,344. (No model.)

Claim.—The herein-described trimming device for an elevator, consisting of the shaft G, journaled in the bearings I K, the bevel-wheel J, adapted to mesh with a bevel-wheel on the lower shaft of the elevator, a frame consisting of side bars, with the non-rotary shaft L connecting the same near their outer ends, the bars H H' being journaled on one end of said shaft G, sprocket-wheels on said shafts L and G, and a chain with flights N thereon, said parts being combined substantially as described.

412,622. RUBBER-DAM CLAMP AND CARRIER. JAMES W. IVORY, Philadelphia, Pa. Filed Oct. 23, 1888. Serial No. 288,927. (No model.)

Claim.—1. The herein-described rubber-dam carrier and clamp, having connected jaws formed with lateral and horizontal lips, and tongues arranged at an angle to said lips, substantially as and for the purpose described.



2. The herein-described rubber-dam carrier and clamp, having the connected jaws provided with lips, and tongues punched out of said lips and arranged at an angle thereto, substantially as and for the purpose described.

412,623. WINDOW-SCREEN. CHARLES JESSAL, Savannah, Ga. Filed June 22, 1889. Serial No. 315,312. (No model.)

Claim.—A window-screen consisting of a frame and a panel of wire-gauze provided with openings near its top formed by cutting the vertical strands of wire and bending them outwardly, so as to form barbs, in combination with a short interior curtain of framinous material attached to the frame and extending downwardly from the top of the screen a little below the transverse openings, and being separated a short distance from the plane of the gauze-panel, substantially as described.

412,624. PAPER-FILE. MARK R. JEWELL, Rochester, N. Y., assignor to the Office Specialty Manufacturing Company, same place. Filed Feb. 6, 1888. Serial No. 263,393. (No model.)

Claim.—1. In combination with the tray having the bent or angular rod d^3, the pressure-arm D, with perforated ear d and ears d'.

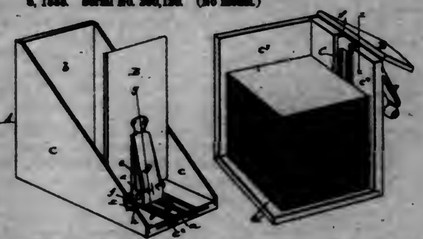
2. In combination with the tray having the groove front, the plate d^3, angular bar d^3, and pressure-arm D, provided with ears d and d'.

3. In combination with a tray or receptacle provided with bar or guide d^3, the pressure-arm D, and the follower C, independently mounted on said guide, substantially as shown.

4. In combination with the grooved tray, the angular bar d^3, the slotted plate d^3, and the pressure-arm D, mounted on the bar and arranged to turn backward over the front of the tray in the manner shown.

5. In combination with a tray or receptacle and a pressure-arm therein, a pressure-sheet or follower provided with strips c, for transmitting the pressure to the marginal portions of the confined sheets.

6. A pressure-sheet for a filing tray or box, provided with elastic metal strips secured thereto and extending from the middle to the margin.



7. The pressure-sheet or follower having the metal stiffening-strips attached to its under and upper faces, and extending from the middle outward.

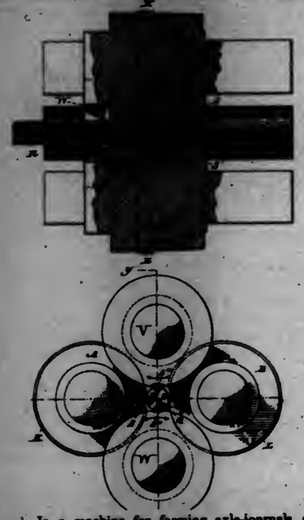
8. The pressure-sheet having the metal strips applied thereto on the two faces, the strips on one face provided with lips passing through the sheet and engaging the strip on the opposite face.

9. In a paper-file, the tray or receptacle, in combination with the index-sheets connected to each other and to the tray by the devices removable at will from the tray and the pressure-arm independently connected to the tray and arranged to turn outward therefrom, whereby the sheets may be removed without detaching the pressure device.

10. In combination with the tray and the removable clip-plates c', to hold the index-sheets, the pressure-sheet C, independently connected to the tray and provided with slots c^4.

412,625. FILE-BOX. MARK R. JEWELL, Rochester, N. Y., assignor to the Office Specialty Manufacturing Company, same place. Filed Nov. 6, 1888. Serial No. 290,128. (No model.)

Claim.—1. In a file-box, a longitudinal guide or rail, the follower-supporting plate c, the swinging link or hinge connecting said plate with the guide, and the lever connected to the plate c, substantially as described.



2. The box or receptacle provided with a guide-rail, in combination with a follower-board and an intermediate connecting-link, said link arranged to slide and to tip forward and backward upon the rail and also jointed to the follower, that the latter may be tipped inde-

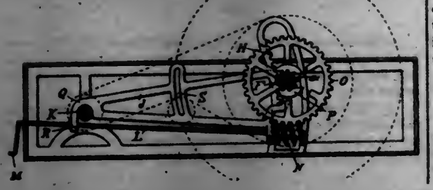
pendently of the motion of the link, whereby the follower is permitted to tip backward to a greater distance than would otherwise be allowable.

3. The guide-rail for a file-box, consisting of the sheet-metal bar longitudinally depressed at its middle, elevated at its edges, and bent downward at one end, as shown.

4. The file-box having the rectangular base and the two vertical walls at right angles to each other, its remaining sides being open, in combination with a longitudinal guide, a horizontal follower-board, and clamping devices, substantially as shown, connecting said follower-board to the guide.

412,626. MACHINE FOR FORMING AXLE-JOURNALS. JOHN R. JONES, Philadelphia, Pa. Filed Aug. 20, 1888. Serial No. 283,268. (No model.)

Claim.—1. In a machine for forming axle-journals, a pair of shaping-rolls provided with embossments for crowding the metal laterally, in combination with a pair of retaining-rolls adapted to hold the axle to the action of the shaping-rolls, in the manner and for the purpose substantially as described.

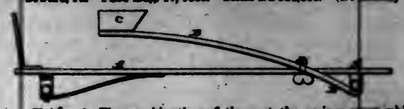


2. In a machine for forming axle-journals, one or more shaping-rolls, in combination with retaining-rolls arranged to hold the axle to the action of the shaping-rolls, in the manner and for the purpose substantially as described.

3. In a machine for forming axle-journals, a pair of twin shaping-rolls provided with tapering or spiral embossments, in combination with retaining-rolls for holding the axle to the action of the shaping-rolls, in the manner and for the purpose described.

4. In a machine for forming axle-journals, a pair of twin rolls provided with tapering embossments for crowding the metal laterally to form a groove, in combination with a smaller auxiliary tapering embossment located upon one side of the main embossment, and being so arranged as to commence acting upon the axle when the main embossment ceases, in the manner and for the purpose set forth.

5. In a machine for forming axle-journals, a pair of shaping-rolls provided with transverse recesses in their peripheries to facilitate the entrance of the axle, in combination with retaining-rolls for holding the axle to the action of the shaping-rolls, substantially as described.



412,627. DEVICE FOR RAISING AND LOWERING HARVESTERS OR GRAIN-BINDERS. JEREMIAH KELLER, Sandusky, Ohio, assignor to Otto Kramer, same place. Filed Oct. 9, 1888. Serial No. 287,691. (No model.)

Claim.—1. In a device for the purpose described, the combination, with the main wheel and the axle F, upon which it is journaled, of the pinions G G, secured to said axle, the counter-shaft K, the segmental circular slotted racks H, secured to the frame, the bracket J, pivotally secured at one end by an opening bearing on said counter-shaft K and at the other end formed with an open bearing sleeved upon the axle F, the shaft L, mounted on said bracket, the worm N, secured upon said shaft, and the worm-gear O, mounted upon the axle, the parts being arranged to operate substantially as described.

2. The combination, with the axle F and shaft K, of a bracket J, having at its front end a bearing for the front end of the shaft L, and the open bearing P, by means of which the bracket is sleeved upon the axle F, the open bearing Q, by means of which said bracket is hinged to the shaft K, the worm-wheel, the segmental racks, the pinions, and the downwardly-projecting leg R, and the shaft L, journaled in said leg and provided at one end with a handle M and at the other with the worm N, substantially as described.

412,628. SPRING-SEAT FOR VEHICLES. CLARENCE M. KIMBALL, Seward, Pa. Filed Aug. 17, 1888. Serial No. 281,116. (No model.)

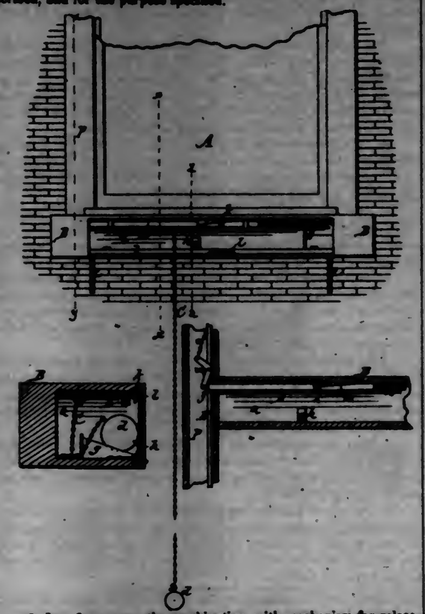
Claim.—1. The combination of the seat, the springs upon which the seat is secured, and the body having suitable openings through it, the rear ends of the springs being made to extend under or through the body and to catch against the axle, substantially as shown.

2. The combination of the elastic body provided with suitable openings or perforations, with the springs, and the seat which is secured to the front ends of the springs, the body forming a fulcrum for each spring, substantially as described.

412,629. FISHING-REEL. JOHN M. KEPLER, Corry, Pa. Filed May 20, 1889. Serial No. 312,155. (No model.)

Claim.—1. In combination with a fishing-rod or section thereof, a reel journaled within an opening formed therein, said reel being mounted upon and secured to a shaft having a crank-arm pivoted thereto, said shaft containing a spring-actuated bolt which engages with notches formed in the crank-handle adjacent to its pivot, substantially as and for the purpose set forth.

2. In combination with a fishing-pole or section thereof having a recess in which is journaled a reel, a cover for said recess, said cover being pivoted and provided adjacent to its pivot with a notch or recess with which a spring-actuated bolt engages for holding the cover closed, substantially as shown, and for the purpose set forth.



3. In combination with a fishing-rod or section thereof, a reel located within a mortise formed in said section, a casing adapted to inclose the reel, said casing having on one side a slot through which the line passes, and opposite thereto a cover, and a pivoted crank-handle for rotating the reel, said handle being adapted to be turned upon its pivot and enter a recess in the casing to lock the reel against rotation, substantially as and for the purpose set forth.

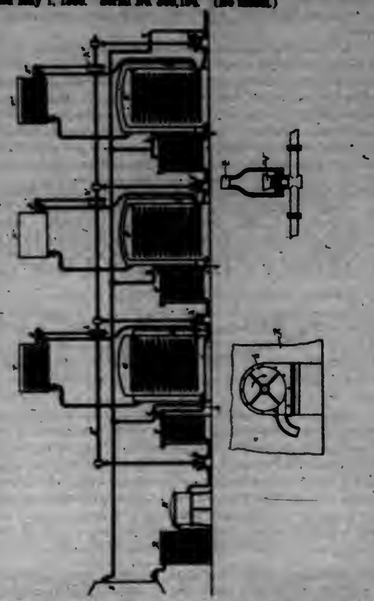
4. In combination with a section of a fishing-rod having a mortise, within which is located a reel, a casing adapted to be secured around said mortise, inner side plates *b b*, against which the flanges of the reel abut, said casing having a cover, the slot through which the line passes, openings through which the shaft upon which the reel is mounted passes, and an opening in which the crank-handle can be turned, substantially as and for the purpose set forth.

412,630. FIRE-ESCAPE. GEORGE KLUPP, Rochester, N. Y. Filed July 13, 1889. Serial No. 317,402. (No model.)

Claim.—1. In a fire-escape, the combination, with the hinged door *h*, provided with the loop *l*, of the catch *k*, engaging with said loop, the slide D, provided with a cam *m* for operating the catch, the retracting spring *n*, connected with one end of the slide, the bell-crank

n, connected with the other end of the slide, the tube E, provided with a rack *s* for operating the bell-crank, the gear *o*, engaging with the rack, and the handle *w* for operating the gear, as shown and described, and for the purpose specified.

2. In a fire-escape, the combination, with mechanism for releasing a door which incloses a chain and ball, of a tube extending the whole height of a building and connected with said mechanism, gears engaging with racks on said tube opposite each floor, and handles for operating the gears, whereby the drop mechanism may be operated from any floor, as herein shown and described.



412,631. WATCH-CRYSTAL GAGE. OMAR C. KRAEHENBUHL, Galena, Ill. Filed Sept. 17, 1888. Serial No. 285,682. (No model.)

Claim.—1. The combination of the plate A, the fixed point *a*, the movable point *b*, the sliding plate F, and the spring-controlled gage thereon, substantially as specified.

2. The combination of the plate having the diagonal and longitudinal marks thereon, the fixed point *a*, the sliding plate having the point *b*, the sliding plate F, the bar G, moving in guides on said plate, the indicator-point, and the spring, substantially as specified.

412,632. APPARATUS FOR THE PASTEURIZATION OF BEER AND OTHER LIQUIDS. WILLIAM KIRR, Germont-Ferrand, France. Filed May 1, 1888. Serial No. 269,194. (No model.)

Claim.—1. The series of connected apparatus for continuous pasteurization under pressure, composed of a number of receptacles provided each with an inlet and an outlet for the beer or other liquid to be pasteurized, and with a close coil therein nearly equal in length and diameter to the inclosing-receptacle, in combination with connecting-pipes from the outlet of each preceding to the inlet of each succeeding receptacle, force-pumps, one in the inlet-pipe of the first receptacle of the series and others in the said connecting-pipes, safety-valves, one for each receptacle, having each its supply-passage in communication with the interior of its appropriate receptacle, and means for supplying the coil of the first receptacle with a heating and of each of the others with a cooling medium, substantially as described.

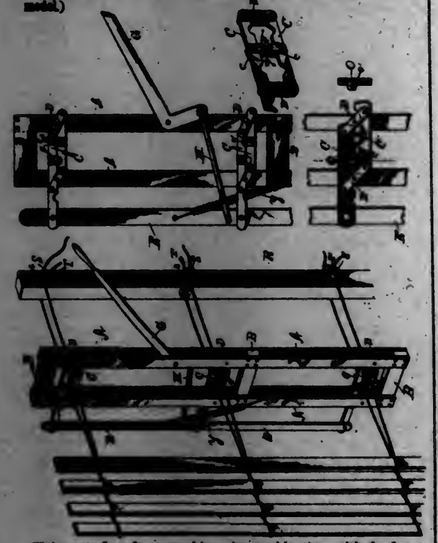
2. The series of apparatus for pasteurization, having pipes connecting the outlet of each preceding with the inlet of the succeeding apparatus, in combination with the ton, the refrigerator, the filter, the force-pump, and the pipes connecting the ton with the refrigerator, the latter with the filter, the filter with the force-pump, and the latter with the first of said apparatus, substantially as described.

3. The series of three connected apparatus for continuous pasteurization under pressure of beer and other liquids, each apparatus being composed of a receptacle and an inclosed coil, and the outlet of each preceding receptacle being in communication by a connecting-pipe with the inlet of the succeeding receptacle, in combination with a supply-pipe for the first and a discharge-pipe for the last apparatus of the series, force-pumps in said connecting and supply pipes, safety-valves having their respective supply-passages in communication with the interiors of the respective receptacles, three reservoirs for hot water, for cold water, and for incompressible liquid, respectively, pipes connecting the reservoir of hot water with the coil of the first apparatus, the reservoir of cold water with the coil of the second apparatus, and the reservoir of incompressible liquid with the coil of the third apparatus, and circulating-pumps connected with said last-mentioned pipes, substantially as described.

4. The combination, with the three apparatus, each composed of a close coil and an inclosing-receptacle provided with an inlet and an outlet, of a coil and force-pump for each apparatus, pipes connecting

the coil last mentioned and its force-pump with each other, pipes connecting the discharge of each force-pump with the inlet of the appropriate receptacle, pipes connecting the inlet of the preceding receptacle with the supply of the force-pump for the succeeding apparatus, a reservoir for each apparatus, pipes connecting each reservoir with the first-mentioned coil of the appropriate apparatus, and pumps connected with the last-mentioned pipes, substantially as described.

5. The series of connected apparatus, each comprising a receptacle, a safety-valve, a jacket for said receptacle, and a coil in said receptacle, in combination with the pumps and connecting-pipes for forcing the beer through the receptacles and the pumps and reservoirs in communication with said coils and jackets, substantially as described.



6. A series of apparatus having jacketed receptacles, the jackets or casings being placed around the lower part of the first receptacle of the series and around the upper part of the balance of said receptacles, in combination with the supply-pipe for the first apparatus, the discharge-pipe for the last apparatus, the connecting-pipes between the different apparatus, and the means or connections for supplying the jacket of the first apparatus with a heating and that of each succeeding apparatus with a cooling medium, substantially as described.

412,683. COMBINED HAME AND COLLAR FOR HORSES. CHRISTIAN H. LEHMANN and JAMES H. SOUTHCOTT, Adelaide, South Australia. Filed Sept. 15, 1888. Serial No. 285,202. (No model.) Patented in South Australia July 23, 1888, No. 1,057; in New South Wales July 30, 1888, No. 815; in Queensland Aug. 1, 1888, No. 851; in New Zealand Aug. 9, 1888, No. 3,166, and in England Sept. 15, 1888, No. 13,262.

Claim.—In a combined horse-collar and hames hinged together at the top, the tubular hame-pieces A A', the latter forming a socket F and the former having the solid projecting piece E, rigidly secured in the tubular end of said piece A, adapted to enter the opposite tubular hame portion and having the seat H, a spring-actuated projection passing through the tubular piece A' and adapted to enter said seat, and a ring for drawing aside said piece A' and separating it from the part A, said ring being connected with the spring-actuated projection, whereby when pulled it first withdraws said projection.

412,684. FENCE-MACHINE. EDGAR A. LEHARD and GEORGE W. SHERK, Karie, Ohio. Filed Aug. 21, 1888. Serial No. 282,461. (No model.)

Claim.—1. In a fence-machine, the combination, with the frame, of the pairs of carriers pivotally mounted at both ends on opposite ends of connecting-links pivoted at the center to the frame, substantially as described.

2. In a fence-machine, the combination, with the frame and links pivotally connected thereto at substantially the center, of the pairs of carriers mounted at both ends on opposite ends of the links, and an operating-bar uniting one of the carriers of each pair, whereby they may be moved simultaneously in either direction, substantially as described.

3. In a fence-machine, the combination, with the frame and links pivotally connected thereto at substantially the center, of the pairs of carriers mounted at both ends on opposite ends of the links, an operating-bar uniting one of the carriers of each pair, and a bell-crank operating handle pivoted to the frame and connected to said bar for imparting motion thereto, substantially as described.

4. In a fence-machine, the combination, with the frame having the double side bars, of the links at the front and back, each pivoted at the center between said bars, and the carriers mounted on opposite ends of each pair of links, substantially as described.

5. In a fence-machine, the combination, with the frame and the links pivoted thereto at the center, to move in a vertical plane, of the carriers mounted on the ends of the links and having the vertical projections for the wire-holders, substantially as described.

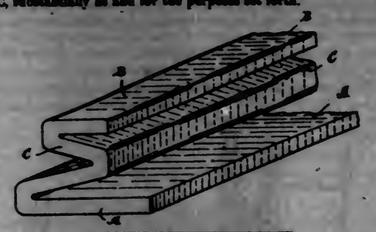
6. In a fence-machine, the combination, with the frame and the links pivoted thereto at the center to move in a vertical plane, of the carriers mounted on the ends of the links and having the vertical projections thereon, with the apertures in the same, through which the wire passes, substantially as described.

7. In a fence-machine, the combination, with the frame and the links pivoted thereto at the center, of the carriers mounted on the ends of the links and having the projections thereon, with the movable plugs therein having the notch in the edge, through which the wire passes, substantially as described.

8. In a fence-machine, the combination, with the frame, the pairs of wire-carriers, and connecting-links pivoted to the frame intermediate the carriers, of a spring for holding said carriers at each extreme of their movement.

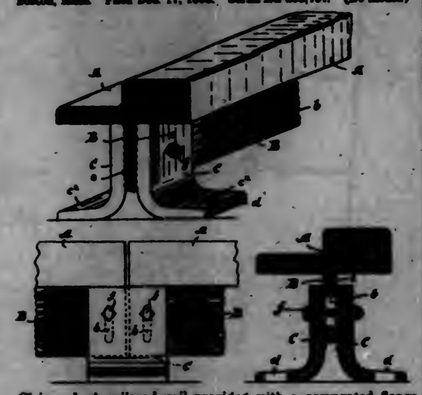
9. In a fence-machine, the combination, with the frame, pairs of wire carriers, connecting-links pivoted to the frame intermediate the carriers, and the bar uniting one of each pair of said wire-carriers, of the spring connected at one end to the bar and at the opposite end to the frame, as set forth.

412,685. APPARATUS FOR REPRODUCING COPIES OF WRITINGS, DRAWINGS, &c. MARC A. LEVY, St. Louis, Mo. Filed Feb. 21, 1889. Serial No. 300,777. (No model.)



Claim.—1. In a duplicating apparatus, the combination of an absorbent pad, an absorbent composition thickly applied to one surface of said pad, and a gelatine substance thinly applied to the outer surface of said composition, all substantially as described, and for the purposes set forth.

2. In a duplicating apparatus, the combination of an absorbent pad having its back, edges, and a border around its face rendered water proof, an absorbent composition thickly applied to the face of said pad within said border, and a gelatine substance thinly applied to the outer surface of said composition, substantially as described, and for the purposes set forth.



412,686. RAILROAD-RAIL. HERMAN W. LEVERY, Boston, Mass. Filed Nov. 16, 1888. Serial No. 291,051. (No model.)

Claim.—1. A railroad-rail consisting of an upper and a lower flange connected together by a >-shaped web, substantially as and for the purposes set forth.

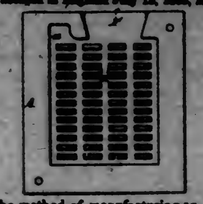
2. A rail for railroads, consisting of a lower flange A for securing the same to the sleepers and an upper flange B for the wheels to run upon, said flange and tread being connected together by a >-shaped web C, substantially as and for the purposes set forth.

412,687. RAILROAD RAIL AND CHAIR. HERMAN W. LEVERY, Boston, Mass. Filed Dec. 17, 1888. Serial No. 293,737. (No model.)

Claim.—1. A railroad-rail provided with a corrugated flange having vertical slots at suitable intervals, substantially as and for the purposes set forth.

2. The rail A, provided with corrugated flange B, having vertical slots b, in combination with a chair formed in two parts C C, their upper inner faces c being corrugated to correspond with the flange of the rail, and their lower ends c^2 provided with oblong holes or slots d, substantially as shown and described.

412,688. AGRICULTURAL MACHINE. GEORGE H. LEVER, Los Angeles, Cal. Filed Jan. 6, 1888. Serial No. 259,762. (No model.)



Claim.—1. In an agricultural machine, the combination of the frame A A', the roller-frame C', and the auxiliary frame or hinge-plates C', with the truck-frame consisting of the tongue E, hinged to the main frame, the yoke I J, and the roller H, substantially as shown and described.

2. The combination of the main frame A A', rollers B B', and frame C, the auxiliary frame C', the adjusting hinge-plate E, the tongue F, yoke I J, roller H, and adjusting-collar L, substantially as shown and described.

3. The main frame, the series of armed rock-shafts R R' R'', the bar D, and lever T, in combination with the arms or hinge bars M, suspended from the frame by the links O', the shanks P, for the cultivator-teeth, pivoted to the hinge-bars, and the rods W, connecting the shanks to the arms of the rock-shafts, substantially as shown and described.

412,689. SECONDARY BATTERY. FARNHAM H. LYTE, London, County of Middlesex, England. Filed Jan. 7, 1889. Serial No. 295,977. (No model.) Patented in England July 13, 1888, No. 9,498.

Claim.—1. The method of manufacturing an electrode of a secondary battery, consisting in making or casting the supporting material around studs, prisms, or bars of spongy or finely-divided lead having collars or projections, or of such form as to be retained in place by the supporting material, substantially as described.

2. The method of manufacturing an electrode of a secondary battery, consisting in making or casting the supporting material around studs, prisms, bars, rods, or other suitable forms of active material.

3. The method of making a secondary-battery element or electrode, consisting in first forming studs, prisms, bars, rods, or other suitable forms of active material, then casting or molding the supporting material around said active studs, prisms, bars, rods, or other forms in such manner as to hold them and expose a portion of their surface.

4. The method of making a secondary-battery element or electrode, consisting in first forming studs, prisms, bars, rods, or other suitable forms of active material, then arranging a number of said studs, prisms, bars, rods, or other forms of active material in a predetermined order and more or less separated from each other, and finally casting or molding the supporting material around said active studs, prisms, bars, rods, or other forms in such manner as to hold them and expose a portion of their surface.

5. The method of making a secondary-battery element or electrode, consisting in first forming studs, prisms, bars, rods, or other suitable forms of active material, and then casting the supporting material around them in the form of a plate end of less thickness than the said studs, prisms, bars, rods, or other forms.

412,640. CAR-BRAKE. BENJAMIN F. HAINES, Troy, N. Y. Filed July 31, 1888. Serial No. 281,943. (No model.)

Claim.—1. The combination, with a four-wheeled truck, of a pair of brake-bars, the brake-shoes thereon, the pairs of brake-levers respectively pivotally connected at their outer ends to the brake-bars and to each other at their inner ends, and the pair of rods pivotally connecting one lever of each pair with one lever of the opposite pair, substantially as and for the purpose described.

2. The combination of a four-wheeled truck-frame, the laterally-movable brake-bars mounted transversely in the frame adjoining each pair of wheels and carrying brake-shoes, substantially as described, with the pairs of brake-levers pivotally connected to the ends of each brake-bar, the link-connection between the levers of each pair, and the brake-chain for operating said levers, and the pair of connecting-rods attached to one lever of each pair, and the retracting-springs, all substantially as specified.

3. The combination of the truck-frame, the grooved hangers thereon, and the brake-bars resting in the grooves of said hangers opposite each pair of wheels, and the retracting-springs engaging said bars, and the brake-shoes on said bars having rearwardly-projecting perforated ears, with the pairs of brake-levers pivotally connected to the ears of the brake-shoes and to each other, and the brake-chain for operating said levers, and the connecting-rods pivotally connected to the opposite levers of each pair near the pivoted outer ends thereof, all substantially as and for the purpose set forth.

412,641. SEAL-LOCK. WILLIAM W. HAMER, Hempville, Tenn. Filed Dec. 3, 1888. Serial No. 292,022. (No model.)

Claim.—1. A seal-lock having the casing and shackle, the pawl

and forwardly-rotatable ratchet-wheel within the casing carrying the detent for engaging the shackle, and the seal for preventing the forward rotation of the ratchet-wheel, as set forth.

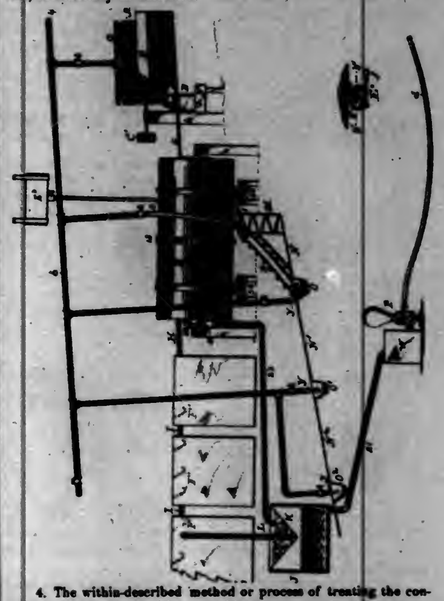
2. In a seal-lock, the combination, with the wheel and clutch for preventing its backward rotation, of the shackle, the detent moved by the wheel and engaging the shackle to prevent its withdrawal, and the seal for preventing the forward rotation of the ratchet-wheel, substantially as described.

3. In a seal-lock, the combination, with the wheel and clutch for preventing its backward rotation, of the shackle, the detent moved by the ratchet-wheel and engaging the shackle to prevent its withdrawal, the headed projection moved by the ratchet-wheel, the stationary headed projection, and the seal engaging said projections to prevent the forward rotation of the ratchet-wheel, substantially as described.

4. In a seal-lock, the combination, with the wheel, the clutch for preventing its backward rotation, and the shackle, of the detent mounted on the ratchet-wheel and engaging the shackle, the arm moved by the wheel having the headed projection thereon, the stationary headed projection, and the seal engaging said projections to prevent the forward rotation of the ratchet-wheel, substantially as described.

5. The combination, with a seal-lock having the two projections for engaging the seal at the top, of the seal formed with the extended body, and the slot at the top through which the projections pass, whereby the body extends over the lock, substantially as described.

412,642. SEED-PLANTER. JAMES I. MAYFIELD, Kosciusko, Miss. Filed July 23, 1888. Serial No. 318,203. (No model.)



Claim.—The combination of the frame A, furrow-opener B, and coverer C with the bars F, hinged or pivoted at their front ends, the seed-boxes G H, the operating-wheel journaled in the rear ends of the bars, the crank-shaft J, the connecting-rods L N, the lever Q, seed-slides S, and stirrer P, substantially as described.

412,643. METHOD OF AND APPARATUS FOR EXTRACTING GOLD. WILLIAM A. MERRAMA, Kansas City, Mo. Filed Nov. 5, 1887. Serial No. 254,447. (No model.)

Claim.—1. The within-described method or process of treating the concentrated placer mine or deposit gold intermediate its passage from the concentrating mechanism to the amalgamator proper, consisting in collecting the flowing gold along with any remaining fine sand and the water carrying the same, draining off the water and settling the pulp, mixing with the pulp a chemical solution consisting of chloride of sodium, cyanide of potassium, chloride of mercury, and water, and agitating by rotation the mixture until the gold is deoxidized or cleaned and becomes coated with a film of mercury, substantially as and for the purpose described.

2. The within-described method or process of treating the concentrated placer mine or deposit gold in its passage from the concentrators to the trap or traps of the amalgamator proper, consisting in collecting the flowing gold along with any remaining fine sand and the water carrying the same, draining off the water and settling the pulp, mixing with the pulp a chemical solution consisting of chloride of sodium, cyanide of potassium, chloride of mercury, and water, placing pieces of iron amidst the mixture, and agitating by rotating the whole until the gold is deoxidized or cleaned and becomes coated with a film of mercury, substantially as described.

3. The within-described method or process of treating the concentrated placer mine or deposit gold in its passage from the concentrators to the trap or traps of the amalgamator, consisting in collecting the flowing gold, fine sand, and the water carrying the same, draining off the water and settling the pulp, mixing with the pulp a chemical solution consisting of chloride of sodium, cyanide of potassium, chloride of mercury, and water, agitating by rotation the mixture until the gold is deoxidized or cleaned and becomes coated with a film of mercury, and then bringing the mixture in contact with mercury or mercury-covered surfaces for effecting complete amalgamation, substantially as described.

4. The within-described method or process of treating the concentrated placer mine or deposit gold on its passage from the concentrators to the amalgamator trap or traps, consisting in collecting the flowing gold, fine sand, overflowing gold slimes, and water carrying the same, draining off the water and settling the pulp, mixing with the pulp a chemical solution consisting of chloride of sodium, cyanide of potassium, chloride of mercury, and water, placing pieces of iron in the mixture, agitating the mixture until the gold is deoxidized or cleaned and becomes coated with a film of mercury, bringing the mixture containing the thus-prepared gold in contact with mercury or mercury-covered surfaces, bringing water in contact with the flowing mixture, and, finally, subjecting the water used to a filtering operation and returning it clean for reuse, substantially as described.

5. The combination of successively lower and finer revolving screens, stationary lateral sluiceways, inclined aprons, water-distributing pipes, connecting gutter at end of last apron, a revolving settling deoxidizing cylinder having a man-hole, one or more water-drain cocks or faucets, and a pulp-discharge cock or faucet, substantially as described.

6. The combination of successively lower and finer rotary screens, lateral sluiceways, stationary inclined aprons, water-supply distributing-pipes, connecting-gutter at end of last apron, a revolving settling deoxidizing cylinder having a man-hole, an overflow passage or man-hole, one or more water-drain cocks, a pulp-discharge faucet or cock, and an overflow stationary settling-box having a skimmer, substantially as described.

7. The combination of successively lower and finer revolving screens, lateral sluiceways, stationary inclined aprons, water-distributing pipes, connecting-gutter at end of last apron, a revolving settling deoxidizing cylinder having a man-hole, water-drain cocks, and a pulp-discharge faucet or cock, a chemical-solution chamber, and an amalgamator consisting of a perforated trough, a vertical chamber having zigzag amalgamation-plates, inclined amalgamation-plates, one of which is formed with a side well for surplus mercury, and an endless-chain mercury-elevator, substantially as described.

8. The combination of successively lower and finer revolving screens, lateral sluiceways, stationary inclined aprons, water-supply distributing-pipes, connecting-gutter at end of last apron, a revolving cylinder having a man-hole, water-drain cocks on different horizontal planes, a pulp-discharge faucet or cock, an overflow passage or man-hole, drain-pipes from the settling deoxidizing cylinder, stationary settling-boxes, overflow-pipes, a filter, filtered-water return-pipes, and a pump, substantially as described.

9. The combination, with the revolving settling deoxidizing cylinder having a man-hole, drain-cocks, and a pulp-discharge cock, of water-distributing pipes and a chemical-solution chamber having a connecting-pipe, substantially as described.

10. The combination of the revolving settling deoxidizing cylinder having a supply man-hole and overflow passage or man-hole, drain-cocks, drain-gutter, stationary settling-boxes, overflow drain-gutters and pipes, water-filter, and return water-pipes, substantially as described.

11. The combination of successively lower and finer screens, lateral sluiceways, stationary inclined aprons, connecting-gutters at end of last apron, a gate for changing the course of the water and substances passed off from the aprons, two revolving settling deoxidizing cylinders, each having an inlet and an outlet man-hole, water-drain cocks, and a pulp-discharge cock or faucet, substantially as described.

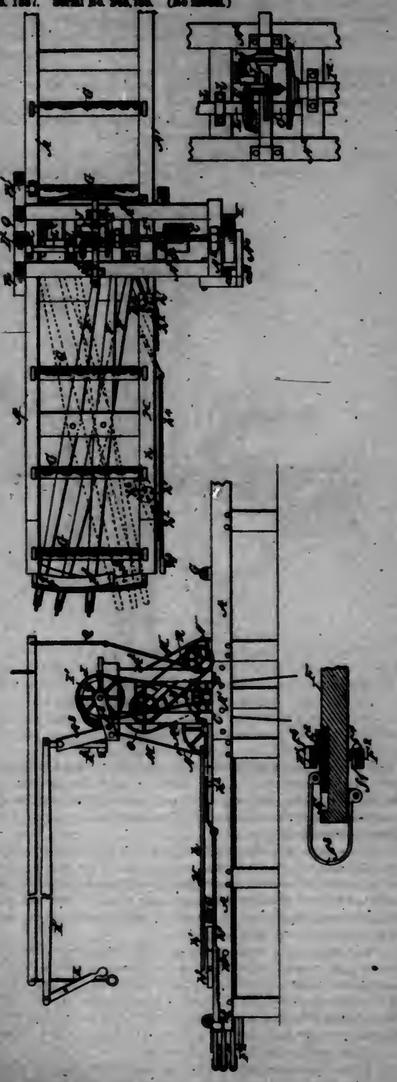
412,644. INDICATOR-VALVE. RICHARD H. B. MEYER, Brooklyn, assignor of one-half to Frederick W. Floyd, New York, N. Y. Filed Feb. 19, 1889. Serial No. 300,628. (No model.)

Claim.—1. In an indicator-valve, the combination, with the valve-operating stem, of two disks located one above the other flatwise, the upper disk being of a diameter or area to cover or conceal the under disk, and adapted to move transversely one over the other, and disk-actuating mechanism, as described, located intermediate the said disks and the valve-stem and operated by said stem, whereby said disks are caused to move flatwise transversely one upon the other concurrently with the movement of the valve-stem in opening and closing the valve, substantially as and for the purpose specified.

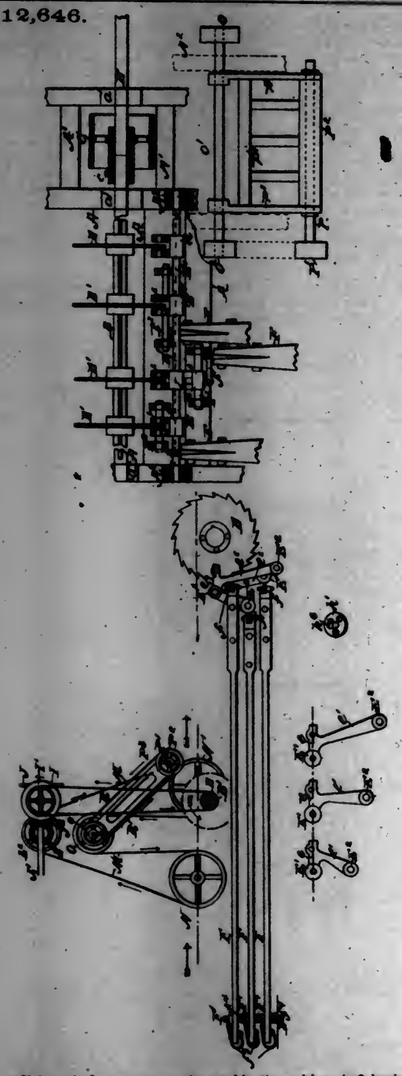
2. In an indicator-valve, the combination, with the valve-operating stem, of two disks located one above the other flatwise, the upper disk being of a diameter or area to cover or conceal the under disk, and one of which is fixed, while the other of which is carried by a nut and adapted to move transversely of and over and upon said fixed disk flatwise, a screw on which said nut works, and gearing, as described, connecting said screw and said valve-stem, whereby the movement of the valve-stem, in opening and closing the valve carried thereby, causes a concurrent movement of the movable disk flatwise transversely of and upon the fixed disk, substantially as and for the purpose specified.

3. In an indicator-valve, the combination, with the valve-operating stem B, provided with a hand-wheel B', of the frame c at right angles to the valve-stem and under the said hand-wheel, the disk E, fixed on said frame, the platform c', the disk E' thereon, movable transversely and flatwise upon said fixed disk, the nut c^3, carrying said movable disk, the screw c^4, on which said nut works, and the gears c^5 and c^6 on said screw and said valve-stem, respectively, substantially as and for the purpose specified.

4. A valve-movement indicator consisting of two disks adapted to move transversely of each other, one over the other flatwise, a frame upon which said disks are mounted, a nut attached to one of said disks, a screw on which said nut works and journaled in said frame, together with gearing on said screw whereby said worm may be connected to and actuated by the stem carrying and operating a valve, substantially as and for the purpose specified.



412,645. VEHICLE-SPRING. GEORGE R. MINARD, Mount Gilead, Ohio, assignor of one-half to Oswald W. Primrose, same place. Filed Aug. 13, 1888. Serial No. 282,620. (No model.)



Claim.—1. A vehicle-spring made up of a bar of metal having a single coil, the extending ends of said bar extending in substantially the same direction, the lower member of the spring being of greater length than the upper member and tapered from a point beneath the end of the upper member to its end, said tapered portion being bent downwardly and then upwardly and formed into an eye, the upper and lower members being one above the other, except at the coil, substantially as shown, and for the purpose set forth.

2. The combination, with the body A, of plates a a', having recesses within which the upper member of the spring lies, a spring having a horizontal upper member connected to the lower member by a single coil, said coiled portion being slightly inclined, so as to locate the lower member beneath the upper member, the terminal portion of the lower member which extends beyond the end of the upper member being tapered to its end, said tapered portion being curved first downwardly and then upwardly, an eye formed at the end of said tapered portion, and a clip attached to the running-gear for attaching the end of the spring thereto, substantially as shown, and for the purpose set forth.

412,646. GANG-EDGER FOR CUTTING DIMENSION LUMBER. JOSEPH H. MORROW and ALFRED H. HEINZ, Evansville, Ind. Filed Sept. 3, 1887. Serial No. 248,782. (No model.)

412,646.

Claim.—1. In a gang-saw, the combination, with a shaft having saws movable thereon, of a bar extending below the saw-bed, guides for the saws sliding thereon, and bars upon different horizontal and vertical planes for steadying each of the said guides, as and for the purposes described.

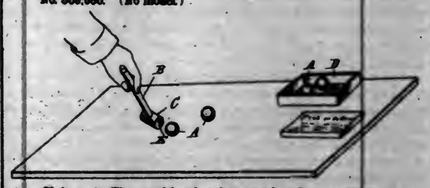
2. In a saw-mill, the combination, with a shaft having saws movable thereon, of guides consisting of two arms, a bar passing through all the guides, bars arranged in different vertical and horizontal planes, each one thereof passing through one arm of one of the said guides, the other arm thereof being slotted to receive and guide a saw, as and for the purposes described.

3. In a saw-mill, the combination, with a frame-work and a shaft having saws mounted thereon, of guides, levers adapted to move the said guides passing between graduated scale-bars, the upper portion of the said bars being corrugated, wedges on the tops of the said levers, U-shaped pieces adapted to draw the said wedge forward, and lips on the under surfaces of the levers, whereby they are locked in position, as and for the purposes described.

4. In a gang-saw mill, a series of saw-guides, each of the said guides consisting of two arms and having the angle formed by the said arms of every guide differing from the corresponding angle of the other guides, as and for the purposes described.

5. In a gang-saw mill, the combination, with a shaft having saws adjustably mounted thereon, of guides, each one thereof consisting of two arms, one arm of each of the said guides receiving one of the said saws, the other arm of each of the said guides terminating at a different level and attached to a lever extending to the front of the mill, a bar passing through all of the said guides at the junction of the two arms, and independent bars, each one situated on a different vertical and horizontal plane and passing through the lower arm of one of the said guides, as and for the purposes described.

6. In a gang-saw mill, the combination, with a frame-work and shaft having saws adjustably mounted thereon, of a bar extending below the saw-bed, guides for the saws sliding thereon, bars upon different vertical and horizontal planes, also below the saw-bed, for steadying each of the said guides, and a gage having legs upon its ends moving in equally-inclined bearings in the frame-work, whereby a forward or backward motion of the gage is converted into a lateral one, as and for the purposes described.



7. In a gang-saw mill, the combination, with a main frame-work A and a shaft provided with adjustable saws mounted thereon, of a bar extending below the saw-bed, guides for the saws sliding thereon, bars, each upon a different vertical and horizontal plane below the saw-bed, for steadying each of the said guides, a frame-work A^1, rising from the frame-work A, a shaft O, mounted on the said frame-work A^1 and having a shaft P, carrying a feed-roller depending therefrom in a frame, and suitable gearing imparting motion from the saw-shaft to the shaft O and from the shaft O to the feed-roller shaft P, as and for the purposes described.

8. In a gang-saw mill, the combination, with a main frame-work A and a shaft provided with adjustable saws mounted thereon, of a bar extending below the saw-bed, guides for the saws moving thereon, bars upon different vertical and horizontal planes, also below the saw-bed, for steadying each of the saw-guides, a frame-work A^1, rising from the main frame-work A, a shaft I^1, mounted thereon and receiving motion by any suitable means, a disk I' on one end thereof, and a shaft J' at right angles to shaft I^1, and having a disk J movably bearing upon the disk I', as and for the purpose described.

9. In a gang-saw mill, the combination, with a shaft having saws adjustably mounted thereon, of a bar extending below the saw-bed, guides for the saws moving thereon, bars upon different vertical and horizontal planes, also below the saw-bed, for steadying each of the said guides, a feed-roller capable of a vertical motion, and disks movable in relation to each other and forming a part of a gearing between the said saw-shaft and feed-roller, as and for the purposes described.

10. In a gang-saw mill, the combination, with suitable saw-guides, of corrugated bars, lever, each one thereof passing between two of the said bars and attached to one of the saw-guides, and having a wedge moving in a slot in the upper surface of its forward end and a lip formed on the lower surface thereof, and of a U-shaped handle pivoted to the said lever and wedge, whereby the lip may be caused to engage the corrugations of the bar below it, as and for the purposes described.

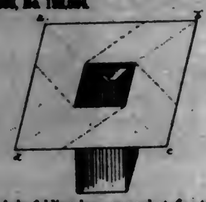
412,647. PUZZLE. ORVILLE M. MORSE, Jackson, Mich., assignor of one-half to John G. Mundy, same place. Filed May 6, 1886. Serial No. 309,680. (No model.)

Claim.—1. The combination, in a puzzle, of one or more spherical bodies, and a scoop consisting of a handle with an annular bearing of smaller diameter than the diameter of the said body or bodies, to be used in the manner and for the purpose described.

2. The combination, in a puzzle, of a number of spherical bodies of different sizes or weight, and a scoop consisting of a handle secured to a tubular body, forming an annular bearing of smaller diameter than the diameter of the spherical bodies, said scoop to be applied substantially in the manner described.

412,648. THILL-COUPLING. GEORGE H. HOFFMANN, Dell Rapids, Dak. Filed July 15, 1889. Serial No. 317,602. (No model.)

Claim.—1. In a thill-coupling, the fastening device E, provided with the cylindrical end portion e, for insertion in the eyes of the clip and thill iron, the hook e', to engage on one of the thill-rings to support the device, and the spring e^2, having a hooked end to engage the upper end of a wedge F and draw it upward between the thill-clip and thill-iron, substantially as specified.

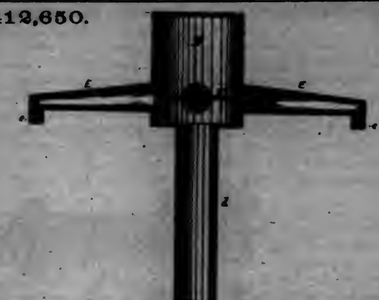


2. In a thill-coupling, the combination, with the fastening device E, having the end e for insertion in the eyes of the clip and thill iron, the hook e', to engage one of the thill-rings, and the spring e^2, having a hooked end, of the wedge F, inserted between the thill-rings and between the clip and thill iron, and provided with the hooked upper end f, which engages the hook e^2 and prevents the end e of the fastening device from being withdrawn, substantially as specified.

3. The combination, with the thill-clip A, having the perforated lugs a, and the thill having the eye c in its iron, of the wedge F, inserted between said lugs and between the clip and thill iron and provided with the upper hooked end f, and the fastening device E, having the end e for insertion in the eyes of the lugs a and thill-iron, the hook e', to engage upon one of the clip-lugs, and the spring e^2, having a hooked end to engage the hooked end f of the wedge and raise the latter, substantially as specified.

4. In a thill-coupling, the combination, with a clip having perforated lugs and the thill having an eye in its iron between said lugs, of a wedge having its base downward, standing between the thill-lugs and between the clip and thill iron and provided with a curved upper end, and a fastening device mounted on the clip and provided with a cylindrical portion inserted in the eyes of the clip-lugs and thill-iron, and a spring having a hook on its end to engage the hooked upper end of the wedge and draw it upward between the clip and thill iron to prevent the thill from rattling, substantially as specified.

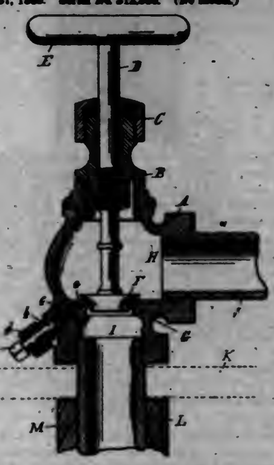
412,649. CARD-BOARD BOX. FRITZ J. MÜLLER, Cologne, Germany. Filed Feb. 5, 1889. Serial No. 299,194. (Model.) Patented in France Aug. 21, 1888, No. 192,894.



Claim.—1. A tightly-folding box or packet for tea, sugar, bonbons, chocolate, snuff, and similar substances, consisting of a case or packet of paper, pulp, stiff linen, or other material, open at one end, which end is provided with a continuous and undivided laterally-projecting rim, which is adapted to be folded over to completely close the box, substantially in the manner and for the purpose as described.

2. A packing-box of paper, stiff linen, or any other suitable material, provided at its open end with an uncut flat rim, which is folded over in two series of folds, the first serving to close the end, and the second series to hold the first firmly down, substantially as described and shown.

412,650. WASH-BOILER. JOHN T. MCCAFFERY, Red Bud, Ill. Filed June 26, 1889. Serial No. 315,603. (No model.)



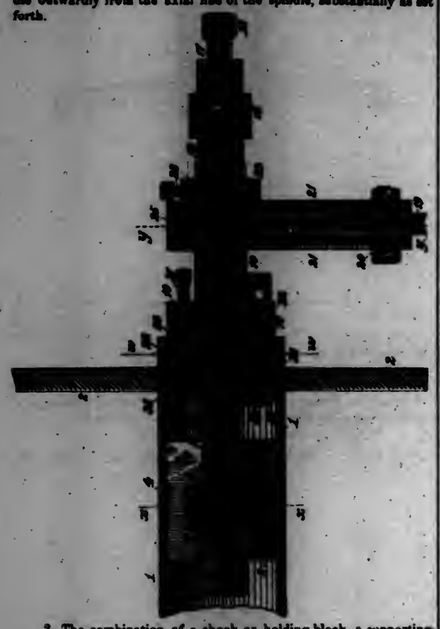
412,650.

Claim.—1. In a wash-boiler, the combination of the perforated plate C, tubes b and d, steam-chamber D, provided with a supplemental bottom, and the tapering arms E, having tube c, substantially as shown and described.

2. In a wash-boiler, the combination of a perforated plate, a steam-chamber having tapering arms, and a supplemental bottom dividing the passage to said arms, and tubes connecting said perforated plate and steam-chamber, substantially as shown and described.

412,651. DRAIN-VALVE. JAMES P. MCELROY, Lansing, Mich. Filed May 27, 1889. Serial No. 312,309. (No model.)

Claim.—1. In a valve of the kind described, a supplementary adjustable aperture or slot formed in the face of the valve-seat independent of the valve-disk, whereby a permanent opening is left for the escape of the contained fluid, substantially as described.



2. In a valve of the kind described, in combination with the inclined valve-seat, the slot-opening formed in the face of the valve-seat, the screw-threaded spindle to adjust the size of said opening, arranged substantially at right angles to the inclined sides of the disk, substantially as described.

3. In a valve of the kind described, the combination, with the inclined valve-seat, the slot-opening formed in the face of the valve-seat, and the screw-threaded spindle adapted to adjust the size of said opening, of the stuffing-box around said spindle and of the wrench-hold, said spindle being substantially at right angles to the inclined face of the disk, substantially as described.

412,652. TUBE CUTTER, EXPANDER, AND BEADER. JAMES MOFFAT, Pittsburg, Pa., assignor of one-half to Thomas Moffat, same place. Filed June 20, 1888. Serial No. 276,893. (No model.)

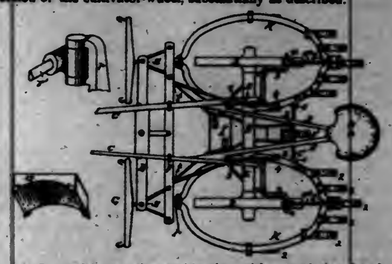
Claim.—1. The combination of a chuck or holding-block, a supporting-spindle fitting centrally therein, a rotatable head or tool-carrier mounted upon the spindle, an adjustable die or box fitted to move within the head radially to the axis of the spindle and adapted to receive and support interchangeably a cutting-roller, an expanding-roller, or a beading-roller, and an adjusting-block movable within the head and provided with an inclined or wedging face for forcing the

die outwardly from the axial line of the spindle, substantially as set forth.

2. The combination of a chuck or holding-block, a supporting-spindle fitting centrally therein, a rotatable head or tool-carrier mounted upon the spindle, an adjustable die or box fitted to move within the head radially to the axis of the spindle, a beading-roller journaled radially to the axis of the spindle upon a block pivoted to the die, an adjusting-block movable within the head and provided with an inclined or wedging face for forcing the die outwardly from the axial line of the spindle, and an adjusting-screw engaging the head and bearing upon the shaft of the beading-roller in position to vary the angular position of said shaft relatively to the axial line of the spindle, substantially as set forth.

3. The combination of a radially-divided series of chuck-segments, which are serrated peripherally, a separate nut fitting centrally in the series of segments, and a supporting-spindle having a conical or tapered end portion fitting a corresponding central bore in the segments and provided with a thread engaging the thread of the nut, substantially as set forth.

4. The combination of an expansible chuck or holding-block composed of a radially-divided series of peripherally-serrated segments and a separate nut fitting centrally in the series of segments, a supporting-spindle having a conical or tapered end portion fitting a corresponding central bore in the segments and provided with a thread engaging the thread of the nut, a rotatable head or carrier mounted upon the spindle, and a roller-tool mounted in an adjustable die or box in the head, substantially as set forth.



412,653. MECHANICAL TELEPHONE. WILLIAM NAYLOR, Alton, Ill.; Edward Craig administrator of said William Naylor, deceased. Filed Mar. 26, 1888. Serial No. 304,094. (No model.)

Claim.—In a mechanical telephone, the combination of the wooden band A, the metallic band C, the diaphragm consisting of the combined layers of linen canvas, card-board, and linen paper glued together, and the backing consisting of the combined layers of card-board and the linen paper glued together, said diaphragm being clamped on said wooden band by said metallic band, substantially as set forth.

412,654. CULTIVATOR. CONRAD HOYER, Marshall, Mich. Filed Nov. 30, 1888. Serial No. 292,315. (No model.)

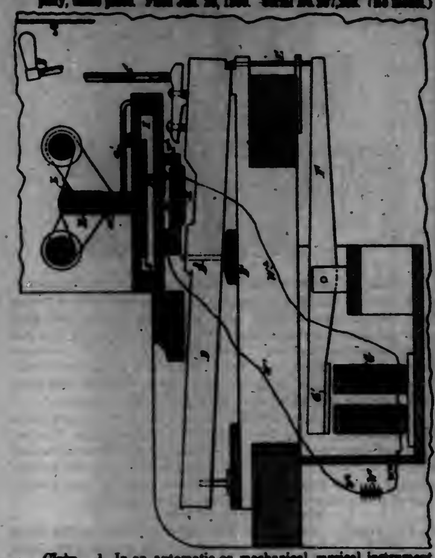
Claim.—1. In a cultivator, the combination, with an axle and a supporting-frame, of an adjustable tooth-bearing frame suspended from the supporting-frame above the axle and surrounding the upper portion of the cultivator-wheel, substantially as described.

2. In a cultivator, the combination, with a tooth-bearing frame adjustably suspended above the axle and surrounding the upper portion of the cultivator-wheel, of a lever, a lever-crank, and a connecting-rod for raising and lowering the rear end of said tooth-frame, substantially as described.

3. In a cultivator, the combination, with a supporting-frame, of two elliptical tooth-bearing frames surrounding the cultivator-wheels and suspended from the supporting-frame, a connecting-rod *d'*, pivoted to said frames in rear of the axle, and levers, toothed segments, and connecting-rods for raising and lowering the rear ends of either of said tooth-bearing frames and retain them at any desired elevation separately, substantially as described.

4. In a cultivator, the combination of a supporting-frame located above the axle, the swing tooth-bearing frames K K, surrounding the upper portions of the cultivator-wheels, a pivoted cross-rod *d'*, connecting said swing-frames at the rear of the axle, a central tooth-bearing frame pivotally supported above the axle between the swing tooth-bearing frames and having its rear end resting on the cross-rod that connects said frames, and levers for vertically adjusting the rear ends of said frames, substantially as described.

412,655. CIRCULAR-KNITTING MACHINE. GEORGE H. NYE, Philadelphia, Pa., assignor of one-half to Edward Trefelt, same place. Original application filed Jan. 2, 1889, Serial No. 295,940. Divided and this application filed May 16, 1889. Serial No. 311,010. (No model.)



Claim.—In a knitting-machine, the base-plate or frame provided with flat bearing-faces, the needle-cylinder therein, the dial-plate, the cross-bar having the dial-plate suspended therefrom, and having at its ends bearing-faces seated on the faces of the frame and vertical holes through the ends, in combination with the vertical bolts of less diameter than the holes passed therethrough into the frame, whereby the dial-plate may be adjusted horizontally in relation to the cylinder without liability of being raised or lowered or tipped out of position.

412,656. PAPER-MACHINE. LAWRENCE O'NEILL, Port Yan, N. Y., assignor to A. Clinton Brooks, John Shutts, and John T. Andrews, 2d, same place. Filed Feb. 5, 1889. Serial No. 299,002. (No model.)

Claim.—In a paper-machine, the combination, with the press-rolls R R' and felt F, passing between said rolls, of the endless rubber jacket J, surrounding the upper roll R, bearings *b b*, arranged adjustably vertically above said roll, and the roller *r*, journaled in said bearings and carrying the aforesaid jacket, substantially as described and shown, for the purposes set forth.

412,657. AUTOMATIC MUSICAL INSTRUMENT. ROBERT W. PAIN, New York, N. Y., assignor to the Aliston Organ and Music Company, same place. Filed Jan. 28, 1889. Serial No. 297,956. (No model.)

Claim.—1. In an automatic or mechanical musical instrument, the combination of electric circuits, electro-magnets serving to produce notes, opposite contacts for said electric circuits, pneumatic motors connecting with certain of the contacts, a tracker communicating with said motors, and a music sheet, card, or tablet, substantially as specified.

2. In an automatic or mechanical musical instrument, the combination of electric circuits, electro-magnets serving to produce the notes, opposite contacts comprised in each electric circuits, pneumatic motors, pins extending between the pneumatic motors and certain of the contacts, the last-named contacts serving to support the motors, a tracker communicating with said motors, and a music sheet, card, or tablet, substantially as specified.

3. In an automatic or mechanical musical instrument, the combination of electric circuits, electro-magnets serving to produce the notes, pairs of contact-pieces comprised in each electric circuits, pneumatic motors, a wind-chest in which such pneumatic motors are arranged, pins extending between and supported by the contact-pieces of the pairs, pneumatic motors contacting with said pins, a tracker communicating with said motors, and a music sheet, card, or tablet, substantially as specified.

4. In an automatic or mechanical musical instrument, the combination of electric circuits, electro-magnets serving to produce the notes, pairs of contact-pieces comprised in each electric circuits, pneumatic motors, pins extending between the pneumatic motors and certain contact-pieces of the pairs, such contact-pieces serving to support the pins and collapse the motors when these are not otherwise actuated, a tracker communicating with said motors, and a music sheet, card, or tablet, substantially as specified.

5. In an automatic or mechanical musical instrument, the combination of a tracker-board, a music sheet, card, or tablet, pneumatic motors communicating with the tracker-board, a wind-chest in which such motors are arranged, exhaust-bellows communicating with such wind-chest, electric circuits, pairs of contact-pieces for the several electric circuits, pins extending from the motors to certain contact-pieces of the several pairs, and electro-magnets in the circuits and serving to produce the notes, the said pins being moved in one direction by the extension of the motors through the admission of atmospheric air to them and moved in the other direction by the contact-pieces upon which they rest, substantially as specified.

6. In an automatic or mechanical musical instrument, the combination of sound-producing devices, manual keys for operating the same, electro-magnets, levers carrying the armatures of said magnets and arranged beneath the keys, pins extending between the levers and the keys, electric circuits connected to the magnets, pairs of contact-pieces for the several circuits, pneumatic motors arranged above the keys, a tracker-board, and a music sheet, card, or tablet, also arranged above the keys, the said motors operating the said contact-pieces, substantially as specified.

7. In an automatic or mechanical musical instrument, the combination of sound-producing devices, electro-magnets for operating the same, electric circuits connected with the magnets, contact-pieces connected with the circuits, pneumatic motors for operating the contact-pieces, bellows for effecting the operation of the pneumatic motors, an electro-magnetic motor for operating the bellows, a tracker communicating with the pneumatic motors, a music sheet, card, or tablet for controlling the pneumatic motors, and a wind-motor operated by the bellows and effecting the travel of the music-sheet, substantially as specified.

8. In an automatic or mechanical musical instrument, the combination of sound-producing devices, electro-magnets for operating the same, electric circuits connected with the magnets, contact-pieces connected with the circuits, pneumatic motors for operating the contact-pieces, bellows for effecting the operation of the pneumatic motors, an electro-magnetic motor for operating the bellows, a regulator for the electro-magnetic motor, a tracker communicating with the pneumatic motors, a music sheet, card, or tablet for controlling the pneumatic motors, and a wind-motor operated by the bellows and effecting the travel of the music-sheet, substantially as specified.

9. In an automatic or mechanical musical instrument, the combination of sound-producing devices, electro-magnets for operating the same, electric circuits connected with the magnets, contact-pieces connected with the circuits, pneumatic motors for operating the contact-pieces, bellows for effecting the operation of the pneumatic motors, an electric motor for operating the bellows, a tracker communicating with the pneumatic motors, a music sheet, card, or tablet for controlling the pneumatic motors, a wind-motor operated by the bellows and effecting the travel of the music-sheet, and a regulating-valve for controlling the wind-motor, substantially as specified.

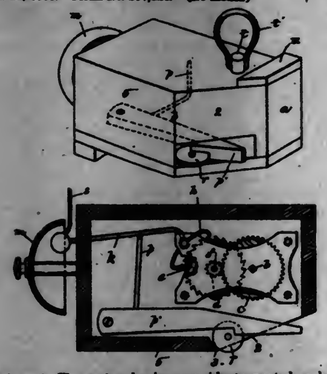
412,658. SASH-CORD GUIDE. STEPHEN PALMER, Lansingburg, N. Y. Filed June 2, 1888. Serial No. 276,057. (No model.)

Claim.—1. A sash-pulley case having formed on its sides angular swellings, on its rear or inner edges chisels or cutters, and on its front or face edges arcs of circles, each arc having formed on its outer periphery a marking-spur, substantially as and for the purposes set forth.

2. A sash-pulley case having formed on its sides angular swellings, its front or face edges curved to form a series of arcs of circles, each arc being provided with a marking-spur located centrally thereof, the spurs of the angular swellings projecting outwardly beyond the curved lines of the face-plate, substantially as and for the purposes set forth.

3. A sash-pulley case having its rearwardly-extending pulley-supporting flanges beveled on their rear edges from their inner to their outer surfaces, forming acute angles at their rear outer edges to serve as chisels, substantially as set forth.

412,659. SMOKE-CONSUMING FURNACE. WILLIAM PERRY, New York, assignor, by direct and mesne assignments, of two-thirds to Ida de Kramer and John U. Shorter, Brooklyn, N. Y. Filed Dec. 15, 1888. Serial No. 293,672. (No model.)



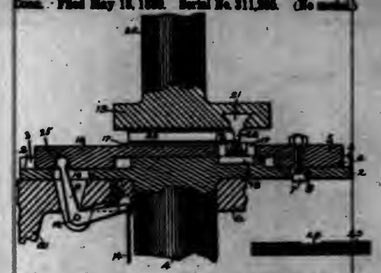
Claim.—The combination, with the rear wall of a furnace having an opening or openings, of an additional transverse wall at some distance back of the same, an arch or floor connecting said walls, and a series of pipes passed through said floor or arch, which pipes are open at the top and bottom, the upper ends of the pipes projecting a short distance above the top of said arch or floor, and the lower parts of the pipes being perforated and in direct communication with the space formed below said arch or floor, substantially as set forth.

412,660. TOBACCO-PIPE. DANIEL PETERS, Cincinnati, Ohio. Filed July 18, 1889. Serial No. 317,989. (No model.)

Claim.—A cob tobacco-pipe provided with an orifice B for the stem and having at the lower end of the bowl the pith-c, and the plate D, secured to the lower outer end, substantially as described.

412,661. BURGLAR-ALARM. CHARLES PERLEY, Salem, Mass. Filed Jan. 22, 1889. Serial No. 297,126. (No model.)

Claim.—1. The casing having one side truncated or beveled to form a shorter beveled face 2 at an angle with the main portion 5 of said side, combined with an alarm mechanism within the casing and a detent pivoted to the casing and having an arm in contact with a moving part of the alarm and another arm projecting through said beveled face and arranged to vibrate freely within the space between said beveled face and a continuation of the longer portion 5, substantially as and for the purpose specified.



2. The casing having the beveled face formed on one of its sides at an angle to the main portion of said side, and an anti-friction roller journaled in the casing near said angle, combined with an alarm mechanism within the casing and a detent pivoted to the casing and having an arm in contact with a moving part of the alarm and another arm projecting through said beveled face and arranged to vibrate freely within the space between said beveled face and a continuation of the longer portion 5, substantially as and for the purpose specified.

412,662. DOMESTIC BOILER. JOHN B. PHILLIPY and SIMON P. DRALY, Hartsville, Ind. Filed Feb. 6, 1889. Serial No. 299,103. (No model.)

Claim.—A domestic boiler consisting of the outer imperforate vessel A, the inner vessel B, having the re-enforced perforated bottom, the perforated body provided with the internally-projecting apertured bead B^1 and upper flange B^2, the apertured cover B^3, and the apertured externally-flanged cover B^4, substantially as specified.

412,666. PROCESS OF AND APPARATUS FOR MANUFACTURING CARRIAGE CORNER-IRONS. EDWARD C. PORTER, New Haven, Conn. Filed May 18, 1889. Serial No. 311,269. (No model.)

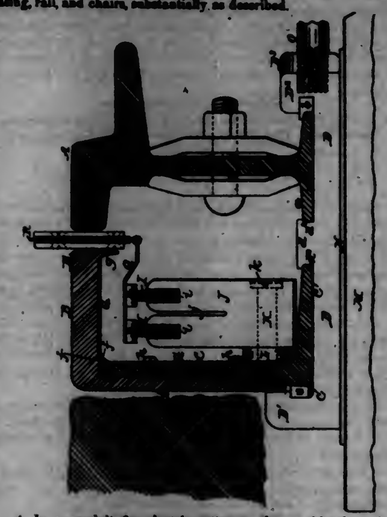
Claim.—1. The herein-described method of straightening corner-irons, the same consisting in clamping them edgewise in dies of proper form while they are arranged upon a bed, and then striking them upon one plane or side with dies having a face of less width than that of the corner-iron, and with a force sufficient to produce a sufficient longitudinal depression in the iron so struck as to permanently retain them when released in the straightened position which the iron occupied in the die after being so struck, substantially as specified.

2. The combination of bed 2, having a supporting-surface 18 for the corner-irons, fixtures 5 and 10, having clamping-faces 17 to receive and clamp the corner-irons, a treadle mechanism to force said fixture 10 toward fixture 5, fixture 19, provided with the striking edges or bars 22, a drop to which 19 is secured, and a press in which said drop may be actuated, all substantially as specified.

412,664. APPARATUS FOR IMPREGNATING LIQUIDS WITH GASES. WILLIAM RADAM, Austin, TEX. Filed July 15, 1889. Serial No. 317,518. (No model.)

Claim.—In an apparatus for impregnating liquids with gases, the combination, with the closed reservoir A for containing the liquid, having windows E upon opposite walls thereof, of the transverse beam F, having its ends supported in said windows, the sulphur-containing vessel F', resting upon said transverse beam, the man-hole B, the air-hole Y, and cocks I and I', substantially as described.

412,665. VEHICLE-SPRING. GEORGE E. RAYMOND, Grand Rapids, Mich. Filed June 15, 1889. Serial No. 314,200. (No model.)



Claim.—In a vehicle, the combination of the vehicle-body, arms supported at their outer ends by side bars, a spring attached at each end to the body, near the outer side thereof, by a rigid attachment to the body and spanning the space between such points of attachment, said arms pivoted near the center of each arm to the body, and at their inner ends connected to the spring near the center of such spring, said spring having a curved form on either side of its center, and adapted to allow for the vertical movement of the center of the spring and the inner ends of the arms without moving the ends of said spring at the point of attachment to the vehicle-body, substantially as described.

412,666. ELECTRICAL-RAILWAY CONDUIT AND CURRENT-FLOW. JAMES W. REID, Denver, Colo. Filed Apr. 29, 1889. Serial No. 308,012. (No model.)

Claim.—1. In a conduit for electric railways, the combination, with the girder-rail, of a hollow metal casing composed of a top and a bottom section joined back to back, the bottom section being secured to the base of said rail, and the top section forming with the rail the plow-slot, substantially as described, for the purpose specified.

2. In a conduit for electric railways, the combination, with a girder-rail, of a casing formed with a top plate, a closed side and a bottom plate arranged at one side of said rail to form a conduit together with the same, forming a slot between said top plate and the head of said rail, and keyed or locked to said rail, substantially as described.

3. In a conduit for electric railways, the combination, with a girder-rail, of a rectangular casing open at one side and secured at the side of said rail to form a conduit together with said rail, locking-chairs clamping the foot of said rail and casing, and keys locking said casing, rail, and chairs, substantially as described.

4. In a conduit for electric railways, the combination of the girder-rail, rectangular casings open at one side and secured at the side of said rail to form a slotted conduit together with said rail, and a drain arranged directly below said rail and conduit forming casing and communicating directly with the latter and the plow-slot, substantially as described, for the purpose stated.

5. In a conduit for electric railways, the combination of a girder-rail, a rectangular plate having a foot-flange C' and a side and arranged at the side of said rail, a rectangular slot-forming plate having a side and a top, and locking-chairs and keys for locking said rail and angle-plates together to form a rectangular slotted conduit, substantially as described.

6. In a conduit for electric railways, the combination of a girder-rail, the angle-plate having the foot-flange C' formed with the rib *e*, and the side C, the angle-plate B, having the side B' and the top formed with the rib *f*, the locking-chair having the upwardly and inwardly turned lock ends, and the keys *b c*, substantially as described.

7. In a conduit for electric railways, the plow-slot formed by the overhanging head of a girder-rail and the overhanging top plate of the conduit, in combination with a bottom plate forming a support for said overhanging top plate, and means, substantially as described, for securing said supporting-plate to the base of the rail, whereby the said slot-forming plate may be removed and replaced, when desired, for access to the current-transmitting devices, substantially as described.

8. In a conduit for electric railways, the combination of the girder-rail and the slot-forming angle-plates arranged to have their joints register, the angle-plates C, arranged to break joints with said rails, and the hood or shield plates G, secured to one of said angle-plates to cover from the inside the joints of said slot-forming angle-plates, substantially as described.

9. In a conduit for electric railways, the combination, with the conduit, of insulators having horns in their lower ends, screw-bolts inserted through said horns and into the side of said conduit, and flexible or rubber washers interposed between said insulators and the side of the conduit, substantially as described.

10. In a conduit for electric railways, the combination of a girder-rail, a rectangular casing open at one side and arranged at the side of said rail to form a conduit and plow-slot, and insulators and conductors secured to the closed side of said casing under the top plate of the same, substantially as described.

11. In a conduit for electric railways, the combination of a rectangular conduit, insulator-blocks formed with slots or seats in their upper ends, conductors supported in said seats, and bolts inserted through said insulator-blocks and into the side of said conduit, substantially as described.

12. In a conduit for electric railways an insulator-block for the electric conductors having slots or seats for said conductors and having a deep slit or recess between said seats, substantially as described.

13. In a conduit for electric railways, the combination of the conduit, insulator-blocks having slots in the upper ends and slits or recesses between said slots, bolts inserted through said blocks into said conduit, and flexible or rubber washers upon said bolts between said blocks and conduit, substantially as described.

14. In a conduit for electric railways, the combination, with a girder-rail, of a hollow rectangular casing open at one side and secured with its bottom to the foot of said rail and with its open side opposite the side of the latter and having its top extending toward the tread of said rail to form the plow-slot, substantially as described.

15. In a conduit for electric railways, the plow-slot formed by the overhanging head of a girder-rail and the overhanging top plate of the conduit, and a bottom longitudinal drain-slot for said conduit formed by the bottom plate thereof and the base-flange of said rail, in combination with means, substantially such as described, for fastening the said conduit-forming plates to the said rail.

16. In an electrical-railway conduit, the combination, with a girder-rail, of a hollow metal casing secured to the base of said rail and forming, together with said rail, the plow-slot and the conduit, substantially as described.

17. In an electric-railway conduit, the combination of a rail having an overhanging side head adapted to form one side of the plow-slot and a conduit-forming casing having a removable plate-section forming the other side of said plow-slot and provided with an under shoulder or ridge *f*, and a fixed base-plate section interlocking with said shoulder or ridge, whereby to hold said slot-forming part in fixed relation to the rail to maintain a uniform width of slot.

18. In an electric railway, the combination, with a railway-rail, of a casing formed of a fixed base part and a removable top part and containing the insulated electrical conductors, and both together forming the plow slot, and the locking-chairs, substantially as described.

19. In an electric railway, a conduit having a removable top L-shaped section, in combination with a base L-shaped section, a rail, and a base-locking device for the parts, the vertical sides of the said casing parts being secured together at the upper end of one and at the lower end of the other, whereby to permit the removal of the said slot-forming part without disturbing the paving or the conduit.

20. A street-conduit for electric railways formed of a casing open at one side and forming one side of the plow-slot and a rail closing such open casing side and forming the other side of said plow-slot, and means for binding said casing to said rail, consisting of a chair having lock-connections with the rail-base and with the casing-base, substantially as described.

21. A conduit-forming casing for electric railways, consisting of an L-shaped plow-slot-forming part, combined with a railway-rail forming one side of said conduit-casing and one side of said plow-slot, and means, substantially as described, for binding the conduit-casing to the base of the rail and for supporting the slot-forming parts, substantially as described.

22. In an electric railway, the insulator having vertical slots, a supporting-bolt therefor, and flexible or rubber washer for insulating it from its bolt-supporting wall, in combination with the conductors loosely supported by said insulators and the yielding contact plow-shoes, substantially as described.

23. In an electric railway, the insulator having the conductor-receiving slots and an intervening slot, all open at the top and mounted upon the wall of the conduit in isolated relation thereto, substantially as described.

24. In an electric railway, the conductors for supplying the current for the moving car and for the return-current arranged upon the same side of the conduit, in combination with the contact-shoes, their connected yielding arms, and the plow or current-taker, the said shoes having a pivotal connection with the latter, substantially as described.

25. The combination, in an electric-railway conduit, of a rail and a hollow casing, the two forming the conduit, of cross base-chairs having exterior and interior locks, with the base-flange of the rail and with the base-plate of the casing, whereby the rail and the casing are bound together at intervals along the track.

26. In an electric railway, a plow device for connecting the car-motor with the conductors, consisting of the side wear-plates, the insulated copper plates E, the clamping screws or rivets 6 6, the plates, the arms hinged upon said plates, and the shoes carried by said hinged arms, substantially as described.

27. In an electric-railway conduit, the rail, the side casing part C C', and a base-chair having the central locking-ridge *d* and the locking ends $D' D^2$, in combination with the top casing part B B' and the wedge *b c*, substantially as described.

28. In an electric-railway conduit, the combination, with a conductor, of the insulator therefor mounted upon the wall of a conduit by means of a bolt and maintained in proper relation to said conductor by means of an angular or square abutting upon the bottom part of said conduit, substantially as described.

29. In an electrical-railway conduit, the combination, with the

rail and a hollow casing, both together forming the conduit, the plow-slot, and a bottom drain-slot, of the cross locking-chairs, the foundation drain-pieces, and the open-top drain-sections supported upon said foundation-pieces, substantially as described.

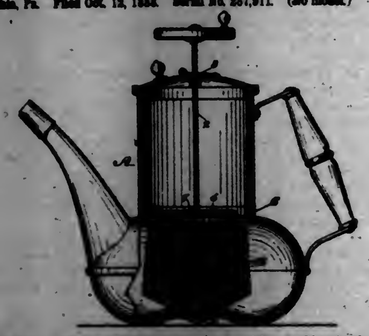
30. In an electric-railway conduit, the combination, with the rail and the conduit-forming-casing parts, of the foundation-pieces M and the drain-pieces P, whereby to form a support and a continuous drain for the conduit, substantially as described.

31. The combination, in an electrical-railway conduit, with the rail, the casing-plates forming the conduit, the locking-chair, and the base-plate N, of the foundation-pieces M, substantially as described, for the purpose specified.

32. The combination, in an electrical-railway conduit, with the rail and the casing-plates forming the conduit, of the foundation-pieces M, having the projecting end shoulders M^3, and the drain-pieces supported upon said shoulders, substantially as described.

33. In an electrical-railway conduit, the combination of the rail and the casing-plates forming the conduit, with the foundation-pieces M, formed with a longitudinal central opening and supporting the conduit, as described, and the drain-pieces supported by said foundation-pieces and opening at the top into the said conduit, substantially as described, for the purpose specified.

34. The combination, in an electric-railway conduit, of the rail and the conduit-casing parts, with the foundation-pieces M, having a longitudinal hole and a base or foot flange broadening out at one side, whereby the center of the foot-flange of the rail will be in vertical line with the middle of the width of said foundation, substantially as described.



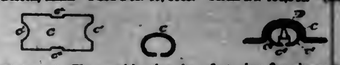
35. The combination, in an electric-railway conduit, of the rail and the conduit-casing parts, with the foundation-pieces M and the drain-pieces P, constructed of two side parts curved and joined at the bottoms, open at top, and bearing at their upper edges against the outer flanges of the rail and the outer side of the base-casing part, whereby, when the earth is packed about the drain parts, they will be tightly pressed together where they join at the bottom and held rigidly against the said rail-flange and conduit-wall.

36. In an electric-railway conduit, the plow or take-up having a hinged contact-shoe at each end, combined with independent conductors arranged side by side in the same horizontal plane and an insulator having open-top slots and convex bearings for said conductors, substantially as described, for the purpose specified.

37. The combination, in an electric-railway conduit, of two independent conductors arranged side by side, and insulators having open-top confining-seats for the conductors with contact-shoes for the conductors, the plow or take-up, and arms hinged to said plow and carrying said shoes independently of each other for the separate conductors.

38. The combination, in an electric-railway conduit, of two independent electric conductors arranged side by side and a seat-forming insulator for both conductors with independent contact-shoes, the plow or take-up, and arms connecting one of said shoes to each end of the take-up.

412,667. COFFEE OR TEA POT. LOUIS J. RICHARDS, Philadelphia, Pa. Filed Oct. 12, 1888. Serial No. 287,911. (No model.)



Claim.—1. The combination of a sack with a holder having a diaphragm provided with a flange rising therefrom, a rod supporting said diaphragm, and a ring which is movably fitted on said rod and adapted to engage with said flange, whereby the sack may be distended and its mouth clamped between the flange and ring, the parts named being combined substantially as described.

2. A coffee or tea pot having a dishing bottom with a concavity therein a vertical rod stepped in said concavity, perforated diaphragms secured to said rod, a sack sustained by said diaphragms, a flange rising from one of said diaphragms, and a ring with cross-piece having opening therein, said parts being combined substantially as and for the purpose set forth.

3. A coffee or tea pot having a rotatable rod journaled therein, perforated diaphragms secured to said rod, a sack or percolator sustained by said diaphragms, a rim attached to one of said diaphragms, and a ring fitting in said rim and having a cross-piece, the latter serving as a bearing for said rotatable rod, and a catch to engage said rod, said parts being combined substantially as and for the purpose set forth.

412,668. FASTENING FOR GLOVES. WILLIAM S. HOUGHTON, Boston, Mass. Filed Feb. 19, 1886. Serial No. 192,241. (No model.)

Claim.—1. The combination, in a fastening for gloves and other articles, of a stud or member of a fastening formed from a cup-eyelet A' having a flange a', which rests upon the under surface of the material to which the eyelet is attached, which eyelet extends through a hole in the material and is provided with a washer b upon the upper or outer surface of the material, and which stud is expanded or enlarged above or without the washer, with the other or female member of the fastening, comprising a section C, having the recess c' bent to form the yielding section c^3, and a cap D, adapted to receive the material to which the member is secured, and the upper section C, to which it is fastened by one or more fastenings extending through the material, as and for the purposes specified.

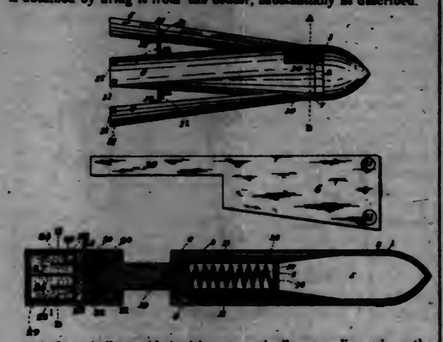
2. The member of a fastening device comprising the section C, having the recesses c' in the yielding sections c^3, and the cap D, attached thereto, as described, all substantially as and for the purposes set forth.

3. The section C of a socket-fastening, made from a flat blank c, having recessed ends bent to bring the recesses opposite each other, all substantially as and for the purposes described.

412,669. THERMO-ELECTRIC GENERATOR. WILLIAM S. DE L. ROGERS and JAMES S. MOLLISET, Sydney, New South Wales. Filed Feb. 9, 1889. Serial No. 299,399. (No model.)

Claim.—1. In thermo-electric generators, the hot-air chamber, in combination with the projecting thermo-electric couples, the separate inner furnace-chamber, and a heat-regulating valve, substantially as described, and as illustrated in the drawings.

2. In thermo-electric generators, the combination of the hot-air chamber and thermo-electric couples with a pyro safety-valve and pyro-gage, substantially as described, and for the purpose herein set forth.



3. In a thermo-electric generator, a couple composed of two metals or alloys which melt at different temperatures, cast one upon or about the other, so that the metal or alloy of which the element is composed shall, while in process of casting, cause the partial fusing of the metal or alloy of which the connecting-pieces are composed, and another alloy be thus formed at the point of union of the metals or alloys, substantially as described, and for the purpose herein set forth.

412,670. PROJECTILE. GEORGE B. ROSS, Buffalo, N. Y., assignor of one-half to Clayton M. Daniels. Filed Dec. 4, 1886. Renewed Apr. 3, 1889. Serial No. 305,912. (No model.)

Claim.—1. A projectile provided with a series of automatically radially-expanding wings having their spring ends rigidly secured to the shell at one side of the longitudinal center of said wings, so that while one side or edge of the free ends of the wings move radially, or nearly so, from the center, the other sides move tangentially from the body of the shell, substantially as and for the purposes described.

2. A projectile provided with automatically-acting wings for imparting a rotary movement to the shell during its flight, a chamber for holding the explosive, and a cylindrical chamber provided with buffer-springs, in combination with a follower adapted to fit said cylindrical chamber and set in conjunction with the springs and having an enlarged portion 20 at its rear, substantially as and for the purposes described.

3. In a shell for firing dynamite or other high explosives, the combination therewith of a cartridge containing a charge of slow-burning powder for giving the shell a comparatively slow start, and a charge of quick-burning powder at the back of the slow-burning powder for increasing its velocity through the gun, with a priming-tube 27, extending from the rear of the cartridge through the quick-burning powder to near the front of the slow-burning powder A, and a series of priming-tubes extending back from the rear of the slow-burning-powder chamber to or near the center of the quick-burning-powder chamber, whereby the slow-burning powder is discharged from front to rear, and a more rapid discharge of the quick-burning powder is obtained by firing it from the center, substantially as described.

4. In a shell provided with automatically-expanding wings, the combination, with said wings, of the soft elastic packing-pieces 31, located on the outside of the rear ends of the wings, as and for the purposes described.

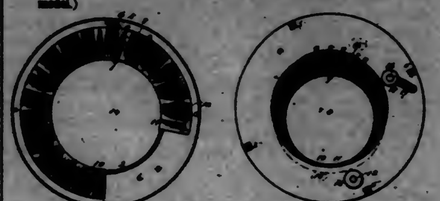
5. In a projectile, a series of automatically-expanding wings having their spring ends rigidly secured to the forward portion of the shell, in combination with the jointed arms 11, secured to or near the rear ends of the wings by joints 12 and 14 and to the body of the shell, as and for the purposes described.

412,671. GRIPPING DEVICE FOR CABLES. THOMAS H. ROSS, St. Louis, Mo. Filed May 9, 1888. Serial No. 310,132. (No model.)

Claim.—1. A gripping device for cables, consisting of a handle, a groove therein in which the cable takes, and an independently-movable gripping-jaw for automatically grasping said cable when weight of the article to be transported is applied to the same.

2. A gripping device for cables, consisting of a handle 7, a downward extension 9, and a gripping-jaw 10, pivoted to said downward extension, to which the articles of freight are adapted to be secured.

3. A gripping device for cables, consisting of a handle 7, having a groove extending from one side thereof, in which groove the cable takes, and a plate 13, pivoted to said handle, adapted to close the open side of said gripping device, for the purpose described.

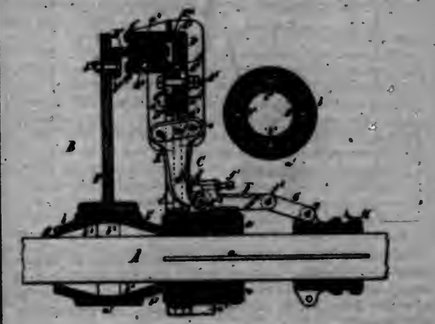


4. The combination, as hereinbefore set forth, to form a gripping device for cables, consisting of a handle 7, a downward extension 9, a gripping-jaw 10, pivoted to said downward extension, to the lower end of which the articles of freight are adapted to be secured, and a plate 13, pivoted to said handle 7, and having cord 15 for manipulating said plate.

412,672. CELERY-BLEACHER. GEORGE W. ROSS, Newark, Ohio. Filed Apr. 2, 1889. Serial No. 305,704. (No model.)

Claim.—A celery-bleacher composed of two continuous rolls or strips of paper which are placed upon opposite sides of each row of the plants, and which paper is held in contact with the plants at its upper edge, substantially as shown.

412,673. ROTARY ADJUSTABLE STOVE-PIPE THIMBLE. JOHN R. SHAFFER, Oak Hill, Mo. Filed Mar. 6, 1889. Serial No. 302,467. (No model.)



Claim.—1. The expanding sleeve 7, formed of two strips carrying radial rings 8 9, overlapping so as to form a close flange working in the recess of a flange surrounding the sleeve 7, for the purpose set forth.

2. The combination of the flue 1, the flange 2 4, turning on the flue and having an annular recess 6, and the expanding sleeve 7, with one end secured to the flue 1 and the other end secured to the turning flange 2 4, and carrying a flexible flange 8 9, working in the recess 6, substantially as and for the purpose set forth.

3. The combination of the flue 1, recessed flange 2 4, turning on the flue, expanding sleeve 7, with one end attached to the flue and having flexible flange 8 9, working in the recess of the turning flange 2 4, and screw-bolt passing through the flanges 2 4 and 8 9, and having a nut adapted to bear upon the outer face of the outer disk 4 of the turning flange, for the purpose set forth.

4. The combination of the flue 1, recessed flange 2 4, turning on the flue, expanding sleeve 7, with one end attached to the flue, and having a flexible flange composed of wings 8 9, working in the recess of the turning flange 2 4, screw-bolt passing through the flanges 2 4 and 8 9, with nut bearing against the outer disk 4 of the turning flange, and a screw-bolt fixed in a wing of the flange 8 9 and extending through an oblique slot of the disk 4, substantially as and for the purpose set forth.

412,674. FRICTION-CLUTCH. NOAH SHAW, San Castro, Wis. Filed June 6, 1888. Serial No. 276,262. (No model.)

Claim.—1. In combination with a friction-clutch pulley, the pivoted operating-lever E, clutching-clamps D D', clutch-frame C, having arm c', and spring d^3 between clutching-clamps D D', bearing against and acting upon both of said clamps with a thrusting force simultaneously, substantially as and for the purpose described.

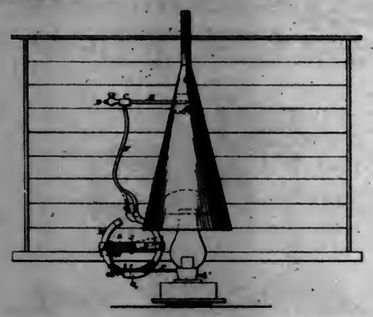
2. In combination with a friction-clutch pulley, the clamps D D', one of which has a lower support for a spring and the other a bearing for said spring, the pivoted operating-lever E, having arm e^4, toggle-link F, and set-screw f' on link F, and accessible for adjusting purposes outside the lever E and pulley B, substantially as and for the purpose described.

3. The combination of the pulley B, having a friction-clutch rim B', clamps D D', pivoted lever E, having arm e^4 and connected to both of said clamps, the set-screw f', and toggle-link F, the said link having the set-screw attached to it, and the said screw exerting its force against the outer side of the lever E for the purpose of adjusting the movement of the said lever and clamps, substantially as described.

4. In combination with a pulley or wheel B, having a friction-rim B', clutch-arm c', a hub c, fixed on the shaft, a sliding sleeve H, two laterally and radially movable clutch members D D', of the type specified, clamp-lever E, pivoted to said clutch members, and toggle-links F G, the inner one of the links thereof provided with means by

which its inner end can be adjusted inwardly or outwardly from a position outside the pulley and clutch-arm, substantially as described.

5. The combination, with the loose pulley B, having the friction-rim B', the hub *c*, having arms *c'*, the movable jaws *d d'*, having wearing-blocks d^3, the spring d^5, lever F, lever E, the loose sleeve H, and the link G, connecting the latter to the lever F, substantially as described.



6. The combination of the pulley having the friction-rim B', the movable jaws D D', spring d^5, lever E, hub *c*, having arm *c'*, lever F, loose sliding sleeve H, and the toggle-link G, connecting said sleeve to the lever F, substantially as described.

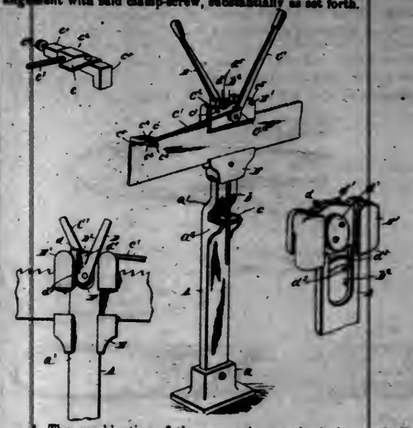
7. The combination of the pulley B, having the friction-rim B', the hub *c*, having the radial arms *c'*, the movable friction-jaws, movable jaws D D', guided on said arms and adapted to engage the inner and outer sides of the rim, the springs d^5, to normally move said jaws in opposite direction from the rim, and the clamp-levers E, pivotally connected to the said jaws, and thereby adapted to move the jaws toward each other and apply them with equal force to the inner and outer sides of the rim, substantially as described.

8. The combination, with a pulley B, having a friction-rim B', two inversely and radially movable clutching-clamps D D', and a radial arm *c'*, of a clutch-frame C, upon which the shanks *d d*^{3} of the clamp-heads *d' d*^{3} of said clutching-clamps are mounted, the outer one of said clutching-clamps being provided with a shoulder d^{10} and the inner one thereof with a shoulder d^3, which is in substantially the same plane with the shoulder of the outer clamp, but nearer to the shaft, and the spring d^5, arranged to thrust against said shoulder, substantially as described.

9. In combination with a friction-clutch pulley, the operating-lever, clutching-clamps, the clutch-frame having an arm, and a spring between the clutch-clamps bearing against and acting upon both of said clamps with a thrusting force simultaneously, substantially as described.

412,675. HEAT-REGULATOR FOR INCUBATORS. WILLIAM P. SHEPARD, Fall River, Mass. Filed May 13, 1889. Serial No. 310,556. (No model.)

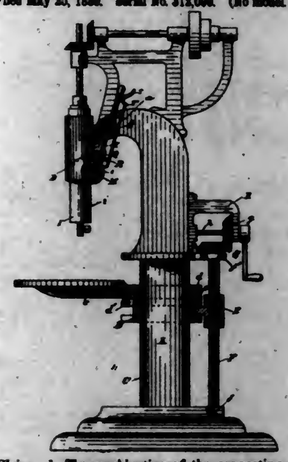
Claim.—1. In an incubator, the combination of an air-chamber placed in the incubator, a connecting-tube, a partially-rotating curved tube containing a body of mercury, and a mechanism operated by the movement of the tube for controlling the flame of the lamp, substantially as shown.



2. The combination of an air-chamber placed in the incubator, a suitable connecting-tube, a bent pipe which is open at one end and provided with suitable journals or bearings, a body of mercury placed in the bent pipe, a counter-balance placed upon the pipe, and an operating mechanism connected to the pipe for controlling the flame of the lamp, substantially as described.

412,676. SAW-SWAGE. WILLIAM W. SHUEY, Vandalia, Ill. Filed Apr. 13, 1888. Serial No. 307,076. (No model.)

Claim.—1. The combination, with the supporting-standard and the saw-blade clamps, of the die-actuating lever or handle carrying the feed device, substantially as specified.



2. The combination, with the supporting-standard and the saw-blade clamps, of the lever or handle actuating the saw-tooth swaging-die and the opposite diagonally-disposed clamp-bar and holding-screws, said bar resting upon the back of the tooth, and the screw bearing upon the clamp-bar, substantially as set forth.

3. The combination, with the supporting-standard and the saw-blade clamps, of the lever or handle actuating the saw-tooth swaging-die, the set or clamp screw bearing against the one side of the saw-tooth, and the cam lever or handle whose cam is provided with a spiral groove or channel which receives a projection upon said supporting-standard, the journal of said cam bearing against the tooth in alignment with said clamp-screw, substantially as set forth.

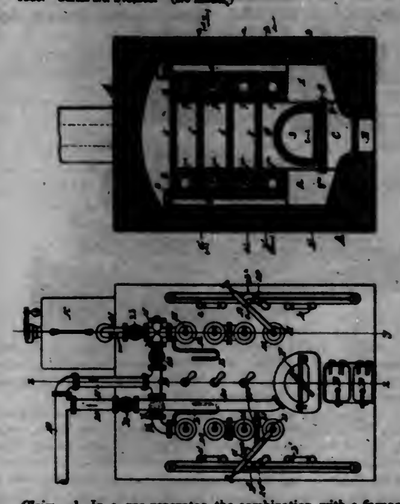
4. The combination of the supporting-standard, the vertically-adjustable saw-clamps, the lever carrying the tooth-swaging die, and the saw-feeding device, the opposite diagonally-disposed clamp-bar and holding-screw, the former bearing upon the back of the saw-tooth at the point and the latter bearing upon said clamp-bar, the clamp-screw bearing against one side of the saw-tooth, and the cam-journals bearing against the opposite side of the tooth, the cam having a spiral groove engaging a projection on the supporting-standard and bearing against a hub-like projection of the upper saw-clamp, substantially as specified.

412,677. DRILL-PRESS. ALBERT P. SIBLEY, South Bend, Ind. Filed May 25, 1889. Serial No. 312,009. (No model.)

Claim.—1. The combination of the supporting-post, the collar thereon, and the drill-table supported by said collar, with a screw-shaft exterior to the post, and a nut on said shaft loosely engaging the said collar, substantially as described.

2. The combination of a drill-spindle, its sleeve, and the shaft and gearing for adjusting said spindle, with the worm-gear loosely mounted on the end of said shaft, the adjustable key engaging said gear, the lever carrying a worm-screw engaging said gear, and the mechanism for disengaging said key and worm-gear, all substantially as specified.

3. The combination, in a drill-press, of the supporting-post, the collar thereon grooved exteriorly, and the drill-table supported by said collar, with a screw-shaft and a nut on said shaft having a lateral rib engaging the groove in said collar, substantially as described.



4. The combination of the drill-spindle, the shaft for operating the same, and the worm-gear on said shaft having radial notches in its face, with the lever mounted on the shaft, a worm-screw carried on a short shaft journaled in said lever and engaging said worm-gear, the spring-controlled key engaging said worm-gear and the bell-crank lever, and pin and latch for shifting said key, all substantially as set forth.

5. The combination of the supporting-post and collar thereon, and a table rigidly connected to said collar, with a vertical screw-threaded shaft exterior to the post, gearing for operating the same, and a nut thereon engaging the collar, substantially as specified.

6. The combination, with the sleeve, the spindle, its rack, and the shaft journaled in said sleeve carrying a pinion engaging the rack and a hand-wheel, and having its other end reduced, bored, and slotted, substantially as described, of the worm-gear mounted on the reduced end of said shaft, having radial notches in its inner face, the spring-controlled key in the slot of the shaft engaging said worm-gear, and the lever embracing said worm-gear and carrying a worm-screw shaft and hand-wheel for operating the same, and a bell-crank pivoted on said lever and operating a pin in the end of the shaft engaging said crank and the key, all substantially as described.

7. The combination of the supporting-post and collar thereon having an L-shaped peripheral groove, and a table rigidly connected to said collar, with a vertical screw-threaded shaft, gearing for operating the same, and a nut on said shaft having a lateral flanged rib engaging the groove of the collar, substantially as specified.

412,678. GAS-GENERATOR. ARMENIS C. SMITH, Sheboygan, Wis., assignor of one-half to Fleetwood Ward, Toledo, Ohio. Filed May 4, 1889. Serial No. 309,569. (No model.)

Claim.—1. In a gas-generator, the combination, with a furnace structure, of a coal-gas retort, a gang of oil-vaporizing pipes at one side of the furnace structure, a gang of steam-superheating pipes, a series of retorts alternately connected at their ends, a steam and vaporized-oil injector connected with the two gangs of pipes and with one of the said alternately-connected retorts, a gas-delivery pipe for the latter, and pipe-connections between the gas-delivery pipe and the coal-gas retort and alternately-connected retorts, substantially as described.

2. In a gas-generator, the combination, with a furnace structure, of a gang of oil-vaporizing pipes, and a gang of steam-superheating pipes, both located at one side of the furnace structure, a series of metallic pipe-lined retorts of refractory material, resting one directly upon another, and having the pipe-linings alternately connected at their ends, and a steam and vaporized-oil injector connected with the gangs of pipes and with one of the retorts, substantially as described.

3. In a gas-generator, the combination, with a furnace structure, of the gangs of oil-vaporizing pipes and steam-superheating pipes arranged at opposite sides of the furnace, the oil-feed pipes connected with the vaporizing-pipes, the steam-supply pipes connected with the superheating-pipes, a series of metallic pipe-lined retorts of refractory material, resting directly one upon another at each side of the furnace, each series having the pipe-linings alternately connected at their ends, connections between the oil-vaporizing pipes, superheating-pipes and the lower retorts, and a gas-delivery pipe having branch connections with the upper retorts, substantially as described.

4. In a gas-generator, the combination, with a furnace structure, of a series of superposed pipe-lined retorts alternately connected at their ends, a gas-delivery pipe connected with the upper retort, the steam-superheating pipes, connections between the latter and the lower retort, the baffle-plates located at one side of the pipe-lined retorts and having alternating end openings, the ascending flue between the opposite side of the retorts and the side wall of the furnace, and a fire-chamber, substantially as described.

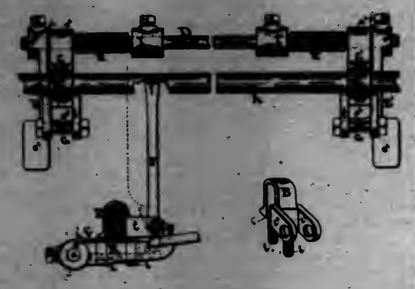
5. In a gas-generator, the combination, with a furnace structure, of the steam-superheating pipes, pipe-lined refractory retorts alternately connected at their ends and in communication with the said pipes, the baffle-plates located at one side of the retorts and having alternating end openings, the ascending flue between the opposite side of the retorts and the side wall of the furnace, and a fire-chamber, substantially as described.

6. In a gas-generator, the combination, with a furnace structure having a fire-chamber, of a series of metallic pipe-lined refractory retorts, resting one directly upon another, and having the pipe-linings alternately connected at their ends, a series of baffle-plates located at one side of said pipe-lined retorts and having alternating end openings, and a gang of steam-superheating pipes connected with one of the retorts, substantially as described.

7. In a gas-generator, the combination, with a furnace structure having a central fire-chamber and opposite blocks or supports arranged at intervals to form opposite side flues, of a main retort arranged between the side flues, a series of superposed pipe-lined retorts on the blocks or supports at each side of the furnace, ascending flue spaces arranged, respectively, between the superposed retorts and the side walls of the furnace, and the baffle-plates located above the main retort and between the pipe-lined retorts at one side and those at the opposite side of the furnace structure and having alternating end openings, substantially as described.

8. In a gas-generator, the combination, with a furnace structure, of a main retort having a gas-discharge pipe, a series of retorts arranged in the furnace and rising above the main retort, a gang of oil-vaporizing pipes and a gang of steam-superheating pipes, both located at one side of the furnace, a gas-delivery pipe connected with the upper one of the series of retorts and with the gas-discharge pipe of the retort, a steam-injector connected with the lower one of the series of retorts and with the two gangs of pipes, and a valved branch pipe connecting the injector with the said gas-discharge pipe, substantially as described.

9. In a gas-generator, the combination, with a furnace structure, of a main retort, a series of superposed retorts rising above the latter, a gang of oil-vaporizing pipes and a gang of steam-superheating pipes located at one side of the furnace, a steam-injector connected with one of the superposed retorts and with the two gangs of pipes, a boiler, a gas-delivery pipe, a pipe-coupling connected with the gas-delivery pipe, the boiler, and the one of the superposed retorts, and provided with two valves to control communication between the retorts and the boiler and gas-delivery pipe, and a pipe connection between the main retort and the gas-delivery pipe, substantially as described.



10. In a gas-generator, the combination, with a furnace structure, of a series of retorts at each side thereof, those of each series having their ends alternately connected, a gang of oil-vaporizing pipes and a gang of steam-superheating pipes embedded in each side wall of the furnace structure, a valved steam-supply pipe for each gang of steam-superheating pipes, an oil-feed pipe for each gang of oil-vaporizing pipes, a steam-injector connecting the gangs of pipes at each side of the furnace with the retorts adjacent thereto, a gas-delivery pipe having a branch-pipe connection with both series of retorts, a boiler, and connections between the boiler and the retorts, substantially as described.

11. In a gas-generator, the combination, with a furnace structure having a fire-chamber, side flues, and ascending flue spaces at its opposite sides, of a main retort having a gas-discharge pipe, a series of superposed pipe-lined retorts arranged at each side of the furnace, those of each series having their ends alternately connected, a gang of oil-vaporizing pipes and a gang of steam-superheating pipes embedded in each side wall of the furnace, a steam-injector connecting the gangs of pipes at each side with the adjacent pipe-lined retorts, a gas-delivery pipe, a steam-boiler, pipe-connections between the gas-delivery pipe and the upper retort of each series, a pipe-coupling connection between the boiler and the retorts at one side of the furnace, steam-supply pipes leading from the boiler to the respective gangs of steam-superheating pipes, and an oil-feed pipe for each gang of oil-vaporizing pipes, substantially as described.

412,679. CHILL-SUPPORT. GEORGE A. BOOTH, Norristown, Pa., assignor of one-half to William H. Lamb, same place. Filed Aug. 5, 1889. Serial No. 319,720. (No model.)

Claim.—1. The combination, with the axle of a vehicle, of a spring-controlled arm or arms supported in bearings on said axle, and a projection or projections on the shafts for engagement with said arm or arms, substantially as shown and described.

2. The combination, with the axle of a vehicle and the clips thereon for the shaft-couplings, of a plate or plates through which project the clip-bolts provided with a boss or bosses in which are journaled a spring-controlled arm or arms, and a projection or projections on the shafts for engagement with said arm or arms, substantially as shown and described.

3. The combination, with the axle of a vehicle, of a spring-controlled rod parallel with and journaled in bearings on said axle, a catch or catches secured on said rod, and a suitable projection or projections on the shafts for engagement with the catch or catches, substantially as shown and described.

4. The combination, with the axle of a vehicle, of a rod parallel with and journaled in bearings on said axle, a pair of helical springs encircling the rod and secured at one end to said bearings, a pair of collars secured on said rod and receiving the other ends of the springs, and a catch on each end of the rod for engagement with projections on the shafts, substantially as shown and described.

5. The combination, with the axle of a vehicle, of a spring-controlled rod parallel with, at the rear of, and journaled in bearings on said axle, and an arm or arms secured on said rod, the outer ends of said arm or arms extending forwardly of the axle and provided with a lateral projection adapted to engage with projections on the shafts, substantially as shown and described.

6. The combination, with the axle of a vehicle, of the arms E E' provided with the projections e^3 e^3 and the thumb-pieces e^4 on their outer ends, each said arms being supported in bearings on said axle and controlled by a spring and adapted to engage with a projection on the shafts, substantially as shown and described.

7. The combination, with the axle of a vehicle, of the plates C C, through which pass the bolts of the shaft-coupling clips, the bosses c^2 c^2 on said plates, with the openings c^3 therein, the arms E E', journally supported in said openings, and springs for the control of and projections on the shafts for engagement with said arms, substantially as shown and described.

8. The combination, with the axle of a vehicle, of a rod D, journaled in suitable bearings on said axle, the springs H H', encircling said rod, a socket in said bearings for the reception of one end of said springs, the collars I I, secured on said rod by bolts i, a socket in said collars for the reception of the other ends of the springs, and a catch secured on each end of the rod and adapted to engage with projections on the shafts, substantially as shown and described.

9. The combination, with the axle of a vehicle, of a spring-controlled rod parallel with and journaled in bearings on said axle, the arms E E', provided with the bosses c^2 c^2, with the openings c^3 therein and secured on said rod, the bolts e e', the projections e^3 e^3, and the thumb-pieces e^4 on the outer ends of said arms, said projections being adapted to engage with suitable projections on the shafts, substantially as shown and described.

10. The combination, with the axle A, of the clips B, the plates C C', the bosses c^2 c^2, with the openings c^3 therein, the rod D, the springs H H', the collars I I', the bolts i, the arms E E', the bolts e e', the bosses c^2 c^2, the openings c^3 in said bosses, the projections e^3 e^3, provided with the shoulders e^5 and the edges e^6, the thumb-pieces e^4, the shaft-irons F, secured to the shafts, the bosses f', provided with the openings f^2 for the passage of the bolts G, the wings b^2, the cam projections f^3, and the shoulders f^4, substantially as shown and described.

11. The combination, with the axle of a vehicle, of a spring-controlled rod parallel with and journaled in bearings on said axle, the arms E E', the bolts e e', securing the arms on the rod, the bosses c^2 c^2, with the openings c^3 therein, the projections e^3 e^3, the thumb-pieces e^4, the bosses f', the cam projections f^3, the bolts G, and the wings b^2 of the clip on the said axle, substantially as shown and described.

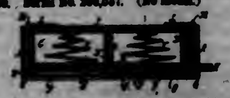
412,680. PROCESS OF TREATING THE MOTHER-LIQUORS OF PHENOL NITRATES. CLAUDE SAVIGNY, Lyons, France, assignor of one-half to Barthélemy Martinez, same place. Filed May 2, 1888. Serial No. 310,681. (No specimens.) Patented in France May 26, 1887, No. 183,768.

Claim.—1. The process herein described of separating the various substances contained in mother-liquors resulting from the manufactory of nitro-phenols and other nitrated substances, which consists in heating the mother-liquors and distilling nitric acid therefrom, and then cooling the mother-liquors and precipitating picric or nitro-cresylic acid, substantially as described.

2. The process herein described of separating the various substances contained in mother-liquors resulting from the manufacture of nitro-phenols and other nitrated substances, which consists in heating the mother-liquors and distilling the nitric acid therefrom, cooling the mother-liquors and precipitating picric or nitro-cresylic acid, and heating the mother-liquors and concentrating the sulphuric acid, substantially as set forth.

3. The process herein described of separating the various substances contained in mother-liquors resulting from the manufacture of nitro-phenols and other nitrated substances, which consists in heating the mother-liquors and distilling nitric acid therefrom, cooling the mother-liquors and precipitating picric or nitro-cresylic acid, heating the mother-liquors and concentrating the sulphuric acid, and adding nitrates to effect the nitrification of phenols, cresols, and the like, substantially as set forth.

412,681. RAIL-CHAIR. MCLEOD W. THOMSON, Altoona, Pa. Filed Mar. 25, 1889. Serial No. 304,626. (No model.)



Claim.—1. The combination, with the cross-ties and the twin chair-sections B B', of the wedge-shaped headless stop-spike p, driven into the tie, wedging against the grain of the wood, and impinging upon the end of the chair, substantially as described.

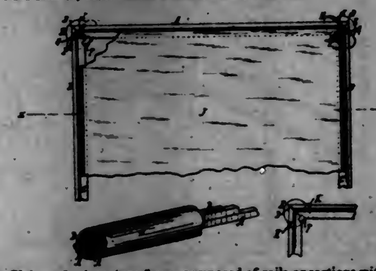
2. The combination, with the cross-ties and the twin chair-sections B B', of the wedge-shaped stop-spike p, driven into the tie, wedging against the grain of the wood, and impinging upon the end of the chair, said chair-sections having the horizontal bases a a, with projecting flanges h, and the upwardly and inwardly extended webs C, connected together and engaging the rails A A by means of the transverse screw-bolts c, passing through the vertical web-extensions D, substantially as described.

3. The combination, with the cross-ties, rails, and twin chair-sections having flanged bases a a, which embrace the foot of the rail, of wedge-shaped stop-spikes inserted in the ties at the ends of the chair-sections at an oblique angle to the face of the tie, substantially as described.

412,682. PHOTOGRAPHIC-PLATE HOLDER. JOSEPH THOMAS, Jersey City, N. J., assignor of one-half to Carl P. Stirn, Brooklyn, N. Y. Filed Jan. 17, 1889. Serial No. 296,857. (No model.)

Claim.—1. The combination, with a plate-holder having a photographic chamber and a receiving-chamber for the reception of the plates, of a slide having a recess of a size sufficient to receive a plate in the photograph-chamber, said slide, by its outward-sliding movement, drawing the plate in its said recess into the receiving-chamber, said lifters adapted to extend through the slide into the receiving-chamber and lift the plate from the recess of said slide, substantially as described.

2. The combination, in a plate-holder having a photograph-chamber and a receiving-chamber, both chambers being adapted for the reception of photographic plates, of a slide or carrier adapted to carry a plate from one chamber to the other, and spring-lifters for holding the plates in the receiving-chamber out of the way of the carrier, said lifters being operated at suitable intervals by the movement of the carrier, substantially as described.

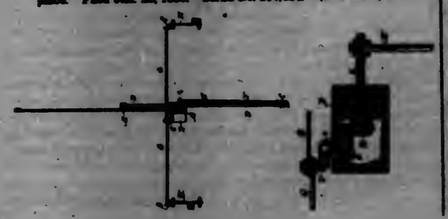


3. The combination, with a plate-holder having a photographic chamber and a receiving-chamber, of a slide having a recess which receives a plate in the photographic chamber, said slide, by its outward-sliding movement, drawing the plate from the photographic chamber into the receiving-chamber, and having adjacent to its plate-receiving recess a projecting shoulder, which lifts the plates in the receiving-chamber as the slide is moved outward, substantially as described.

4. The combination, with a plate-holder having a photographic chamber and a receiving-chamber, of a slide having a recess which receives a plate in the photographic chamber, said slide, by its outward movement, drawing the plate from the photographic chamber into the receiving-chamber, and having a projecting shoulder which lifts the plates in the receiving-chamber as the slide is moved outward, and lifters adapted to pass through the slide and lift the plate from the recess thereof, substantially as described.

5. The combination, with a plate-holder having a photographic chamber and a receiving-chamber, each adapted to contain a series of independent plates, and a spring arranged in the photographic chamber for pressing the plates therein toward the opening for exposure, of a slide having a recess of a size to receive within it a plate, and into which recess the latter is pressed by the spring, said slide, by its outward movement, drawing the plate from the photographic chamber into the receiving-chamber, substantially as described.

6. The combination, with the plate-holder frame having a photographic chamber and a receiving-chamber, and provided with the springs T, of the slide F in front of the photographic chamber, for exposing a plate, and the slide H, adapted to receive a plate in the photographic chamber and by its outward-sliding movement draw said plate into the receiving-chamber, said slides each having a stop-pin S to engage the springs on the plate-holder frame, substantially as described.



412,683. PICTURE-FRAME. GEORGE B. THROOP, New York, N. Y. Filed Feb. 14, 1889. Serial No. 299,896. (No model.)

Claim.—1. A picture-frame composed of rails or sections mitered at the ends, and combined with ornamental corner-pieces placed upon the angles of the frame and provided with flexible clamping-tongues bent into the inner angles of the frame, and wires bent over the edges of the sections on each side of the outer angles, substantially as described.

2. In a picture-frame, the combination, with the sections A and B, formed with rabbets and miter-joints D, of the ornamental corner-pieces E, provided upon their backs with the clamping-tongues F, bent into the inner angles of the frame and over upon the rabbeted edges, and the flanges K, bent over the outer edges of the sections A and B on each side of the miter-joints, substantially as described.

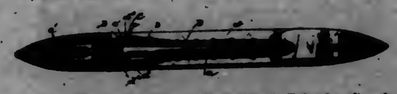
412,684. SLIDING OR ROLLING GATE. JOSEPH H. VARNUM, Terre Haute, Ind., assignor of one-half to Leonel Ford Purdue, same place. Filed Jan. 28, 1889. Serial No. 297,194. (No model.)

Claim.—1. In a sliding or rolling gate, the combination, with the spindles c and c and their beveled gearing, of the pitmen or connecting rods loosely connected to the crank of spindle c, and the stirrups to which the outer ends of said pitmen are loosely connected, substantially as described.

2. In a sliding or rolling gate, the combination, with the spindles c and c and their beveled gear-wheels, of the pitmen or connecting rods G G, the stirrups H H, the gate B, and the arm E, keyed at one end to the spindle c and at its other end pivotally or loosely connected to arm F, the other end of which latter arm is hinged or connected to the gate, substantially as described.

412,685. FISHING-REEL. JULIUS VAN HOUT, Brooklyn, assignor to Charles F. Ambrie, New York, N. Y. Filed Mar. 26, 1889. Serial No. 304,889. (No model.)

Claim.—1. The combination, with the side plate of a fishing-reel, of a spool having a shaft journaled in said plate, and an adjustable cap G secured to said plate and having a pin bearing against the end of said shaft.



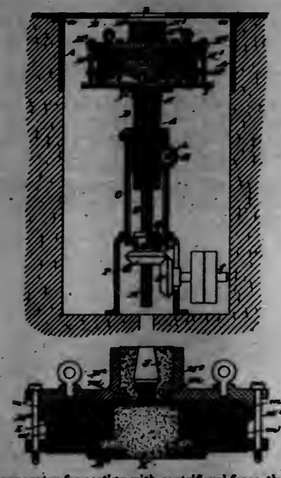
2. The combination of the side plate of a fishing-reel, having a journal-box with screw-threaded end projecting outside of the plate, a spool having a shaft journaled in said box, and an adjustable cap screwed upon the screw-threaded end of the box and having a pin bearing against the end of said shaft.

3. The combination of the side plate of a fishing-reel, having a journal-box with screw-threaded projection, a spool having a shaft journaled in said box, a screw-cap secured to said projection and having a pin bearing against the end of said shaft, and a washer interposed between the cap and plate, substantially as described.

4. The combination of the side plate of a fishing-reel, having a screw-threaded projection and journal-box, a spool having a shaft journaled in said box, a screw-cap secured to said projection and having a pin bearing against the end of the shaft, a metal washer next to the screw-cap, and a washer interposed between the metal washer and the plate.

5. The combination of the side plate of a fishing-reel, a pawl in said plate, a spool journaled in said plate, an adjustable cap secured to the plate and having a pin bearing against the end of the spool-journal, and a ratchet for the pawl on the plate.

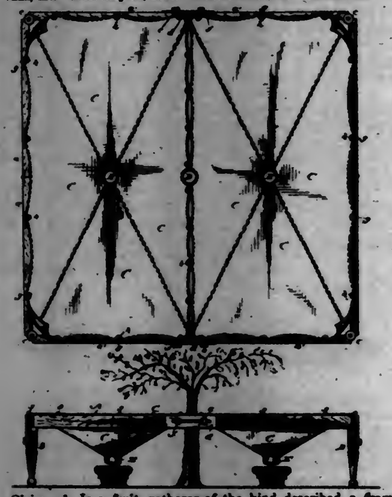
412,686. BOBBIN. J. HENRY WELLS, Fall River, Mass. Filed Apr. 6, 1889. Serial No. 306,072. (No model.)



Claim.—The combination, with the bobbin B, having the enlarged base b and the circumferential groove in said base, said bobbin having its end from the lower shoulder of the groove reduced and beveled outwardly, of the metal cap D, having an inner flange d inserted in the bore of the bobbin, a base d' against the end of the bobbin, an outer flange d^2 on the outer surface of the base, and a spun-in flange d^3, entering the groove C, binding on the shoulder c', and preventing the latch from receding said shoulder or stripping the base, substantially as specified.

412,687. APPARATUS FOR CASTING METALS. HENRY W. WILKINSON, Sheffield, county of York, England, assignor of two-thirds to John B. Farwell, East Orange, and Frank Wilkinson, Orange, N. J. Filed Jan. 30, 1889. Serial No. 298,063. (No model.)

Claim.—1. In apparatus for casting with centrifugal force, the slide D and means for raising and lowering it, in combination with the shaft H, feather G^2, sleeve G, and wheel G', and with the mold M revolved thereby, and the floor-plate B, with its pouring-hole b, arranged for joint operation as herein specified.

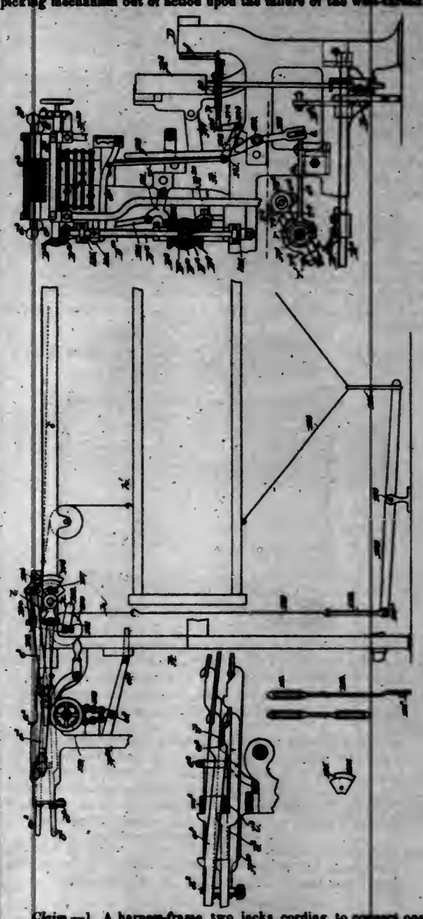


2. In apparatus for casting with centrifugal force, the metal mold $M' M^2 M^3$, being upper and lower portions separated by a considerable interval, in combination with the holding-bolts M^2 and with the po-

cipheral earthy molded part L, arranged for joint operation as herein specified.

3. In apparatus for casting with centrifugal force, the mouth part J, central part K, and peripheral part L, in combination with each other and with the metal portion M' M² M³ of the mold, and with the wheel I, shaft H, and suitable means for rapidly revolving the whole, as herein specified.

412,688. FRUIT OR NUT GATHERER. IRA H. WILLIAMS, Nevada, Mo. Filed May 10, 1889. Serial No. 310,264. (No model.)



Claim.—1. In a fruit-gatherer of the kind described, a frame formed of sections, each composed of side and end pieces, the former hinged together so as to fold outwardly upon each other, and the latter hinged to the outer ends of the side pieces so as to fold inwardly thereon, and means for fastening the sections together, substantially as described.

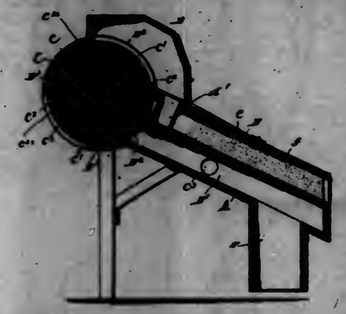
2. The combination, to form a fruit-gatherer, of the frame formed of sections adapted to be fastened together and each composed of side and end pieces the former hinged together so as to fold outwardly upon each other, and the latter hinged to the outer ends of the side pieces so as to fold inwardly thereupon, and the canvass having the discharge-openings in their depressed centers, eyeleted holes along their outer edges adapted to catch over hooks on the frame-bars, and suitable fastenings along their meeting edges, substantially as described.

3. The combination, to form a fruit-gatherer, of the frame adapted to be set up around a tree, formed of sections, each composed of side and end pieces, the side pieces hinged together so as to fold outwardly upon each other, and the end pieces hinged to the outer ends of the side pieces so as to fold inwardly thereupon, slotted plates connected to the ends of the end pieces of one section, and thumb-screws upon the meeting ends of the end pieces of the other section, adjustable legs at the intersection of the side and end pieces of each section, and canvass adapted to be stretched upon the frame to receive the fruit from the tree and having discharge-openings in their depressed centers for the fruit to escape into receptacles therebeneath, eyeleted holes along their outer edges to catch over hooks on the frame-bars, and suitable fastenings along their meeting edges, substantially as described.

412,689. LOOM. HERBERT WYMAN, Worcester, Mass., assignor to the Crompton Loom Works, same place. Filed Mar. 9, 1889. Serial No. 302,695. (No model.)

Brief.—The objects of the invention are to relieve the tension on the harness-frame cording, and to provide means for throwing the picking mechanism out of action upon the failure of the weft-thread.

Claim.—1. A harness-frame, two jacks, cording to connect one end of one of the said jacks to the upper side of the harness-frame, a sheave to support the said cording, cording intermediate one end of the other of the said jacks and the under side of the harness-frame, and a sheave, as 100, over which the said cording is extended, combined with a movable sheave-carrying frame and with a compensating device to hold the frame against and strain the cording during the time that the shed is being formed and to move the said frame to reduce the strain on the cording when both of the said jacks are engaged by the evener, substantially as described.



2. A harness-frame, two jacks, cording to connect one end of one of the said jacks to the upper side of the harness-frame, a sheave to support the said cording, cording intermediate one end of the other of the said jacks and the under side of the harness-frame, and a sheave, as 100, over which the said cording is extended, combined with a movable sheave-carrying frame and with a compensating device having a cam-surface to rest upon a roller or other stud 105 of the said sheave-carrying frame to hold the frame against and strain the cording during the time that the shed is being formed and to move the said frame to reduce the strain on the cording when both of the said jacks are engaged by the evener, substantially as described.

3. The crom-shaft A', provided with the hubs having lugs and the roller-carrying arms pivoted thereon, and the sleeve-hubs engaging the said roller-carrying arms loosely, combined with arms to engage the said sleeves, connections between the said arms, and a lever 138, to move the said arms to throw the rolls out of position and stop the picking, substantially as described.

4. A lever 138, to control the stopping and starting of the picking mechanism, and a latch, a projection to be engaged by and arrest the latch, a spring to normally draw the latch past the projection, and means to release the latch from the said projection, combined with means, substantially as described, between the said latch and lever, whereby when the latch is released from the projection the spring is made to move the lever 138 and stop the picking, substantially as described.

5. The lever c^6, the clutching-hub, connections between the said lever and hub to move the latter, a latch, a projection to be engaged by and arrest the latch, a spring to normally draw the latch past the projection, and means to release the latch from the said projection, combined with means, substantially as described, between the said latch and lever, whereby when the latch is released from the projection the spring is made to move the lever c^6 and place the said hub in position to stop the forward rotation of the pattern mechanism, substantially as described.

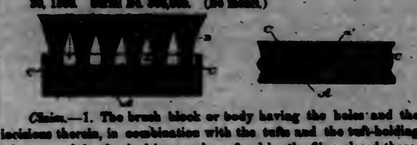
412,690. TRUNK AND CONDENSER FOR COTTON-GINS. CORNELIUS YOUNG, Selma, Ala. Filed May 2, 1889. Serial No. 309,377. (No model.)

Claim.—1. The cotton-gin condenser having a cylinder provided with heads and divided into compartment-chambers by radial blades, said cylinder having its heads provided with wire-cloth-covered openings, a cap provided with a wire-cloth bottom, the inclined trunk subdivided into two flues and having vertical passages, and inclined side flues outside of said trunk, one flue of the trunk connecting through said vertical passages with the semicircular chamber of the cap fitting partly over said cylinder, the said flue also connecting with the compartment-chambers of the cylinder through said side flues and openings, substantially as set forth.

2. The cotton-gin condenser having the trunk provided with flues, the cap having a wire-cloth bottom applied to its chamber, passages connecting one of said flues with said chamber, side flues connecting with the same trunk-flue through openings, and the compartment-cylinder having wire-cloth-covered openings in its heads communicating with said flues, substantially as set forth.

3. The cotton-gin condenser having the cap provided with a semicircular chamber and the trunk provided with two flues and vertical and lateral passages, the lower flue connecting by said vertical passage with said semicircular chamber, the cylinder having radial compartments and blades, the heads of said cylinder having wire-cloth-covered openings, the side flues connecting with the compartments of said cylinder through said wire-cloth-covered openings and with the lower flue of the said trunk through said lateral passages or openings, the plates, one applied to said cap and the other to the upper edge of the trunk, and the chute or flue connecting with the lower flue of the trunk, substantially as specified.

412,691. METHOD OF SECURING WIRE OR THE LIKE IN WOODEN BODIES. MCCLINTOCK YOUNG, Frederick, Md. Filed Apr. 20, 1888. Serial No. 308,094. (No model.)



Claim.—1. The herein-described method of seating and securing a wire or the like in wood, consisting in first providing the wood with a fine slit or incision, then forcibly inserting the wire laterally into the slit, thereby displacing or separating the walls of the slit, and finally permitting the wood to react to close above the wire.

2. The method of inserting or securing a wire or similar strip in wood, consisting in providing the wood with a fine slit or incision terminating short of its edges, and thereafter forcing the wire, of greater width than the slit, laterally into the same and below the surface of the wood, and finally permitting the fiber to react and close together above the wire, whereby the wire is concealed within the wood and secured both against lateral and longitudinal motion.

3. The method of inserting and securing wires or like metal strips in wood, consisting in providing the wood with a thin slit or incision and forcing the wire laterally into said slit below the surface of the wood, and finally wetting the wood to cause the reaction of the fiber above the wire.

412,692. BRUSH. MCCLINTOCK YOUNG, Frederick, Md. Filed Apr. 20, 1888. Serial No. 308,093. (No model.)

Claim.—1. The brush block or body having the holes and the incisions therein, in combination with the tufts and the tuft-holding wires seated in the incisions and confined by the fiber closed thereover, as described.

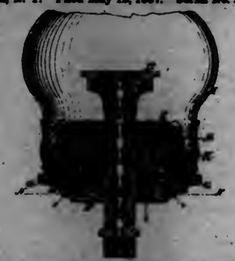
2. A brush-block having a series of holes and intersecting incisions terminating at their ends within the edges of the block, in combination with the tufts, and the wires or fastenings seated in the incisions and with the fiber closed thereover.

3. The brush block or body consisting of the wooden block provided with the series of tuft-receiving holes, and with the incisions formed therein without removal of the wood, whereby they are adapted to close over wires inserted therein.

412,693. BALANCED SLIDE-VALVE. JAMES B. ALLISON, Indianapolis, Ind. Filed Apr. 3, 1889. Serial No. 305,944. (No model.)

Claim.—1. In balanced slide-valves, the combination, with the valve-stem, of the two valves adapted to move to and from each other and provided on their ends with lugs or ledges having beveled sides, and two clamps correspondingly formed and adjustable on the stem, substantially as described.

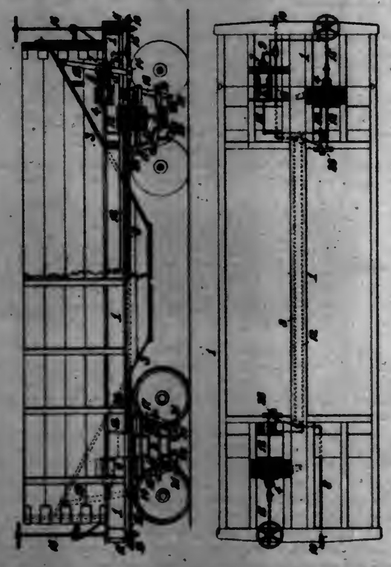
2. In balanced slide-valves, the combination, with the valve-stem provided at one end with a right-handed screw and at the other end with a left-handed screw, of two valves held apart by springs and provided on their ends with lugs having beveled sides and two clamps screw-threaded to fit the ends of the valve-stem and formed with ledges fitting said lugs, substantially as described.



3. The combination, with the valve-stem, the two valves adapted to move transversely with respect thereto, and means for increasing or decreasing the extent of such movement, of lock-nuts and washers placed on the valve-stem inside between the valves, the same being faced off and bearing against faced-off portions of the valves, which are squared and faced to receive them, substantially as described.

4. The combination, with the valve-stem, of two valves adapted to move transversely with respect thereto and formed on their ends

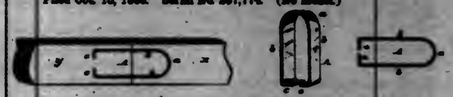
with the lugs or ledges having beveled sides, the two clamps correspondingly formed for adjusting the valves, and lock-nuts and washers placed on the valve-stem inside between the valves, the same being faced off and bearing against faced-off portions of the valves, which are squared and faced to receive them, substantially as described.



5. In balanced slide-valves, the combination, with the valve-stem and eccentric-rod, of the yoke R, having projection *t*, through which the stem passes, and the nuts T T and U, fitting on said stem on either side of said projection, substantially as described.

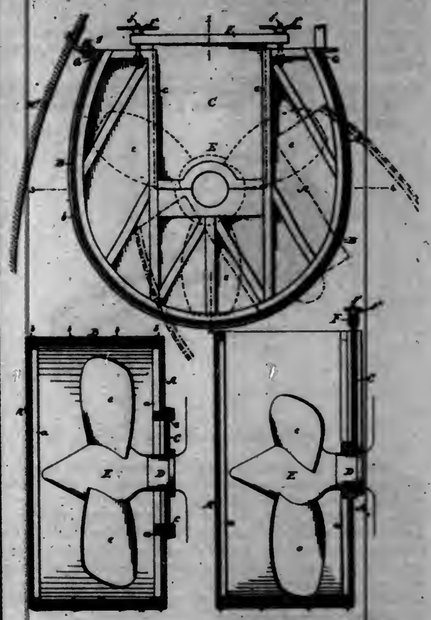
412,694. GAS-BURNER. DANIEL K. BAKER, Chicago, Ill., and CHARLES H. GREEN, New York, assignors to the New York Brass Company, New York, N. Y. Filed May 12, 1887. Serial No. 287,901. (No model.)

Claim.—In a gas-burner, the tube C, having the hollow laterally-projecting arms D, the funnel-shaped cap B, secured to the top of the tube C, and the annular reservoir or chamber E, having top perforations, said chamber surrounding a portion of the tube C and communicating therewith through the medium of the hollow arms D, combined with the supply-tube A, extending upward within the tube C and opening into the cap B, wire screens located within the chamber E between its top and the points of connection with the arms D, the perforated cone F, surrounding the chamber E, and the perforated screens H and M, surrounding, respectively, the top and bottom of the chamber E, for the purpose specified.



412,695. AIR-BRAKE APPARATUS FOR CARS. RICHARD W. BAYLEY, Pittsburg, Pa., assignor to the Westinghouse Air Brake Company, same place. Filed July 22, 1889. Serial No. 318,394. (No model.)

Claim.—1. The combination of two brake-cylinders each fixed to a car-body above and adjacent to one of its trucks, a main air or brake pipe, an auxiliary reservoir and triple valve connected with the brake-pipe and with each of the brake-cylinders, two brake-cylinder levers, each coupled to the car-body above one of the brake-cylinders and to the piston-rod of said cylinder, and draft-connections coupling the free ends of the brake-cylinder levers to the brake-levers of the adjoining truck, substantially as set forth.

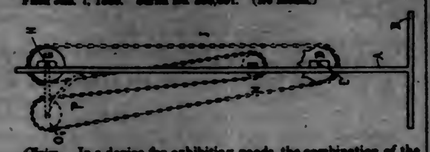


2. The combination of two brake-cylinders each fixed to a car-body above and adjacent to one of its trucks, a main air or brake pipe, an auxiliary reservoir and triple valve connected with the brake-pipe and with each of the brake-cylinders, two brake-cylinder levers, each coupled to the car-body above one of the brake-cylinders and to the piston-rod of said cylinder, and chains, each connecting the lower end of one of the brake-cylinder levers to one of the brake-levers of the adjacent truck and passing around a guide on the opposite brake-lever of said truck, substantially as set forth.

412,696. METALLIC FASTENER FOR WOOD JOINTS. JOHN I. BERRY, Williamsport, Pa., assignor to George W. Klump, same place. Filed Oct. 10, 1888. Serial No. 287,774. (No model.)

Claim.—A metallic fastener made of thin flat sheet metal of a general horseshoe shape, with straight parallel sides and with retaining ends or lugs *c c*, and adapted to be driven edgewise, substantially as set forth.

412,697. PROPELLER-DAM. GEORGE CLARKE, Jersey City, N. J. Filed May 14, 1889. Serial No. 310,727. (No model.)



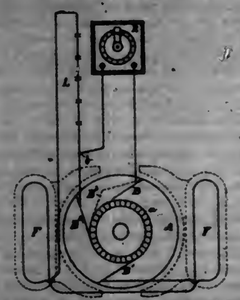
Claim.—1. The combination, with a propeller or coffer dam for vessels of the heads A A', with the body B, the head A having an opening for the reception of the shank or bracket of the propeller and a gate for closing said opening, substantially as specified.

2. In combination, a propeller or coffer dam for vessels, having two heads, one of which is adapted to receive the shank or bracket of the propeller, said dam having a body of the form substantially as shown and described, so that the said propeller-dam will fit over either the right or left hand propeller, substantially as described.

3. The combination of the heads A A' and the body B, with securing-flange on the body, said flange being adapted to be secured to a flange on the vessel, substantially as described.

4. The combination of the heads A A', the body B, an opening in the head A for the reception of the shank or bracket of the propeller, with a gate C, adapted to said opening, a bar F, secured to the head, with bolts passing through said bars, and nuts for fixing the gate to its seat.

412,698. EXERCISING DEVICE. FREEMAN H. GOULD, Chicago, Ill., assignor to Denton B. Turner and Annie B. Cobbs, both of same place. Filed Jan. 7, 1889. Serial No. 295,697. (No model.)

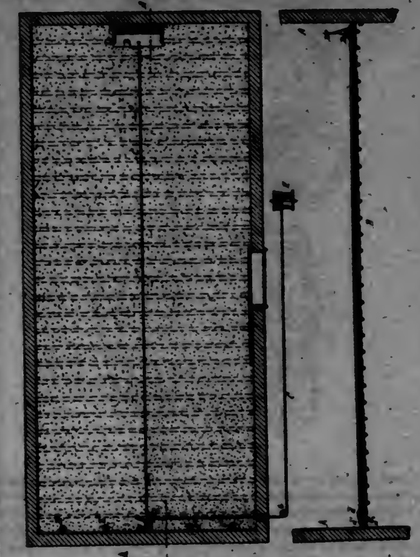


Claim.—In a device for exhibiting goods, the combination of the supporting-frame with a cross-shaft below carrying two sprocket-wheels D D, short shafts above carrying the pulleys G G, and pulleys N between the sprocket-wheels D and pulleys G, and the pulleys O, supported at one side of the pulleys G, and endless belts J, passing over all of said sprocket-wheels and pulleys and carrying cross-bars, substantially as and for the purpose set forth.

412,699. TIRE FOR WHEELS-WEDGES. EDWARD H. DU BOIS, Philadelphia, Pa. Filed Nov. 1, 1888. Serial No. 289,763. (No model.)

Claim.—A wheel having wrought-iron tire with side flanges, bolts securing the tire to the rim of said wheel, an elastic tread having the inclined sides 4 and the inclined shoulders *c*, and provided with recess 5 on its inner sides, forming a circumferential groove coinciding with the heads of the bolts, the side flanges of the tire being inwardly inclined and embracing the inclined sides 4, so as to be flush with the outer face of the tread, their lower ends being in contact with the inclined shoulders *c*, said parts being combined substantially as described.

412,700. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. WILLIAM H. BAKER, Cambridge, Mass., assignor of two-thirds, by direct and mesne assignments, to Arthur B. Griggs, Boston, Mass., and Polly Gray, De Funiak Springs, Fla. Filed Jan. 13, 1888. Serial No. 260,703. (No model.)



Claim.—In combination with the armature A and its commutator *a*, the main brushes B F', the additional brush B², and the adjustable resistance R, the brushes B and B² being connected to the work-circuit at *b*, with the resistance R between the brush B and the junction *b*, all arranged and operating as described to keep the current constant by variations in the current supplied by the brushes B² and B, substantially as described.

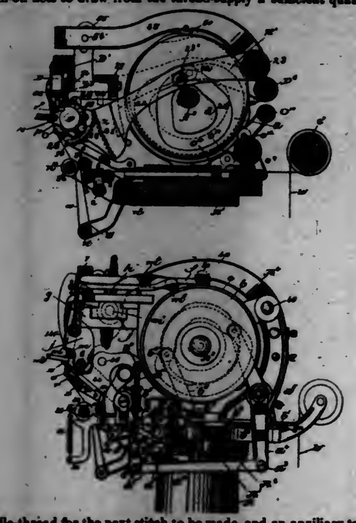
412,701. MALT-TURNING APPARATUS. JOSEPH EISENHARDT, New York, N. Y. Filed Mar. 17, 1888. Serial No. 267,471. (No model.)

Claim.—1. The combination of a malt kiln provided at one end with a series of eyes disposed at certain distances apart, a sliding block for turning the malt, of a width corresponding to the distance between the eyes, a detachable pulley for engaging said eyes in succession, a fixed pulley, a rotary drum, and a rope secured at one end to said sliding block and passing over said pulleys and drums, substantially as described.

2. The combination of a malt-kiln provided at each end with a series of eyes disposed at certain distances apart, a sliding block for turning the malt, of a width corresponding to the distance between the eyes, detachable pulleys supported by a pair of said eyes, fixed pulleys, a drum, and a cord passing over said drum and pulleys and attached at one end to said block.

412,702. SAFETY APPARATUS FOR CARBONIC-ACID-GAS FLASKS. JOHANNES FLEISCHER, Frankfort-on-the-Main, assignor of one-half to Wilhelm Theiss, Offenbach-on-the-Main, Germany. Filed June 15, 1889. Serial No. 314,516. (No model.) Patented in Germany June 17, 1888, No. 46,822.

Claim.—1. The combination, with a receptacle for the character described, of a reticulate cage completely enveloping the receptacle or the weaker wall thereof, and provided with an elastic internal bearing, against which the wall of the receptacle rests, substantially as described.



2. The herein-described safety apparatus for high-pressure receptacles, consisting of a reticulate cage adapted to completely envelop the receptacle or the weaker wall thereof, and provided with an elastic internal bearing for the wall of the receptacle, as set forth.

412,703. SEWING-MACHINE. ZACHARY T. PERRIN and WILLIAM C. MEYER, Boston, Mass., assignors to the Goodyear Shoe Machinery Company, Hartford, Conn. Filed Nov. 23, 1887. Serial No. 255,975. (No model.)

Claim.—1. In a wax-thread sewing-machine, the following instrumentalities, viz: a work-support an oscillating curved hooked needle, a looper to supply it with thread, a curved awl, a shuttle-race, a substantially circular shuttle therein, a take-up, a clamp to act directly upon the needle-thread on its way to the take-up, a pull-off to act upon the needle-thread between the said clamp and the thread-supply, and means actuating the said clamp and pull-off, whereby the clamp acts to hold the needle-thread between the pull-off and the take-up, while the pull-off acts to draw from the thread-supply a sufficient quantity of needle-thread for the next stitch to be made, substantially as described.

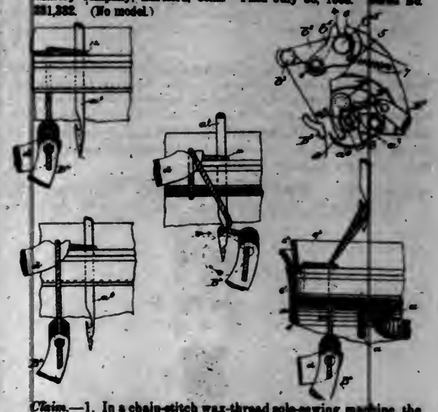
2. In a wax-thread sewing-machine, the following instrumentalities, viz: a work-support, an oscillating curved hooked needle, a looper to supply it with thread, a curved awl, a shuttle-race, a substantially circular shuttle therein, a take-up, a clamp to act directly upon the needle-thread on its way to the take-up, a pull-off to act upon the needle-thread between the said clamp and the thread-supply, and means actuating the said clamp and pull-off, whereby the clamp acts

to hold the needle-thread between the pull-off and the take-up, while the pull-off acts to draw from the thread-supply a sufficient quantity

of needle-thread for the next stitch to be made, and an auxiliary take-up, to operate substantially as described.

3. In a wax-thread sewing-machine, the following instrumentalities, viz: a circular shuttle-race, a substantially circular shuttle therein, a curved hooked needle, a thread-guide, a looper to supply it with thread, a take-up to act upon the needle-thread, means to actuate the take-up, a curved awl, means to actuate the said needle and awl, a channel-guide to retain the stock at a predetermined level as the needle enters it for each stitch, a thread-clamp to act directly upon the needle-thread between the thread-supply and the said take-up, a yielding work-support, a pull-off to act directly upon the needle-thread between the thread-clamp and the thread-supply, and variable-motion devices intermediate and connecting the said yielding work-support on which the work rests with the said pull-off, whereby as the work-support rises and falls, owing to variations in the thickness of the stock upon it, the said pull-off will have given to it automatically a variable throw, to thereby adapt the length of the loop of needle-thread to the thickness of the stock, substantially as described.

4. In a wax-thread sewing-machine, the curved hooked needle, the yielding work-support, a pull-off consisting, essentially, of a lever having a roll and a sliding shoe mounted upon one arm of the said lever, combined with an adjustable connecting rod or link joined at one end to the said shoe and at its other end to the said work-support, to operate substantially as described.



5. In a wax-thread sewing-machine, the yielding work-support, the curved hooked needle, and a clamp consisting of a bar, as 5, and rolls 3 4, located at opposite sides the said bar to clamp the needle-thread, a pull-off to act upon the needle-thread between the said clamp and the thread-supply, and connecting devices between the pull-off and the said yielding work-support, combined with means to automatically operate the said clamp, substantially as described.

6. In a wax-thread sewing-machine, the yielding work-support, the curved hooked needle, and a clamp consisting of a bar, as 5, and rolls 3 4, located at opposite sides the said bar to clamp the needle-thread, a pull-off to act upon the needle-thread between the said clamp and the thread-supply, and connecting devices between the pull-off and the said yielding work-support, combined with means to automatically operate the said clamp, and with the auxiliary take-up, to operate substantially as described.

7. In a wax-thread sewing-machine, the curved oscillating hooked needle and the looper having a hollow shank and upwardly-extended arm o', and bearings for the said shank, combined with gear o^{16}, the segmental lever o^{17}, the lever o^{9}, link o^{8}, and with means to actuate said levers to not only reciprocate the said looper, but to also impart a slight rocking motion thereto, substantially as described.

8. In a wax-thread sewing-machine, the yielding work-support, the curved hooked needle, a take-up for the needle-thread, a shuttle, and a shuttle-race therefor, combined with a loop-guide, as r^{6}, located between the shuttle-race and the said work-support and having its delivery end terminating near the upper side of the stock being sewed, the said loop-guide receiving upon it and guiding the loop of needle-thread as it is discharged from the shuttle and during the time the loop is being drawn down to the work by the take-up, substantially as described.

412,704. SHOE-SEWING MACHINE. ZACHARY T. PIERCE and WILLIAM C. MEYER, Boston, Mass., assignors to the Goodyear Shoe Machinery Company, Hartford, Conn. Filed July 30, 1888. Serial No. 281,282. (No model.)

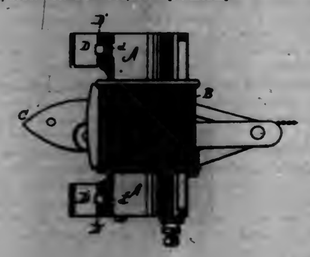
Claim.—1. In a chain-stitch wax-thread sole-sewing machine, the following instrumentalities, viz: a channel-guide, a hooked needle, the needle-segment, feeding mechanism, actuating means for the said needle-segment, as the link B^{2}, lever B^{4}, and cam 200, to force the needle with a loop upon its shank into the stock and out through the inner channel of the sole and there hold the said needle temporarily substantially at rest while the stitch is being set, a thread-guide, means to actuate it to supply the hooked needle with thread, and a take-up, as b^{3}, a cam, as C, and connecting devices intermediate the said cam and the said take-up, the said cam through the said connecting devices actuating the said take-up to pull upon the loop of needle-thread about the shank of the needle while the needle is in the stock and holds the said loop upon its shank, the said take-up drawing the said loop about the shank of the needle, as described, to set the last stitch, of which the said loop forms a part, without straining the between substance, the said stitch being set before the loop to form the next stitch is drawn through it, substantially as described.

2. In a chain-stitch wax-thread sole-sewing machine, a hooked needle, a thread-guide to supply it with thread, feed mechanism to feed the stock while the hooked needle holds on its hook a loop of thread, and means to actuate the said needle to force it into the upper and sole and out through the channel therein and temporarily hold the said needle substantially at rest in the stock, combined with a take-up, as b^{3}, and means to actuate it to act upon the thread and draw the same back through the sole and upper while the last loop formed by the needle is yet on the shank of the needle, the needle yet remaining in the stock, the said take-up completing the setting of the stitch before the said needle is withdrawn from the stock and out from the old loop upon its shank, substantially as described.

3. In a chain-stitch wax-thread sole-sewing machine, a hooked needle, means to actuate it to enter the upper and sole and emerge therefrom in the inner channel thereof, and a thread-guide and means to actuate it to supply the hook of the needle with thread, combined with a feeding mechanism, a take-up, a cam, and intermediate devices to actuate the said main take-up to draw the thread about the shank of the needle and set the stitch while the needle is in the stock and the loop of thread last drawn through the stock by it is yet on the shank of the needle, the said cam and intermediate devices at the same time moving the take-up far enough to draw thread from the thread-supply sufficient for a new stitch, and with an auxiliary spring-actuated take-up to take up the slack in the needle-thread drawn off by the main take-up, the said auxiliary take-up thereafter giving up the said slack thread to the needle as the latter again acts to draw a loop of thread through the stock, substantially as described.

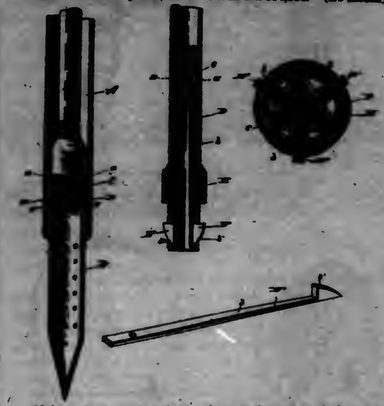
4. In a chain-stitch wax-thread sole-sewing machine, the take-up b^{3} and the auxiliary take-up b^{5}, the thread-guide, and the hooked needle and actuating means therefor, combined with the thread-holder d and means to actuate it, whereby the said thread-holder is made to act upon the needle-thread between the said thread-guide and the stock and while the needle is in the stock and the last loop of thread drawn therethrough is yet upon the shank of the needle, the said thread-holder taking from the auxiliary take-up and through the said thread-guide before the latter acts to lay its thread in the hook of the needle a sufficient quantity of thread to prevent the rending of the same across the hook of the needle as the loop is being drawn by the needle through the stock, substantially as described.

5. In a chain-stitch wax-thread sole-sewing machine, a hooked needle, a thread-guide to supply the needle with thread, means to actuate the needle to draw the thread in the form of a loop from the inner channel of the sole through the between substance and upper, feeding mechanism to move the sole, and means to move the needle forward to pass through the upper and between substance and sole substantially at rest, combined with a take-up, as b^{3}, and means to actuate it while the needle is in the stock to pull upon the loop of thread yet on the shank of the needle next the outer side of the shoe and pull the said thread back through the upper and about the said needle to set the stitch, the pull on the thread in setting the stitch being in the direction to draw the upper closely to the sole, substantially as described.



412,705. FIRE-LADDER. HENRY T. HAYES, Oakland, Cal. Filed Jan. 12, 1889. Serial No. 296,189. (No model.)

Claim.—1. The herein-described trussed fire-ladder, which consists in a double frame having the interposed truss-blocks, with square ends and binding-rods, passing through said blocks, and ladder-frames held in position by nuts upon the outer face of the rear ladder-frame, as set forth and specified.

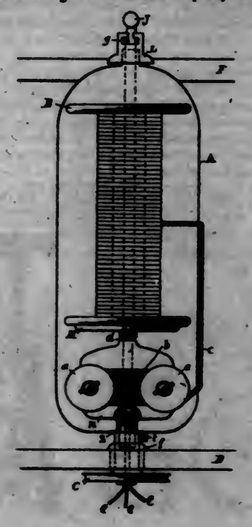


2. The ladder composed of the double frames on the sides, each frame having truss-blocks I and bolts $I^{\times}$ for uniting and holding its two parts, and one of the said parts of each frame being provided with series of brackets or plates H, bolted to its inner face and provided with sockets or eye-holes for the ends of the rounds, as described.

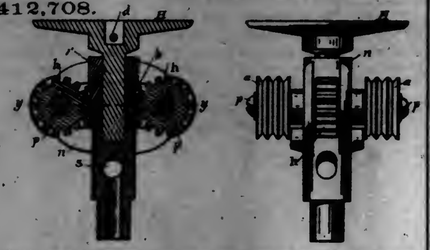
412,706. CAR-COUPLING. IVORY HAMILTON, Boston, Mass. Filed Aug. 9, 1888. Serial No. 282,269. (No model.)

Claim.—The combination, with the frame A of the coupler, of the buffer described, consisting of the metallic case or shell D, open at its rear side and suspended in front of said frame, and the rubber block or cushion D, inclosed in said shell and projecting slightly rearward therefrom, substantially as and for the purpose set forth.

412,707. EXTRACTOR FOR TUBE-WELLS. JOSEPH H. HILL, Chicago, Ill. Filed Apr. 19, 1888. Serial No. 307,316. (No model.)



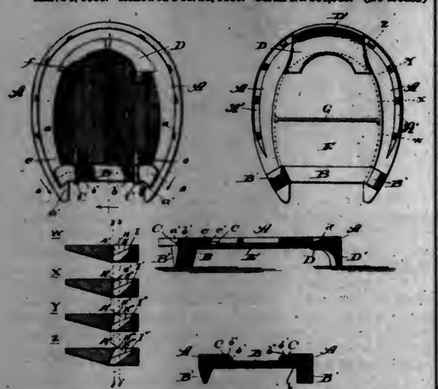
Claim.—1. An extracting-tool consisting of a tubular rod screw-threaded externally at its lower end, a vertically-adjustable collar tapped on this rod, and three or more spring-catches inserted in the said tubular rod and provided with beveled projecting noses, substantially as described.



2. The combination of a tubular rod D, provided with vertical slots at its lower end, a vertically-adjustable collar tapped upon the lower end of this rod, a removable block G, secured in the tube D, and the spring-catches F, secured to the block G and provided with beveled noses which project out through the notches in the lower end of the said tube D, substantially as described.

412,708. CAPSTAN-HEAD FEED-MOTION FOR ROPE OR TWINE MACHINES. WILLIAM HOLLINGSWORTH, Baltimore, Md., assignor to William J. Harper, same place. Filed June 26, 1888. Serial No. 316,671. (No model.)

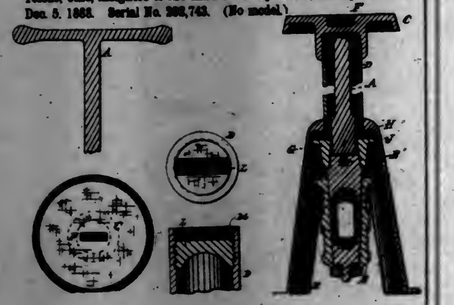
Claim.—A feed-head for twine and rope machines, consisting of a frame carrying a central vertical shaft having a worm-wheel fast-ened thereon, and one or more horizontal shafts having bearings in said frame and having one or more feed-pulleys and a worm-gear



412,708.

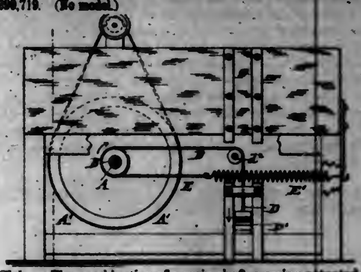
wheel secured thereon, the worm-gear engaging with the central worm-wheel and being moved thereby, substantially as and for the purpose set forth.

412,709. HORSESHOE. ALBERT B. HOLSON, Chicago, Ill. Filed Mar. 31, 1888. Renewed Feb. 28, 1889. Serial No. 301,563. (No model.)



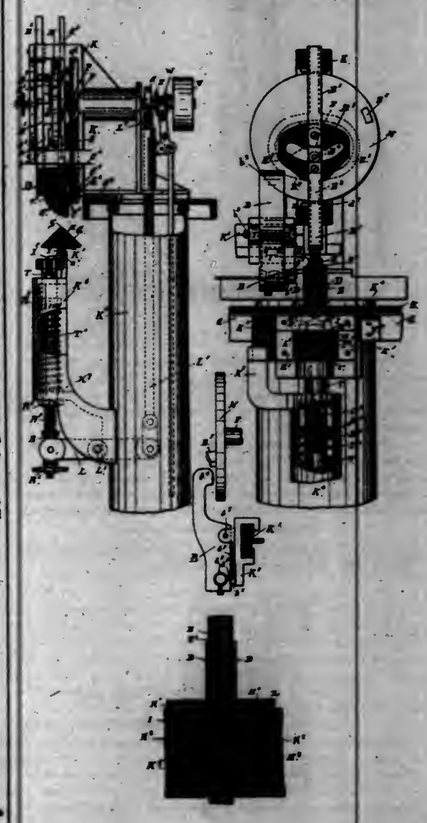
Claim.—1. In a horseshoe, the combination of a main shoe, a grooved bar forming heel and toe bars attachable to said main shoe, said bars having calks integral therewith, with a plate overlapping at the sides thereof onto said main shoe and pressing between said heel and toe bars at the ends of said plate, and means for securing said plate in position, all substantially as described.

2. The combination of shoe A, having beveled edge *a* and notches *a'* thereon, with grooved bars B D, having calks thereon integral therewith, plate E, having lugs *e e* F F thereon, pins C C, fitting into holes in lugs *e e* on said plate and into holes *b''* on bar B, and pins *f f*, integral with lugs F F on plate E and fitting into holes in bar D, all substantially as described.



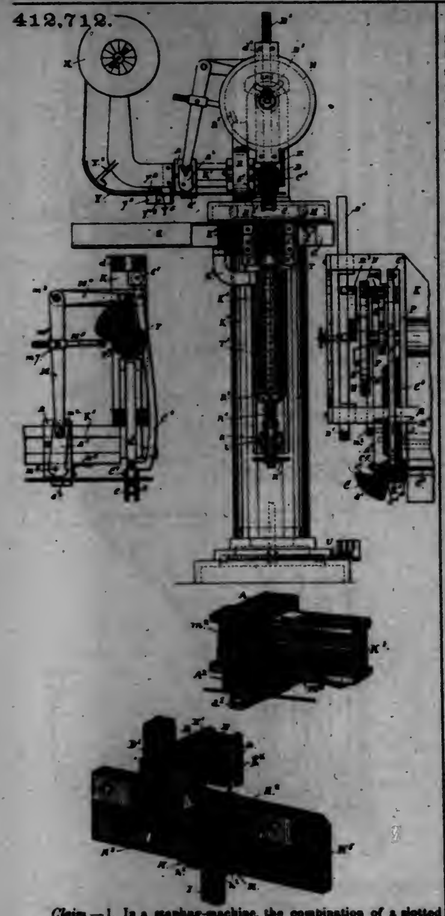
3. In a horseshoe provided with a groove on the under side thereof with a constantly-varying side and bottom, and having nail-holes placed in said groove, the combination of beveled faces forming said groove and beveled faces forming with one of the beveled faces of the groove the sides of said nail-holes, the ends of said nail-holes being parallel, and the said nail-holes having openings on the upper sides of said shoe of equal size.

412,710. CURB-BOX. ANDREW KELLER, Jr., and FRANK KELLER, Toledo, Ohio, assignors of one-third to Henry Keller, same place. Filed Dec. 5, 1888. Serial No. 292,743. (No model.)



Claim.—In a curb-box, the faucet-plug B', having an angular head, the coupling G, fitting said head and provided with an angular recess in its upper face, said coupling having a circular flange J in combination with the conical case E, embracing said faucet and coupling and loosely fitting said flange, all as and for the purpose described.

412,711. FOOT-POWER. JAMES KELLY, Newport, R. I., assignor to Adolph von Schade, same place. Filed Feb. 13, 1888. Serial No. 299,719. (No model.)



Claim.—The combination of a main shaft, a spring-actuated pawl located in a recess of the same, a sleeve on said driving-shaft provided with interior ratchet-teeth, belts attached to said sleeve and wound in opposite direction around the same, a hinged actuating-treadle attached to the opposite end of one of the belts, and a spiral spring attached to the opposite end of the other belt, substantially as set forth.

412,712. BOOK-STAPLING MACHINE. JOSEPH LYMAN, San José, Cal. Filed Dec. 24, 1888. Serial No. 294,862. (No model.)

412,712.

Claim.—1. In a stapling-machine, the combination of a slotted table to support the sheets, a staple-forming device consisting of a swinging anvil to support the staple-blank in horizontal position above the table, having a width of supporting-surface corresponding to the size of the staple to be formed; a pair of reciprocating jaws cutting outside of said anvil to reciprocate against the sides thereof, and having edges to strike and turn down the end portions of the blank against the sides of the anvil, and grooves in the inner faces to take in the turned-down portions, a vertically-acting hammer reciprocating between said jaws and adapted to drive the formed staple and force back the anvil from beneath it, a prong-clinching device beneath the table and in the same plane with the driver, and a wire feed and cutting device arranged at one side of the forming device above the table to feed and place a blank or cut-off portion of wire at right angle to said staple-forming device, substantially as described.

2. In a stapling-machine, the combination of the swinging anvil held rigidly in position during the forming operation while the ends of the blank are being bent squarely and released and allowed to swing from beneath the staple during the driving operation, and the vertically-reciprocating jaws arranged outside of said anvil to work in close relation to the sides thereof, and having grooves in the inner faces to take in and confine the bent prongs of the staple, substantially as described.

3. In a stapling-machine, the combination of the swinging anvil C, spring C^3, stop-lever C^5, operating, as described, to hold and release the anvil, the reciprocating jaws D D, adapted to bend the staple-blank over the anvil, and the driving-hammer E, arranged to work between said jaws and to force back the anvil from under the staple during the driving operation, substantially as described.

4. A staple-forming device consisting of a swinging anvil having a blank-supporting face of equal width to the length of the staple to be formed, a pair of bending-jaws embracing and reciprocating outside of said anvil at right angle to the supporting-face and in close relation to the sides of the anvil, and having grooves in the inner faces to take in the bent portions of the staple, and the driver moving in the same plane with the said jaws and in the grooves thereof above the staple and adapted to force out the formed staple and throw back the anvil from beneath it, substantially as described.

5. In a staple forming and driving mechanism, the combination, with staple-bending jaws and a driving-hammer, of the swinging anvil and mechanism, substantially as described, whereby the anvil is held in position to receive the staple-blank during the feeding operation, and is set and locked to hold the blank while the jaws are bending the prongs, and is finally released and allowed to turn and be pressed back from under the formed staple by the stroke of the hammer, as specified.

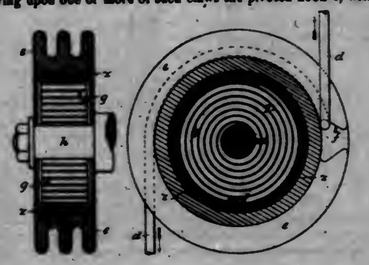
6. The swinging anvil C, having a straight top face to support the staple-blank, vertical sides over which the prongs of the staple are bent, and a curved bottom edge set for operation with relation to the work-supporting table, as described, in combination with the reciprocating jaws having grooves for confining and guiding the prongs of the staple, and the driving-hammer arranged for joint operation as specified.

7. In a staple-forming mechanism, a pair of reciprocating jaws formed of two parallel plates with a space between them corresponding to the length of staple to be formed, and having vertical grooves in their inner faces, in combination with a staple-blank support of corresponding width of blank-supporting surface, which is adapted to present the blank to said jaws while they descend and bend the prongs, and then swing or move outwardly from beneath the staple as the latter is pressed down, substantially as specified.

8. In a staple forming and driving machine, the combination of staple-forming jaws and a driving-hammer adapted to place and drive the formed staple and then remain in position to hold it down while the clinching is being done, and the clinching dies and hammer arranged for operation, as described, to turn and clinch the prongs of the staple.

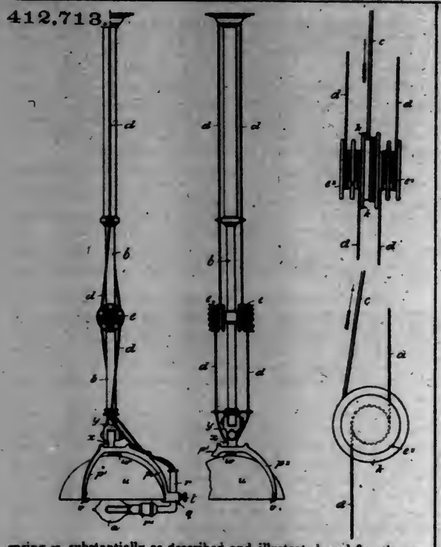
9. The wire-feed consisting of the stationary carriage-guide, reciprocating carriage having a rest or support for the wire, the pivoted dog with wire-gripping face set with relation to the said rest, as described, mechanism connected directly to said dog above its pivot to move the carriage, and a resistance-spring applied to produce the required friction of the carriage on its guide in the feeding movement, as specified.

10. In combination with the wire-feed and the blank-supporting anvil, the stationary cutter *b'*, the vibrating jaw B, having a cutter b^3, and means whereby said jaw is actuated with respect to the movements of the wire-feed, as specified.



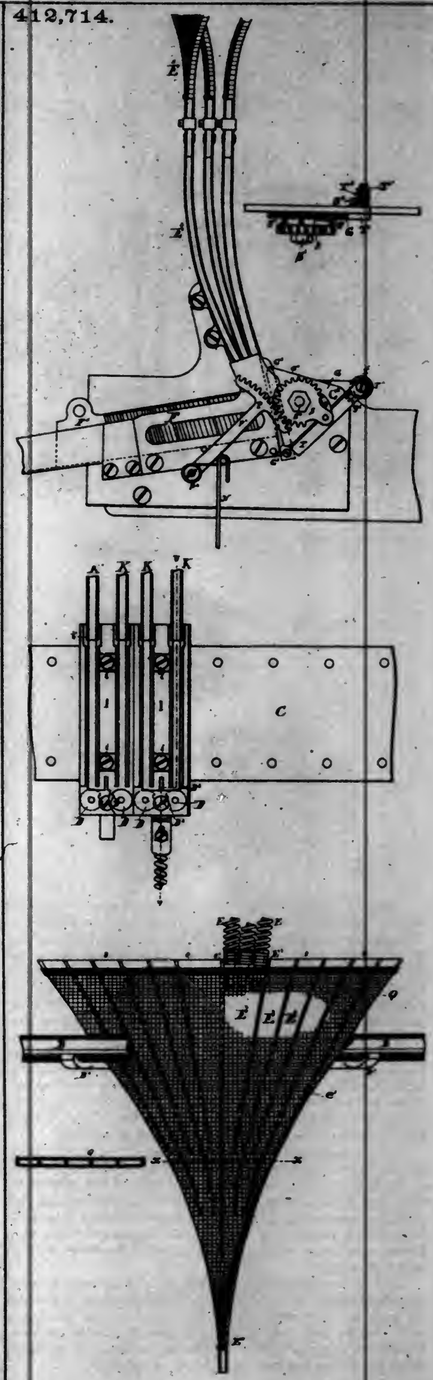
11. In a stapling-machine, the combination of staple forming and driving mechanism, a yielding table or support for the sheets to be bound, and a reciprocating clinching-hammer operating in an upward direction through a slot in the table and capable of adjustment to regulate the intensity of the blow, substantially as specified.

412,713. FITTING AND HOISTING GEAR FOR ELECTRIC LAMPS. WILLIAM R. SAYERS, Lisbon, Portugal, and WILLIAM H. BYNGE, Birmingham, England. Filed June 16, 1888. Serial No. 277,202. (No model.) Patented in England July 19, 1887, No. 10,071.



Claim.—1. In an electric-light fitting, the combination of the spring-drums *c c'* and the electric conducting-cords *d' d*, attached at their centers to the peripheries of the drums, and having their leads reversely coiled thereon, as shown and described.

2. In an electric-light fitting, the combination of the drums *c' c'*, having their leads reversely coiled thereon, with the hoisting-drum *k*, substantially as described.

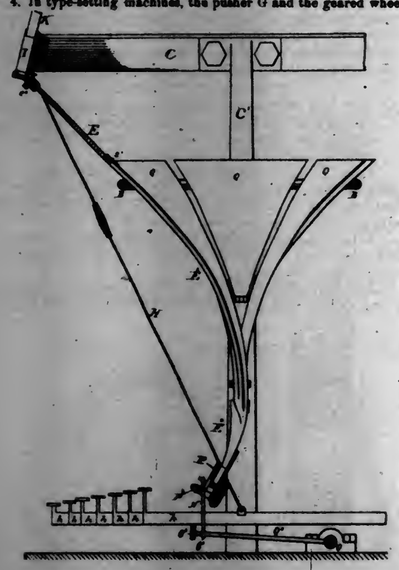


3. In an electric-lamp fitting, the combination of the claws *p p' p'*, having upon one or more of such claws the pivoted hook *v*, with the

412,713.

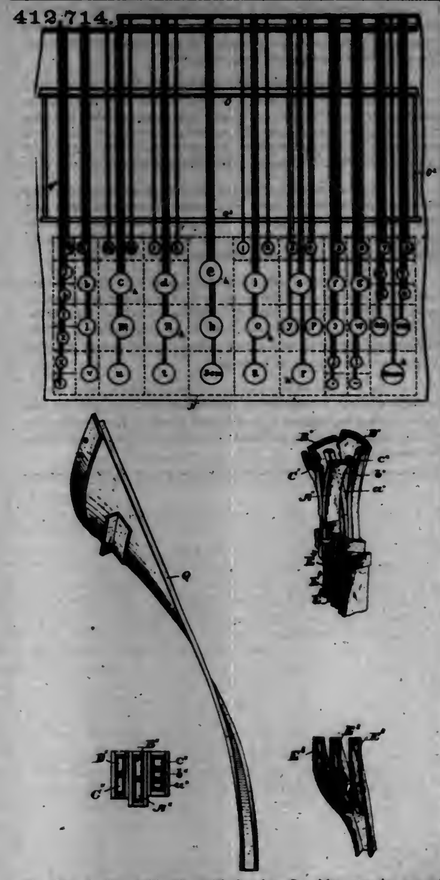
412,714.

spring *w*, substantially as described and illustrated, and for the purposes specified.



412,714. TYPE-SETTING MACHINE. LORENZO DOW, Boston, Mass., assignor to the American Type Setter Company, Portland, Me. Filed Dec. 6, 1888. Serial No. 290,594. (No model.)

Claim.—1. In a type-setting machine, the inclined channels I and the converging wire channels, in combination with the rollers D and their springs d^2, substantially as and for the purpose set forth.



2. In type-setting machines, the coiled-wire tube flattened to receive and convey, without rotating, type of varying size, as and for the purposes described.

3. In type-setting machines, the plates Q, with their converging partitions between the plate and the cover adapted to receive type of varying thicknesses, and bent and twisted, whereby they will deliver the said type in the position desired into the channels E^2, as and for the purposes described.

4. In type-setting machines, the pusher G and the geared wheel

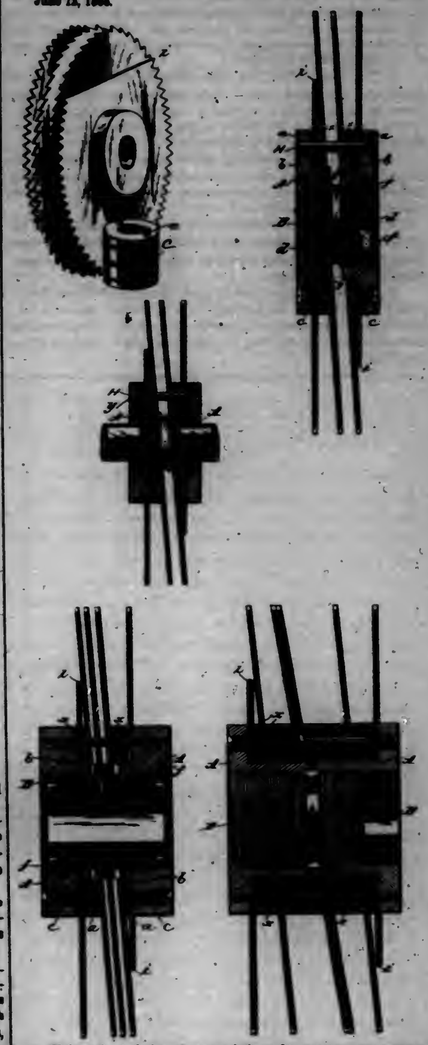
412,714.

f^3 and pawl f^4, in combination with the piece S and its actuating geared sector P, as and for the purposes described.

5. In type-setting machines, the type-channels and type-discharging mechanism, as set forth, in combination with the stick F, the piece F^1, the pusher G, the rod G^2, the sector P, the pinion S, and connections, as set forth, between the sector and pinion and the levers of the key-board, substantially as and for the purposes set forth.

6. In type-setting machines, a key-board with the letters of the lower case arranged substantially as in the printer's case, with the letters of the upper case arranged to the right and left of the same, as and for the purposes described.

7. In a type-setting machine, in combination with the type-channels, in which the type are placed before being set, the longitudinally-grooved rollers D, normally in position to present their rounded sides to the lower ends of the type-channels, the springs connected with each, the key-levers, and the rods connecting them with the rollers, substantially as described, whereby the pressing of a key of the key-board partially rotates said roller, and thereby presents a groove into which said column descends, and which roller, on release of the key under the finger, returns to its former position, carrying out the bottom type, as and for the purposes described.



8. In type-setting machines, the piece T, in combination with the spring T^2 and the piece G, as and for the purposes mentioned.

9. The type-channel, in combination with the recessed roller normally in position to present its rounded side to the lower end of the type-channel, and with means, substantially as described, for actuating the rollers.

10. In a type-distributing machine, substantially as described, flexible tubes for type-channels, substantially as and for the purpose described.

REISSUES.

11,033. DADO-CUTTER. WILLIAM B. FOX, Grand Rapids, Mich. Filed July 20, 1889. Serial No. 318,119. Original No. 364,343, dated June 13, 1887.

Claim.—1. A dado-cutter consisting of two outer saws arranged parallel to each other and intermediate saws arranged at an angle thereto adjustable with the outer saws to lessen or widen the cut, substantially as described.

2. A dado-cutter consisting of outer parallel saws and inner inclined saws occupying the intermediate space, the outer and inner saws being connected in pairs or series and adjustable toward and from each other to lessen or widen the cut, substantially as described.

3. A dado-cutter consisting of outer parallel saws and inner inclined saws connected in pairs or series and mounted upon a right and left hand screw-threaded sleeve, whereby the saws are adjusted to different widths, substantially as described.

4. In a dado-cutter, parallel outer saws, inner inclined saws, flanged rings for connecting the saws together in pairs or series, and outer

rings internally screw-threaded—one upon each side—connected one to each set of saws, and a right and left hand screw-threaded sleeve upon which the rings are mounted and by which the series of saws are adjusted, substantially as described.

5. The combination, in a dado-cutter, of the outer rings A A, having inner flanges, straight and inclined saws arranged in series and supported on said inner flanges, thimbles and screws for securing the rings and saws of each set together, and a right and left hand screw-threaded sleeve adapted to corresponding threads on the rings A A, substantially as described.

6. The combination, in a dado-cutter, of the straight and inclined saws arranged in pairs, a right and left hand screw-threaded sleeve for adjusting the saws, having depressions on its face, and a wrench for operating the sleeve, having projecting pins adapted to the depressions, substantially as described.

7. A dado-cutter consisting of two outer adjustable saws arranged parallel to each other, intermediate inclined saws adjustable with the outer saws, and a fixed inclined saw between the adjustable inclined saws, substantially as described.

8. A dado-cutter consisting of two outer adjustable saws arranged parallel to each other and a double set of intermediate saws, the saws of each set being adjustable with the respective outer saws, substantially as described.

9. In a dado-cutter, a screw-threaded sleeve, saws carried thereby so as to be adjusted to cut varying widths of grooves, said saws having straight cutting portions for marking the width of the groove, and inclined portions for removing the intervening stock, substantially as described.

10. In combination with a dado-cutter having saws adapted to be adjusted, a loose connection between the saws for maintaining them in relative position peripherally without interfering with the adjustment thereof toward and from each other.

11. An adjustable dado-cutter comprising a right and left hand screw-threaded sleeve and saws mounted thereon so as to be adjustable toward and from each other, said saws being provided with cutting portions in vertical plane for marking the width of the groove and cutting portions arranged at an angle to the vertical portions for removing the stock intervening, substantially as described.

12. In a dado-cutter, a right and left hand screw-threaded sleeve, saws mounted thereon so as to be adjustable toward and from each other, each of said saws having cutting portions in vertical plane for marking the width of the groove and inclined cutting portions for removing the intervening stock, substantially as described.

13. In combination with an adjustable dado-cutter having a right and left hand screw-threaded sleeve, and saws supported thereon so as to be adjusted toward and from each other, a loose connection between the saws for maintaining them in relative position peripherally without interfering with the adjustment thereof toward and from each other, substantially as described.

14. In a dado-cutter, a screw-threaded sleeve, saws carried thereby so as to be adjusted to cut varying widths of grooves, said sleeve having depressions in its face, and a wrench for operating the sleeve, having projecting pins adapted to the depressions, substantially as described.

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

CONSOLIDATED BUNGING APPARATUS COMPANY *et al.* *v.* H. CLAUSEN & SON BREWING COMPANY.

Decided June 21, 1889.

1. MELLER AND HOFMANN—MAKING BEER—CLAIMS 1 AND 2—PROCESS OLD.

The first and second claims of Letters Patent No. 215,679, granted upon the application of Leonard Meller and E. Hofmann to George Bartholomae, assignee, May 20, 1879, are as follows: "1. The process of preparing beer for the market, which consists in holding it under controllable pressure of carbonic-acid gas when in the 'kraeusen' stage, substantially," &c. "2. The process of treating beer when in the kraeusen stage, which consists in holding it in a vessel under automatically-controllable pressure of carbonic-acid gas, substantially," &c. *Held* that these processes are invalid for lack of novelty. The vent-bungs known as the "Shaefer bung," the "Guth bung," the "Bachman bung," and others are the vent-bung of this patent in the sense that they have the same functions and are automatic valves designed to control the pressure of the gas, and were used commercially in many breweries between 1861 and 1876, being applied to shavings-casks after the beer had reached the kraeusen stage, and, before the end of that stage, for controlling the pressure of the gas.

2. SAME—SAME—CLAIM 3 CONSTRUED—INFRINGEMENT.

The third claim of the patent—viz., "the process of preparing and preserving beer for the market, which consists in holding it under controllable pressure of carbonic-acid gas from the beginning of the kraeusen stage until such time as it is transferred to kegs and bunged," &c.—must be limited to the application of the apparatus at the beginning of the kraeusen stage, and is not infringed by defendant's apparatus, which, though the same vent-bung as that of the patent, is not applied until several days after the kraeusen has been introduced, the beer in the interval being allowed to work out of the bung-hole of the shavings-cask.

ON FINAL HEARING for infringement of Letters Patent No. 215,679.

For a full description of this patent see the opinion of the Supreme Court in *New Process Fermentation Co.* v. *Maus et al.*, (39 O. G., 1419; 7 Sup. Ct. Rep., 1304; 20 Fed. Rep., 725.)

Messrs. Banning & Banning & Payson for the complainants.

Mr. Josiah Sullivan, *Mr. C. P. Jacobs*, and *Mr. B. F. Thurston* for the defendant.

WALLACE, *J.*:

This suit is founded upon Letters Patent granted May 20, 1879, to George Bartholomae as assignee of Leonard Meller and Edmund Hofmann, inventors, for an improvement in processes for making beer. The application for the patent was filed February 12, 1879.

The patent has 8 claims, 4 of which are in controversy in this suit. These claims are as follows:

1. The process of preparing beer for the market, which consists in holding it under controllable pressure of carbonic-acid gas when in the "kraeusen" stage, substantially as set forth.

2. The process of treating beer when in the kraeusen stage, which consists in holding it in a vessel under automatically-controllable pressure of carbonic-acid gas, substantially as described.

3. The process of preparing and preserving beer for the market, which consists in holding it under controllable pressure of carbonic-acid gas from the beginning of the kraeusen stage until such time as it is transferred to kegs and bunged, substantially as described.

4. The method herein described of preserving beer in a marketable condition after it has passed the kraeusen stage, which consists in holding it under pressure of carbonic-acid gas, said pressure being automatically regulated by a counteracting hydrostatic pressure, substantially as described.

These claims relate to the treatment of the beer in the shavings cask after it has been drawn from the ruh casks, and after the kraeusen in the beer has been added to produce the secondary fermentation during which the beer is to be ripened and clarified and prepared for market use. The term "kraeusen" stage, as that term is used in the claims, is the period of active fermentation in the shavings-cask induced by the introduction of the kraeusen into the old beer, and this period ends when the beer becomes clarified and brilliant. It begins as soon as the active secondary fermentation commences. The "holding" the beer "under controllable pressure," mentioned in the claims, describes the means by which the pressure is controlled, consisting of a vent-bung applied to the shavings-cask, which vent-bung is of the kind particularly described in the specification, or any other self-acting valve adapted to control the gas and permit or prevent its escape at any predetermined degree of pressure.

Aside from the language of some of the claims themselves, the general statement of the nature of the invention, and the description of the bunging apparatus, the patent does not point out specifically how the processes of the claims in controversy are to be practiced. The specification seems to assume that it is only necessary to describe the apparatus used in order to enable any person skilled in the art of beer-making to use it so as to carry out the processes claimed. Inferentially the specification suggests that the processes claimed involve holding the beer under the gas-pressure during the whole period of the shavings-cask stage, beginning as soon as the secondary fermentation becomes sufficiently active to cause the beer to flow through the bung-hole of the cask and the gas to escape, and ending when the beer is ready to be drawn off for market. This is to be implied because the specification states that the "cask being closed none of the beer wastes by running over, and the foul smell and washing of the casks and cellars are avoided,"

and "the escaping carbonic-acid gas does not settle in the brewing-cellars to endanger life." Referring to this part of the specification when the patent was considered by the Supreme Court in *New Process Fermentation Co.* v. *Maus et al.*, (39 O. G., 1419; 122 U. S., 413; 7 Sup. Ct. Rep., 1304,) the Court said:

> This is fairly to be read as a statement that the beer is to be thus treated during the whole of its subjection to the shavings-cask stage of the process, whether in one closed cask or in two or more closed casks connected together. The statement is that the cask or casks are to be closed—that is, closed throughout the shavings-cask stage of the process, and kept during that process under automatically-controllable carbonic-acid-gas pressure, generated either by the mild fermentation of the beer or artificially. It is also stated that none of the beer wastes by running over, and that the foul smells and washing of the casks and cellars are avoided, and that the escaping carbonic-acid gas is conducted to the open air. These consequences cannot follow, nor can the advantages of the invention set forth be fully availed of unless the casks are closed from the beginning of the shavings-cask kraeusen stage.

There is nothing in the specification to restrict the scope of the first or second claims to a process for holding the beer under pressure at any particular period of the kraeusen stage, or for any length of time during that stage, or for treating the beer according to any special conditions. They are broad claims for processes, respectively, in which the controllable pressure is applied at any time during the kraeusen stage, the only difference between them being that the first includes pressure, whether applied automatically or not, while the second is restricted to automatic pressure. The limitations expressed in the third and fourth claims emphasize the interpretation of the first and second as claims for processes without any limitation or condition in respect to the pressure period. These claims must therefore be deemed as claims for the process of treating the beer whenever it is in the kraeusen stage by holding it under the pressure of carbonic-acid gas by means of the vent-bung applied to the shaving-scask. The third claim is for a process of like treatment, in which the pressure is applied at the beginning of the kraeusen stage—that is, as soon as the fermentation is active—and is maintained until the beer is ready to be drawn off for market. The fourth claim is capable of two interpretations. It may be construed as one for the process of the third claim continued after the beer has become ready for market, to preserve it in good condition, or as a claim for a process of treatment which does not begin until the end of the kraeusen stage. The latter seems the better construction.

It is doubtful whether the first two claims are not invalid upon the face of the patent, as being merely for the functions of the bunging apparatus. Unless the method of using such apparatus was so well known as not to require to be pointed out to those skilled in the art, the specification is insufficient; and, if it was so well known that description was not necessary, there is no novelty in the claims. However this may be, these claims are invalid upon other grounds. Their novelty is negatived by evidence which establishes beyond any reasonable doubt the prior public use in this country of the respective processes claimed more than two years before the application for the patent was filed. The evidence is overwhelming that the vent-bungs known in the record as the "Shaefer bung," the "Guth bung," the "Bachman bung," and others, which are the vent-bung of the patent in the sense that they have the same functions, and are automatic valves designed to control the pressure of the gas, were used in many breweries during the period between the years of 1869 and 1876. Some of them were used in large numbers, and they were applied to shavings-casks after the beer had reached the kraeusen stage for controlling the pressure of the gas. The proofs establish that in some instances these vent-bungs were used before the end of the kraeusen stage, but generally they were used after the active fermentation had subsided, when it was desired to hold the beer in the shavings-cask for some period of time before drawing it off for market. The testimony of Mr. Sturm, a highly-intelligent witness, shows the use of an equivalent vent-bung as early as 1861 in two breweries in Indianapolis. The bungs were designed and made by him at the request of the brewers by whom they were used; they were used, not experimentally, but commercially; were applied to the shavings-casks before the active fermentation had subsided in the beer, and were intended and used to prevent the gas from escaping into the cellar and the foam and yeast particles from running over the cask.

This evidence not only defeats the novelty of the first and second claims, but also the novelty of the fourth claim, unless that claim is merely a restatement of the third claim in different phraseology.

The complainants have failed to establish infringement by the defendant of the third claim of the patent. The Eureka vent-bung, which the defendant employs, differs in details of construction from the vent-bung particularly described in the patent, but is the vent-bung of the claim, because it performs the function of holding the beer under automatic gas-pressure. But the testimony for the complainants does not show that the defendant has applied this apparatus in its brewery at the beginning of the kraeusen stage in the treatment of the beer, and the testimony for the defendant is explicit that the apparatus as it has always been used there is not applied until several days after the kraeusen has been introduced, during which time the beer is allowed to work out of the bung-hole. The direct testimony for the defendant is consistent with probability because it appears that as commonly used by brewers the bunging apparatus particularly described in the patent and equivalent apparatus are not applied until the beer has been allowed to clean itself for a few days of the kraeusen stage.

Mr. Schwartz, one of the expert witnesses for the complainants, states that as a practical brewer he would not use the apparatus of the patent until the kraeusen stage is somewhat advanced, and that it is desirable to allow the beer to work out of the cask for a few days, and thereby eliminate the bulk of the impurities before applying the apparatus. He states that, although some brewers apply it at the beginning of the kraeusen stage, brewers generally do not, but find the best results are obtained by allowing the active fermentation to proceed a few days before doing so. There is considerable other testimony in the record to the same effect as respects the use of this apparatus and of the several other equivalent devices.

The proof seems clear that the defendant has used the Eureka device in just the same way in which the Guth vent-bung was used in its brewery in 1875, and just as the Meller and Hofmann vent-bung was used in its brewery during the time it was authorized to use that device.

The bill is dismissed, with costs.

U. S. Circuit Court—Northern District of Illinois.

IDE *v.* BALL ENGINE COMPANY.

Decided July 23, 1889.

1. NOVELTY—PATENT DECLARED VOID FOR WANT OF.
   Letters Patent No. 301,720, granted July 8, 1884, to Albert L. Ide, for an improvement in steam-engine governors, declared void for want of patentable novelty.

2. INVENTION—MECHANICAL SKILL.
   Where the joint operation of mechanical parts, old in themselves, when combined is the same as and only that of their separate operation in the older machines, there is no patentable combination, although there may be some convenience in bringing these parts together and making a more compact machine. Such change is merely mechanical, and does not rise into the realm of invention.

Messrs. Offield & Towle for the complainant.

Mr. John K. Hallock and *Mr. J. H. Raymond* for the defendant.

BLODGETT, *J.:*

This is a bill in equity for an injunction and accounting, by reason of the alleged infringement by defendant of Letters Patent No. 301,720, granted July 8, 1884, to the complainant for a steam-engine governor.

The nature and scope of the invention covered by this patent are described by the patentee in his specification as follows:

> This invention relates to that class of steam-engine governors known as "fly-wheel governors," and has for its primary object to provide means for holding the eccentric steadily in its proper poised position, in opposition to the tendency of certain extraneous forces which are calculated to disturb the movements of the valve, as sought to be determined by the balanced forces of weights and springs when the engine is in motion.
>
> To this end the invention consists in the combination of a dash-pot with the governor and pulley, said dash-pot connected with a fixed and a movable part, or with two relatively or unequally movable parts—as, for example, with the extremity of a weight-lever and the pulley-hub.
>
> In this class of governors the position of the eccentric is variably determined by the opposing and self-balancing forces exerted by the centripetally-acting spring or springs and the centrifugally-acting weight or weights connected with said springs, the intention being to hold the eccentric permanently in a certain poised position for a given speed of the wheel to which the governor is applied, and to vary the position of the eccentric exactly as the speed of said wheel is varied. There are, however, certain temporarily-acting causes of disturbance calculated to change the position of the eccentric independently of the speed of the wheel. The principal of these disturbing causes is the inertia of the reciprocating parts, including the eccentric and the parts actuated thereby; and a secondary cause is the gravity of the eccentric when not counterbalanced by some special device for the purpose. At a regular and very high speed of the governor wheel or pulley these disturbing forces operate but slightly, owing to the momentum of the weights, which serve to prevent their deflection from a regular course; but at lower speeds than that at which the apparatus is adjusted to run, and particularly in accelerating or retarding the engine, as in starting up or slowing down, these incidental disturbing forces interfere materially with the valve action and give an objectionable irregularity to the movements of the weights. In the case of an engine used for running a dynamo for electric-lighting purposes, and subject to sudden and wide changes in requisitions of power and speed, the effects of the disturbances referred to manifest themselves also in the quality or intensity of the lights. A dash-pot constructed and attached to the apparatus in such manner as to prevent sudden movements of the weight-levers or of the eccentric is found in practice to wholly overcome the defects indicated and to give a desirable steadiness and regularity to the movements of the movable parts of the governor, as well as accuracy and reliability to the cut-off action of the valve.
>
> * * * * * * *
>
> * * * The cylinder of the dash-pot is filled with glycerine or some other non-compressible liquid, preferably one that is also not congealable at a temperature to which the engine is likely to be exposed. By means of the dash-pot applied to the relatively movable and stationary parts or to the unequally-moving parts, as described, wide and sudden radial movements of the weights E' are prevented, and as a consequence the governor will have a steady and efficient action at all speeds of the pulley or wheel to which said governor is applied. * * *
>
> * * * * * * *
>
> By the term "dash-pot" in the appended claim I mean the device technically known by that name—usually comprising a closed cylinder, a piston having a passage through or around it, and a fluid confined in the cylinder, as shown—or its equivalent.

The patentee has but one claim, which is—

> In a fly-wheel governor, the combination, with relatively-movable parts, of a dash-pot, substantially as described.

The proof shows without dispute that as early as 1880 the Buckeye Manufacturing Company, of Salem, Ohio, placed upon the driving-shafts of their engines governors with weighted arms arranged to swing centrifugally as the shaft revolved so as to act upon the eccentric, and kept from swinging too readily by centripetal springs, the arrangement and function of the movable and fixed parts of the governor being substantially like the movable and fixed parts of the Ide governor, except that it had no dash-pot, the operative parts being held in place upon the shaft of the engine within a comparatively light shell or case with radial arms extending from the shaft. One of these Buckeye engines was placed in what was known as the "Pacific Elevator" or "Dow's Stores," in Brooklyn, in the State of New York, and its governor not securing such steadiness of motion in the engine as was desired, a dash-pot was, in December, 1880, put into the governor in substantially the manner shown by the defendant's "Exhibit B," in evidence in this case, the dash-pot in "Exhibit B" being attached to one of the swinging arms of the governor and to a fixed part, so that its operation was essentially the same as that of the dash-pot in the complainant's patent.

In July, 1881, governors similar in arrangement of parts and with dash-pots were put into the engines of the Hartford Carpet Company, at Thompsonville, Conn., and the engine of the Hartford Manilla Company, at Burnside, Conn., and these governors with dash-pots attached had continued in use on these engines up to the time the proofs were taken in this case, and all had proved effective in securing steadiness of action in the engines to which they were attached, or, as the witnesses expressed it, preventing sudden and violent fluctuations of the governor.

The dash-pots attached to these Buckeye governors were connected with a movable and fixed part of the governor in such a manner as to be accurately described by the specifications of complainant's patent. In other words, the structure of these Buckeye governors with the dash-pot added was such as to make them a manifest and palpable infringement of the complainant's patent if they had been made and used after instead of before that patent.

The only feature in which these Buckeye governors with the dash-pot added can be differentiated from the complainant's patent is, that they were not placed in the fly-wheel of the engines to which they were attached. Mr. Ide has taken this Brooklyn and Thompsonville governor out of the shell or disk in which it was placed by the agents of the Buckeye Company on the shaft and attached it to the hub and radial arms of the fly-wheel of his engine, and the claim of his patent is for putting this governor with dash-pot into the fly-wheel of the engine. The most that he has done has been to fasten this old Brooklyn and Thompsonville governor to the arms of the fly or balance wheel of his engine instead of leaving it on the driving-shaft, where he found it, and the only question is, has he invented anything in doing this? I do not learn from the proof that any new function is obtained from the combination covered by this claim. The governor still performs the same function and no other that it did when fastened to the shaft by the shell and

arms as in the Brooklyn and Thompsonville governors, and the fly-wheel still performs the functions it did before the governor was brought into it. Their joint operation, when combined, is the same, and only that of their separate operation in the older machines.

The patent, therefore, seems to me to come clearly within the rule in *Reckendorfer* v. *Faber* (92 U. S., 354) and *Pickering* v. *McCullough*, (104 U. S., 310.) It is true there may be some convenience in bringing these parts together and making a more compact machine, but that is a mere mechanical change which does not rise into the realm of invention.

As was said by Mr. Justice Mathews in the case last cited:

> In the patentable combinations of old elements all the constituents must so enter into it as that each qualifies every other. * * * It must form either a new machine of a distinct character and function or produce a result due to the joint co-operating action of all the elements. It is not a mere adding together of separate contributions.

For these reasons I am of opinion that the patent is not valid, and that the bill should be dismissed for want of equity.

U. S. Circuit Court—District of Massachusetts.

THE UNITED STATES OF AMERICA *v.* THE AMERICAN BELL TELEPHONE COMPANY *et al.*

Decided September 9, 1889.

1. PRACTICE IN THE COURTS—AMENDMENT OF EQUITY PLEADINGS.

Although under the acts of Congress the power of the courts of the United States with respect to the amendment of equity pleadings is plenary, the allowance of such amendment is a question of judicial discretion depending largely on the special circumstances of the cases.

2. SAME—SAME.

One of the defendants, C, filed a general answer to the bill and another defendant, B, filed a plea and answer in support thereof. Before any evidence had been taken in the cause the defendant C asked leave to withdraw its answer and to file the same plea and answer in support thereof which had been filed by the defendant B. *Held* that the motion was not open to the objection of introducing a new defense on a new state of facts, or of changing the substance of the case made by the bill, or of setting up a merely technical defense, and that, as the convenience of the case would be best promoted by having the issues proceed *pari passu* as to each defendant, the motion should be granted.

Mr. George A. Jenks and *Mr. Charles S. Whitman* for the complainant.

Mr. Chauncey Smith and *Mr. Elias Merwin* for the defendants.

COLT, *J.*:

In this case the defendant company has filed a general answer to the bill, and the defendant Bell has filed a plea and answer in support thereof. The defendant company now asks leave to withdraw its answer and to file the same plea and answer in support thereof which has been filed by Bell.

By section 954 of the Revised Statutes the courts of the United States may at any time permit either of the parties to amend any defect in the process or pleadings upon such conditions as they may in their discretion or by rule prescribe.

The plenary power of the courts of the United States with respect to amendment of pleadings under the acts of Congress is recognized in *Eberly* v. *Moore*, (24 How., 147.)

In *Hardin* v. *Boyd* (113 U. S., 756) the Supreme Court states the rule as follows:

> In reference to amendments of equity pleadings the courts have found it impracticable to lay down a rule that would cover all cases. Their allowance must at every stage of the cause rest in the discretion of the court, and that discretion must depend largely on the special circumstances of each case. It may be said generally that in passing upon applications to amend the ends of justice should never be sacrificed to mere form or by too rigid an adherence to technical rules of practice. Undoubtedly great caution should be exercised when the application comes after the litigation has continued for some time, or when the granting of it would cause serious inconvenience or expense to the opposite side. And an amendment should rarely, if ever, be permitted where it would materially change the very substance of the case made by the bill, and to which the parties have directed their proofs.

It thus appears that the allowance of amendments of equity pleadings is a question of judicial discretion, depending largely on the special circumstances of each case. The present motion is not open to the objection of introducing a new defense on a new state of facts, or of changing the substance of the case made by the bill. It is not made for the purpose of setting up a merely technical defense, nor after the litigation has continued and evidence has been taken, nor does it seem to me that granting it would cause inconvenience or expense to the other side. Upon this last point it is urged by the defendants that it will be more convenient and less expensive to first try the question of fraud which is raised by the plea, and which may dispose of the case. The counsel for the defendants further say that the general answer was filed on behalf of the Bell Company under the misapprehension that the equity rules of this court were the same as prevail in the Massachusetts State Court, and that but for this misapprehension the same plea and answer in support thereof would have been filed on behalf of the defendant company as was filed by the defendant Bell.

Although the question of priority of invention is raised by the bill, the defendants insist that when this case was before the Supreme Court on demurrer (128 U. S., 315) that Court directed its examination to the question of whether the bill contained sufficient allegations of fraud, and that the Court refused to go a step beyond the position that the Government had the power to bring suit to annul a patent in the event that it was obtained by fraud. In view of this opinion of the Supreme Court it is urged that the issue of fraud should be first tried as to both of the defendants.

With the decision of the Supreme Court before me, I think there are strong equitable grounds for granting this motion. Limiting the case to the question of fraud may confine the testimony within comparatively narrow bounds, whereas the question of priority alone involves a laborious and extensive examination. If there is an issue in the case which may dispose of it without going into that elaborate investigation, it seems to me that the discretion of the court should be exercised in favor of such a limitation. Again, so far as the defendant Bell is concerned, this issue must be first tried, because the plaintiff has filed a replication to Bell's plea.

While it must be admitted that a motion to withdraw an answer and substitute a plea is rare in equity causes, still, taking into consideration all the circumstances as presented in this case, I am of opinion that the justice and convenience of the case will be best promoted by having the issues proceed *pari passu* as to each defendant, and that therefore the motion should be granted.

Motion granted.

Changes in Classification.

(ORDER No. 578.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 2, 1889.

The following changes are directed in Division IV:

New Class 189, Iron Structures, and sub-classes thereunder are established, as follows:

1. Jails.
2. Buildings.
3. Grilles.
4. Metallic ceilings.

The following sub-classes are established:

In Class 14, Bridges:
11. Flooring.
12. Truss, Bow-string.

In Class 108, Roofing:
8. Flashing.

In Class 159, Fire Escapes and Ladders:
20. Fluid-check.
21. Fly-check.
22. Escapement-check.
23. Governor-check.

ROBERT J. FISHER,
Acting Commissioner.

Additional Sub-Classes.

(ORDER No. 579.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 3, 1889.

The following additional sub-classes are hereby established in Division XXVI:

In Class 171, Electricity, Generation:
121. Inductoriums—
122. Induction-coils.
123. Transformers, Rotary.
124. Transformers, Stationary.
125. Pyro-magneto-electric devices.

In Class 172, Electricity, Motive-Power:
126. Motors, Reciprocating.

ROBERT J. FISHER,
Acting Commissioner.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., September 13, 1889.

SIR: The Secretary of the Interior has ordered that J. M. D. Miller, of Iuka, Miss., be not recognized after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,
E. M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

Issue of October 15, 1889.

DESIGNS.

19,352.—BROUGHAM BODY.—*William Richard Connor*, New York, N. Y. Application filed September 11, 1889. Serial No. 323,670. Term of patent 3½ years.

19,353.—HEATING-STOVE.—*James Dwyer*, Detroit, Mich Application filed August 19, 1889. Serial No. 321,308. Term of patent 7 years.

19,354.—CAP.—*Jacob M. Frank*, Philadelphia, Pa. Application filed February 16, 1889. Serial No. 300,173. Term of patent 3½ years.

19,355.—FONT OF PRINTING-TYPE.—*William W. Jackson*, Philadelphia, Pa., assignor to *The MacKellar, Smiths & Jordan Company*, same place. Application filed September 16, 1889. Serial No. 324,107. Term of patent 14 years.

19,356.—TOY SAVINGS-BANK.—*Charles G. Shepard* and *Peter Adams*, Buffalo, N. Y.; said *Adams* assignor to *Walter J. Shepard*. Application filed August 12, 1889. Serial No. 320,506. Term of patent 7 years.

19,357.—BOTTLE.—*William G. Walter*, Pittsburg, Pa. Application filed August 17, 1889. Serial No. 321,151. Term of patent 3½ years.

19,358 and 19,359.—BELT BUCKLE.—*Louis Sanders*, Brooklyn, N. Y. Applications filed September 11, 1889. Serial Nos. 323,653 and 323,654. Term of patents 3½ years.

19,360.—BELT.—*Louis Sanders*, Brooklyn, N. Y. Application filed September 11, 1889. Serial No. 323,655. Term of patent 3½ years.

19,361.—TEA OR COFFEE POT HANDLE.—*Charles G. Shepard* and *Peter Adams*, Buffalo, N. Y.; said *Adams* assignor to *Walter J. Shepard*, same place. Application filed July 8, 1889. Serial No. 316,845. Term of patent 7 years.

19,362.—GUM FOR ARTIFICIAL TEETH.—*Eli T. Starr*, Philadelphia, Pa., assignor to *The S. S. White Dental Manufacturing Company*, same place. Application filed April 16, 1884. Serial No. 123,160. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

17,096.—TABLE-SALT.—*William C. Baird*, New York, N. Y. Application filed August 30, 1889. Used since August 15, 1889.
"The word 'ROYAL.'"

17,097.—SHOES.—*Eva Palsimer*, Philadelphia, Pa. Application filed September 11, 1889. Used since January, 1888.
"The word 'OUR,' the representation of an American dollar, upon the face of which appears the numeral '3,' in combination with a hand holding a shoe with one side turned over bearing the inscription 'SEWED.'"

17,098.—CHOCOLATE CONFECTIONS.—*Fobes, Hayward & Company*, Boston, Mass. Application filed August 31, 1889. Used since September, 1886.
"The word 'CLIMAX.'"

17,099.—LOZENGES.—*Fobes, Hayward & Company*, Boston, Mass. Application filed August 31, 1889 Used since December, 1878.
"The word 'PEERLESS.'"

17,100.—SHOE-ELASTIC.—*Herbert & Rapp Company*, Brockton and Boston, Mass. Application filed September 14, 1889. Used since August 15, 1889.
"A reversely-pieced triangular figure, at every apex of which is a re-entering angle containing a small ball-shaped device, within which figure are the words 'VIS GORE.'"

17,101.—METALLIC RINGS FOR THE CURE OF RHEUMATISM AND THE LIKE.—*Leonard G. Abbott*, Boston, Mass. Application filed August 31, 1889. Used since December 15, 1888.
"The compound word 'FRANCO-GERMAN.'"

17,102.—CIGARS.—*Pedro Mireda*, Havana, Cuba. Application filed September 18, 1889. Used since July, 1880.
"The words 'LA DILIGENCIA.'"

17,103.—BASIN-LIFTS FOR WASH-BASINS AND BATH TUBS.—*William H. Ward*, Boston, Mass. Application filed August 26, 1889. Used since February, 1887.
"The word 'ACME.'"

17,104.—VALVES FOR WATER-CLOSET TANKS AND CISTERNS.—*William H. Ward*, Boston, Mass. Application filed August 26, 1889. Used since February, 1887.
"The word 'IMPERIAL.'"

17,105.—WATCH-MOVEMENTS.—*American Waltham Watch Company*, Waltham, Mass. Application filed September 4, 1889. Used since January 1, 1861.
"The words 'APPLETON, TRACY & Co.' stamped or engraved in a semicircular or curved manner in script letters."

17,106.—STRAW CIGARETTE-PAPER.—*Charles E. Wackerhagen*, Canaan, N. Y. Application filed June 10, 1889. Used since January 1, 1881.
"A parallelogram in light tint representing a cigarette-wrapper having two or more longitudinal water-lines from end to end."

17,107.—LINEN HYDRAULIC HOSE.—*Eureka Fire Hose Company*, New York, N. Y. Application filed August 21, 1889. Used since July, 1889.
"Red, white, and blue lines running longitudinally upon the hose and the words 'EUREKA UNDERWRITERS.'"

17,108.—COGNAC BRANDY.—*Gautier Frères*, Aigre, France. Application filed August 8, 1888. Used since 1862.
"A multicolor label with irregular borders, showing a mural crown and turreted upper corners."

17,109.—COGNAC BRANDY.—*Gautier Frères*, Aigre, France. Application filed August 8, 1888. Used since 1865.
"A white label in the form of an inverted truncated cone with rounded upper corners and a golden border."

17,110.—PREPARATIONS ENTITLED LIQ. SANTAL FLAV. C BUCHU ET CUBEBA AND MIST. PEPSINÆ CO. C BISMUTHO.—*C. J. Hewlett & Son*, London, England. Application filed May 12, 1880. Used since December 1, 1875.
"The representation of an owl."

17,111.—CACHEMIRES FOR DRESSES.—*Hilton, Hughes & Denning*, New York, N. Y., and Paris, France. Application filed August 20, 1889. Used since 1872.
"The letters 'R D.'"

17,112.—WATCH-CASES.—*Roy Watch Case Company*, New York, N. Y. Application filed September 16, 1889. Used since July 1, 1885.
"The word 'ROY.'"

17,113.—GAMES.—*Ralph G. Barnes*, Syracuse, N. Y. Application filed September 3, 1889. Used since July 1, 1888.
"The word 'SAFE.'"

17,114.—EMMENAGOGUE.—*Chichester Chemical Company*, Philadelphia, Pa. Application filed January 24, 1889. Used since October 20, 1887.
"The words 'CHICHESTER'S ENGLISH RED CROSS DIAMOND BRAND PENNYROYAL PILLS.'"

17,115.—PUZZLES.—*James C. Collin*, Syracuse, N. Y. Application filed September 5, 1889. Used since July 1, 1886.
"The word 'CANUDOIT.'"

17,116.—GLOVES.—*August C. Hartmann*, New York, N. Y. Application filed September 6, 1889. Used since September 4, 1889.
"The words 'LE GRAND PRIX.'"

17,117.—PLAYING-CARDS.—*The Russell & Morgan Printing Company*, Cincinnati, Ohio. Application filed September 7, 1889. Used since June 26, 1888.
"The word 'SEAT.'"

17,118.—SIDE-SPRING WAGONS.—*Harvey A. Moyer*, Syracuse, N. Y. Application filed September 5, 1889. Used since January 1, 1889.
"The word 'BANNER.'"

17,119.—TONICS, FEBRIFUGES, AND THE LIKE.—*Charles Wright & Company*, Detroit, Mich. Application filed September 27, 1888. Used since April 1, 1888.
"The representation of the head of a gargoyle inclosed by a circle having a shield partly within it."

LABELS.

6,035.—Title: "CHICHESTER'S ENGLISH, DIAMOND BRAND, RED CROSS, PENNYROYAL PILLS."—*Chichester Chemical Co.*, Philadelphia, Pa. Application filed December 24, 1888.

6,036.—Title: "CHICHESTER'S ENGLISH, DIAMOND BRAND, RED CROSS, PENNYROYAL PILLS."—*Chichester Chemical Co.*, Philadelphia, Pa. Application filed December 24, 1888. (Trade-Mark Registered.)

6,037.—Title: "DR. PETTITT'S PERFECT BLOOD AND LIVER TONIC." *Grayson Medicine Company*, Sherman, Tex. Application filed July 16, 1889.

6,038.—Title: "STYPTIC LOTION FOR BURNS, SCALDS, FROSTBITES, CUTS, AND SORES."—*Edwin Augustus Levering*, Germantown, Pa. Application filed August 30, 1889.

6,039.—Title: "DR. TOLAND'S LIVER TONIC OR BLOOD PURIFIER." *Oscar Lincoln*, Prescott, Arizona Ter. Application filed September 18, 1889.

6,040.—Title: "DR. HILDEBRAND'S IMPROVED SYPHON VAGINAL DOUCHE AND IRRIGATOR."—*E. H. Sargent & Company*, Chicago, Ill. Application filed September 9, 1889.

DISCLAIMERS.

197,441.—*Basil M. Wilkerson*, Baltimore, Md. Patent dated November 20, 1877. IMPROVEMENT IN DENTISTS' CHAIRS. Disclaimer filed October 3, 1889, by the present assignees, *The S. S. White Dental Manufacturing Co.*

Enters its disclaimer to that part of the claim in the specification which is in the following words, to wit:
"23. In a dental chair, a head-rest pivoted twice about parallel axes and once about a ball-and-socket joint, as set forth."

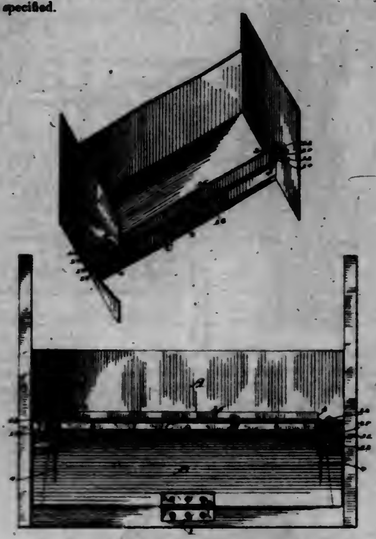
315,559.—*August Schwarzschild* and *Nelson Greenfield*, New York, N. Y. Patent dated April 14, 1885. IMPROVEMENT IN CONFECTIONERY. Disclaimer filed October 9, 1889, by the patentees.

Enter their disclaimer "to that part of the claim in said specification which includes more, or can now be construed to include more, than a candy egg or a candy consisting of the combination described in said specification and claim and resembling in its whole combination an egg in exterior and interior construction and general appearance, the intent and meaning of this disclaimer being to limit and confine the invention described in the specification and claimed in the claim to a candy consisting of the combination of a hard smooth exterior or shell composed of sugar or sugar compound with a soft interior composed of marsh-mallow or moonshiner stock, the whole combination made to resemble an egg in exterior and interior construction and general appearance."

PATENTS

GRANTED OCTOBER 15, 1889.

412,715. BAND-CUTTING FEEDER FOR THRASHING-MACHINES. CHARLES H. ASHPAUGH and JOHN J. WILHELM, Cedar Grove, Ind. Filed Dec. 26, 1888. Serial No. 294,842. (No model.)



Claim.—An endless traveling carrier having projecting pins or fingers and a rotating shaft having a central band-cutter and oppositely-twisted spreading spirals on each side of said cutter, in combination with a vertically-movable feed-controlling frame located behind said rotary shaft, downwardly-projecting fingers *q* on said frame, a lever for raising and lowering said frame, a vertically-sliding bar W, sliding in said frame in front of said fingers *q*, and a rotating crank-shaft journaled in said frame and operating said bar W, substantially as set forth.

412,716. DEVICE FOR PREVENTING HORSES FROM CRIBBING. ANDREW J. AVERY, Norway, Me. Filed Apr. 17, 1889. Serial No. 307,547. (No model.)

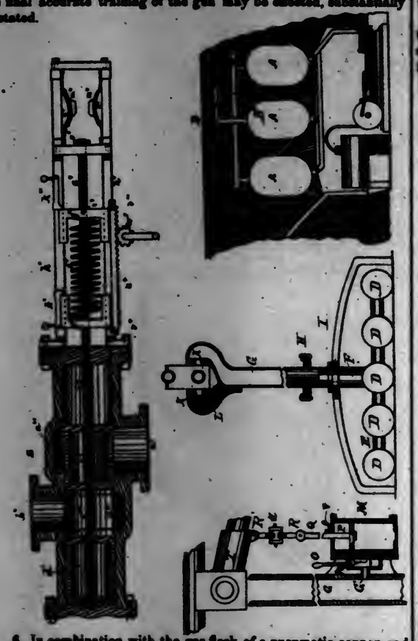
Claim.—1. The combination, with a feed-box, of a hinged side, a shaft journaled therein, a swinging frame arranged on said shaft to swing upward over the upper edge of the hinged side, and chains secured on said shaft and to the sides of the feed-box, substantially as described, and for the purpose specified.

2. The combination, with a feed-box, of a hinged side formed with a tubular bearing longitudinally extended through it, and cut-away end portions, a shaft projected through said tubular bearing and provided with annular collars to prevent end-play, clamping-sleeves on the projecting ends of said shaft, chains having one end secured to said sleeves and the other end fastened to the feed-box, and the swinging frame formed with slotted end arms arranged on the shaft and clamped between the sleeves and the collars thereon, substantially as specified.

3. In a device for preventing animals from cribbing, the combination of a hinged plate constituting one side of the feed-box and provided with a tubular bearing extended longitudinally through it, a shaft mounted in said bearing, a swinging frame mounted on said shaft to turn upward over the upper edge of the hinged plate, and means, substantially as described, for holding the plate in normal position and for throwing the swinging frame upward, all substantially as specified.

412,717. PNEUMATIC CANNON AND SUPPLY SYSTEM. WALLACE A. BARTLETT, Washington, D. C., assignor, by mesne assignments, to the Pneumatic Dynamite Gun Company, New York, N. Y. Filed Mar. 9, 1886. Serial No. 193,532. (No model.)

Claim.—1. A pneumatic cannon, an air-flask therewith, a source of air-supply, (as a compressor or tank,) and separate systems of protected supply-pipes leading to the gun-flask from the source of supply.



2. In combination with a gun, a supply-pipe leading thereto, a stop-valve, connections with the pipe and valve on the gun side for opening said valve, and automatic mechanism (as a spring or its equivalent) for closing the valve on the reduction of back-pressure.

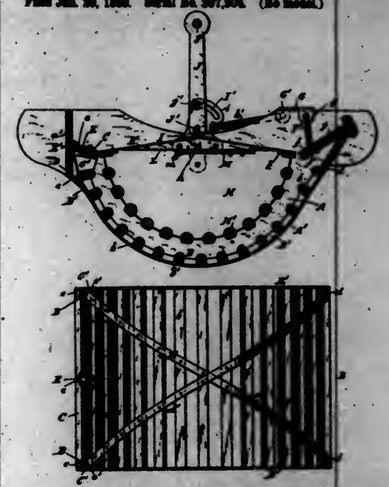
3. In combination with the gas-flask of a pneumatic cannon, a plurality of supply-pipes leading thereto, each pipe being provided with a check-valve and a back-pressure valve.

4. The combination, with the gas-supply pipe of a pneumatic cannon, of a closing-valve, a spring or its equivalent to close the same, and a bolt or catch operated by the back-pressure in the pipe to retain the valve open, but to permit its closure on the reduction of back-pressure, substantially as set forth.

5. The combination, with a pneumatic training device, of a sup-

plementary screw attachment between the same and the gun, whereby the final accurate training of the gun may be effected, substantially as stated.

6. In combination with the gas-flask of a pneumatic cannon and a supply-pipe or standard leading therefrom, on which the gun is supported, a support for said standard independent of the flask, substantially as described.



412,718. STEAM-BOILER. JOHN RAMBHART, Altoona, Pa. Filed June 8, 1889. Serial No. 313,542. (No model.)

Claim.—1. In combination, the fire-pot, the upper and lower flue-sheets, the main flues *c'*, extending from the fire-box above the water-line and connected with the upper sheet *g*, the shell *K* for the upper flue-sheet, said shell extending below the water-line, the flange K, and the series of supplemental tubes *c* outside the shell *K* and below the water-line, substantially as described.

2. In combination, the fire-pot, the flue-sheets, the inner series of tubes *c'*, extending above the water-line, the shell *K* and flange K, the supplemental tubes *c* below the water-line, and the ring 4 upon the flange K, substantially as described.

412,719. WASHING-MACHINE. GEORGE H. ROSS, Lebanon, Ind. Filed Jan. 29, 1889. Serial No. 297,904. (No model.)

Claim.—1. The combination, with the curved side plates of the wash-board having the enlargements C and the lugs D at one end, of the parallel slats secured between the side plates, with their ends abutting against the sides of said plates, the slanting end pieces secured between the said enlargements, and the diagonally-crossed stays secured to the under side of each of the slats and to lugs D, substantially as and for the purpose set forth.

2. In a washing-machine, the combination, with the drip-board provided with a groove, of the rod pivoted in the said groove, a plate *f'* in the middle of the drip-board, and two similar plates at the ends of the said board upon the opposite side of the crank-rod from the central plate, each of the said plates having one end secured to the drip-board and the other end bent into the groove over the said rod for retaining it in position, substantially as set forth.

3. The combination, with a washing-machine tub, of the plates G, secured upon the top of the sides of the tub and provided with the downwardly-projecting lugs *g* and G' at the opposite ends of the said plates and inside and outside the tub respectively, each lug being provided with a pivot-hole, substantially as and for the purpose set forth.

4. The combination, with the wash-tub and the pivot-rod A, supported by the tub, of the reciprocating rubber, the plates secured to the sides of the rubber and journaled upon the said pivot-rod and provided with the ledges *i'*, resting on the top of the rubber, and the extensions *i* above the rubber, having the curved slots *I* in them, the handles pivoted to said plates between the curved slots and the pivot-rod holes, and the screws passing through said curved slots and adjustably connecting the handles to the said plates, substantially as set forth.

5. The combination, with a reciprocating rubber, of a pivot-rod, a lid closing the top of the rubber, and a connecting device—such as a clip—for attaching the lid to the pivot-rod and retaining said lid in a horizontal position when the rubber is moved back and forth, substantially as set forth.

6. The combination, with a reciprocating open-topped rubber, of a pivot-rod for the rubber, a removable non-reciprocating lid closing the top of the rubber when in its central position, and spring-clips rigidly secured to the lid at one end, with their free ends engaging with the pivot-rod, for connecting the lid to the said pivot-rod, substantially as set forth.

7. The combination, with a reciprocating open-topped rubber, of a pivot-rod for the rubber provided with flat places on its lower side, a lid fitting inside the top of the rubber, and the springs secured to the lid and provided with downwardly-bent ends and with horizontal portions bearing against the said flat places on the pivot-rod, substantially as and for the purpose set forth.

8. The combination, with a reciprocating open-topped rubber, of

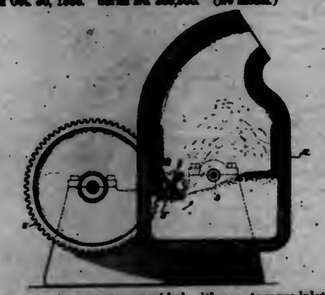
a pivot-rod for the rubber, a removable sheet-metal lid sloping downwardly at each end and provided with flat-bottomed sides having central notches fitting over the pivot-rod, and springs secured to the said side pieces of the lid and retaining the pivot-rod in the said notches, substantially as and for the purpose set forth.

412,720. APPARATUS FOR HEATING GLUE. HILLARD P. BRAMAN, Chicago, Ill. Filed Mar. 9, 1889. Serial No. 302,993. (No model.)

Claim.—1. The apparatus for melting glue, consisting of the covered steam-chamber A, having an interior perforated partition for diffusing the steam, and a steam-inlet, in combination with open-work trays for the glue, adapted to be suspended in said chamber, substantially as set forth.

2. The apparatus for melting glue, consisting of the covered cylinder A, an inner perforated cylinder B, the two forming a steam-space *c*, and a steam-inlet, in combination with open-work trays for holding the glue, adapted to be suspended within the inner cylinder, substantially as set forth.

3. The apparatus for melting glue, consisting of the covered chamber A, having a steam-inlet, and means for diffusing and breaking up the current of the steam, in combination with one or more trays for holding the glue and adapted to be suspended in said chamber, substantially as set forth.



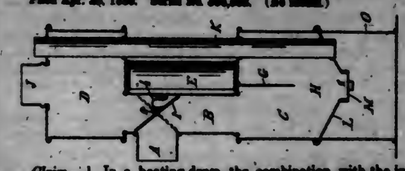
4. The apparatus for melting glue, consisting of a covered chamber having a steam-inlet and provision for catching the melted glue as it drops from the trays, in combination with open-work trays, in which the glue may be suspended in said chamber, substantially as set forth.

5. The apparatus for melting glue, consisting of a chamber covered at the top and permanently open at the bottom, and having a steam-inlet, in combination with one or more trays, in which the glue may be suspended in said chamber, substantially as set forth.

6. The combination, with the chamber A and its steam-inlet, of an interior partition for diffusing and breaking up the current of steam, such partition being perforated except in that portion opposite the inlet, and trays for holding the glue, substantially as set forth.

7. The combination, with the chamber A and its steam-inlet, of the inner perforated cylinder B, the two forming the space *c*, wherein the steam is diffused around the chamber and its currents broken up, the drainage-pipe A, for draining off the water of condensation from such space *c*, and trays for holding the glue, substantially as set forth.

412,721. CONVERTER. JOHN W. BOOTHALEL, Springfield, Ohio, assignor to the Bookwalter Steel and Iron Company, Jersey City, N. J. Filed Oct. 30, 1888. Serial No. 289,980. (No model.)



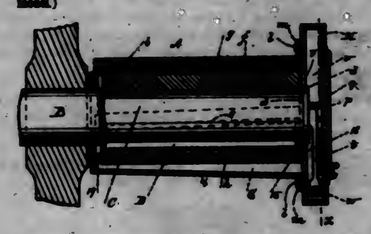
Claim.—1. A converter provided with one or more inlet-pipes or tuyeres, and with a paddle arranged above and in position to act upon limited portions of the bath of metal in the converter at the surface of the metal to separate such portions from the main body and expose them to the converting agent, substantially as and for the purpose set forth.

2. The combination, with a converter having a tuyere, of a revolving paddle arranged to act locally upon a part of the bath of metal in the converter at the surface thereof to throw the same upward from the main body, substantially as described.

3. The combination, with a tilting converter having a tuyere, of a revolving paddle arranged with its axis above the level of the surface of the bath of metal and at one side of the center of the converter, substantially as set forth.

4. The combination of a converter having a tuyere, a revolving paddle arranged with its transverse axis above the level of the surface of the metal in the converter in position for the blades to act only on a limited portion of metal at the surface of the bath, and a driving-shaft for imparting rapid rotation to the paddle-shaft, substantially as set forth.

412,722. HEATING-DRUM. ANDREW W. BRADY, Shepherd, Mich. Filed Apr. 26, 1889. Serial No. 308,382. (No model.)



Claim.—1. In a heating-drum, the combination, with the inlet-pipe A and the flue B, formed with chambers C and D, of the reversible damper I, the flues E and F, connecting the two chambers, and the circulating-flue K, arranged substantially as shown and described.

2. In a heating-drum, the combination of the inlet-pipe A, the flue B, provided with the reversible spring-controlled damper, the chamber C, provided with the inclined bottom and the removable cap and with the partition G, the flues E and F, and chamber D, and the circulating-flue K, the parts being arranged to operate substantially as described.

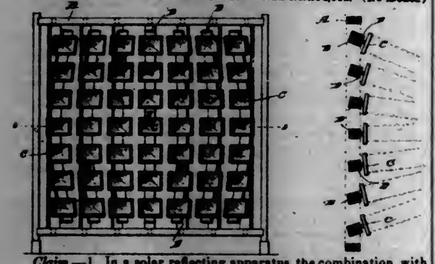
3. In a heating-drum, the combination, with the inlet-pipe, of the vertical flue B, provided with the damper having the abutment *a* and the spring *b*, arranged to hold it in either one of its adjusted positions, substantially as and for the purpose described.

412,723. JOURNAL-BOX FOR RAILWAY-CARS. PATRICK BROWSLEY, St. John, New Brunswick, Canada, assignor of one-half to James Straton, same place. Filed Mar. 5, 1888. Serial No. 301,493. (No model.)

Claim.—1. In a journal-box of the character described, the combination of a body provided with a bushing in its upper portion, a horizontal partition below the axle-opening, forming a packing-chamber and lubricant-reservoir, inwardly-inclined distributing-shelves above said packing-chamber, a box on the outer end of said body, into which the reservoir opens, ducts leading from said box onto said shelves, and an arm secured to the journal and fitted to rotate in said box, substantially as and for the purpose set forth.

2. In a device of the character described, the combination of a body, a bushing bearing upon the axle-journal, a box in the outer end of said body provided with a door, a packing-chamber in said body opening into said box, a door for said chamber, a reservoir in the body opening into said box, ducts leading from said box onto inwardly-inclined distributing-shelves in the body, and a laterally-projecting arm on said journal fitted to rotate in said box and raise the lubricant to said ducts, substantially as described.

3. In a journal-box, a body provided with a bushing for supporting it on an axle-journal, a box on said body provided with a door, an oil-reservoir leading into said box, ducts leading from the box onto inclined shelves in the body for distributing the lubricant onto the journal, and an arm fixed to the outer end of the journal and rotating in said box, said arm having a forked head, whereby the lubricant



from the reservoir may be conveyed to said ducts, substantially as described.

4. In a journal-box, a body provided with a bushing bearing on the axle-journal, a circular box on the outer end of said body provided with a door, a packing-chamber below said journal opening into said box, an oil-reservoir opening into said box and provided with an outwardly-inclined bottom, ducts leading from said box onto inwardly-inclined distributing-shelves in said body, and an arm projecting laterally from the outer end of said journal and fitted to rotate in said box, said arm having a forked head provided with curved prongs, whereby oil from the reservoir may be conveyed to said ducts, substantially as described.

5. In a journal-box, the axle-journal C, provided with the flange *d*, in combination with the body A, having the bushing *g*, the box H on said body, the reservoir G, opening into said box, the inclined shelves 17, the ducts 18, leading from said box to said shelves, and the arm *t*, secured to said journal, all being arranged to operate substantially as described.

6. In a journal-box, the combination of the axle B, the body A, having the bushing *g* bearing on the journal C, the box H, provided with the inclined bottom *i* and door *p*, the partitions *h*, forming packing-chamber D and reservoir G, opening into said box, the door 16 for said chamber, the ducts 18, leading from said box to inclined distributing-shelves in said body, and the arm *t*, provided with the forked head *w*, substantially as and for the purpose set forth and described.

412,724. SOLAR REFLECTING APPARATUS. WILLIAM CALVER, Washington, D. C. Filed Dec. 31, 1888. Serial No. 294,992. (No model.)

Claim.—1. In a solar reflecting apparatus, the combination, with a mirror-supporting frame, of a series of mirror-sustaining bars pivoted to said frame and each provided with a mirror-carrying strip, and a series of mirrors carried by each of said strips, substantially as set forth.

2. In a solar reflecting apparatus, the combination, with a mirror-supporting bar, of a curved or flexible mirror-carrying strip attached to said bar, and a series of mirrors carried by said strip, substantially as set forth.

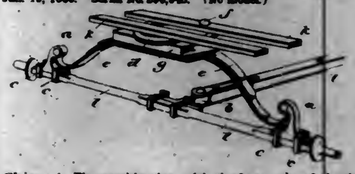
3. In a solar reflecting apparatus, the combination, with a mirror-supporting bar, of a flexible strip attached thereto, a series of mirrors carried by said strip, and adjusting appliances for bending the mirror-carrying strip to any desired curvature, substantially as set forth.

412,725. SOLAR STOVE. WILLIAM CALVER, Washington, D. C. Filed Dec. 31, 1888. Serial No. 294,993. (No model.)

Claim.—1. A solar stove consisting of inner and outer boxes with spaces between them, one side of each of said boxes being of transparent material, substantially as set forth.

2. A solar stove consisting of inner and outer boxes with spaces between them, one side of each of said boxes being transparent and the outer box having a top extension, substantially as set forth.

3. A solar stove consisting of inner and outer boxes with spaces between them, one side of each of said boxes being transparent and the outer box having a top extension with a mirror-facing on its under side, substantially as set forth.

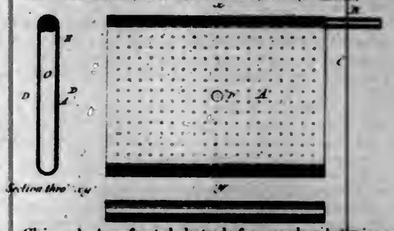


4. A solar stove consisting of inner and outer boxes with spaces between them, one side of each of said boxes being transparent and the outer box having top and side extensions on its transparent side, substantially as set forth.

5. A solar stove consisting of inner and outer boxes with spaces between them, said boxes both having transparent doors, substantially as set forth.

6. A solar stove consisting of inner and outer boxes with spaces between them, and provided with transparent doors, combined with a thin flat removable boiler having an enlarged top and an extended base, substantially as set forth.

7. A boiler for a solar stove, formed thin and flat and having an enlarged top and an extended base, substantially as set forth.



412,726. VEHICLE-GEAR. DANIEL W. CARP, Lincoln, Nebr. Filed Jan. 19, 1889. Serial No. 296,945. (No model.)

Claim.—1. The combination, with the front axle, of the shackles secured thereon and against the shoulders thereof, the springs secured at one end to the shackles and at the opposite end to the head-block, the lower section of fifth-wheel arranged upon the upper side of the head-block, the spring-bars, the upper section of fifth-wheel secured to said bars, both sections of said wheel having concentrically-arranged apertures and connected by a bolt passing through said apertures, substantially as specified.

2. The combination, with the front axle, of the shackles secured thereon and against the shoulders thereof, the springs secured at one end to the shackles and at the opposite end to the head-block, the lower section of fifth-wheel arranged upon the upper side of the head-block, the spring-bars, the upper section of fifth-wheel secured to said bars, both sections of said wheel having concentrically-arranged apertures and connected by a bolt passing through said apertures, and the reach having its forward end secured to the front axle beneath the fifth-wheel and free from the latter, substantially as specified.

412,727. SECONDARY BATTERY. HIRAM H. CARPENTER, Denver, Colo. Filed Dec. 26, 1888. Serial No. 294,689. (No model.)

Claim.—1. A perforated electrode for secondary batteries, composed of cerusite made into compressed tablets and inclosed in a perforated case composed of lead or any alloy thereof.

2. A perforated electrode for secondary or storage batteries, made or composed of cerusite, substantially as described.

3. An electrode for secondary or storage batteries, perforated through and through with a multiplicity of small holes, composed entirely of active matter, with a conducting support or case A, also perforated, as and for the purpose intended, substantially as described.

4. An electrode for secondary batteries, composed of cerusite, and perforated as herein described, in combination with a perforated envelope or case having a post made integral therewith, substantially as described.

412,728. COMBINED HORSESHOE NAIL AND CALK. ASMUS CARSTENS, Flensburg, Prussia, Germany. Filed July 11, 1888. Serial No. 279,604. (No model.) Patented in Germany Nov. 29, 1887, No. 44,297; in Norway June 5, 1888, No. 894; in England June 6, 1888, No. 8,394; in Sweden June 7, 1888, No. 1,565; in Canada Sept. 11, 1888, No. 29,938, and in Denmark Nov. 28, 1888, No. 967.

Claim.—A horseshoe-nail having, as usual, a tapered head to fit a corresponding socket in the shoe, said head having on its front surface ribs or ball-shaped projections integral with the face of the nail-head, arranged in a curved line, so that the head may be wedged into its socket, and having also integral therewith a tapered calk, substantially as shown and described.

412,729. LEAF AND FLOWER ALBUM. HIRAM T. COOK, Alba, Mich., assignor of one-half to Frank D. Hopkins, same place. Filed Oct. 23, 1888. Serial No. 288,893. (No model.)

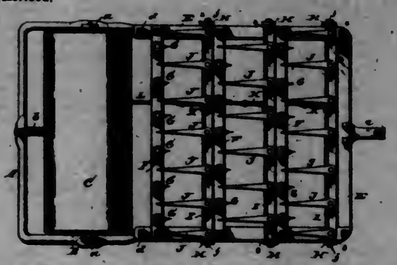
Claim.—1. The herein-described book or album having pieces arranged between the leaves at their edges to hold their opposing sides apart, and having ornamental pieces applied to the sides of the leaves and secured thereto at intervals, whereby the stems of leaves and other articles may be inserted between the said pieces and the leaves, substantially as and for the purpose specified.

2. The herein-described leaf for albums and books, having its edges or corners thickened by separate pieces applied thereto between the edges and secured at intervals, whereby spaces are left between the points of attachment for the insertion of the stems of leaves and other articles, substantially as described.

412,730. COOKING UTENSIL. CHRISTOPHER G. DAVIS, Kansas City, Mo. Filed June 3, 1889. Serial No. 312,967. (No model.)

Claim.—1. The combination, with a pan provided with an air-tight cover, of a reticulated grate hinged to the interior wall of said pan above its bottom, a leg to support the opposite end of said grate above the bottom of the pan, and a bail secured to the free end of said grate, substantially as set forth.

2. The combination, with a pan provided with an air-tight cover, of a reticulated grate hinged to the interior wall of said pan above its bottom, and a support for the opposite edge of said grate.



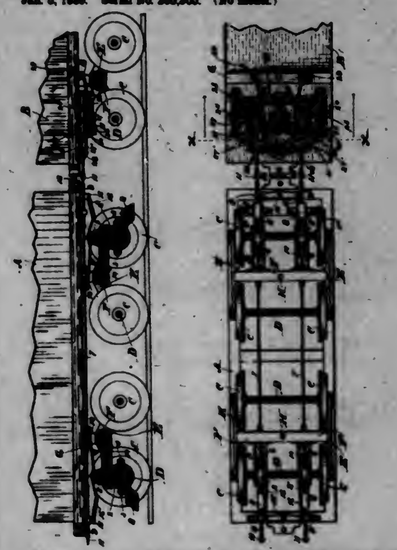
3. The combination, with a pan provided with an air-tight cover and a socket adapted to be engaged by a stove-lid hook, of a grate inclosed within said pan and supported above its bottom.

412,731. COMBINED HARROW AND ROLLER. JAMES A. DAWSON, Tiptonville, Tenn. Filed June 15, 1888. Serial No. 314,326. (No model.)

Claim.—1. The combination, with the roller-frame and the roller, of the harrow-frame pivotally connected to the roller-frame and provided with harrow-teeth and teeth for ejecting trash, substantially as shown and described.

2. The combination, with the roller and its frame, of the harrow-frame, the harrow-teeth attached thereto, and the trash-ejector teeth on said harrow-frame, and means for raising and lowering the ejector-teeth independent of the harrow-frame, substantially as and for the purpose specified.

3. The combination, with the roller-frame, the roller, and the harrow-frame and the harrow-teeth, of the trash-ejector teeth on the harrow-frame and free to vibrate laterally, substantially as shown and described.



4. The combination, with the roller and its frame and the harrow-frame and its teeth, of the lugs attached to the side bars of the harrow-frame, the bars I, having bearings in said lugs and formed with shoulders and free to move endwise in their bearings, and the teeth J, attached to said bars, substantially as and for the purpose specified.

5. The combination, with the roller and its frame, of the harrow-frame pivotally connected to the roller-frame, the harrow-teeth on the harrow-frame, the bars I, journaled in bearings on the harrow-frame, the arms K, attached at their lower ends to said bars, and the longitudinal bar L, connecting the upper ends of said arms, substantially as shown and described, and for the purpose specified.

6. The combination, with the roller and the harrow-teeth and their frames, of the trash-ejector teeth arranged at an angle of about forty-five degrees with the harrow-teeth and in the spaces between the said harrow-teeth, as set forth.

412,732. CAR-MOVER. BERA DUDERSTADT, Milwaukee, Wis. Filed Jan. 3, 1889. Serial No. 295,905. (No model.)

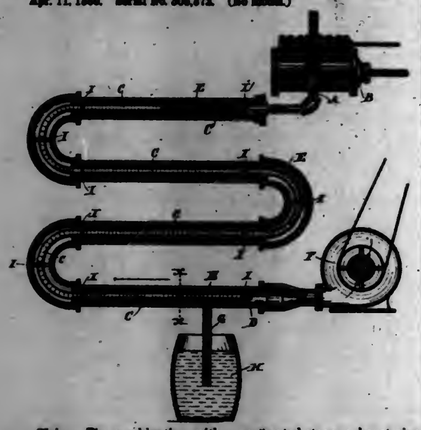
Claim.—1. A car-mover consisting of two ratchet-wheels rigid on a car-axle, two cases, one about each ratchet-wheel, oscillating on the axle, each provided with a gravity-weight or counterpoise and carrying a pivoted pawl, in combination with two reciprocating rods connected with the oscillating cases, and means, substantially as described, for reciprocating the rods, all for the purpose set forth.

2. A car-mover consisting of two ratchet-wheels rigid on a car-axle, two cases, one about each ratchet-wheel, oscillating on the axle and carrying a pivoted pawl, in combination with two reciprocating rods connected, respectively, with the oscillating cases, which rods, being connected with mechanism for operating them, are adapted for tilting the cases alternately, and a central pivoted oscillating lever

connected at its ends to the oscillating cases, whereby when one case is tilted forward the other case is drawn up rearwardly; substantially as described.

3. The combination, in a car, of two or more sets of ratchets, cases, pawls, and two reciprocating rods connected with the cases, each set of ratchets being on one axle, and the ratchet-wheels and cases of the two sets being, in sets, reversed in direction, with two reciprocating rods, each rod being connected with one case of each set, whereby the two rods and the two cases of one or more sets may be alternately tilted in the same direction, and by the same rods, operated in the reversed direction, the two cases of one or more of the other sets may be tilted in the other direction, substantially as described.

4. In a car-mover, a tilting case and therein a pulley having a double groove, or groove in the bottom of a groove, in its periphery, in combination with a chain running therein, such chain being made of links alternately at right angles to each other, substantially as described.



5. In the tilting case of a car-mover, a pivoted pawl and a thereto-pivoted arm supported on the case, and a stationary bracket, against which the arm is adapted to impinge, substantially as and for the purpose set forth.

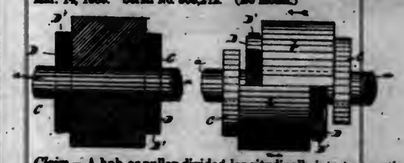
6. In the tilting case of a car-mover, a grease-cup having a false top with an aperture therein so located as to permit a fluid lubricant to come or be brought up to the supporting-axle by the tilting of the case, substantially as described.

7. The combination of ratchets, pawls, and cases in sets on the axles of a car and two reciprocating rods, one connected to each of a set of cases and both connected to the respective ends of a centrally-pivoted lever, with a movable carriage supported in ways on the bottom of a car and carrying the centrally-pivoted lever, to which the reciprocating rods are connected, the carriage by its movement being adapted to take up slack in the reciprocating rods, substantially as described.

8. A car-mover consisting of two ratchet-wheels rigid on a car-axle, two cases, one about each ratchet-wheel, oscillating on the axle, each provided with a gravity-weight and carrying a pivoted pawl, in combination with two reciprocating rods connected, respectively, with the oscillating cases, which rods, being connected with mechanism for operating them, are adapted for tilting the cases alternately, and a central pivoted lever, connected at its ends to the oscillating cases, whereby when one case is tilted forward the other case is drawn rearwardly, substantially as described.

412,783. CONDENSER. BERA DEDERICK, Milwaukee, Wis. Filed Apr. 11, 1889. Serial No. 306,972. (No model.)

Claim.—The combination, with a perforated steam-exhaust pipe leading from the cylinder of an engine, of a steam-tight case inclosing the exhaust-pipe throughout all that part of the pipe that is provided with perforations, an air-blower located in a case having an opening for receiving air, and a duct leading into the inclosing-case for forcing air into the inclosing-case about the perforated exhaust-pipe, and a supply of water in which the drip-pipe terminates, which drip-pipe leads from the inclosing-case at or near its lowest point, substantially as described.



412,784. BED-PAN. OTTILIE DRAEGE, Milwaukee, Wis. Filed May 20, 1889. Serial No. 311,491. (No model.)

Claim.—1. The pan or receptacle herein described, having a vertical rear wall and bottom A, horizontal in cross-section and curved longitudinally and upwardly from the lower end of the vertical rear wall at the point *x* to the point *y*, vertical side walls having horizontal upper edges between the points *a a*, a concave tight cover or plate C at its front end, formed integral therewith, inclining rearwardly and downwardly from the front end toward the center of the receptacle, the rear end of said receptacle being open at its top, all substantially as and for the purpose specified.

2. As a new article of manufacture, the receptacle herein described, consisting of the chamber D, the bottom A of which is horizontal in cross-section and curved longitudinally forwardly and upwardly from its vertical rear wall to its front end and having open rear end, its front end being provided with an inclosing concave plate C, converging downwardly and inwardly toward the center of the receptacle, and its rear end provided with a handle B, affixed thereto, all substantially as and for the purpose specified.

412,785. DIVIDED HUB OR PULLEY. CHRAVELL L. DUNTON, Brockton, Mass., assignor of one-half to Thomas F. Sullivan, same place. Filed Mar. 14, 1888. Serial No. 302,212. (No model.)

Claim.—A hub or pulley divided longitudinally into two sections, each having at one end a laterally-projecting female locking-plate and at its opposite end a laterally-projecting male locking-plate, which male plates respectively interlock with the female locking plates when one hub-section is moved into proper position on the other hub-section, substantially as described.

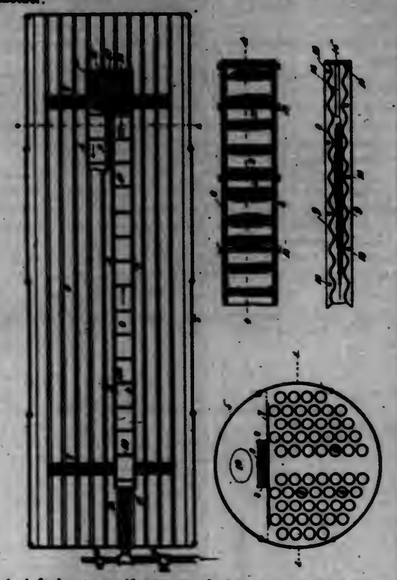
412,786. LAMP-WICK. JULIUS HELM, Liège, Belgium, assignor of one-fourth to A. Schoverling, New York, N. Y. Filed June 9, 1888. Serial No. 276,642. (No specimens.) Patented in England May 15, 1888, No. 4,962.

Claim.—1. The described lamp-wick, formed of clay, silica, borax, and cellulose moistened and mixed into a paste and vitrified by the action of heat, substantially as described.

2. A lamp-wick consisting of the following elements: clay, silica, borax, cellulose, gypsum, and white lead vitrified by heat, substantially as described.

3. The described lamp-wick, formed of clay, silica, borax, and cellulose moistened and mixed into a paste and molded into the tubular form of the lamp-wick while in a plastic state and vitrified by the action of heat, substantially as described.

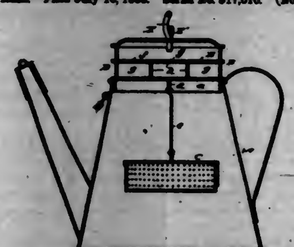
412,787. PROCESS OF PREPARING CANE REEDS FOR WEAVING. ANDREAS A. REESEN, Leipsic, Germany. Filed Sept. 21, 1888. Serial No. 314,128. (No specimens.)



Claim.—The process of preparing cane reeds for weaving, which consists in removing the skin, splitting the cane, impregnating it with a softening mixture, and washing it, substantially as specified.

412,788. FEED-WATER PURIFIER. GEORGE B. FIELD, New York, N. Y. Filed Nov. 26, 1888. Serial No. 292,061. (No model.)

Claim.—1. A feed-water purifier horizontally arranged within a boiler and made up of corrugated sheet-metal top and bottom, whereby an increased heating-surface is presented and the corrugations in the bottom serve as catch-basins for the sediment.

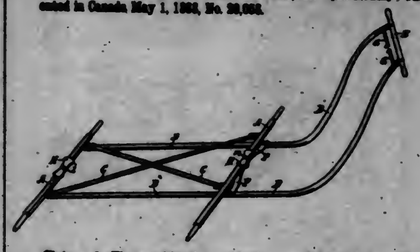


2. The combination, to form a feed-water purifier adapted to be inserted in a boiler, of the corrugated metal 9 9, the wooden pieces 8 8, bolts 10, securing the latter together and forming a close joint with the corrugated metal parts 9 9 and a feed-water pipe 12.

3. A feed-water purifier adapted to be inserted in a boiler, having two or more lengths composed of side pieces 8 8, of wood, a corrugated sheet-metal top and bottom 9 9, bolts 10, for securing the sides together and holding them in contact with the sheet-metal top and bottom, the end board 15, and slots, as 16, in the adjacent parts of the adjoining lengths, whereby the feed-water can circulate from one length to another.

4. A feed-water purifier composed of two or more lengths, each length made up of side pieces 8 8, of wood, a top and bottom of corrugated sheet metal, bolts 10, securing said side pieces together and holding them in intimate contact with the sheet-metal top and bottom, the end board 15, slots 16 in the two adjacent lengths of the purifier, a feed-water connection, and a blow-off, substantially as described.

412,789. COFFEE-POT. GEORGE M. FLEMING and CHARLES W. HOYER, Beloit, Kans. Filed July 10, 1888. Serial No. 317,010. (No model.)

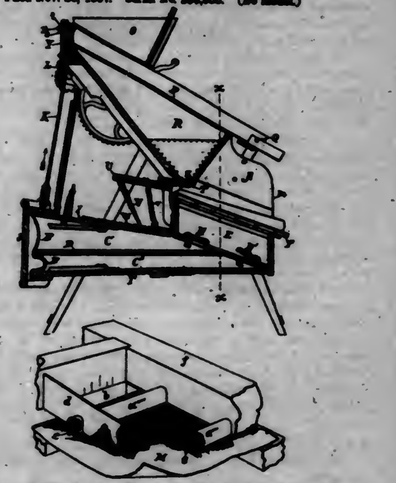


Claim.—1. The combination, with a coffee-pot, of a cover having a plurality of apertures in its top, a condensing-chamber arranged above the cover and divided into an upper and lower compartment, and a pipe leading through the cover from the interior of the coffee-pot and through the condensing-chamber above the same, and having its opposite end opening into the upper compartment of the condensing-chamber, substantially as specified.

2. The combination, with a coffee-pot, of a cover having perforations in its top, a condensing-chamber arranged above the cover, and a steam-pipe passing from the interior of the cover in a loop form above the condensing-chamber, and having its opposite end entering the upper compartment of said chamber, whereby said pipe may serve the additional function of a handle, substantially as specified.

3. The condensing-chamber divided into an upper and lower compartment by a horizontal partition, and the lower compartment divided by vertical partitions, so as to form a central and two lateral chambers, the lateral chambers having their top walls perforated to communicate with the upper chamber, and a steam-pipe passing through the central lower compartment above the condenser in a loop form, and having its opposite end passing into the upper chamber of a condenser, the whole adapted to serve upon a coffee-pot, substantially as specified.

4. The combination, with a coffee-pot, of a cover having perforations in its top, a percolator suspended from the cover, and a condensing-chamber arranged above the cover and divided into compartments, and a steam-pipe having one end communicating with the interior of a coffee-pot and its opposite end entering the upper chamber of the compartment, substantially as specified.

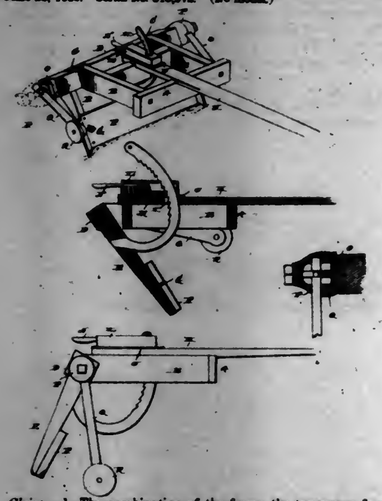


412,740. VEHICLE-GEARING. SIMON S. FAY, Woodstock, Ontario, Canada. Filed July 7, 1888. Serial No. 279,340. (No model.) Patented in Canada May 1, 1888, No. 30,002.

Claim.—1. The combination, with the parallel handle-bars D D, of the front axle and cross-bar F, to which said handle-bars are pivoted, the rear axle pivoted to the said cross-bar, and the cross-reaches C, pivotally connected to the front and rear axles, whereby the handle-bars are held parallel to each other in such manner that the backward or forward movement of the same will change the relative position of the axles, so as to alter the direction of the wheels, substantially as specified.

2. The combination, with the handle-bars D D and the rear cross-bar E, to which they are pivoted, of the front axles, to which the forward ends of the handle-bars are pivoted, the rear axle, and cross-reaches C C, pivotally connected thereto and to the front axle, the cross-bar F, to which the rear axle is pivoted and which is pivotally connected with the handle-bars D D and the levers G G, whereby the said bars D D are shifted directly back and forth to alter the position of the axles, substantially as specified.

412,741. ORE-SEPARATOR. JAMES R. FREEMAN, Los Angeles, Cal. Filed Nov. 30, 1887. Serial No. 256,205. (No model.)



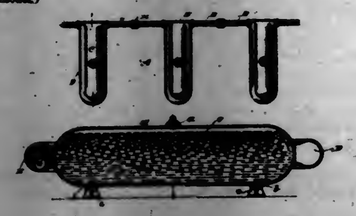
Claim.—1. The feed-box R and valve T, in combination with levers U and V, rack-bar W, and movable leaf I of bellows B, as described.

2. The improved apron for gold-separators, comprising the frame, the riffles *a a' a'' a'''*, bent into the form of an inverted trough, the wire-cloth N, fastened to the frame and pressed into the said riffles, the strips of tin *e*, entering the said riffles and fastening the wire-cloth therein, the ribs *d d'*, notched on the under side, said notches fitting over the said riffles and holding them in place, and the muslin or canvas strip *m*, fastened to the bottom of the frame, substantially as described.

3. The combination of the feed-box R, valve T, provided with the levers U and V, bellows B B', valves H H, air-chest K, and apron P.

412,742. ROAD-SCRAPER. GEORGE FRY, Phœnix, Ariz. Filed June 28, 1889. Serial No. 315,872. (No model.)

Claim.—1. The combination of the frame, the transverse frame-bar journaled in suitable bearings at the rear end of said frame, the standards extending downwardly from said frame-bar, the scraper attached to said standards, and the arms extending forwardly from said frame-bar at an angle to the standards and having wheels or rollers at their outer ends, substantially as set forth.



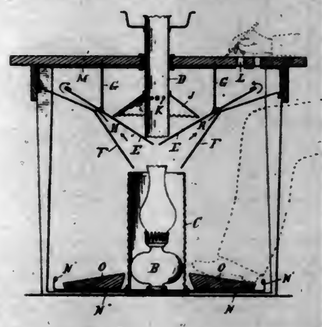
2. The combination of the frame, the transverse frame-bar journaled at the rear end of the same, the tongue attached to and extending forwardly from the frame, the standards extending downwardly from the transverse frame-bar and carrying the scraping-blade, the segmental ratchet-bar attached to one of said standards and extending upwardly through a slot in the tongue, and a spring-latch engaging said ratchet-bar, substantially as set forth.

3. The combination of the frame, the transverse frame-bar journaled at the rear end of the same and having squared ends or extensions, the hubs or collars mounted upon said extensions, the forwardly-extending arms fixed in said collars, and the wheels or rollers at the outer ends of said arms, substantially as set forth.

4. The combination of the frame having the forwardly-extending tongue, the transverse frame-bar journaled at the rear end of said frame and having downwardly-extending standards, the scraper secured to the lower ends of said standards, the eyebolts passing through said standards and scraper for the attachment of the draft, the collars mounted upon square projections at the ends of the transverse frame-bar, and arms fixed in said collars, extending downwardly and forwardly at an angle to the standards, and having wheels or rollers at their outer ends, substantially as set forth.

5. In a scraping and leveling machine, the combination of a frame, a tongue extending forwardly from the same, a transverse bar journaled at the rear end of said frame and having downwardly-extending standards carrying the scraping-blade, a ratchet-bar extending from one of the standards through a slot in the rear end of the tongue, a spring-latch engaging said ratchet-bar, and arms extending forwardly from the transverse frame-bar at an angle to the standards and provided with wheels or rollers at their outer ends, substantially as set forth.

412,743. STEAM-HEATER FOR RAILROAD-CARS. SAMUEL F. GOLD, Englewood, N. J. Filed Apr. 17, 1889. Serial No. 307,542. (No model.)



Claim.—1. In a heater for railroad-cars, containing a storage-chamber and a branch steam-conduit for heating the same, a contracted steam passage or port located in the main steam-pipe between the connections of the branch conduit therewith, for the purpose set forth.

2. A storage-heater for railroad-cars, composed of a storage-chamber and a loop-shaped heating-conduit having a part of its heating-surface in contact with the chamber and a part exposed to the air of the car, in combination with a main steam-pipe provided with a contracted passage or port located between the connections of the loop-shaped conduit therewith, for the purpose set forth.

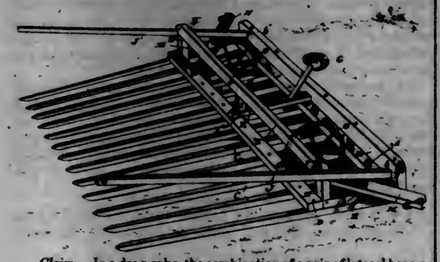
3. The combination of several storage-heaters, each composed of a storage-chamber and a branch conduit for heating the same, with a main steam pipe or conduit provided with contracted passages or ports, one of which is located between the connections of each of the branch conduits therewith to form a series of storage-heaters located beneath the transverse seats of a railroad-car and extending throughout the length of the car, substantially as and for the purpose described.

412,744. BODY-WARMER. THOMAS C. GREEN, South Haven, Mich. Filed Feb. 7, 1889. Serial No. 299,046. (No model.)

Claim.—1. In a body-warmer, the combination, with a table or desk, of a source of heat mounted below said table, and a radiating-surface below the top of said table or desk, adapted to be heated thereby and arranged to radiate the heat toward one or more sides of said table or desk, and the adjustable deflectors, substantially as described.

2. In a body-warmer, a table or desk, in combination with a radiating-surface and a source of heat mounted below said table and arranged to radiate the heat to one or more sides of said desk or table, and a radiating-surface in the top of said table, and adjustable deflectors arranged between said radiating-surfaces, substantially as described.

3. In a body-warmer, substantially as described, the combination, with a desk or table, of a stove or heater mounted below the same and having an escape-pipe through the top of said table or desk, a deflector or deflectors adapted to form an adjustable cut-off for the hot air and gases between the escape-pipe and heater, substantially as described.



4. In a body-warmer, the combination of the following elements: the table or desk, the stove or heater, the escape-pipe through the top of the desk or table, the deflectors, and the radiating-surfaces adapted to radiate the heat to the side of table or desk, all combined and operating substantially as described.

5. In a body-warmer, the combination, with the desk or table, of the stove or heater adjustably mounted below said desk or table, the gravitating deflectors, the radiating-surfaces adapted to be heated thereby and radiating to the sides of the desk or table, and the vertically-adjustable escape-pipe, all arranged to operate substantially as described.

6. In a body-warmer, the combination, with a table or desk, of the stove or heater mounted below the same, the vertically-adjustable escape-pipe through the top of said desk or table, the outwardly-inclined deflectors between the top of the heater and the escape-pipe and adapted to form adjustable cut-offs between the same, and the radiating-surfaces below the deflectors, substantially as described.

7. In a body-warmer, the combination, with the desk or table, of the heater B, the surrounding guard C, the vertically-adjustable escape-pipe D, perforated with the conical or pyramidal collar J, having its lower edge serrated, the gravitating deflectors E, the radiating-surfaces F, and the radiating-surface L in the top of the table, all arranged to operate substantially and for the purpose as described.

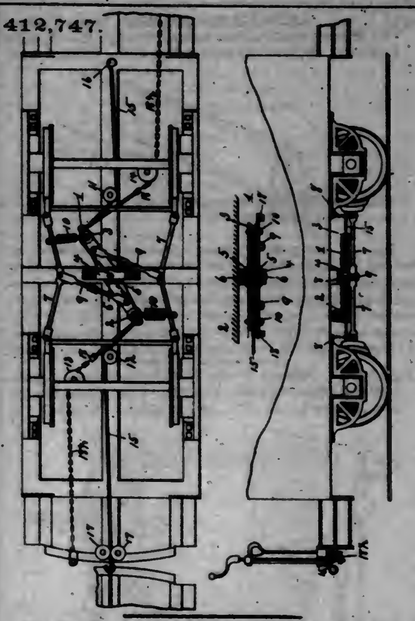
412,745. DRAG-RAKE. JAMES HARRYMAN, Harris, and GEORGE COONEY, Galt, Mo. Filed June 10, 1889. Serial No. 314,702. (No model.)

Claim.—In a drag-rake, the combination of a pair of lateral beams, rake-teeth secured to said beams, a vertical back piece erected on the rear lateral beam at right angles thereto, cross-pieces connecting said beams at their middle and outer ends, upright posts erected on said cross-pieces, tongues mortised into said vertical back piece and resting on the outside posts, respectively, a third lateral beam resting at its middle on the middle vertical post and at its outer ends on the tongues, a seat secured on the middle cross-piece, wheels mounted to turn on axles secured between the rake-teeth, and draft-bars secured to the front lateral beam and extending rearward beneath said tongues and resting on the outside cross-pieces, respectively, all arranged in the manner and for the purpose described.

412,746. WAGON-BOX. RUSSELL A. HART, Battle Creek, Mich. Filed Aug. 26, 1889. Serial No. 322,004. (No model.)

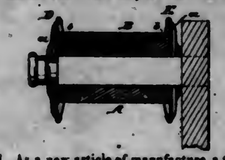
Claim.—A wagon-box having sectional sides, said sides consisting of the base fixed sections comprising sections of stakes having side-boards attached thereto and additional like sections, all of which sections are detachably and adjustably attached to each other by means of the fulcrum-pivots, the projections, the fulcrum-holes, and the holes to receive the projections, substantially as set forth.

412,747. CAR-BRAKE. ROBERT HAWES, Chicago, Ill., assignor of one-half to John Miller, same place. Filed Aug. 19, 1889. Serial No. 321,294. (No model.)



Claim.—1. A car-brake consisting of the combination of a duplicate lever pivoted beneath the center of a car, two sheaves pivoted between the parts of said lever, two toggle-joints pivoted each to two brake-shoes or to the opposite brake-bars and suspended between adjacent car-wheels, connecting-links pivoted to the junctions of the toggle-joints and to said lever, and a rope or chain passing through said lever to brake-handle rod, substantially as and for the purposes specified.

2. A car-brake composed, in combination, of a duplicate lever pivoted beneath the middle portion of a street-car, two sheaves pivoted between the parts of said lever, two toggle-joints pivoted each to two brake shoes or bars and suspended between adjacent car-wheels, rigid connecting-links pivoted to junctions of toggle-joints and to said levers on opposite sides of its center, a rope or chain secured at one end to bottom of car or to corresponding rope under next rear car and passed through said lever to brake-handle rod, the retracting-spring 10, and the sheaves 11 and 12, substantially as and for the purposes specified.

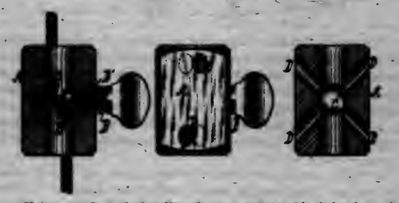


3. In a car-brake mechanism, the duplicate lever 1, the toggle-joints 7 7, pivoted to brake shoes or bars, the connecting-links 9 9, sheave-rod 18, secured to end of lever 1, and chain 18½, secured to brake-handle staff, as and for the purpose stated.

4. In a street-car-brake mechanism, the combination of the duplicate lever 1, the bracket 4, having sockets in its center and formed to allow said lever to pass through it, the bosses 5 5, secured to the center of the parts of said lever, and the pivots 6 6, secured in said bosses so as to pass into said sockets, as and for the purpose stated.

412,747.

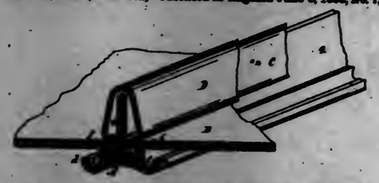
412,748. TOP-PROP REST FOR VEHICLES. WILLIAM LE B. HAWES, Cincinnati, Ohio. Filed July 26, 1889. Serial No. 318,654. (No model.)



Claim.—1. As a new article of manufacture, a top-prop rest composed of a rubber cylindrical body with its ends expanded within hollow metallic washers, substantially as shown and described.

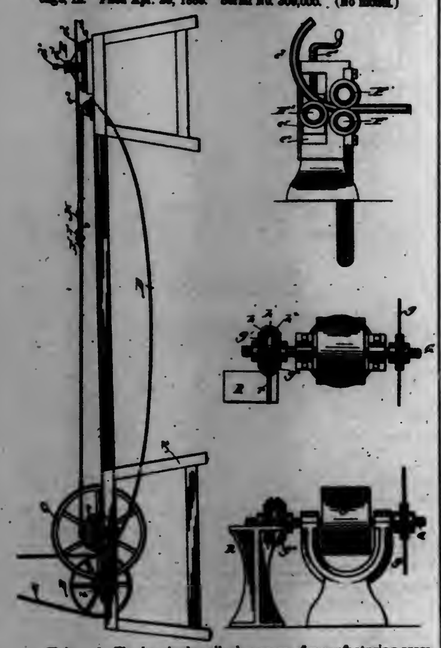
2. In a top-prop rest, the combination of hollow metallic washers with a rubber top-prop block whose ends are expanded within the back shells of said washers to hold them in place, substantially as and for the purpose described.

3. In a top-prop rest, the combination, with a top-prop block, of hollow metallic washers, the front shells of which are covered with leather and the back shells folded over the outer edges of the leather to hold the same in place, substantially as shown and described.



412,749. CLOTHES-LINE CLAMP. MICHAEL F. HAYES, New York, N. Y. Filed Jan. 8, 1889. Serial No. 295,811. (No model.)

Claim.—1. In a clothes-line clamp, a tubular block having a lateral screw-hole with a clamping-screw fitted therein, and lateral guide-holes inclined toward the interior of the block for the passage of the line ends, substantially as shown and described.

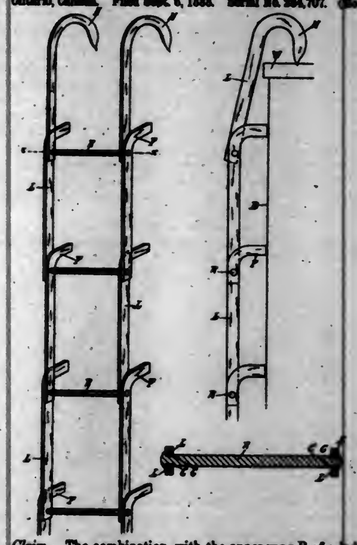


2. In a clothes-line clamp, a tubular block having a lateral screw-hole with a clamping-screw fitted therein, a recess opposite said hole on the interior of the block to receive the line ends under the impulse of said screw, and lateral guide-holes inclined toward the interior of the block for the passage of the line ends, substantially as shown and described.

412,750. GLAZING-BAR FOR SKYLIGHTS. THOMAS W. HELLAWELL, Brighouse, County of York, England. Filed Mar. 23, 1887. Serial No. 232,209. (No model.) Patented in England June 8, 1886, No. 7,988.

Claim.—A glazing-bar or astragal made of solid rolled metal, and combining in a single piece a central rib or web *a*, laterally-extending flanges having inner ledges *c c*, grooved on their upper surfaces, so as to hold a yielding packing for supporting the glass, channels *m m* between the ledges *c c* and the central rib or web *a*, outer ledges *d d*, the upper edges of which are below the plane of the glass, and channels *l l* between said outer and inner ledges, substantially as set forth.

412,751. PROCESS OF MANUFACTURING METALLIC CROSS-BARS AND RAILS FOR WINDOW-SASHES. WILLIAM HENDERSON, Chicago, Ill. Filed Apr. 30, 1889. Serial No. 309,055. (No model.)



Claim.—1. The herein-described process of manufactoring cross-bars, rails, and fastenings for window-sashes, &c., consisting, first, in passing the strips of metal through a die or dies giving the bars the desired conformation or shape, then cutting or sawing the formed strips into proper lengths, then notching the ends of the strips, and then passing the notched strips through a device for bending the same into suitable shape or curve ready for use, substantially as and for the purpose set forth.

2. The herein-described process of manufactoring metallic cross-bars, rails, and fastenings for window-sashes, consisting, first, in drawing the strips of metal through a die or dies making the proper conformation or shape, then placing the strips horizontally against a revolving circular saw and cutting them to proper lengths, then notching the ends of the formed strips by placing them longitudinally against a series of revolving disks, then passing the notched strips through a series of rollers, then bending them to a proper curve ready for use, substantially as shown and described, and for the purpose set forth.

3. The herein-described process of manufactoring metallic cross-bars, rails, and fastenings for window-sashes, consisting, first, in passing strips of metal through a die or dies forming a bar and cap of desired conformation, then placing the cap on the rib of the bar and cutting them into proper lengths, then notching the ends of the strip, and then passing the notched strips through a device for bending the same to a desired curve, then removing the adjustable cap and clipping the ends of the rib of the bar at a desired angle, substantially as shown and described, and for the purpose set forth.

4. The herein-described method of manufactoring hollow metallic cross-bars, rails, and fastenings for window-sashes, consisting, first, of forming a metallic bar and cap in separate pieces, then adjusting the cap on the rib or web of the bar, then bending, cutting, and notching the same as a whole, then removing the adjustable cap and cutting the ends of the web or rib of the bar, substantially as and for the purpose specified.

412,752. FIRE-ESCAPE LADDER. WILLIAM HEWITT, London, Ontario, Canada. Filed Sept. 6, 1888. Serial No. 284,707. (No model.)

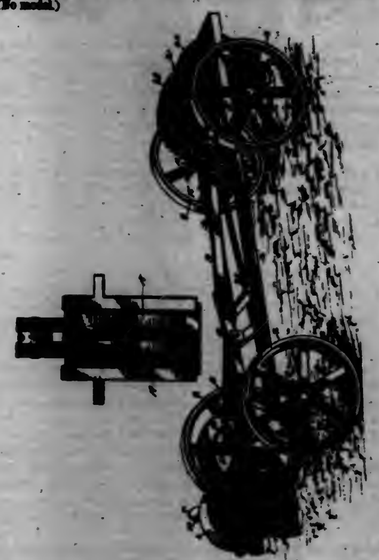
Claim.—The combination, with the upper rung R of a ladder and the bent ends of the links L, connected thereby, of the side pieces loosely secured to the said rung and formed at their free ends with pointed hooks H integral therewith, which are adapted to be rigidly secured to the edge of the window-sill and be bound thereto by the full weight of the ladder and its occupant, substantially as specified.

412,753. CORNET. BERT H. HYDE, Morgantown, W. Va. Filed July 9, 1888. Serial No. 316,960. (No model.)

Claim.—1. A valve for cornets and similar instruments, made substantially sector-shaped and provided with apertures, as described.

2. A valve for cornets and similar instruments, having a longitudinal curved aperture and two transverse curved apertures in a horizontal plane different from the other, as described.

3. A cornet or similar instrument provided with valves substantially sector-shaped, each having a longitudinal curved aperture, and two transverse curved apertures in a horizontal plane different from the other apertures to provide a continuous curved passage for the wind in producing all tones, substantially as described.



4. A cornet or similar instrument having all its valve-shell openings in the same plane and communicating with the crooks, as described.

5. A cornet or similar instrument having a valve-shell with apertures in the same horizontal plane, valve-slides communicating with the apertures in the manner described, and valves within the valve-shell provided with the longitudinal and transverse curved passages described, affording communication, as set forth.

6. A cornet or similar instrument comprising the usual wind-passage for open-tones, and having a valve-shell divided into communicating compartments by perforated partitions, valves moving within said compartments, each provided with three curved passages in two horizontal planes, and valve-slides in the same horizontal plane communicating with the curved passages in the valves through the perforations in the shell, all as set forth.

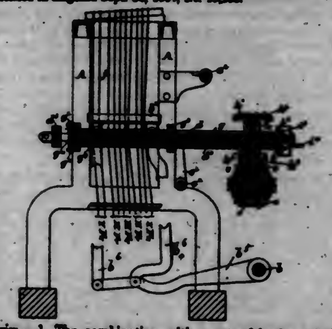
7. In a cornet or similar instrument, substantially sector-shaped valves and valve-stems joined to the valves near their spaces, as described.

412,754. GEARING FOR HIGH-SPEED MOTORS. PLEASANT HOSTETT, Colorado Springs, Colo. Filed Feb. 13, 1889. Serial No. 299,873. (No model.)

Claim.—1. In combination with a car, a driving-shaft which revolves at high speed, suitable supporting and driving wheels, a slowly-revolving driven shaft rigidly connected with the driving-wheels, ratchet-gearing, wheels connected thereto, and suitable reducing-levers extending under the car and transmitting motion from the driving-shaft to the ratchet-gearing, substantially as described.

2. In combination with a car, an electric motor on the car, a slowly-revolving driven shaft, ratchet-gearing connected thereto, and suitable reducing-levers extending under the bottom of the car and transmitting motion from the armature-shaft of the motor to the ratchet-gearing, substantially as described.

3. In combination with a car, an electric motor on the car, a crank-shaft geared to the armature-shaft of the motor by suitable cog-wheels, a driven shaft with driving-wheels keyed thereon, ratchet-gearing connected to the driven shaft by suitable cog-wheels, and reducing-levers extending under the car and transmitting motion from the crank-shaft to the ratchet-gearing, substantially as described.



4. In combination, a frame, a shaft turning in bearings in said frame, and a pinion keyed upon said shaft, a second shaft, a gear-wheel keyed upon this shaft and meshing with the pinion, two ratchet-wheels keyed upon said second shaft, the teeth of one ratchet-wheel facing in opposite direction to the teeth of the other, a reciprocating piece carrying spring-pawls which engage with said ratchet-wheels, suitable cams, and plungers controlled by said cams for lifting either or both of the pawls out of engagement with its ratchet-wheel, substantially as described.

5. In combination, a main frame, a ratchet-wheel, a continuously-reciprocating piece, a spring-pawl mounted on the continuously-reciprocating piece and tending to engage with the ratchet-wheel, a plunger mounted in the reciprocating piece and connected to the spring-pawl, a second plunger mounted in the main frame and having a broad face against which one end of the first plunger bears, whereby the spring-pawl may be thrown into or out of gear with the ratchet-wheel and the motion of the latter be discontinued at will, while the motion of the reciprocating piece is continuous, substantially as described.

6. The compound ratchet-gearing, which consists of the ratchet-wheel, the two or more pawls spring-pressed upon the ratchet-wheel and so spaced that only one of them can engage a tooth at one time, and the plunger for lifting them all out of engagement with the ratchet-wheel, substantially as described.

7. In combination, a main frame, two ratchet-wheels journaled in bearings in said main frame and rigidly connected together, the teeth of one of said ratchet-wheels facing in opposite direction to the teeth of the other, a continuously-reciprocating piece carrying spring-pawls which engage with said ratchet-wheels, suitable plungers, which are also mounted in said continuously-reciprocating piece, and which bear upon the spring-pawls, together with cams mounted in the main frame for controlling the said plungers, substantially as described.

412,755. JACQUARD APPARATUS. SAMUEL HOLDSWORTH, Durham, England. Filed Sept. 6, 1888. Serial No. 284,682. (No model.) Patented in England Sept. 26, 1887, No. 12,105.

Claim.—1. The combination, with a set of horizontal needles, vertical needles for controlling the position of said horizontal needles, and means for presenting a pattern-surface to said vertical needles, of a reciprocating carrier and removable and replaceable plates *i* carried thereby, substantially as described.

2. The combination, with a set of horizontal needles, vertical needles for controlling the position of said horizontal needles, means for presenting a pattern-surface to said vertical needles, a trap-board having holes therein, with a portion of the said holes formed with their narrow parts on the side of said holes opposite to that on which said narrow parts are formed in the rest of the holes, and harness-cords, said needles having the eyes and loops, as described, of a carrier and removable and replaceable plates *i* carried thereby, as described.

3. The combination, with a set of horizontal needles, vertical needles for controlling the position of said horizontal needles, means for presenting a pattern-surface to said vertical needles, a trap-board having the holes therein arranged with a portion thereof formed with their narrow parts on the side of said holes opposite to that on which the said narrow parts are formed in the rest of the holes, and harness-cords, said needles having the eyes and loops, as described, of a carrier and plates *i* carried thereby and notched or cut away, as described.

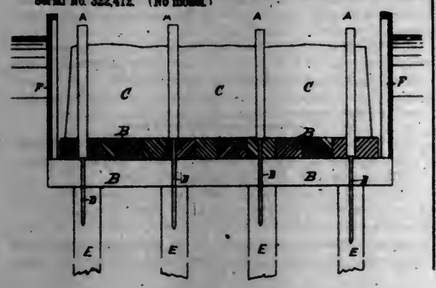
4. The combination, with a set of horizontal needles, vertical needles for controlling the position of said horizontal needles, means for presenting a pattern-surface to said vertical needles, a trap-board having the holes arranged therein with a portion thereof formed with their narrow parts on the side of said holes opposite to that on which the said narrow parts are formed in the rest of the holes, and harness-cords, said needles having the eyes and loops, as described, of a carrier and removable and replaceable plates *i* carried thereby and notched or cut away, as described.

5. The combination, with a set of needles *g*, the supplemental or part needles g^1, vertical needles for controlling the position of said needles g^1, and means for presenting a pattern-surface to said vertical needles, of a reciprocating carrier and removable and replaceable plates *i* carried thereby, substantially as described.

412,756. CORN-HARVESTER AND SHOCK-BUNDLER. EDWARD HOUSE, Mount Oak, assignor of one-half to Jonah F. Williams, same place. Filed Oct. 20, 1888. Serial No. 288,693. (No model.)

Claim.—1. The combination, with the bed or platform having the corn cutter and elevator on one side, of the bundling-box pivoted on the platform and adapted to swing outward transverse to the platform, said bundling-box having the hinged bottom extension f^{10} and hinged outer side extension h^2, and connections between the exten-

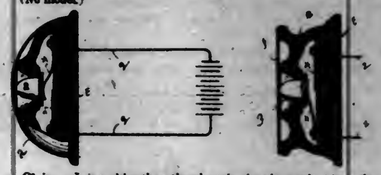
sions f^3 and A^2, whereby the extension A^2 is automatically operated by the extension f^3, substantially as described.



2. The combination, in a corn-harvesting machine, of the bed or platform having the corn cutting and elevating apparatus on one side, the pivoted bundling-box arranged on the platform and having a hinged bottom extension f^3 and hinged outer side extension A^2, and connections between said extensions, whereby the extension A^2 is automatically operated by the said hinged bottom extension f^3, the rearwardly-extending lever I^2, secured to the latter, the detent N^2, pivoted to the rear end of the bundling-box and adapted to engage said lever, and the stud O^2 on the rear end of the bed or platform A to disengage the detent from the lever I^2 when the bundling-box is swung outward, substantially as described.

3. The combination, in a corn-harvesting machine, of the bed or platform having the corn cutter and elevator on one side, the standard L^2, rising from the rear end of said bed or platform and supporting the driver's seat, the bundling-box pivoted on the standard L^2, and thereby adapted to swing outward transverse to the platform, said bundling-box having the hinged bottom extension f^3 and hinged outer side extension A^2, connections between said extension, whereby the extension A^2 is automatically operated by the extension f^3, and the lever M^2, attached to the bundling-box, substantially as described.

4. The combination, in a corn-harvester, of the transverse inclined elevator-frame having the arm X at its lower end, the guide-arm at its front side, the cutter-bar supported on said guide-arm, the roller Y^2 at the lower end of the frame, having the sprocket-wheel P' at its front end, the rod connecting said sprocket-wheel to the cutter-bar, the roller Z^2 at the upper end of the elevator-frame, the endless carrier having the cleats or catches and connecting the rollers Z^2 Y^2, the shaft W', socketed at one end on the front side of the elevator-frame, the sweep-reel X' on said shaft, the sprocket-wheel S^2 on the front side of the elevator-frame, the chain connecting said sprocket-wheel to the wheel P', the shaft Z', jointed to the wheel S^2, and gearing connecting said shaft to the sweep-reel to rotate the latter, substantially as described.



5. The combination, in a corn-harvesting machine, of the transverse inclined elevator-frame having the cutting apparatus at its lower front corner, the rollers Y^2 Z^2 at the lower and upper ends of said frame, respectively, said lower roller having the driving gear-wheel O' at its rear end and the sprocket-wheel P' at its front end, the pitman connecting said sprocket-wheel and the cutter-bar, the sprocket-wheel S^2, journaled on the front side of the elevator-frame, the endless sprocket-chain connecting the wheels P' S^2, the shaft W', socketed at one end on the front side of the elevator-frame, the sweep-reel on said shaft, the shaft Z', jointed to the wheel S^2, gear-wheels connecting said shaft to the shaft W', and the endless carrier-belts connecting the rollers Y^2 Z^2, substantially as described.

412,757. FASTENING GRILLAGES, PLATFORMS, OR FOUNDATIONS OF STRUCTURES TO PILES OR OTHER MATERIALS. RANDELL HUNT, San Francisco, Cal. Filed Oct. 31, 1888. Renewed Aug. 30, 1889. Serial No. 322,412. (No model.)

Claim.—As a means of enabling spikes or the like to be driven into the foundations of masonry, the combination of metal tubes with masonry built upon a supporting-platform, all substantially as shown and described.

412,758. ELECTRIC CIRCUIT-CLOSING DEVICE. WILLIAM C. JOHNSTON, Jr., Lynn, Mass. Filed Mar. 31, 1888. Serial No. 269,123. (No model.)

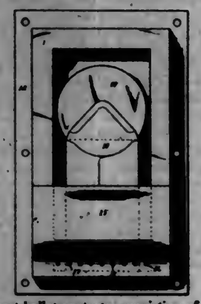
Claim.—In combination, the electric circuit, a suitable casing, contact-points 4 within the same, one of said points being movable, and a covering rigidly secured to said casing by its edges, whereby dust is excluded therefrom, the said covering being composed of flexible material and arranged independent of the movable contact-point but in proximity thereto, in order to move the same when pressed upon, substantially as described.

412,759. METHOD OF MAKING PATTERNS. WILLIAM J. KERR, Detroit, Mich. Filed Oct. 23, 1888. Serial No. 288,970. (No model.)

Claim.—1. The process herein described of making patterns, which consists in making a matrix and electroplating the face of the same, then placing a patrix over said matrix and pouring a non-metallic composition having a low melting-point into the space between the electroplate and the patrix, substantially as described.

2. The process herein described of making patterns, which consists in first preparing a pattern-block, then making a matrix from said block, then lining the interior of the matrix with material substantially of the thickness the desired article is to be cast, then making a patrix on the face of the lined matrix, next removing the lining, then electroplating the matrix, next replacing the patrix, and then pouring into the space between the patrix and metal plate a composition having a low melting-point, substantially as described.

3. The process herein described of making patterns, which consists in first making a matrix and electroplating the same, then painting the reverse side of the film with a material of low melting-point, then placing over the film a patrix, and then pouring into the space between the film and the patrix a non-metallic material having a low melting-point, substantially as described.



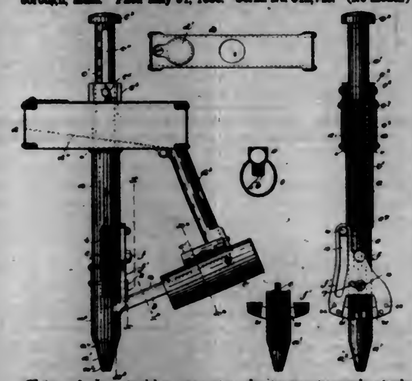
412,760. PROCESS OF PRODUCING FROM A COPY A PLATE OR TYPE FOR PRINTING. FRANK X. KEITTER, Milwaukee, Wis. Filed May 3, 1889. Serial No. 310,093. (No model.)

Claim.—1. The process of producing a plate for printing from types or from a printed copy by transferring the same directly upon a prepared asphaltum-covered zinc plate and producing the printing-plates therefrom, substantially as described.

2. The process of transferring ink from a printed copy upon an asphaltum-covered zinc plate, removing the asphaltum beneath the ink, and producing the type in depressed letters in the zinc plate by the use of acid, substantially as described.

412,761. APPARATUS FOR USE IN SECRET VOTING. LOUIS KUTSCHER, Bridgeport, Conn. Filed July 17, 1889. Serial No. 317,703. (No model.)

Claim.—1. A secret-ballot protector consisting of a frame-work placed in the door of a voting-compartment, a socket in said frame-work to receive the lower end of an envelope, and a door in said frame-work closing over the envelope, so that it cannot be removed from the inner side.



2. In a device of the class described, a frame-work having a guard upon its inner side, and openings through said guard, and a door upon said frame-work having prongs upon its inner side adapted to engage the openings in the guard, so that an envelope placed between the guard and the door cannot be removed until the door is opened.

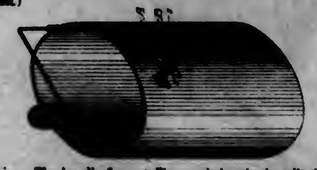
3. In a device of the class described, a frame-work, a door acting in connection therewith and having a fastening upon the outer side and prongs upon its inner side near the lower edge, and a guard upon the inner side of the frame-work adapted to receive the envelope, and having holes near the bottom corresponding with the prongs upon the door, so that an envelope placed in the guard is locked in place, when the door is closed, by the prongs passing through it and engaging said openings.

4. In a device of the class described, a frame-work having a socket 14 and a guard upon its inner side, in combination with a door adapted to cover an envelope in the guard, so that it cannot be removed until the door is opened.

5. In a device of the class described, a frame-work having a socket, and a guard upon its inner side having openings, and a door having prongs upon its inner side adapted to engage said openings and upon its outer side a dial and a latch, substantially as described.

412,762. TACKING-TOOL. RICHARD C. LAMBERT, North Middleborough, Mass. Filed May 31, 1889. Serial No. 312,748. (No model.)

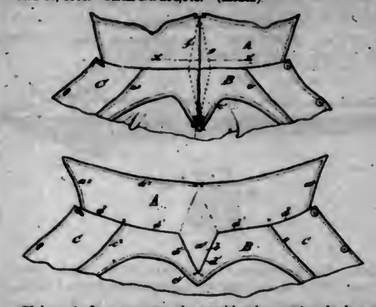
Claim.—1. In a tacking apparatus, the hopper to receive tacks or nails, a raceway, a conductor between the hopper and raceway, and the case or shell and driver-bar, and driver, combined with the separator having separating and detaining blades 20 21, located in substantially the same plane, and operating substantially as described.



2. The raceway, the case or sleeve having the driver passage or throat, and the driver and driver-bar, combined with the separator having separating and detaining blades 20 21, located in substantially the same plane, and having a space between their ends for the passage of a tack or nail from the end of the raceway into position against the side of the driver, the separating-blade keeping the tack against the side of the driver while the latter is completing the driving of a tack or nail and is being partially elevated, substantially as described.

3. The raceway, the case or shell in communication therewith, the driver, and the driver-bar having a projection and stud, combined with a separator having a slot, as 13, and two blades 20 and 21, to operate substantially as described.

4. The case or shell, the driver-bar, and driver therein, combined with the hopper, through which the said case or shell is extended, a raceway, and a conductor connecting said hopper and raceway, to operate substantially as described.



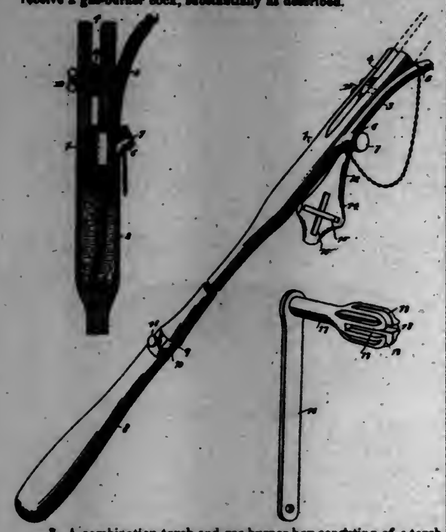
5. In a tacking apparatus, the raceway, the case or shell, the driver-bar, and driver therein, combined with the hopper and conductor, the raceway being provided with the cover having a concave or curved interior surface, and located immediately above the slot in the raceway, to operate substantially as described.

412,763. HANDLE FOR METALLIC VESSELS. WILLIAM C. LEAVITT, Norway, Me. Filed July 20, 1889. Serial No. 318,202. (No model.)

Claim.—The handle for metallic vessels herein described, consisting of a metal handle A, having a bead formed on its lower edge and a wooden hand-piece B, formed with a central longitudinal hole and a slit leading from the said hole to the surface of the hand-piece to hold the bead and embrace the body of the metal, substantially as specified.

412,764. SHIRT, &c. ALBERT R. LEHMAN, Saugerties, N. Y. Filed Jan. 17, 1889. Serial No. 296,673. (Model.)

Claim.—1. In a garment, the combination, with a body portion, of a band-like portion united thereto and comprising two portions made separate from each other, each of said portions of the band-like portion being provided with separate folds extending inwardly, the outer edge of each fold being united by a draw-thread to the portion of the band-like portion in which the fold is formed, substantially as specified.



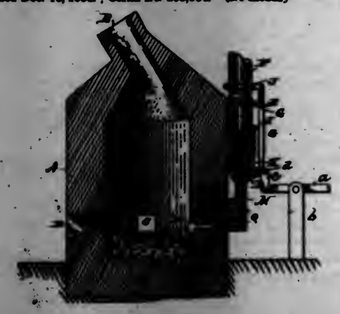
2. In a garment, the combination, with a body portion, of yoke portions made separate from each other, a collar having two portions made separate from each other, said collar being provided with gore-shaped pieces extending into and united at their edges to V-shaped openings in the yoke-pieces, said gore-pieces being folded in the direction of the width of the collar and tucked between the yoke-pieces and collar-pieces in opposite directions, the side edges of the folds thus formed being united by draw-threads, substantially as specified.

412,765. COMBINED TORCH AND GAS-BURNER KEY. GEORGE W. LEMBAY, Gainesville, Tex. Filed Nov. 21, 1888. Serial No. 291,450. (No model.)

Claim.—1. A combined torch and gas-burner key consisting of a handle having near its upper end a reservoir, from which projects a wick-tube in close proximity to the extreme upper end of the handle, and an arm adjustably pivoted to the upper end of the handle above the reservoir and provided with slots for engaging a gas-burner cock, substantially as described.

2. In a combined torch and gas-burner key, the combination, with a body portion having a forked upper end and provided with a

reservoir below the same and a wick-tube projecting therefrom at one side of and in close proximity to the said forked end, of an arm pivoted in the forked upper end of the body and provided with slots to receive a gas-burner cock, substantially as described.



3. A combination torch and gas-burner key consisting of a torch having reservoir 2, wick-tube 3, forked end 4, and arm 12, pivoted thereto on screw 13, and having enlarged end 14, with cross-slots 15, substantially as shown and described.

412,766. FENCE-POST. JOHN LOUDERBERRY, Owego, N. Y. Filed Apr. 23, 1888. Serial No. 308,268. (No model.)

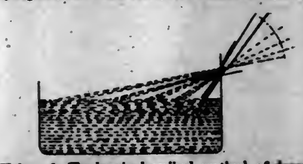
Claim.—The metal post A, constructed of two angular sides *b c*, which form a V in cross-section throughout its length, and increasing in width in a direction toward its lower end, and having a tapering point, which is also angular in cross-section, in combination with the anchor B, formed of two angular sides *d e*, and having the angular loop *f* to conform to the angular sides of the post, and the inclined edges *h* of an angle to conform to the edges *i* of the point of the post, said anchor at its upper portion being of greater width than that of the post, substantially as and for the purpose set forth.

412,767. CONVERTER. ROBERT F. LUDLOW, Springfield, Ohio. Filed Dec. 18, 1888. Serial No. 293,961. (No model.)

Claim.—1. In an apparatus for decarbonizing iron and liberating the impurities contained therein, the combination, with a converter-vessel, of groups of tuyeres in vertical series, the individual tuyeres thereof running at an angle to one another, and a common mouth for all the tuyeres of the group terminating in close proximity to their confluence and including in its circumference the said ends of the whole group, whereby each tuyere directs its air-current to different places across the surface of the bath in the converter.

2. In an apparatus for decarbonizing iron and liberating the impurities contained therein, the combination, with a converter-vessel, of groups of tuyeres in vertical series, the tuyeres of each group running at an angle to one another, and the groups adjustable upon a vertical axis to change their lateral direction.

3. In an apparatus for decarbonizing iron and liberating the impurities contained therein, the combination, with a converter-vessel having a series of openings in one wall thereof, of a series of groups of tuyeres, the tuyeres of each group running at an angle to each other and connecting with a common head-pipe, a tuyere-section to which said heads are connected, and the air-blast pipe to which the tuyere-section is rotatably connected, and suitable cut-offs for the tuyeres.



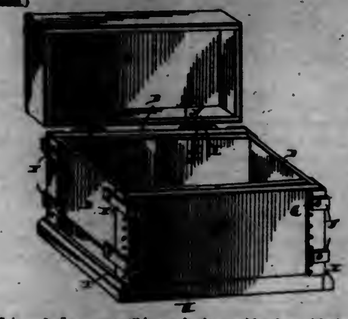
4. In an apparatus for decarbonizing iron and liberating the impurities contained therein, the combination, with a stationary converter-vessel having a series of openings in one wall thereof, of a corresponding series of groups of tuyeres, the tuyeres of each group running at an angle to each other and connecting with a common head-pipe, a cut-off for each tuyere, the cut-offs of all the tuyeres on the same horizontal plane being connected together, a tuyere-section to which the heads are secured, and a blast-pipe with which said section is rotatably connected.

5. In an apparatus for decarbonizing iron and liberating the impurities contained therein, a group of tuyeres in vertical series, the individual tuyeres thereof running at an angle to one another, and a common mouth for all the tuyeres of the group terminating in close proximity to their confluence and including in its circumference the said ends of the whole group, whereby each tuyere directs its air-current to a different place across the surface of the bath in the converter, and a common head-pipe to which the tuyeres connect at their free ends, and a suitable cut-off in each tuyere.

6. In an apparatus for decarbonizing iron and liberating the impurities contained therein, the combination, with a converter-vessel, of tuyeres in vertical series, each tuyere running at an angle to the other and one or more of them at an angle to the vessel, and means to adjust the whole series vertically with respect to the vessel, the said angle to the vessel and the said adjustability changing the place of contact of the air with the surface of the molten metal contained in the vessel from side to side of the vessel.

7. In an apparatus for decarbonizing iron and liberating the impurities contained therein, the combination, with a converter-vessel, of vertically-adjustable air-tuyeres running at an angle to the vessel and pointing toward the surface of the contained bath at an angle thereto and with their points above the same, and means to adjust the tuyeres vertically with respect to the vessel, the said angle of the tuyeres to the vessel and the said adjustability operating to change the place of contact of the air with the surface of the bath contained in the vessel from side to side thereof.

412,768. PROCESS OF MAKING STEEL. ROBERT F. LUDLOW, Springfield, Ohio. Filed Jan. 23, 1889. Serial No. 297,296. (No specimens.)



Claim.—1. The herein-described method of decarbonizing iron and liberating the impurities contained therein, the same consisting in disturbing and putting in practically uniform motion the essential mass of a bath of molten iron by constantly varying the place of contact therewith, of air-currents projected against and upon the surface thereof at an angle thereto, and in maintaining this operation until the contained carbon and impurities are liberated and the latter collected on the surface of the bath.

2. The herein-described method of decarbonizing iron and liberating the impurities contained therein, the same consisting in disturbing and putting in practically uniform motion the entire mass of a bath of molten iron by directing air-currents upon and against the surface thereof at an angle thereto, and in constantly varying the places of contact back and forth across said surface, in maintaining this operation until the contained carbon and impurities are liberated from the iron, in removing the collected impurities, and in uniting with the bath in this condition some recarbonizing agent in quantities to suit the product sought.

412,769. ALTERATIVE TONIC. WILLIAM H. LYON, New Haven, Conn. Filed Feb. 26, 1889. Serial No. 301,286. (No specimens.)

Claim.—The herein-described composition of matter to be used as a tonic and alterative, consisting of an infusion in water and alcohol of queen of the meadow, burdock-root, black-cohosh root, grove tops of the shrub bonfire, and white granulated sugar, in proportions as specified.

412,770. CONVERTIBLE TRUNK AND WARDROBE. FRANK J. LYLE, Humboldt, Nebr. Filed May 2, 1889. Serial No. 309,378. (No model.)

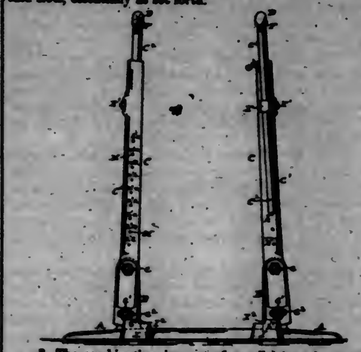
Claim.—1. In a convertible trunk, the combination, with the permanent bottom, of the hinged sides and end pieces, the end pieces hinged to the sides and folding inwardly upon the latter, and a false bottom having a flange extending around its sides and adapted to receive the permanent bottom, substantially as set forth.

2. In a convertible trunk, the combination of the bottom, the hinged side pieces, the end pieces hinged to the latter, the end pieces hinged to the bottom, the angle-plates secured to the sides, and screws for connecting the said angle-plates detachably to the end pieces of the trunk-body, substantially as set forth.

3. In a convertible trunk, the combination, with the trunk-body having the hinged sides and ends, and the end pieces hinged to the sides and folding inwardly upon the latter, of the detachable top or cover having hinge-plates provided with hooks adapted to engage the pintle of the hinge-plates attached to the upper edge of the rear side of the trunk, substantially as set forth.

4. In a convertible trunk, the combination, with the trunk-body comprising the permanent bottom, the sides and ends hinged to the latter, and the end pieces hinged to the sides and adapted to fold inwardly upon the latter, of the flanged bottom secured detachably to the under side of the permanent bottom, and the detachable top or cover, substantially as and for the purpose set forth.

5. In a convertible trunk and wardrobe, the combination of the permanent trunk-bottom, the sides and ends hinged to the latter, the ends hinged to the side pieces and adapted to fold inwardly upon the same, the angle-plates or braces secured to the sides and connected detachably with the ends of the trunk, the false bottom secured detachably to the under side of the permanent bottom, the top and bottom strips provided on their rear sides with cleats, and the side strips having dowel-pins adapted to engage the recesses in the bottom strip and provided with hinged doors, substantially as herein described and for the purpose set forth.



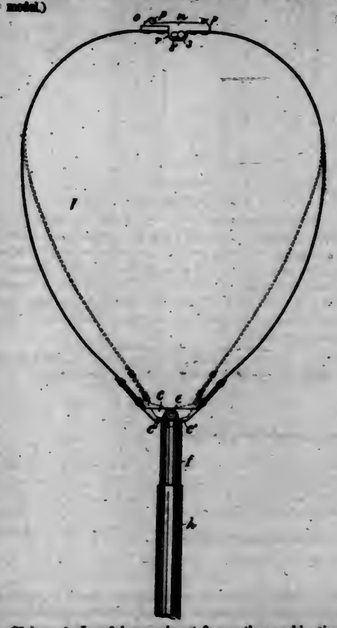
412,771. ART OF CLEANING FILES. JEREMIAH R. MATTHEWMAN, Sheffield, England, assignor to Benjamin G. Tilghman and Richard A. Tilghman, Philadelphia, Pa. Filed Aug. 3, 1889. Serial No. 319,561. (No specimens.)

Claim.—The method of cleaning files from the glaze formed by the protecting covering during the hardening process, which consists in subjecting them to the action of a rapidly-driven jet of fluid abrasive mud.

412,772. PARALLEL BARS FOR GYMNASIUMS. FREDERICK MEDART, St. Louis, Mo. Filed July 19, 1888. Serial No. 280,622. (No model.)

Claim.—1. A set of parallel bars for gymnasiums, comprising, in combination, the base A and standards B, the bars D, and the supporting-posts C, secured to the standards B by a pivot-bolt *c*, so as to be capable of a pivotal adjustment in a lateral direction, essentially as set forth.

2. A set of parallel bars for gymnasiums, comprising, in combination, the base A and the standards B, the posts C, provided with elongated slots, pivot-bolt *c*, and clamping-bolts *d*, passing through said slots, essentially as set forth.



3. The combination, in a set of parallel bars for gymnasiums, of the posts or legs C, formed in sections, and made vertically adjustable one upon the other, the laterally-moving clamping-sleeve E, stem *d*, and nut E', substantially as described.

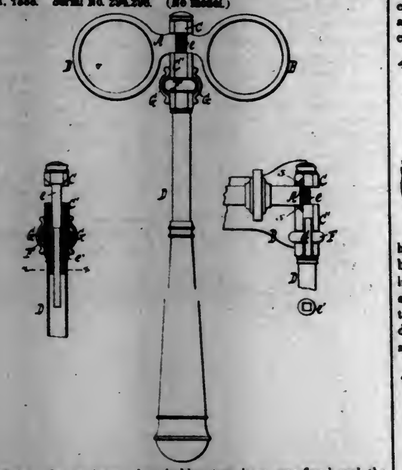
4. The combination, in a set of parallel bars for gymnasiums, of the parallel bars D D and posts C with the T-shaped bracket F, having a vertical socket member F' and a horizontal member F², and having its top concaved, substantially as and for the purpose set forth.

5. The combination, in a set of parallel bars for gymnasiums, of the parallel bars D D and posts C with the T-shaped bracket F, having a vertical socket member F', a hollow swelled portion F³, and a horizontal member F², having its top concaved, and vertical attaching-bolt G, the head of which is arranged within the swelled portion F³ of the bracket, substantially as described.

6. The combination of the hollow projections I, casters J, vertically-moving blocks I', latch-piece I², and hook-leg *i*, substantially as set forth.

412,773. FISH-NET. ADOLPH F. MEISSELBACH and WILLIAM MEISSELBACH, Newark, N. J. Filed July 1, 1889. Serial No. 316,127. (No model.)

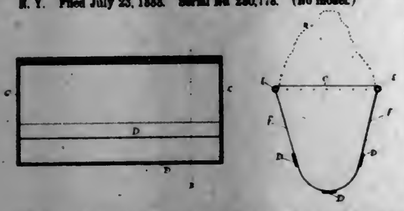
Claim.—1. In a fisherman's-net frame, the combination, with the inner ends of the bows, of arms secured thereon, having ears with



inclined outer edges, as described, a pivot-block having a solid screw-shank projecting therefrom, a pin for pivoting the arms detachably to such block by means of the said ears, and a handle provided with a ferrule adapted to be secured upon the said screw-shank in contact with the ears upon the arms, as and for the purpose set forth.

2. In a fisherman's-net frame, the combination, with the inner ends of the bows, of arms secured thereon, each having two ears with inclined edges, as described, a pivot-block having a projecting screw-shank, a pin for pivoting the arms to such block, with the said ears interlocking thereon, and a handle provided with a ferrule adapted to be secured upon the said screw-shank in contact with the ears upon the arms, as and for the purpose set forth.

3. In a fisherman's-net frame, the combination, with the outer ends of the bows *a a'*, of catch-pieces *n*, secured thereto, one being provided with a hook *o* at one end and the other with a pin *p* at the opposite end to engage the same, ears *r* upon the catch-pieces, one being provided with a slot *t'* and the other with a pin *s*, projecting through such slot, the whole arranged and operated substantially as shown and described.



4. In a fisherman's-net frame, the combination, with the outer ends of the bows *a a'*, of catch-pieces *n*, secured thereto, and provided with hooks *o* at their outer ends and pins *p* at their inner ends to engage the same, ears *r* upon the catch-pieces, one being provided with a slot *t'* and the other with a pin *s*, projecting through such slot, the whole arranged and operated substantially as shown and described.

412,774. OPERA-GLASS HOLDER. Emil B. Metzowitz, Ridgefield, N. J., assignor to Levy, Dreyfus & Co., New York, N. Y. Filed Dec. 21, 1888. Serial No. 294,208. (No model.)

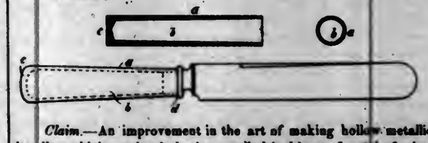
Claim.—In an opera-glass holder, two jaws, one fixed and the other movable, adapted to grasp a cross-bar of the opera-glass, the inner faces of said jaws having grooves parallel and opposite to each other with their bases inclined in reverse directions, to receive said bar, a non-rotating screw-rod carrying the movable jaw, a handle, a screw-nut on said rod intermediate of the fixed jaw and the handle, and side arms connecting the fixed jaw and handle, substantially as and for the purpose described.

412,775. ELEVATOR-BUCKET. Alexander Miller, New York, N. Y. Filed July 23, 1888. Serial No. 280,773. (No model.)

Claim.—An elevator-bucket consisting of a frame having a bag or sack made of fibrous or flexible material fitted into said frame and secured to said frame, for the purpose and substantially as herein described.

412,776. MACHINE FOR PRESSING FABRICS. George W. Miller, Woonsocket, R. I. Filed Nov. 12, 1888. Serial No. 290,555. (No model.)

Brief.—Cutting or abrasion of the jacket, resulting either from the bending of the cylinder or the springing upward of the jacket, is prevented by the devices set forth in the claims.

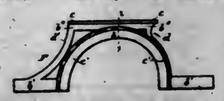


Claim.—1. The combination, with a cylinder and a bed, of disks equal in diameter to the cylinder and arranged in proximity to the ends thereof, substantially as set forth.

2. The combination, with the cylinder and bed of a pressing-machine, of a jacket or lining covering the face of the bed and extending beyond the ends of the cylinder, and disks arranged at the ends of the cylinder opposite the edges of the jacket, substantially as set forth.

3. The combination, with the cylinder, bearings, and bed of a cloth-pressing machine, of two disks, one at each end of the cylinder and carried by the bearings thereof, and as great in diameter as the cylinder, substantially as and for the purpose set forth.

412,777. ART OF MAKING HOLLOW METALLIC HANDLES. Isaac E. Moody, Toledo, Ohio. Filed July 25, 1889. Serial No. 318,645. (No model.)



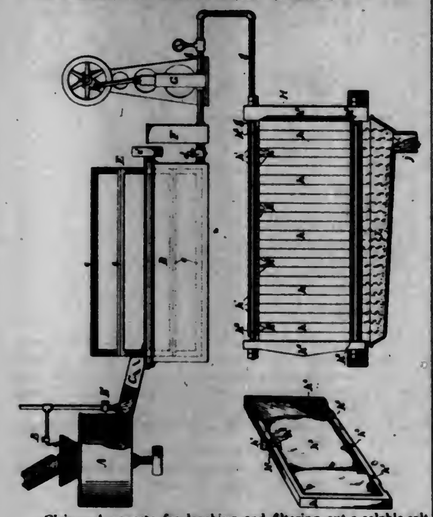
Claim.—An improvement in the art of making hollow metallic handles, which consists in boring a cylindrical bore of metal of suitable length from one end nearly to the other, thus forming a tube having a solid closed end, said bore tapering from its outer to its inner end, then pressing or hammering said tube, so that the same shall taper toward its open end, whereby the shell of the completed handle is formed of equal thickness throughout its length, substantially as described, for the purposes specified.

412,778. WAGON-BODY. William H. Morrell and Charles A. Eddy, Waterloo, N. Y. Filed Feb. 1, 1889. Serial No. 298,342. (No model.)

Claim.—In the class of vehicles or road-wagons hereinbefore specified, a body in which are combined the rockers or sills B B, arched as described, and the rail F, attached or connected to the said sills and made in one piece extending continuously along the sides and rear end of a platform E, of which it forms a part, substantially as and for the purposes specified.

412,779. VEHICLE-BODY. William H. Morrell and Charles A. Eddy, Waterloo, N. Y. Filed July 11, 1889. Serial No. 317,141. (No model.)

Claim.—1. In an arched vehicle-body, a pair of arched metallic side pieces having sill-lapping extensions and seat-supports, in combination with body side bars or sills terminating at or near the lower ends or corners of the said side pieces, substantially as and for the purposes specified.



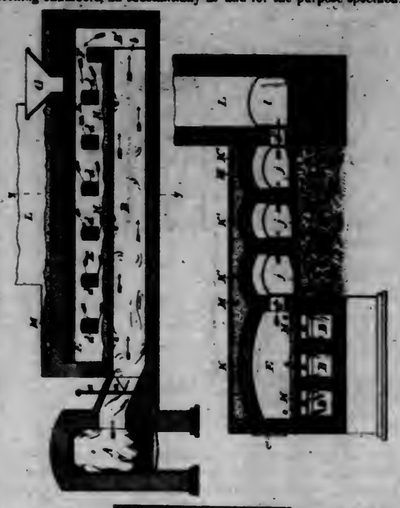
2. The combination, in an arched vehicle-body, of the arched metallic side pieces F F, having front and rear sill-lapping extensions *b' b'* and seat-supports, the said metallic parts having their sides or faces

arranged vertically, and wooden body side bars or sills terminating at or near the lower ends or corners of the said metallic arches, substantially as and for the purposes specified.

3. The combination, in an arched vehicle-body, of the arched metallic side pieces F F, having a T-shaped seat-supporting rail or bar at or near its top or apex, and also having sill-lapping extensions *b' b'* projecting forwardly and rearwardly from the lower ends or corners of the said metallic arches, respectively, and the body side bars or sills terminating at or near the said corners, substantially as and for the purposes specified.

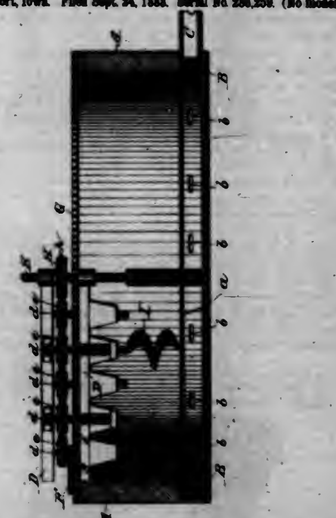
4. The combination, in an arched vehicle body, of the arched metallic side pieces F F, having thereon a seat-supporting rail *b''*, with depending arms *d* and *d'*, uniting the said side pieces, and the latter also having the sill-lapping extensions *b' b'*, and the body side bars or sills terminating at or near the lower corners of the said arches, substantially as and for the purposes specified.

412,780. PROCESS OF FILTERING. James McNab, Camden, N. J., assignor to the United States Chemical Company, same place. Filed June 26, 1887. Serial No. 242,447. (No model.)



Claim.—A process for leaching and filtering out a soluble salt from a mixed mass of soluble and insoluble material, which consists in grinding the mass together with water in sufficient quantity to make a thick homogeneous paste, in subjecting the ground mass mixed with additional water in sufficient quantity to dissolve the soluble portions and form a thoroughly-fluid homogeneous mixture with the insoluble material to treatment in an agitating-tank, and then forcing the homogeneous mixture into the fibrous bags of a filtering-press by means of a force-pump, so as to express all of the solution and separate it from the insoluble material.

412,781. FURNACE FOR CALCINING BONE-BLACK. James McNab, Camden, N. J., assignor to the United States Chemical Company, same place. Filed June 22, 1887. Renewed Mar. 19, 1889. Serial No. 303,943. (No model.)

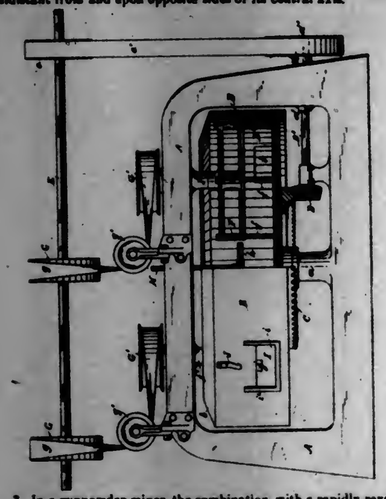


Claim.—1. In a furnace for calcining and purifying bone-black, the combination of the fire-chamber A, flues B, passing from the fire-chamber beneath the calcination-chamber and opening into it at their back end, the calcination-chamber E, having a feed-opening G at the end where flues B enter it, doors *c* in its front wall, and multiple flues *d*, arranged from front to rear along its back wall, and a stack L, connected with said flues *d*, so as to draw the gases from the back of calcination-chamber E all along its length.

2. In a furnace for calcining and purifying bone-black, the combination of the fire-chamber A, flues B, passing beneath the calcination-chamber, the calcination-chamber E, having doors *c* in its front wall and flues *d* in its back wall, and a feed-opening G at the end where the flues B open into it, one or more settling-chambers, and a stack L, connecting with the flues *d d'* through the settling-chambers, all substantially as and for the purpose specified.

3. In a furnace for calcining and purifying bone-black, the combination of the fire-chamber A, flues B, passing beneath the calcination-chamber, the calcination-chamber E, having doors *c* in its front wall and flues *d* in its back wall, and a feed-opening G at the end where the flues B open into it, one or more settling-chambers lying alongside of the chamber E, and having their roofs K' substantially on a level with the roof K of said chamber to form a drying-platform, and a stack L, connecting with the flues *d d'* through the settling-chambers, all substantially as and for the purpose specified.

412,782. MALTING-MACHINE. John Noye and Henry Noye, Davenport, Iowa. Filed Sept. 24, 1888. Serial No. 286,259. (No model.)



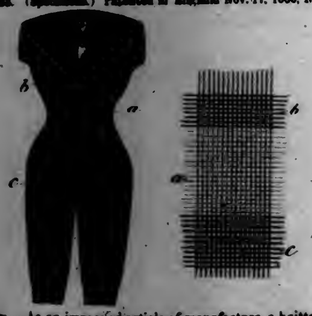
Claim.—In combination with a malting-tub, the spiral blade-stirrer having an interior vertical opening, such stirrer attached at its upper end to a vertical rotating shaft, and such shaft attached to a horizontal wing axially attached to a central vertical revolving shaft within such tub, substantially as described.

412,783. MIXER. Paul A. Oliver, Oliver's Mills, Pa. Filed June 18, 1888. Serial No. 277,668. (No model.)

Claim.—1. In a gunpowder-mixer, the combination, with a rapidly-revolving tub balanced upon a central pivot, of two agitators revolving rapidly in a contrary direction to the tub and arranged upon opposite sides of its central axis.

2. In a gunpowder-mixer, the combination, with a rapidly-revolving tub balanced upon a central pivot, of two agitators revolving rapidly with equal velocity in a contrary direction to the tub and arranged equidistant from and upon opposite sides of its central axis.

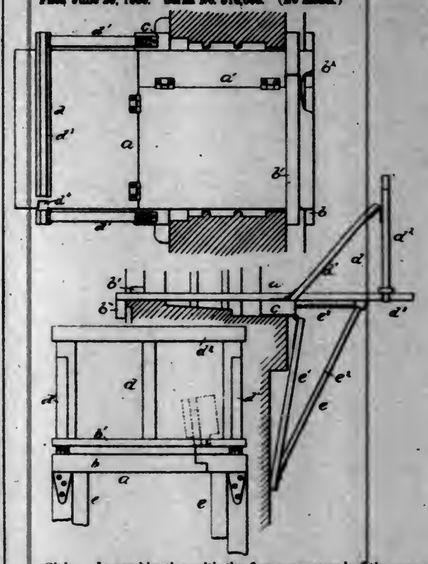
3. In a gunpowder-mixer, the combination, with a rapidly-revolving tub balanced upon a central pivot, of a soft non-metallic lining for the tub and two agitators revolving rapidly in a contrary direction to the tub upon opposite sides of its central axis.



4. In a gunpowder-mixer, the combination, with a rapidly-revolving tub balanced upon a central pivot, of two agitators revolving rapidly in a contrary direction to the tub, and a spray-pipe for moistening the materials in the tub.

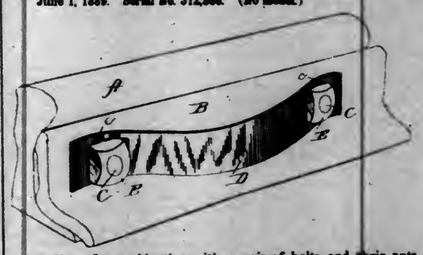
5. In a gunpowder-mixer, the combination, with a rapidly-revolving tub balanced upon a central pivot and provided with a discharge-opening in its side and a door for closing said opening, of two agitators revolving rapidly in a contrary direction to the tub upon opposite sides of its axis, whereby the materials are discharged when said door is opened, substantially as set forth.

6. In a gunpowder-mixer, the combination, with a rapidly-revolving open-top tub having an inwardly-sloping portion around its top edge, of two agitators consisting of frames provided with depending bars and revolving rapidly in a contrary direction to the tub upon opposite sides of its axis.



7. In a gunpowder-mixer, the combination of the framing provided with a central pivot, the mixing-tub mounted on said pivot and provided with mechanism for revolving it, the agitators inside the tub, provided with vertical spindles journaled in the frame, the driving-pulleys secured upon said spindles, the guide-pulleys supported by the frame, and the main driving-shaft provided with belt-pulleys for communicating rotary motion to the tub-driving mechanism and to the agitators, substantially as and for the purpose set forth.

412,784. **KNITTED UNDER-GARMENT.** MARGARET ORR, London, County of Middlesex, England. Filed Nov. 29, 1887. Serial No. 256,493. (Specimens.) Patented in England Nov. 17, 1886, No. 14,951.

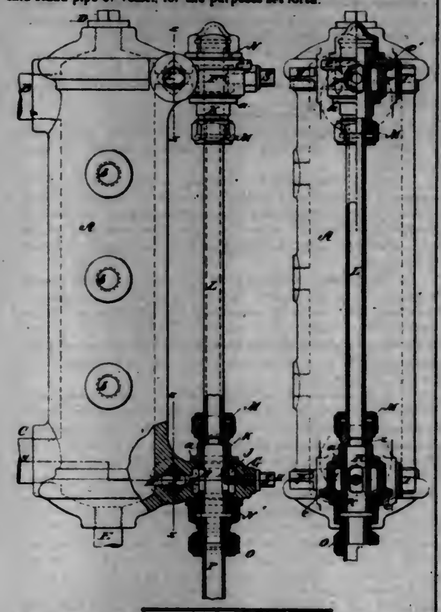


Claim.—As an improved article of manufacture, a knitted under-vest or combination-garment having a broad zone at the waist continuous with the adjoining upper and lower portions thereof, but composed of finer yarn than the remainder, substantially as and for the purpose set forth.

412,785. **WINDOW-JACK.** CHARLES PARKER, Hartford, Conn. Filed June 20, 1889. Serial No. 314,998. (No model.)

Claim.—In combination with the frame composed of the several parts united by hinges, the cross-bars *b b'*, secured across the inner end of the frame, the rest or base-piece *c*, secured to the outer part of the frame, the folding-back support *d*, the upright part d^2, being provided with the tenons d^3, adapted to fit sockets in the frame, and the folding bracket attached to the under side of the frame, all substantially as described.

412,786. **NUT-LOCK.** FERDINAND POST, Baton Rouge, La. Filed June 1, 1889. Serial No. 312,866. (No model.)



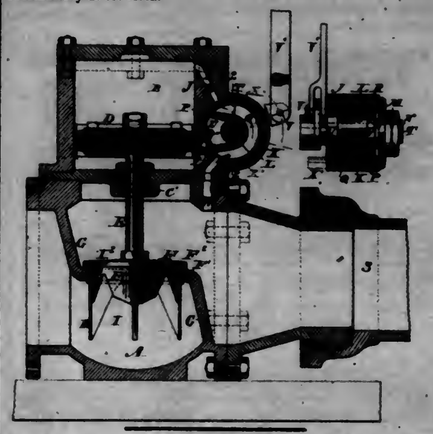
Claim.—In combination with a pair of bolts and their nuts, a locking-plate for said nuts of spring metal, having its central portion curved outwardly and its ends slightly flattened, holes at its ends adapted to register with the nut when the plate is flattened out, but drawing the outer edges of each opening in the plate beneath the adjacent edges of the nut when the spring-plate is relieved from its pressure, whereby the sides of the opening in the spring-plate are brought above the bottom line of the nut, and thus the turning of the nut prevented, substantially as described.

412,787. **WATER-GAGE.** NATHANIEL W. PRATT, Brooklyn, N. Y. Filed June 4, 1888. Serial No. 275,922. (No model.)

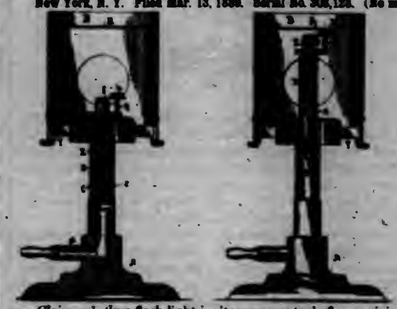
Claim.—1. The combination, with the stand-pipe or other vessel having hollow projections made integral therewith extending in a fixed position from its side, of the separable tubes or nipples secured to said projections in a common axial line to receive the ends of a glass tube, and the cocks seated in the said projections to intercept the port communication of the same with the said stand-pipe or other vessel.

2. The combination, with the stand-pipe or other vessel having hollow projections extending in a fixed position from its side, of tubes or nipples intersecting said projections in a common axial line, clamping-nuts for securing said tubes or nipples longitudinally in place, and the herein-described screwed studs entering the longitudinal slots of said tubes or nipples at a point in line with their port connection with said stand-pipe or vessel, for the purposes set forth.

412,788. **DROPPING-STOPPER FOR MEDICINE-BOTTLES.** WILLIAM W. PRESTON and EDWARD F. PRESTON, Bismarck, Mich., assignors to the Preston Ice Creeper Company, Chicago, Ill. Filed Dec. 3, 1888. Serial No. 292,578. (No model.)



Claim.—The combination, with a medicine-bottle and its stopper, of a dropping-tube passing through the cork and constructed with a single bore, said tube having a dropping-aperture at its outer point and air-inlet port back of its point but outside the cork, a fluid-inlet within the bottle, and an air-outlet near its extreme inner end, such inner end being closed, substantially as set forth.



412,789. **HYDRAULIC-VALVE MECHANISM.** HUBERT F. PROBST, Three Rivers, Mich., assignor of one-half to the Sheffield Velocipede Car Company, same place. Filed Nov. 12, 1888. Serial No. 290,561. (No model.)

Claim.—1. The combination, with the water-main, of a hydraulic-valve mechanism consisting of a main valve for opening and closing the water-main, having an annular seat and tapering projections separated by water-spaces, a piston connected with the main valve, a single pressure-cylinder in which the piston works, an auxiliary-valve mechanism, a port connecting the auxiliary valve with the water-main, and two ports connecting the auxiliary valve with the pressure-cylinder, the one admitting water to the cylinder for opening the main valve and the other for closing it, substantially as set forth.

2. The combination, with the main valve and pressure-cylinder and piston, of the auxiliary valve L, the ports R, S, and W, a U-shaped compartment O, a water-passage Q, the bridge U, for controlling the flow through the port S, and opening T, constructed and arranged substantially as set forth.

412,790. **FLASH-LIGHT IGNITOR.** HERMANN G. RAMPENDAHL, New York, N. Y. Filed Mar. 13, 1889. Serial No. 303,128. (No model.)

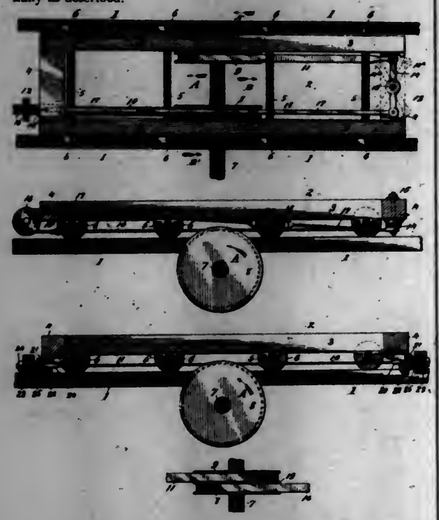
Claim.—1. In a flash-light igniter, a receptacle for receiving the charge, in combination with a glowing igniter adapted to move toward the charge, substantially as described.

2. In a flash-light igniter, a receptacle for receiving the charge, in combination with a carrier adapted to move toward the charge and provided with an igniter, substantially as described.

3. In a flash-light igniter, a horizontal receptacle B for the charge, having an orifice, and a carrier adapted to move toward the orifice in a vertical line and provided with an igniter, substantially as described.

4. The combination, with a receptacle for the charge, of a cylinder arranged in line with the same, a carrier fitted in the cylinder and containing an igniter, and means for propelling the carrier toward the charge, substantially as described.

5. The combination, with a receptacle for the charge, of a cylinder, a hollow carrier fitted to the cylinder and adapted to move toward the receptacle, a spring-supported igniter within said carrier, a stop engaging the upper end of the igniter, and a pneumatic bulb coupled to the cylinder, substantially as described.



6. The combination, with the receptacle for the charge, of a carrier adapted to move toward the receptacle and provided with a spring-supported igniter, a post on the carrier engaging with the receptacle for limiting the movement of the carrier, and having a transversely-projecting stop engaging with the igniter, substantially as described.

412,791. **MECHANISM FOR RECIPROCATING SAW-MILL CARRIAGES.** GEORGE R. RAY, Manistee, Mich. Filed May 24, 1889. Serial No. 311,961. (No model.)

Claim.—1. In mechanism for reciprocating saw-mill carriages, the combination, with a revolving and reversible shaft provided with two drums, of a saw-mill carriage and two flat bands which are connected to the opposite ends of said carriage and wound upon said drums in opposite directions and in coils one upon the other, substantially as described.

2. In mechanism for reciprocating saw-mill carriages, the combination, with a revolving and reversible shaft provided with two

drums, of a saw-mill carriage and two flat steel bands which are connected to the opposite ends of said carriage and wound upon said drums in opposite directions and in coils one upon the other, substantially as described.

3. In mechanism for operating saw-mill carriages, the combination, with a carriage, of a revolving and reversible drum-shaft provided with two drums, two flat steel bands connected to the opposite ends of said carriage and wound upon said drums in opposite directions and in coils one upon the other, and compensating mechanism for adjusting the tension and slack of said bands as they are wound upon and unwound from said drums, substantially as described.

4. In mechanism for operating saw-mill carriages, the combination, with a carriage, of a revolving reversible drum-shaft provided with two drums, two flat steel bands connected to the ends of said carriage and wound upon said drums in opposite directions and in coils one upon the other, and a compensating lever fulcrumed upon said carriage and connected with the ends of said belts or bands, substantially as described.

5. In mechanism for operating saw-mill carriages, the combination, with the carriage 2, of the revolving reversible drum-shaft 7, provided with the two drums 8 and 9, the lever 14, fulcrumed at one end of said carriage, the guide-pulley 16, journaled at the other end of said carriage, the rod or bar 17, pivotally connected to one end of said lever, the band 10, secured to said rod or bar, passed around said pulley 16, and wound upon said drum 8 in coils one upon the other, and the band 11, pivotally connected to the other end of said lever and wound upon the other drum 9 in an opposite direction to the other band 10 and in coils one upon the other, substantially as described.

6. In mechanism for operating saw-mill carriages, the combination, with the carriage 2, of the revolving reversible drum-shaft 7, provided with the two drums 8 and 9, the lever 14, fulcrumed at one end of said carriage, the pulley 16, journaled at the other end of said carriage, the rod or bar 17, formed with the slot 18 and pivotally connected to one end of said lever, the band 10, secured to said rod or bar, passed around said pulley 16, and wound upon said drum 8 in coils one upon the other, and the band 11, pivotally connected to the other end of said lever and wound upon the other drum 9 in an opposite direction to the other band 10 and in coils one upon the other, substantially as described.

7. In mechanism for operating saw-mill carriages, the combination, with the carriage 2, of the revolving reversible drum-shaft 7, provided with the two drums 8 and 9, the lever 14, fulcrumed at one end of said carriage, the pulley 16, journaled at the other end of said carriage, the rod or bar 17, formed with the slot 18 and pivotally connected to one end of said lever, the cable chain 10', connected to the other end of said rod or bar and passed around said guide-pulley, the band 10, connected to the other end of said cable chain and wound upon said drum 8 in coils one upon the other, and the band 11, pivotally connected to the other end of said lever and wound upon the other drum 9 in an opposite direction to the other band 10 and in coils one upon the other, substantially as described.

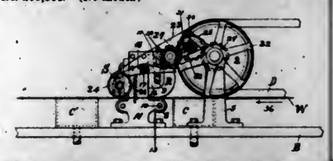
412,792. CRYSTALLINE CALCIC TETRAPHOSPHATE AND THE PROCESS OF MAKING THE SAME. JACOB REESE, Pittsburg, Pa. Filed Sept. 23, 1887. Serial No. 250,479. (No specimens.)

Claim.—1. The process for the manufacture of crystallized tetrabasic phosphate of lime, which consists in oxidizing phosphorus at a high temperature while in the presence of lime, until the lime is charged with phosphoric acid, then withdrawing the charged lime and subjecting it to slow cooling, substantially as described.

2. In a new article of manufactnre, crystallized tetrabasic phosphate of lime.

3. As a new article of manufacture, pulverized crystals of tetrabasic phosphate of lime.

412,793. PROCESS OF MAKING PHOSPHATES. JACOB REESE, Pittsburg, Pa. Filed Sept. 23, 1887. Serial No. 250,480. (No specimens.)



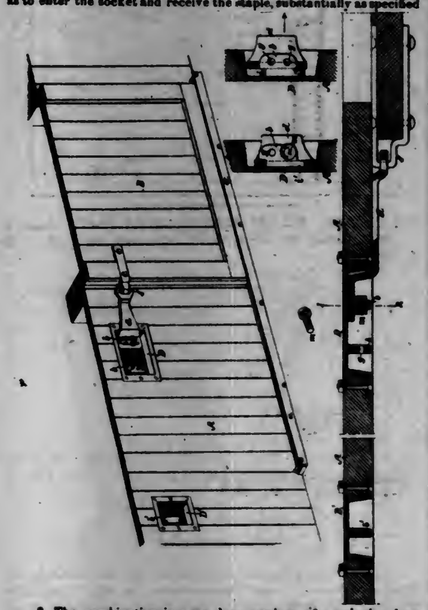
Claim.—1. The process of producing calcium phosphates, which consists in blowing molten phosphoritic iron with an air-blast while held in a basic-lined vessel, and in the presence of lime additions until the phosphorus has been reduced to not less than one-half of one per cent., then withdrawing the phosphate so formed from the presence of the metal.

2. The process of producing calcium phosphates, which consists in blowing molten phosphoritic iron with an air-blast while held in a basic-lined vessel, and in the presence of lime additions until the desired amount of phosphorus is oxidized to phosphoric acid and held in the lime as a phosphate, then stopping the blast and removing the phosphate while the metal still contains not less than one-half of one per cent. of phosphorus.

3. In the manufacture of calcium phosphate from phosphoritic iron by oxidizing the phosphorus with an air-blast while the metal is in a molten state and held in a basic-lined vessel in the presence of lime additions, the method of withdrawing the lime from the vessel after it has been charged to the desired degree with phosphoric acid, and then recharging fresh lime, whereby phosphates having any desired percentage of phosphoric acid may be produced.

4. In the manufacture of calcium phosphates from phosphoritic iron by oxidation with an air-blast, the method of preventing the deposit of a large amount of oxide of iron in the phosphate, which consists in stopping the blast and withdrawing the phosphate from the vessel before the phosphorus has been reduced in the metal below one-half of one per cent., (.5 per cent.,) whereby the large amount of oxide of iron produced while the last .5 per cent. of phosphorus is eliminated is prevented from entering the phosphate.

412,794. WATER-MARKER FOR PAPER-MAKING MACHINES. FRANCIS H. RICHARDS, Springfield, Mass. Filed May 31, 1887. Serial No. 239,868. (No model.)

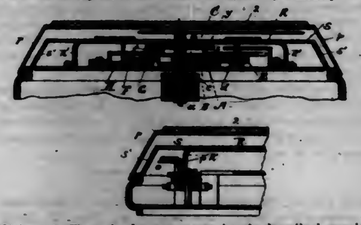


Claim.—1. In a water-marking device for paper-making machines, the combination of the shaft carrying the water-markers, a driving-pulley, substantially as described, thereon, a projecting arm or dog fixed on said shaft, a reciprocating stop-arm interposable into the path of said dog for interrupting the rotation of said shaft, and means for intermittingly oscillating the stop-arm, all substantially as described.

2. The combination, in a paper-making machine, of the wire W, shaft 8, carrying the water-markers, having a pulley whereby it is driven, and a dog 16, a stop-arm operating to interrupt the movement of said dog and shaft 8, and a cam having a continuous movement slower than the movement of shaft 8 and operating said stop-arm, all substantially as described.

3. The combination, in a paper-making machine, of the wire carrying the web, a shaft above and crosswise of said wire and carrying the water-markers, and having thereon a dog for stopping the revolution thereof, means, substantially as described, operating to impart to said shaft a normally-continuous and uniform rotary movement, a stop-arm arranged to intercept said dog and thereby stop said shaft, a cam operating said stop-arm to release said dog, and change-gearing driving said cam, whereby the interruption of the movement of said shaft may be continued for a longer or shorter time, all substantially as described, and for the purpose specified.

412,795. CAR-DOOR RETAINER AND SEAL. ANTHONY ROELOFS, Philadelphia, Pa. Filed Aug. 17, 1887. Serial No. 247,162. (No model.)



Claim.—1. The combination, in a hasp and staple retainer for car-doors, of the door of the car, a socket-plate secured to the side of the car flush with the face of the same, a staple contained wholly within the socket of said plate, and a hasp hung to the car-door and bent so as to enter the socket and receive the staple, substantially as specified

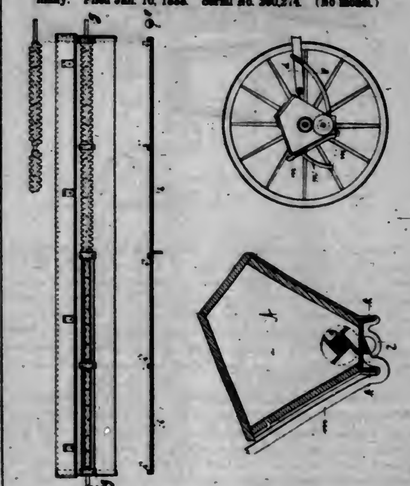
2. The combination, in a car-door retainer, of a swinging hasp, with a staple having inner and outer portions, each of substantially the same size as the opening in the hasp, the outer portion being in a higher plane than the inner portion, substantially as specified.

3. The combination of the socket-plate secured to the side of the car flush with the face of the same, a hasp hung to the door and bent so as to enter the socket, a staple engaging with the hasp, and a sealing-rivet applied to the staple outside of the hasp, both staple and rivet being wholly within the limits of the socket, substantially as specified.

412,796. CALENDAR-WATCH. BERNHARDT ROSENBURG, Waltham, Mass. Filed July 16, 1888. Serial No. 280,092. (No model.)

Claim.—1. The calendar-movement herein described, consisting of the combination of the pinions c and e, wheels A, B, C, d, F, D, and H, pins *y*, *z*, and *f*, clicks E, K, and I, and suitable indicating-hands, all arranged substantially as and for the purposes set forth.

2. In a calendar-watch, the independent ring-dial S, for the day of the month, provided with the bezel S', and the independent dial R, having two faces, one for the days of the week and one for the months of the year, and provided with a bezel R', and both combined with a watch movement and case, and arranged in relation to the time-dial as herein described, all substantially as and for the purposes set forth.

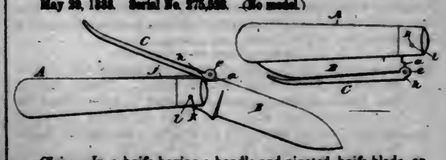


3. In a calendar-watch, the calendar-train, consisting of the pinion e, provided with the teeth, the wheel A, provided with forty teeth, the pinion c, provided with six teeth, the wheel B, provided with thirty-six teeth, the wheel D, provided with seven teeth, the wheel d, provided with seven teeth, the wheel G, provided with thirty-one teeth, the wheels F, G, and H, each provided with twelve teeth, and the clicks I K E and pins *y*, *z*, and *f*, all combined with the center arbor of the watch-movement and adapted to operate substantially as and for the purposes set forth.

412,797. RAILWAY-RAIL FASTENING. WILLIAM SALISBURY, Cleveland, Ohio. Filed July 10, 1888. Serial No. 317,067. (No model.)

Claim.—In a railway-rail fastening, the fish-plate held in contact with the rail by a threaded bolt *d*, which engages with nuts placed in a groove outside of said plates, and which is provided with a spike-point to secure the same firmly to the tie, substantially as described.

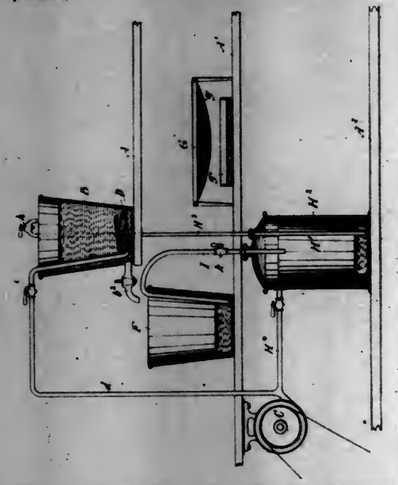
412,798. MACHINE FOR DISTRIBUTING FERTILIZERS. WILHELM SCHMIDT and PAUL P. SPIESS, Halle-on-the-Saale, Prussia, Germany. Filed Jan. 10, 1888. Serial No. 260,274. (No model.)



Claim.—1. In a machine for distributing fertilizers, the combination, with the hopper having the discharge-opening and an agitator located therein, of the semicircular valve co-operating with the opening in the hopper-bottom to regulate the exit of material, substantially as described.

2. In a machine for distributing fertilizers, and in combination with an adjustable opening in the bottom of the hopper, as hereinbefore described, a revolving stirrer provided with blades set at an angle, whereby the contents of the hopper is forced through the discharge-opening, the said blades being provided with toothed edges, substantially as described.

3. In a machine for distributing fertilizers, and in combination with an adjustable opening in the bottom of the hopper, as hereinbefore described, a revolving stirrer provided with blades set at an angle, whereby the contents of the hopper is forced through the discharge-opening, the said blades being provided with toothed edges, so that the teeth on one side correspond with spaces between the teeth on the other side, substantially as described.



412,799. POCKET-KNIFE. JOHN C. F. SHERMAN, Maine, Ill. Filed May 20, 1889. Serial No. 311,233. (No model.)

Claim.—In a knife having a handle and pivoted knife-blade, an arm attached near the pivoted end of the knife-blade for applying

force against the blade for the purpose of swinging the same open or out of the handle, substantially as described.

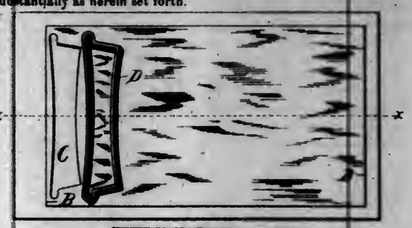
412,800. PROCESS OF MAKING LEAD CHLORIDE. WALDRON SHAPLEIGH, Camden, assignor to the Electric Storage Battery Company, Gloucester City, N. J. Filed Apr. 9, 1889. Serial No. 306,543. (No specimens.)

Claim.—1. In the manufacture of chloride of lead, introducing a blast of air into an aqueous solution of nitric acid during the admission of finely-divided lead thereto and while the solution is undergoing chemical action, substantially as and for the purposes set forth.

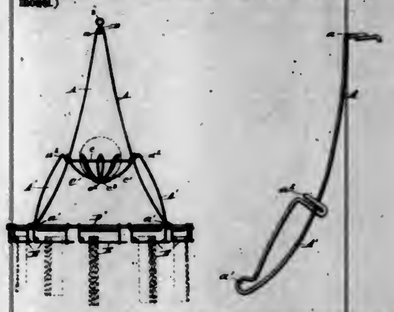
2. In the method of making chloride of lead, adding to a solution of lead nitrate hydrochloric acid and then introducing a blast of air into the same while the chemical reaction is taking place between said lead nitrate and hydrochloric acid, substantially as and for the purposes set forth.

3. In the method of making chloride of lead, precipitating the lead from a solution of lead nitrate in the form of lead chloride by the addition of hydrochloric acid, then introducing a blast of air into said solution during the reaction to oxidize the lower oxides of nitrogen given off during the reaction, and then adding lead nitrate thereto to remove the excess of hydrochloric acid, substantially as and for the purposes described.

412,801. MACHINE FOR GROOVING TIRES FOR CARRIAGE-WHEELS. JOSEPH SHAW, Manchester, County of Lancaster, England. Filed July 2, 1889. Serial No. 316,276. (No model.) Patented in England July 3, 1888, No. 9,623.



Claim.—1. In an apparatus for producing dovetailed and undercut recesses in metal bars, the combination and arrangement of the roll C with the bearing-rolls F and G and a die H, substantially as hereinbefore described, and as illustrated by the accompanying drawings.



2. In an apparatus for producing dovetailed and undercut recesses in metal bars, the combination and arrangement of the bearing-roll G with the die H, substantially as hereinbefore described, and as illustrated by the accompanying drawings.

412,802. BLOCKS USED AS BEDS IN PUNCHING AND CUTTING MACHINES AND IN CUTTING OUT GENERALLY. PIERRE J. SEROULIN, Paris, France, assignor, by mesne assignments, to Charles Edward Shafer, same place. Filed Feb. 2, 1888. Serial No. 262,804. (No model.) Patented in France May 3, 1887, No. 183,309; in England July 14, 1887, No. 9,910, and in Belgium Nov. 14, 1887, No. 79,868.

Claim.—The combination, with a knife or cutter, of a block or sheet the base of which is composed of soluble nitro-cellulose, the knife being operated by pressing it through the material laid upon the block or bed and partly into the surface of the block or sheet, substantially as herein set forth.

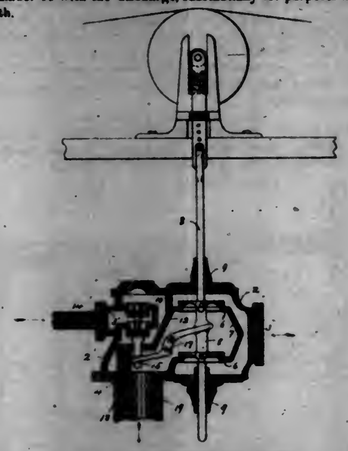
412,803. BAG AND TWINE OR SAMPLE HOLDER. FRANK H. SMITH, Chicago, Ill. Filed June 24, 1889. Serial No. 315,304. (No model.)

Claim.—1. In a bag and twine holder, the combination of the hanger-arms formed of single lengths of wire and coiled in their middles about a suspending hook or ring to form a swivel-support, and the hoop supported by said arms, substantially as set forth.

2. In a bag and twine holder, the combination of the hanger-arms formed of single lengths of wire and coiled in their middles about a suspension-hook to form a swivel-support, the hoop supported by said hanger-arms, and the twine-holder supported by hooks formed at the upturned ends of the arms, substantially as set forth.

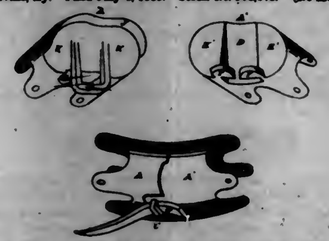
3. In a twine and bag holder, the hanger-arms formed of single lengths of wire supporting the hoop, and the spring-pin having upper curved approximately U-shaped portions to clamp over the hoop or ring, and the lower spring-pin portion, substantially as set forth.

4. In a twine and bag holder, the combination of the hanger-arms formed of single lengths of wire and coiled in their middles about a hook or ring to form a swivel-support, the twine-holder bushed at its outlet or opening and supported by hooks formed on the upturned ends of said hanger-arms, the hoop supported thereby, and the spring-pins having upper curved approximately U-shaped portions to clamp over the hoop or ring, substantially as set forth.



5. In a twine and bag holder, the combination of the supporting-arms formed of a single length of wire, said arms being coiled at their middles about a stemmed suspending-ring to form a swivel-support, the hoop supporting the hooks or pins, and the twine-support, substantially as set forth.

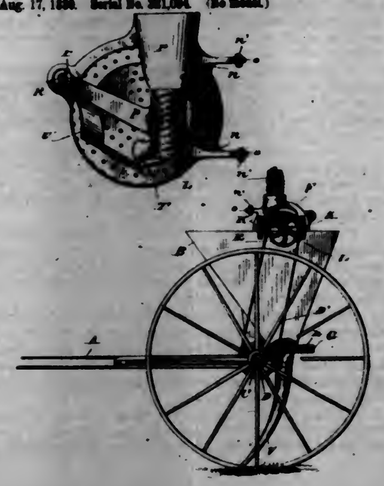
412,804. STEAM-CONTROLLING DEVICE. RICHARD SMITH, Sherbrooke, Quebec, Canada. Filed Sept. 14, 1888. Serial No. 285,209. (No model.)



Claim.—1. A steam-controlling device, substantially as described, composed of a valve case or shell provided with a main supply opening, a delivery or discharge opening, and a main valve which controls said supply-opening, combined with an auxiliary inlet supply-opening and its controlling-valve connected with and actuated by the main valve by means of a connecting-lever pivoted near its center, substantially as and for the purposes stated.

2. In valve-cases provided with two inlet supply-openings and a common delivery-opening, an adjustable valve 5 and the adjustable glands 9, combined with the secondary valve which governs the secondary inlet-opening and the interconnecting lever by which the main valve causes the auxiliary valve to open, substantially for purposes stated.

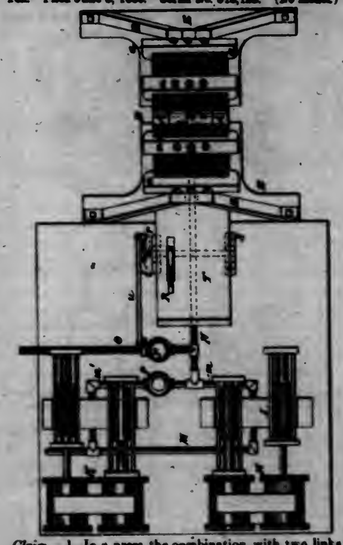
3. In combination, the valve-case 2, having the inlet supply-openings 3'3', the valves 5 13, which respectively control said openings, and the lever-rod 16, pivoted to the valve-cast and operated by the main valve 3 to open the valve 13, and the pipe 18, which connects the chamber 10 with the discharge, substantially for purposes herein set forth.



412,805. HORSE-COLLAR FASTENER. WILLIAM T. SUMNER, Louisville, Ky. Filed July 1, 1889. Serial No. 316,175. (No model.)

Claim.—In a horse-collar fastening, the combination, with a metal tip A, having a hollow sloping tongue C, a lip J, and the countersinks H H, of the metal tip A', having a sloping slot D, and hooks F F, and a hame-string G, substantially as set forth, and for the purposes specified.

412,806. SEED-PLANTER. THOMAS H. TABOR, Hilgay, Ga. Filed Aug. 17, 1889. Serial No. 321,094. (No model.)



Claim.—1. The combination, with a corn-planter, of a shelling device, whereby the corn will be removed from the cob and intermittently fed to the ground, as set forth.

2. The combination, with a planter having a pulley D and belt D', of the disk L, having pulley E, and the hinged hopper P, arm *p*, bolt R, thumb-nut *r*, and spring S, as set forth.

3. In a sheller and planter, the combination of the disk L and devices for operating the same, with the hinged sectional hopper P, provided with the finger T, the arm *p*, having integral guide U, and the bolt R, nut *r*, and spring S, substantially as shown and described.

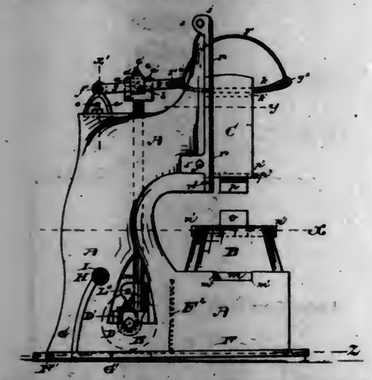
412,807. COTTON-PRESS. JAMES W. THOMPSON, Fort Worth, Tex. Filed June 5, 1889. Serial No. 312,122. (No model.)

Claim.—1. In a press, the combination, with two links formed of uprights A, provided with curved connections at the top and at the base, of a fixed upper platen conforming to said links, binders *a*, which are made fast to said upper platen and embrace said links, a semicircular block fitting within said links at the base, a cylinder mounted on said block, said cylinder being provided with a plunger, and a platen in position above the plunger to be operated thereby, substantially as and for the purposes described.

2. The combination, with the fixed upper platen of a press, said platen being perforated, of a screw-rod provided with a hook at its lower end and placed in the perforation, a nut *h* on said rod and resting on the platen, whereby the hook on the latter may be raised, and a plunger provided with a loop in position to connect with said hook on the rod, substantially as set forth and described.

412,808. GRAIN-DRILL. WILLARD A. VAN BRUNT, Horicon, Wis. Filed Aug. 3, 1889. Serial No. 319,622. (No model.)

Claim.—1. The combination, with feed-spouts and shares or hoes, of covering-wheels connected therewith and springs for retaining the shares in the ground at a uniform depth and transferring the pressure to the wheels the moment the shares tend to sink into the ground beyond this uniform depth, substantially as set forth.



2. The combination, with drag-bars, hoes or shares connected thereto, and feed-spouts located on the shares or hoes, of straps or bales pivotally secured to the drag-bars, covering-wheels journaled in the straps or bales, and springs adapted to transfer pressure upon the covering-wheels when the shares or hoes sink beyond a certain depth, substantially as set forth.

3. The combination, with drag-bars, shares or hoes secured thereto, and feed-spouts located on the shares, of straps or bales, cov-

oring-wheels journaled therein, a rod extending upward from the share, and a spring mounted thereon and adapted to exert a constant pressure upon the share and transfer its pressure to the wheels when the share has reached a certain depth, substantially as set forth.

4. The combination, with drag-bars, shares, feed-spouts, and straps or bales pivotally secured to the drag-bars and having covering-wheels journaled in their rear ends, of a rocking shaft, arms thereon, rods pivotally secured to the shares and having loose connection with the arms, said rods having washers thereon, and springs mounted on the rods between the arms and washers, adapted to exert a constant pressure on the shares and transfer this pressure to the wheels when the share has reached a certain depth, substantially as set forth.

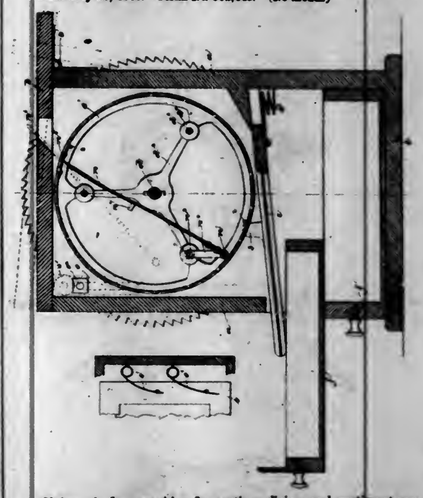
412,809. **POWER-HAMMER.** CHARLES A. VAUGHN, Newark, N. J. Filed Nov. 14, 1888. Serial No. 290,796. (No model.)

Claim.—1. In a power-hammer, the combination, with the driving mechanism, of a helve pivoted at one end to the frame and provided at the other end with a semicircular spring made integral therewith, and a flexible strap adjustably secured between the ends of said spring by bolts, substantially as described.

2. In a power-hammer, the combination, with the driving mechanism, of a vibrating helve pivoted at one end to the frame, the other end being provided with a semicircular spring made integral therewith, a flexible strap adjustably secured between the ends of said spring, and adjustable bearings for receiving the end of a rod from the driving-shaft, substantially as shown and described.

3. In a power-hammer, the combination, with the driving mechanism, of a vibrating forked helve pivoted at one end to the frame and adjustably connected to the driving-shaft by a suitable connecting-rod, as shown, and provided at its other end with a semicircular spring, and a flexible strap adjustably secured between the ends of said spring, substantially as shown and described, for the purposes set forth.

4. In a power-hammer, the combination, with the driving mechanism, of a vibrating forked helve pivotally connected at one end to the frame and adjustably connected with the driving-shaft by a suitable connecting-rod, as shown, the other end of said helve being provided with a semicircular spring and a slot in said helve at the base of said spring, and a bolt for holding one end of a flexible strap between the ends of said spring, substantially as described, and for the purposes set forth.



5. In a power-hammer, the combination, with the driving mechanism, of a pivoted connection and bearings for a helve, consisting of a spindle with a tapering bushing firmly fixed thereon and adapted to enter a tapering hole in the bearing, as described, and for the purposes set forth.

6. In a power-hammer, the combination, with the frame and driving mechanism of the machine, of a hammer-stock, a helve pivoted at one end to the frame, a semicircular spring on the other end of said helve and integral therewith, a flexible strap extending between the ends of said spring, whereby said helve is connected with said hammer-stock, and a slot in said helve adapted to receive a bolt for adjustably securing one end of the flexible strap, as shown, and for the purposes set forth.

7. In a power-hammer, the combination, with the hammer-stock of ways between which the hammer-stock slides, and a helve pivoted at one end to the frame and also adjustably and pivotally connected to the driving-shaft, as shown, and for the purposes set forth.

8. In a power-hammer, the combination, with the hammer-stock provided with a slot k', of ways between which the hammer-stock slides, bolts s s, rubber washers or cushions s^2 s^2, a helve pivoted at one end to the frame, a semicircular spring upon the other end of said helve, a flexible strap extending between the ends of said spring and passing through slot k' in said hammer-stock, bolt f, adapted to slide in slot g^4 in said helve for adjustably securing one end of said flexible strap, adjustable bearings c on said helve, and rod M, pivotally connected at one end to said adjustable bearings c and at the other end to the driving-shaft, substantially as shown and described, and for the purposes set forth.

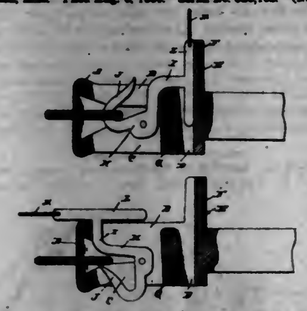
412,810. **MACHINE FOR CUTTING, SHAVING, AND GRINDING CHEESE.** JOSEPH VERCELLI and BATTISTA GRAHANA, Boston, Mass. Filed May 28, 1888. Serial No. 312,449. (No model.)

Claim.—1. In a machine for cutting, slicing, and grating cheese, &c., the revolving grating-cylinder and circular saw, having their bearings in the frame-work of the box-like structure, the cylinder being within said structure, combined with a slicing-knife inclosed in the said cylinder, substantially as described.

2. The grating-cylinder d', arranged on the shaft d in the box-like structure, having a pivoted top plate b, combined with the separable retaining device for the shaft, consisting of the recessed flange i^2, slide P thereon, and pivoted segment i^4, normally resting on the top of said slide, substantially as described.

3. The grating-cylinder and pins 2, carried by it, the inclined plate e, partially perforated, arranged below the grating-cylinder, and retractive springs attached thereto and having the ear 3 in the path of movement of said pins, to be acted on thereby, and the two compartments f f', substantially as described.

4. The grating-cylinder arranged in a box-like structure having a pivoted top plate, the movable plate e, partially perforated, and receptacles f f', arranged to slide under said plate, combined with the adjusting device for the top plate, consisting of the slotted plate o and set-screw o^3, substantially as described.



5. The top plate, the opening therein, the grating-cylinder having an opening through it to register with the opening in the top plate, combined with a knife n, inclosed in said cylinder, a crank by which the knife is borne carried by the cylinder, and a rotatable shaft or stud for the crank, substantially as described.

6. The top plate, the opening therein, the grating-cylinder having an opening to register with the opening in the top plate, combined with a knife n, having a pin n^1, the crank n^3, shaft n^2, and rod d^3, wherewith said pin co-operates, all located in said cylinder, substantially as and for the purposes specified.

7. In an organized machine for cutting, slicing, and grating cheese, &c., the top plate having an opening therein, and an extended portion, the circular saw and guide carried by said extended portion, the grating-cylinder, a shaft upon which said saw and cylinder are mounted, and the movable slicing-knife carried by the cylinder, all substantially as and for the purposes set forth.

8. In an organized machine for cutting or slicing and grating cheese, &c., the top plate having the opening m^3 therein, the grating-cylinder and shaft carrying it, and a cutting device consisting of a circular disk secured by a set-screw m' on said shaft projecting through said opening in the top plate, and protruding knife-edges on the face of said disk for slicing or shaving material held against said face, substantially as and for the purposes set forth.

412,811. **CAR-COUPLING.** CHRISTOPHER C. WARREN, Chamley's Station, Miss. Filed Aug. 6, 1889. Serial No. 320,162. (No model.)

Claim.—1. The combination of the draw-head and the hook pivoted therein and provided with a U-shaped portion adapted to be struck by the link, as set forth.

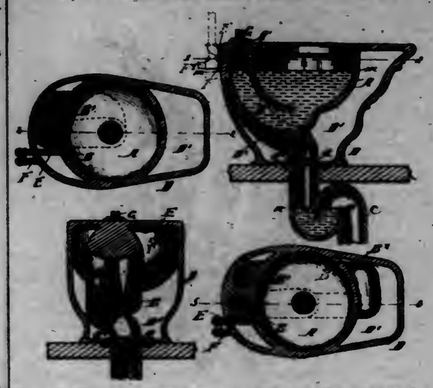
2. The combination of the draw-head and the coupling-hook pivoted therein and having a central U-shaped portion, the lever L, rising from the back edge of said U-shaped portion, and the engaging-hook K, projecting forward from the said U-shaped portion, as set forth.

3. The combination of the draw-head having longitudinal slots in its top and bottom, the internal partition G, and the recessed lug E, and the coupling-hook pivoted in the slot in the bottom of the draw-head and having a central U-shaped portion fitting over the internal partition therein, and a lever engaging the recessed lug, as set forth.

412,812. **DENTAL MATRIX.** GEORGE M. WHITON, Philadelphia, Pa., assignor to Henry D. Justi, same place. Filed May 27, 1889. Serial No. 312,282. (No model.)

Claim.—A dental matrix consisting of a band of flexible metal and a single loop, the band having an eye which is permanently affixed to one side of the loop, and having its other end passing freely between said eye and the opposite side of the loop, substantially as described.

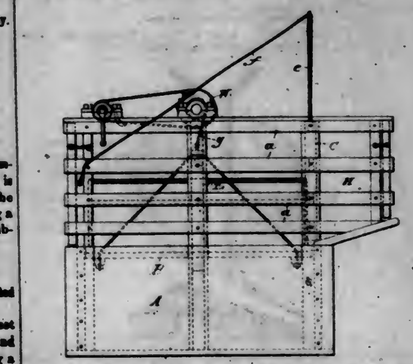
412,813. **CLASP.** ISAC L. WERNHOFF, Furth, Bavaria, Germany. Filed Jan. 4, 1889. Serial No. 295,620. (No model.)



Claim.—In a clasp for attaching the trousers to a shirt, the combination of the flat hook c, hinged to the guard-plate f, which is depressed from the hook c by the spring m and provided with the curved part k, having holes therein, with the pin A, the pin g, having a notch, and the spring lever or catch l falling into this notch, all substantially as described, and for the purpose set forth.

412,814. **WATER-CLOSET.** FRANK A. WELLS, Nutley, N. J. Filed Jan. 24, 1888. Serial No. 297,410. (No model.)

Claim.—1. In a water-closet, in combination, substantially as set forth, the bowl having a siphonic soil-passage leading therefrom and a pedestal inclosing both the bowl and the soil-passage, leaving a cavity or chamber within the pedestal around the bowl and soil-passage, the pedestal being apertured at the lower part and the soil-passage of the bowl discharging through such aperture, a flushing-pipe communicating with the bowl, and a water-pipe discharging into the chamber within the pedestal surrounding the bowl.

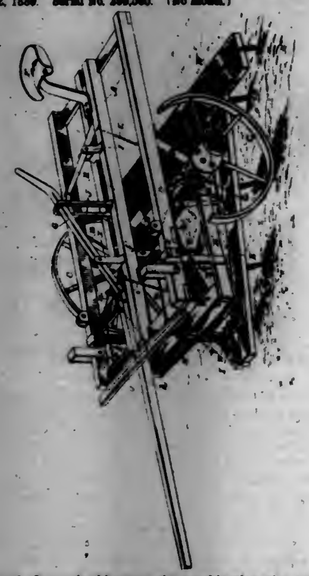


2. In a water-closet, in combination with the closet-bowl having a siphonic soil-passage leading therefrom, said soil-passage comprising two traps, and a pedestal inclosing the bowl and its soil-passage, including both traps thereof, and forming a chamber about them and having in its base an aperture through which the soil-passage discharges, a flushing-pipe communicating with the bowl, and the water-pipe communicating directly with the chamber in the pedestal surrounding the bowl and traps, substantially as set forth.

3. A water-closet bowl having a siphonic soil-passage leading therefrom, said soil-passage and bowl being formed integrally, and a pedestal also formed integrally with the bowl and soil-passage and inclosing them both, leaving a cavity or chamber within said pedestal and around the bowl and soil-passage, the bottom wall of said pedestal being apertured and the soil-passage terminating concentrically with said aperture, so that it may discharge through it, an annular space being left between the end of the soil-passage and the margin of the aperture through the pedestal-base, a flushing-pipe communicating with the bowl, and a water-pipe discharging into the chamber in the pedestal, in combination, substantially as set forth.

4. A water-closet bowl having a siphonic soil-passage leading therefrom, said bowl and soil-passage being formed integrally, the soil-passage comprising two traps, and a pedestal also integral with the bowl and its soil-passage and inclosing them both, forming a chamber about them, and having an aperture in its base concentric with the terminus of the soil-passage, an annular aperture being left between the end of the soil-passage and the margin of the aperture in the pedestal-base, a flushing-pipe communicating with the bowl, and a water-pipe communicating directly with the chamber in the pedestal about the bowl and traps, in combination, substantially as set forth.

412,815. **MACHINE FOR DIPPING ANIMALS.** JACOB E. WEAVER, Burton City, Ohio. Filed Apr. 3, 1889. Serial No. 305,894. (Model.)



Claim.—1. In a machine for dipping animals, the combination, with a tank, of a platform and suitable raising and lowering mechanism, and a supplemental platform provided with grooves, as and for the purpose set forth.

2. In a machine for dipping animals, the combination, with a vertically-adjustable platform B, of the frame d, mounted thereon, such frame consisting of suitable uprights rounded on their upper ends and connected by longitudinal bars, as and for the purpose set forth.

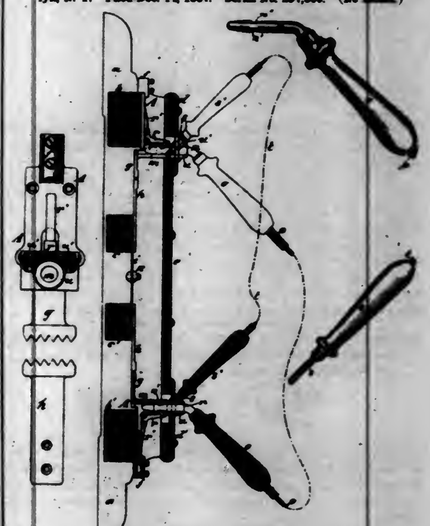
3. The combination, with the platform B, of the metal frame d and the vertically-movable gate C, provided with downwardly-projecting spring-arms e, substantially as and for the purpose specified.

412,816. HARROW. WASHINGTON WILKIN, Syracuse, Ala. Filed Feb. 12, 1889. Serial No. 299,565. (No model.)

Claim.—1. In a wheel-harrow, the combination of a top frame carrying coacting levers, a tooth-frame having its rear end suspended by flexible connections from the rear lever, an intermediate frame hinged to the side of the axle and being suspended from the forward lever by flexible connections, a pair of hangers in which the side bars of said frame operate, an adjustable supporting-hook extending down from the hinged frame, and links connecting the latter to the forward end of the tooth-frame, all arranged and adapted to operate in the manner and for the purpose substantially as described.

2. In a wheel-harrow, the combination of a top frame, an intermediate frame hinged to the harrow-axle and having a depending hook in its front portion, a tooth-frame having an elongated link in its forward end, and a link connecting said depending hook and elongated link, substantially as described.

412,817. SHOT-CASE. ISAAC H. WILLIS, Marceline, Mo. Filed July 29, 1889. Serial No. 319,057. (No model.)



Claim.—1. The combination of the shot-case having the radial compartments, and the central tube provided at its upper and lower ends with openings communicating with said compartments, and the vertically-movable revoluble tube D, arranged in the central tube and having the openings at its upper and lower ends adapted to communicate with those of the compartments, and having the inclined chute *b*, registering with the opening at its upper end, substantially as described.

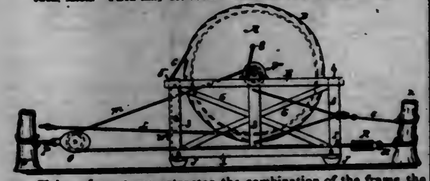
2. The shot-case having the radial compartments, and the central tube C, having openings *c c'* at its upper and lower ends into each of said compartments communicating with the upper and lower sides of the compartments, in combination with the vertically-movable tube D in said tube C, and having the hopper at its upper end, the opening *d*, forming the discharge of the hopper and adapted to register with either of the openings *c* when the tube D is lowered, and the opening *d'* at the lower end adapted to register with either of the openings *c'* when the tube D is raised, for the purpose set forth, and the discharge-chute F, attached to the shot-case and with which the lower end of tube D communicates, substantially as described.

3. The shot-case having the radial compartments, and the central tube having openings communicating with the upper and lower ends of the compartments, in combination with the vertically-movable revoluble tube D in the central compartment, and having the openings *d d'*, adapted to register with the upper and lower openings in the central tube, respectively, when the tube D is lowered and raised, the stops to limit its vertical play, and the hopper at its upper end communicating with the upper opening *d*, substantially as described.

412,818. ELECTRICAL SWITCH-BOARD. JAMES J. WOOD, Brooklyn, N. Y. Filed Dec. 14, 1887. Serial No. 257,869. (No model.)

Claim.—1. The combination, in a switch-board, of two terminals adapted to be introduced in the circuit and formed with horizontal socket-holes, with two switch-pins adapted to fit said holes, a handle fastened to each pin and projecting angularly therefrom in such direction that when the pin is in its normal position in the socket the handle inclines downwardly, and a flexible conducting loop or cable secured at each end to the pins and passing through and issuing from said handles, whereby the flexure of the cable at its junction with the handles is reduced, and by its weight it tends to hold the pins in their normal position in the sockets, substantially as and for the purpose set forth.

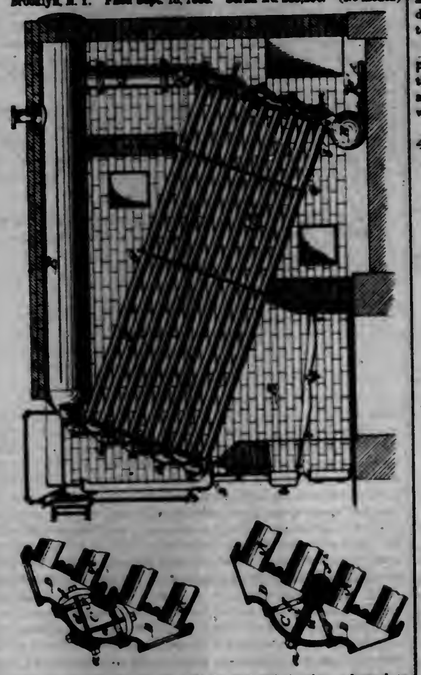
2. In a switch-board, the combination, with terminals or socket-heads having a socket *m* and an engaging-latch *r*, of the bent switch-pin *n*, having recess *n'*, and crank-handle *o* relatively arranged so that when the recess is in position to be engaged by said latch the crank-handle is turned downward and tends by its weight to keep the pin locked by said latch, substantially as and for the purpose set forth.



3. In a switch-board, the combination, with two sets of socket-terminals having spring-latches entering their sockets and said latches relatively inverted in the respective sets, of two switch-pins and an intervening loop or cable, with its opposite ends connected to said pins, each of said pins bent downwardly and a handle fixed on the bent portion thereof, with the cable issuing from the end of the handle, and the pins formed each with notches or recesses on both top and bottom sides for engagement by said latches, whereby the pins may be entered in the sockets of either set of terminals interchangeably, and when engaged therewith the handles project downwardly and the weight of the handles and cable tends to retain the pins in the engaging position, substantially as set forth.

4. In a switch-board, the combination of terminals or socket-heads formed with main sockets *m*, extending horizontally and with minor sockets *n'*, extending downwardly at an inclination adjacent to the main sockets, with main switch-pins to fit the main sockets, formed with handles bent downwardly, and minor switch-pins to fit the minor sockets, formed with straight handles, all combined and arranged substantially as shown and described, whereby, when the pins are inserted, the handles of the main pins project downwardly and those of the minor pins project upwardly at widely-diverging angles, so that they are readily distinguishable and accessible without interfering with one another.

5. In a switch-board, the combination, with the end brackets *a a'*, of the longitudinal bars *b b'*, marginal boards *d d'*, pin sockets or terminals fixed to bars *b b'* and projecting through said boards *d d'*, and central sliding leaf *e*, substantially as shown and described.



6. In a switch-board, a terminal or socket-head formed with the binder *f*, socket-tube *m*, and prong *g*, substantially as and for the purpose set forth.

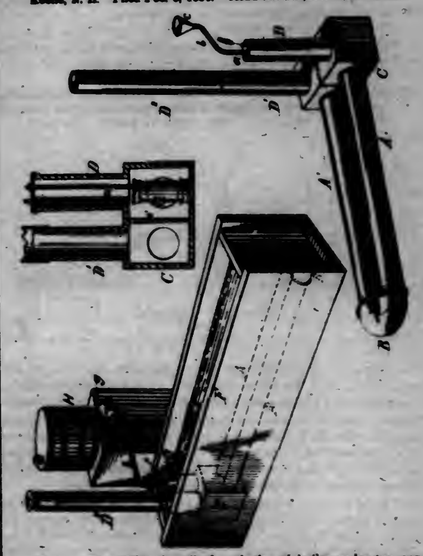
412,819. STUMP-EXTRACTOR. JASPER A. WOODWORTH, Saugatuck, Mich. Filed May 16, 1889. Serial No. 310,913. (Model.)

Claim.—In a stump-extractor, the combination of the frame, the single and double blocks, the fastenings carried by said blocks, the grooved and ratcheted wheel mounted on a shaft journaled on top of the frame, the pawl, the rope having one end secured in the groove of the wheel and adapted to have power applied at its other end, and the continuous rope passing through said wheel and through the single and double blocks and adapted for winding on the shaft at each side of the wheel, substantially as shown and described.

412,820. SECTIONAL STEAM-BOILER. AMASA WORTHINGTON, Brooklyn, N. Y. Filed Sept. 13, 1888. Serial No. 285,280. (No model.)

Claim.—1. The herein-described sectional header, adapted to connect staggered tubes of a water-tube boiler in a single vertical series, as described, said header consisting of a series of inclined sections or units that receive the tubes, and a series of oppositely-inclined connecting-bends that connect the adjacent ends of said sections or units at points opposite the entrance thereto of the said tubes, said inclined sections and oppositely-inclined connecting-bends being united by seating surfaces or joints that lie in planes at the described opposite angles to the axes of the boiler-tubes connected to said sections, whereby a substantially straight-way vertical water-course is obtained.

2. In a sectional header adapted to connect staggered boiler-tubes, the combination, with the series of inclined sections thereof and oppositely-inclined connecting-bends that are united to said sections by seating surfaces or joints at angles to each other, as described, of clamping-bolts extending through the crowns of said connecting-bends to and between adjacent portions of said sections provided with lugs, said bolts having anchor-shaped heads that act upon said lugs with acting-surfaces that are convergent in the direction of draft of said bolts, whereby the contraction of the said seating-surfaces is effected in directions parallel with the axes of the openings thereof.



3. The combination, with the inclined water-tubes of a water-tube boiler and the vertical headers connecting the ends thereof, of a mud-drum interposed and directly connected between the lower ends of the bottom series of said inclined water-tubes and the lower ends of their adjacent headers.

4. The herein-described mud-drum, having a chambered upper portion or series of chambered portions adapted to receive and intercept the ends of the bottom series of inclined water-tubes of a water-tube boiler and the terminal openings of an adjacent series of headers, through which water-circulation is delivered to bottom series of said tubes, said chambered upper portion or portions of the drum opening vertically to the lower or main portion of the drum to permit the gravitation therein of the heavier water impurities.

5. In a water-tube steam-boiler, the combination, with the inclined water-tubes, the sectional headers having sections adapted to connect the ends of said tubes in pairs, and the connecting-bends adapted to connect said sections in vertical series, of a mud-drum having a chamber or series of chambers in its upper portion adapted to connect with a terminal series of connecting-bends of sectional headers at the rear of the boiler, a terminal series of semi-sections of said sectional headers at the front of the boiler, located opposite said drum-chambers, and a bottom series of inclined water-tubes connecting between the drum-chambers and the corresponding series of semi-sections adapted to effect a portion of the circulation through the drum.

6. In a water-tube boiler, the sectional bridge-block, as G', composed of half-sections that embrace the water-tubes by pairs, one section whereof, as *g'*, is downwardly elongated to form a hanger that is adapted, as by a cap *n'*, to embrace a third tube and to retain the same with reference to the adjacent tubes above, as set forth.

412,821. AGRICULTURAL BOILER OR HEATER. JOHN A. WRIGHT, Keene, N. H. Filed Feb. 8, 1889. Serial No. 299,217. (No model.)

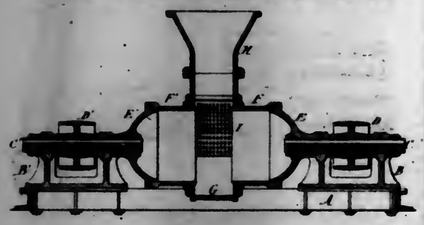
Claim.—The within-described agricultural boiler or heater, consisting of the following instrumentalities in combination: a water-tank,

a fire-chamber therein provided with a pipe-coil having an outlet and also an inlet, a gauze-wire covering for this inlet, a feed-pipe leading to a fuel-cartridge, and a reservoir provided with a regulating-cock, all as specified.

412,822. BAG-HOLDER. COLUMBIA L. YATES, Upper Lisle, N. Y. Filed June 15, 1889. Serial No. 314,381. (No model.)

Claim.—1. In a bag-holder, the combination of the frame and the keepers secured on the upper side of the same and projecting inward and downward therefrom to engage over the upper edge of the bag, as set forth.

2. The combination, with the frame, of the hooks mounted vertically therein and adapted to engage the bag, and the springs arranged around the shanks of the hooks between the frame and the heads of the hooks, as set forth.

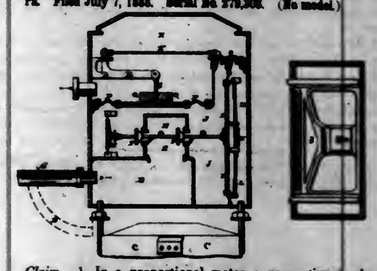


3. The combination, with the frame, of the keepers secured thereto, the guide-loops on the inner side thereof, the hooks mounted vertically in the frames and having their points playing through the said guide-loops, and the springs arranged around the shanks of the hooks between the frame and the heads of the hooks, as set forth.

4. The improved bag-holder herein described and shown, consisting of the U-shaped frame, the brackets secured to the outer side thereof, the supporting-legs pivoted to said brackets, the spring-actuated hooks mounted in the frame and adapted to engage the bag, and the keepers secured to the frame and adapted to engage over the edge of the bag, as set forth.

5. In a bag-holder, the frame, combined with the right-angled hooks mounted therein, and the springs coiled around the body of the hooks and bearing against the frame, as set forth.

6. In a bag-holder, the frame having the guide-loops on the inner side, and the spring-actuated U-shaped hooks mounted in the frame and having their points engaging the loops, as set forth.



412,823. ROTARY PULVERIZER. ROBERT YATES, Omaha, Nebr., assignor to himself, and Charles Kaestner and Frank A. Hecht, both of Chicago, Ill. Filed June 7, 1888. Serial No. 276,315. (No model.)

Claim.—1. In a rotary pulverizer, the combination, with the pulverizing-chamber, the rotary cylinders F F', and the exhaust-pipe J, communicating with the pulverizing-chamber, of the concavo-convex screen I, located between the pulverizing-chamber and the exhaust-pipe to screen the material passing from the chamber to the exhaust-pipe, said screen being terminated short of the wall of the exit-passage from said chamber to form an open channel for the return of coarse material to the chamber, substantially as described.

2. In a rotary pulverizer, the combination of the non-rotating central section G, the rotary sections or cylinders F F', having concaved heads, the hopper leading into non-rotating section, the upwardly-extending exhaust-pipe J, communicating with the non-rotating section and formed with an enlarged section or separating-chamber K, and the concave-convex screen I, located at the rear of the non-rotating section between it and the exhaust-pipe, substantially as described.

412,824. PROPORTIONAL METER. FRED R. YOUNG, Pittsburg, Pa. Filed July 7, 1888. Serial No. 279,308. (No model.)

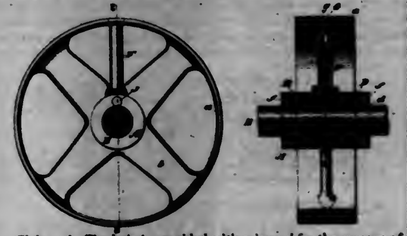
Claim.—1. In a proportional meter, a proportional valve controlling two triangular openings, which bear a determined ratio to each other, the center line of which approximately coincides with the center line of the openings, substantially as specified.

2. In a proportional meter, the combination of a receiving-chamber for the unmeasured volume of gas, an outlet-chamber from which the gas is taken, a diaphragm placed between the two chambers, and a proportional valve which is operated by the diaphragm, the larger opening of the valve being placed between the inlet and outlet chambers, and its smaller opening being placed between the delivery side of the meter and the outlet-chamber, substantially as described.

3. In a proportional meter, the combination of a meter with a regulator provided with an inlet-pipe, an outlet-chamber, and a chamber into which the gas from the meter is discharged, the inlet and the meter delivery-chambers being separated from the outlet-chamber by a proportional valve and a diaphragm which operates the valve, substantially as specified.

4. The combination, in a regulator for a proportional meter, of an inlet-chamber, a balance-valve, a diaphragm for operating this valve, a chamber into which the gas passes from the inlet-chamber, a chamber into which the gas is discharged from the meter, a proportional valve, a diaphragm which operates the proportional valve, and an outlet-chamber, substantially as shown and described.

5. In a regulator for a proportional meter, the combination of two diaphragms, a balance-valve which is attached to one of the diaphragms, and a proportional valve which is attached to the other diaphragm, the diaphragms being controlled independently of each other by the pressures of the measured and unmeasured gas, substantially as specified.

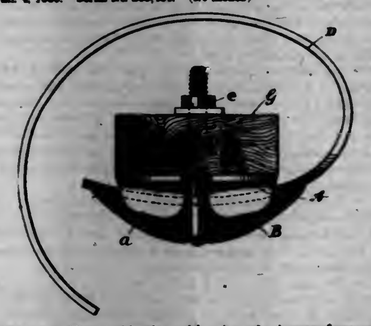


412,825. STIRRUP-STRAP LOOP. WILLIAM P. YOUNG, Bear Wallow, Ky. Filed June 12, 1889. Serial No. 314,031. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described loop for stirrup-straps, the same comprising, in combination, a main or body portion substantially rectangular in form, with the lower horizontal portion slightly shorter than the upper and having its free end vertically bifurcated, and a substantially L-shaped lever provided upon its under side near the angle with a leg or extension adapted to be pivotally secured within the said bifurcated free end of the loop, the long arm of the lever resting normally upon the lower horizontal arm of the body portion and adapted to receive the loop of the stirrup-strap, substantially as described, and for the purpose specified.

2. As an improved article of manufacture, a loop for stirrup-straps, consisting of a main body substantially rectangular in contour, with one side open, and a substantially L-shaped lever pivotally secured near its angle to the outer end of the lower horizontal arm of the body of the loop, with its longer arm normally resting upon said lower horizontal arm and adapted to be normally held against said horizontal arm by the stirrup-strap, and its shorter arm normally extending vertically and partially closing the open side of the rectangle, substantially as shown and described.

412,826. LUBRICATING DEVICE FOR LOOSE PULLEYS. THOMAS R. ALMOND, New York, and LOUIS J. GROSSMAN, Brooklyn, N. Y. Filed June 26, 1889. Serial No. 315,694. (No model.)



Claim.—1. The hub A, provided with a bore *d* for the passage of the shaft B, and having a longitudinal channel D open throughout its length to said bore and extending along parallel therewith, said channel being provided with absorbent material and having inclosing-walls to retain the absorbent material against displacement by centrifugal action, and a radial centrifugal collecting-chamber F, closed at its outer end, projecting from the rear wall of the channel, and opening into the channel behind the absorbent material, substantially as described.

2. The hub A, provided with a bore *d* for the passage of the shaft B, and having a longitudinal channel D extending along parallel with said bore and communicating therewith by a longitudinal slot of less width than the channel, absorbent material confined within the channel, an end plug *f* for the ready insertion and removal of said material, and a radial centrifugal collecting-chamber F, projecting from the rear wall of the channel behind the absorbent material, substantially as described.

3. The chamber F, having the threaded feed-opening provided with the funnel-shaped flaring mouth, combined with the threaded plug G, the head of said plug having a circular inner edge abutting against the inclined wall of said funnel-shaped mouth, so as to make a tight joint therewith, substantially as described.

412,827. HARROW. BYRON M. RANNEY, Ashtabula, Ohio. Filed Jan. 4, 1889. Serial No. 295,481. (No model.)

Claim.—1. The combination, with a bar of a harrow-frame and a harrow-tooth, of a base having a curved tooth-bearing surface and sides provided with vertical grooves, a cap-piece provided with a groove extending crosswise thereof communicating with the grooves of the base, and a clip-bolt and engaging-nuts, substantially as shown and described.

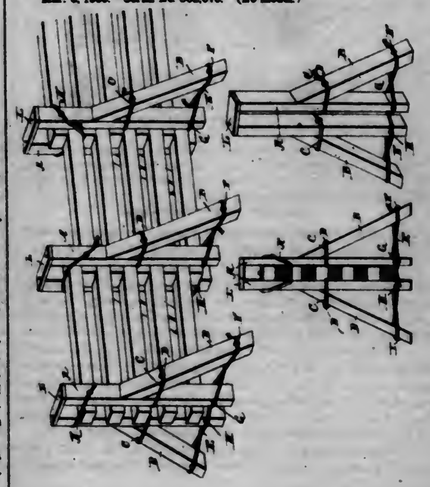
2. The combination, with a spring harrow-tooth and the bar of a harrow-frame, of a base having a curved tooth-bearing surface provided with vertical ribs or flanges extending lengthwise of the base, and sides provided with vertical grooves, a cap-piece provided with a groove extending crosswise thereof communicating with the grooves of the base, and a clip-bolt and engaging-nuts, substantially as shown and described.

3. The combination, with a spring harrow-tooth and a bar of a harrow-frame, of a base having a curved tooth-bearing surface and sides provided with vertical grooves, a cap-piece provided with a groove crosswise thereof, the ends of the cap-piece extending beyond the ends of the base adapted to bear against the tooth at points outside of the base, and a clip-bolt and engaging-nuts, substantially as shown and described.

4. The combination, with a spring harrow-tooth and a bar of a harrow-frame, of a base having a curved tooth-bearing surface provided with vertical ribs or flanges extending lengthwise of the same, the sides of said base being provided with vertical grooves, a cap-piece provided with a groove extending crosswise thereof, the ends of said cap-piece projecting beyond the base and adapted to bear against the tooth at points outside of the base, a clip-bolt adapted to engage with the grooves of the cap piece and base, and engaging-nuts, substantially as shown and described.

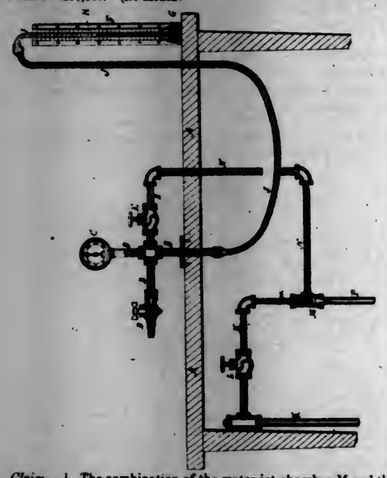
5. The combination, with a spring harrow tooth and a bar of a harrow-frame, of a base having a curved tooth-bearing surface provided with vertical ribs or flanges extending lengthwise thereof, the sides of the base being provided with vertical grooves, a cap-piece having a tooth-clamping surface curved slightly more than the tooth, and having a groove extending crosswise of the reverse side of said cap-piece, and a clip-bolt and engaging-nuts, substantially as shown and described.

6. The combination, with a spring harrow-tooth and a bar of a harrow-frame, of a base having a curved tooth-bearing surface and sides provided with vertical grooves, a cap-piece provided with a groove extending crosswise thereof, a clamping-plate, clip-bolt, and engaging-nuts, substantially as shown and described.



412,828. LAMP-SHADE. WALTER S. BURR, Philadelphia, Pa. Filed June 22, 1889. Serial No. 315,211. (No modelled.)

Claim.—1. An extensible-canopy lamp-shade consisting of fabric-covered ribs, the upper sections of which are inclined in a straight line from their points of connection to a top notch-ring A, to compose a dome of given dimension and contour, said ribs being from thence curved toward their terminal points to compose the section of a sphere of larger dimensions, in combination with runner-ring E and stretchers S, pivotally connected at opposite ends to said ring and ribs, substantially as described.



2. An extensible-canopy lamp-shade consisting of fabric-covered ribs B, bent to compose sections 1 and 2, in combination with runner-ring E, stretchers S, and vertical supporting-rods C, permanently attached at their upper ends to top notch-ring A and at their lower ends to base-ring D, said rods passing intermediately through orifices of runner-ring E; whereby as said runner-ring is moved vertically the canopy will assume varied configuration, substantially as described.

412,829. FENCE. DWIGHT H. BLAKESLEE, Stockbridge, Mich. Filed Mar. 6, 1889. Serial No. 302,070. (No model.)

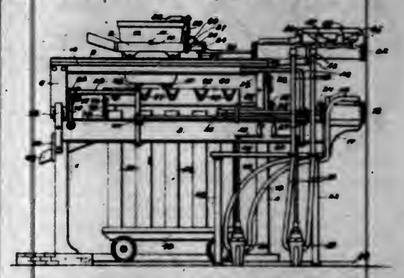
Claim.—As an improvement in fences, the combination, with the herein-described posts, comprising the vertical stakes, the inclined braces, the wires twisted around and connecting the said stakes and braces near their lower ends, the wire loops encircling the upper ends of the stakes and secured to one of said stakes only, the securing-staples, and the caps secured to and connecting the upper ends of the vertical stakes, of the panel-rails arranged as herein described and resting upon the bottom wires connecting the posts and braces, substantially as herein set forth.

412,830. INSTRUMENT FOR TESTING AND GRADUATING VACUUM-GAGES. CHARLES B. BOSWORTH, Everett, assignor to the Crosby Steam Gage and Valve Company, Boston, Mass. Filed Dec. 10, 1888. Serial No. 293,077. (No model.)

Claim.—1. The combination of the water-jet chamber M and the water-jet pipe *m*, the barometric column F, the piping connecting the chamber and column, the gage attachment secured to the piping, and the valves for controlling the water-jet and the exhaust, as set forth.

2. The combination of the water-jet chamber M, the supply-pipe therefor with its valve and the jet *m*, the barometric column F, the pipes N and J, leading to the chamber and column, the cross-pipe B, and the valve E, all constructed and arranged as described.

412,831. SPIKE. LEWIS A. BOWEN, Wilmington, Del., assignor to the Diamond State Iron Company, same place. Filed Aug. 26, 1889. Serial No. 322,013. (No model.)



Claim.—A spike provided with a plurality of points, and a bevel-channel cut upon one side of the spike and extending at its widest part between the points and forming two oppositely-inclined chisel cutting-edges, substantially as set forth.

412,832. DEVICE FOR CASTING INGOTS. THOMAS BRADY, South Chicago, Ill. Filed May 6, 1889. Serial No. 309,810. (No model.)

Claim.—1. In an ingot-plant, the combination of the converters, the receiving-cranes, the center or distributing crane, the frames arranged concentrically with said center crane and supporting the longitudinally and transversely adjustable ladle-carriers, and means for adjusting the latter, substantially as and for the purpose herein set forth.

2. In an ingot-plant, the combination of the converters, the receiving-cranes, the center or distributing crane, the frames arranged concentrically with the latter and supporting the longitudinally and transversely adjustable ladle-carriers, the tracks arranged between the sides of the respective frames, and the cars or carriages supporting the molds, substantially as and for the purpose herein set forth.

3. The combination of the supporting-frame, the transversely-movable carriage, the hydraulic cylinder arranged longitudinally with relation to the frame, the bell-crank levers mounted in bearings attached to the frame, the rod or bar connecting the laterally-extending arms of said bell-crank levers, the pitman connecting said rod or bar with the piston-rod of the hydraulic cylinder, and the pitmen connecting the longitudinal arms of the bell-crank levers with the transversely-movable carriage at points near the front and rear ends of the latter, substantially as and for the purpose set forth.

4. The combination, with the supporting-frame, of the transversely-movable carriage, the ladle-carrier arranged to move longitudinally upon said carriage, the hydraulic cylinder mounted upon said transversely-movable carriage, the piston-rod having its front end connected detachably with the ladle-carrier, and the flexible or swivel-jointed pipes connecting the front and rear ends of the said cylinder with a stationary valve-case, substantially as herein described, and for the purpose set forth.

5. The combination, with the supporting-frame, of a transversely-movable carriage, a hydraulic cylinder mounted upon said carriage and connected by swivel-jointed pipes with the stationary valve-case, the ladle-carrier arranged to move longitudinally upon the transversely-movable carriage, the piston-rod provided with a yoke at its front end and having downwardly-extending brackets adapted to ride upon the track of the ladle-carrier, and means, substantially as described, for connecting the said yoke detachably with the ladle-carrier, as and for the purpose set forth.

6. The ladle-carrier provided with bearings for the trunnions of the ladle and having a pivoted frame in which is journaled a worm-shaft equipped with a ratchet-lever, in combination with the ladle, one of the trunnions of which is provided with a worm-gear, substantially as and for the purpose set forth.

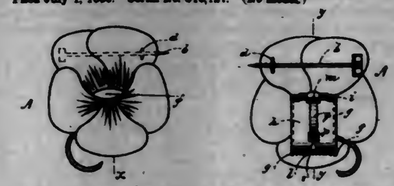
7. The combination of the ladle-carrier, a frame mounted pivotally upon one of the side beams of the same and provided with a lever or handle and a pair of laterally-extending brackets, a worm-shaft journaled in the said brackets and provided with a ratchet-lever, a pair of stops extending from the side beam of the ladle-carrier to retain the lever or handle of the pivoted frame in position, and the ladle having a worm-gear attached to one of its trunnions, substantially as and for the purpose herein shown and specified.

8. The combination, with the ladle mounted in a carrier longitudinally adjustable upon a transversely-movable carriage, of a trough or runner mounted adjustably on a horizontal plane below said ladle and having a series of spouts adapted to register with the molds or flasks, substantially as and for the purpose herein set forth.

9. The combination, with the tilting ladle mounted upon a longitudinally and transversely adjustable carrier, as herein described, of the trough or runner mounted adjustably below the said ladle and provided at its front end with a dam and an inclined slag-spout, substantially as herein described, and for the purpose set forth.

10. The herein-described runner, consisting of a longitudinal trough the sides of which are provided with spouts having dams or skimmers, said trough being provided at its front end with a dam for the overflow of slag and with a downwardly-extending bracket to which is connected an inclined slag-spout, substantially as and for the purpose set forth.

11. The combination of the supporting-frame, the U-shaped brackets attached to the front and rear cap-beams of the same, the runner supported upon the said brackets, and a lever connected pivotally with the said runner and fulcrumed in a staple upon one of the side beams of the frame, substantially as and for the purpose set forth.



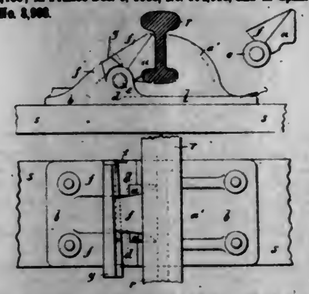
12. The combination of the supporting-frame, the U-shaped brackets attached to the front and rear cap-beams of the same, and the runner supported in said brackets and having downward-extending studs to limit its longitudinal movement, substantially as set forth.

13. The combination of the supporting-frame, the U-shaped brackets attached to the front and rear cap-beams of the same, the runner mounted in the said brackets, a rock-shaft journaled in bearings upon one of the side beams of the frame and having laterally-extending arms, links connecting the ends of said arms with one side of the runner, and a lever pivoted to the side of the latter and fulcrumed in a staple upon one of the side beams of the frame, substantially as and for the purpose set forth.

14. The combination, with a ladle and adjusting mechanism for the same, substantially as herein described, of the longitudinally and transversely adjustable runner, the lever for manipulating the same, and the cars provided with molds or flasks arranged in position to correspond with the spouts extending laterally from the sides of the runner, substantially as and for the purpose set forth.

15. The combination of the supporting-frame, the transversely-movable carriage having the longitudinally-movable ladle-carrier and provided with staples or eyes upon its under side, and the guides attached to the supporting-frame and extending through the said eyes or staples, substantially as and for the purpose herein shown and specified.

412,833. BOUQUET-PIN. WILLIAM A. BRENEA, Boston, Mass. Filed July 1, 1889. Serial No. 316,127. (No model.)



Claim.—1. In a bouquet-pin, a body having a flower-opening and attaching-pin, a clamp secured to the rear of said body, comprising a hinged toothed plate, and a flat spring having one end detachably disposed in a slot in said hinge and its opposite end at the free end of said lid, substantially as described.

2. In a bouquet-pin, a clamp comprising guide-plates secured to the pin-body at each side of its flower-opening, a toothed lid hinged to said plate, an attaching-pin, and a detachable flat spring having an end projecting into a slot in the plate-hinge, its opposite end resting on a stud at the free end of said lid, substantially as described.

3. In a bouquet-pin, the body A, having the opening *f* and pin *b*, in combination with the guide-plates *g*, lid *h*, hinged at *i* and having the stiffening-piece *t*, slot *p*, and lip *r*, the spring *q*, and hinge-slot *m*, all being arranged to operate substantially as described.

412,834. COUPLING FOR PERMANENT WAYS. ROBERT CARDWELL, Liverpool, and SAMUEL WARNE, Manchester, County of Lancaster, England. Filed Apr. 23, 1889. Serial No. 308,182. (No model.) Patented in England June 6, 1888, No. 8,176; in Belgium Dec. 5, 1888, No. 84,186; in France Dec. 6, 1888, No. 194,610, and in Spain Dec. 17, 1888, No. 8,966.

Claim.—In single and joint railway-chairs secured to or formed with a sleeper, the hinged jaw *a*, in combination with a metal wedge *g*, driven between the same and the projections *f*, formed on the base *b* of the chair, substantially as and for the purpose specified.

412,835. LIQUID DIGESTIVE COMPOUND. JOHN CARBRICK, New York, N. Y. Filed June 22, 1889. Serial No. 315,205. (No specimens.)

Claim.—1. A liquid compound adapted to cause the digestion and absorption of fats, containing a fluid extract of pancreas and bile mixed in suitable proportions.

2. A liquid compound adapted to cause the digestion and absorption of fats, containing suitable proportions of a fluid extract of pancreas, bile, and alcoholic preservative.

3. A liquid compound adapted to cause the digestion and absorption of fatty matter, containing a fluid extract of pancreas, purified bile, an alcoholic preservative, sugar, and suitable flavoring substances.

412,836. PREPARING DIGESTIVE COMPOUNDS. JOHN CARBRICK, New York, N. Y. Filed June 22, 1889. Serial No. 315,204. (No specimens.)

Claim.—1. The process of preparing a compound for causing the digestion and absorption of fats, albuminous and starchy matters, which consists in treating pancreas or sweet-breads with alcohol and pressure to remove the fatty matter, then agitating the resulting pancreatine in water to form a watery pancreatic solution, purifying bile by treating it with alcohol, filtering through charcoal, and drying, then mixing the bile with a watery solution of pancreas and a suitable preservative.

2. In the manufacture of a digestive compound, the herein-described method of preparing the watery solution of pancreas used therein, which consists in removing the fatty matter from the pancreas or sweet-breads first by mechanical means, then by maceration of the comminuted pancreas in alcohol and subjecting it to pressure, then agitating the resulting fibrous pancreatine in water to impregnate the water with pancreatic extract.

3. In the manufacture of a digestive compound, the herein-described method of preparing the pancreatine used therein, which consists in removing the fatty matter from pancreas or sweet-breads by macerating the comminuted pancreas in alcohol, then subjecting it to pressure to squeeze out the moisture and fat, and then drying to preserve it.

412,837. DIGESTIVE COMPOUND. JOHN CARBRICK, New York, N. Y. Filed June 22, 1889. Serial No. 315,205. (No specimens.)

Claim.—1. A dry digestive compound composed of powdered pancreatine and powdered bile.

2. A powdered digestive compound adapted to cause the digestion of fats, albuminous substances, and starchy matter, composed of powdered pancreatine and bile and inclosed in capsules or formed into pills, and having a coating adapted to resist the acid action of fluids in the stomach.

3. A digestive ferment compound adapted to cause the digestion and absorption of fatty matter and albuminous substances, and to convert starchy matter into an assimilable condition, coated with a substance that will resist the acid action of the stomach-fluids, but which will be readily dissolved in the alkalies secretions which flow into the intestinal canal.

412,838. MEDICAL COMPOUND. JOHN CARBRICK, New York, N. Y. Filed June 22, 1889. Serial No. 315,206. (No specimens.)

Claim.—1. A medical compound containing caffeine, phosphoric acid, and an antipyretic, as antipyrene or antifebrine.

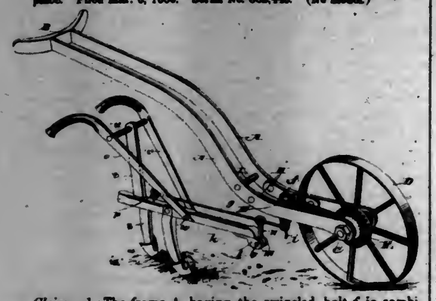
2. A granular effervescing compound containing, as active ingredients, caffeine, phosphoric acid, and an antipyretic, such as antipyrene or antifebrine.

3. A medical compound in the nature of a sedative, nerve, and brain food, containing caffeine, phosphoric acid, an antipyretic, as antipyrene or antifebrine, and one or more sedatives, as extract of celery and sodium or potassium bromide.

4. A granular effervescing medical compound in the nature of a sedative, nerve, and brain food, containing caffeine, phosphoric acid, an antipyretic, as antipyrene or antifebrine, extract of celery, and sodium or potassium bromide.

412,839. PREPARED FOOD FOR INFANTS AND INVALIDS. JOHN CARBRICK, New York, N. Y. Filed Aug. 22, 1889. Serial No. 321,640. (No specimens.)

Claim.—1. The process of preparing a milk-food, which consists in removing from sweet milk a portion of the butter-fat and adding to the milk a suitable proportion of cocoa-butter, then partially digesting the milk and preparing the added cocoa-butter for assimilation by means of a digestive ferment, then arresting the digestive process by increasing the temperature and evaporating the mixture to dryness.



2. The process of preparing powdered milk-food, which consists in removing from the milk a portion of its natural fat and substituting therefor a suitable proportion of cocoa-butter, also adding a suitable quantity of milk-sugar, then partially digesting the milk and preparing the cocoa-butter for assimilation by means of a digestive ferment at the proper temperature, then raising the temperature for arresting the digestive process and rendering the product sterile and evaporating the mixture to dryness, and finally reducing to a powder.

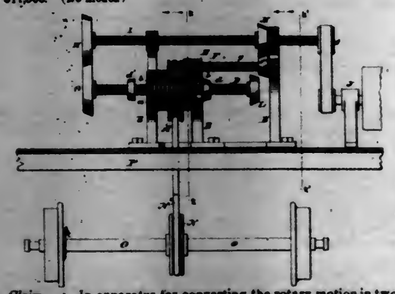
3. As a new article of manufacture, partially-digested milk and cocoa-butter.

4. As a new article of manufacture, granular or powdered partially-digested milk and cocoa-butter.

5. An article of manufacture composed of partially-digested milk from which part of the natural fat has been removed, cocoa-butter, and added milk-sugar.

412,840. GARDEN PLOW, CULTIVATOR, &c. CORNELIUS COLLINS, Albia, Iowa, assignor of one-half to George W. McBurney, same place. Filed Mar. 8, 1889. Serial No. 302,442. (No model.)

Claim.—1. The frame A, having the swiveled bolt *f*, in combination with the rod *g*, passed through an eye at the lower end of the bolt and having the hook or stop at its front end, the beam carrying the implement to act on the soil and having its rear end loosely connected to the rear end of said rod, and the link-arm having its upper end loosely connected to and adapted to slide longitudinally on the rod and its lower end pivotally connected to the lower end of the frame, substantially as described.



2. The frame comprising the parallel compound curved bars A, the yoke B, connecting the rear ends of the said bars, the shaft connecting the front ends of the bars, and the driving and supporting wheel mounted on said shaft, substantially as described.

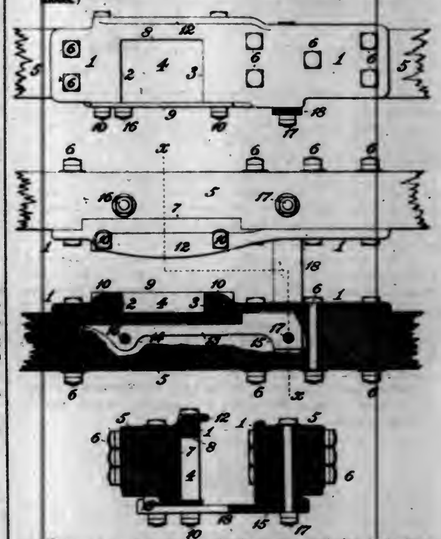
3. The frame having the swiveled bolt *f*, the rod *g*, connected at its front end to said bolt and arranged at right angles thereto, and the beam carrying the implement to act on the soil, said beam being pivotally and loosely connected to the rod *g*, so as to slide thereon, as set forth.

4. The frame having the wheel D and bars A, combined with the beam carrying the implement to act on the soil, the swiveled bolt *f* on the frame-bars A, the beam of the implement being connected to the bolt *f*, as set forth.

5. The frame comprising the parallel bars A, shaped and curved substantially as shown, and having the curved yoke B connecting their rear ends, the wheel D, journaled between their front ends, and the casting F, connecting the bars A in rear of the wheel and providing a bearing for a pivot-bolt, to which the implements are connected, as set forth.

412,841. MECHANICAL MOVEMENT. JOSEPH I. COGHLIN, Brooklyn, assignor of five-eighths to Ed. Hueretel, New York, N. Y., and Wm. Hy. Rushforth, Rutherford Park, N. J. Filed July 15, 1889. Serial No. 317,568. (No model.)

Claim.—1. In apparatus for converting the rotary motion in two directions of the shaft O into rotary motion in but one direction of the shaft I, the combination of said shafts O I with the threaded longitudinally-movable shaft D and the internally-threaded pulley A, through which the shaft D passes, means, substantially as described, for preventing lateral movement of said pulley, and with two sets of gearing between the shafts D and I, arranged so that when the shaft D is in one position it will actuate one set of gearing and when in another position it will actuate the other set of gearing, as and for the purpose described.



2. In apparatus for converting the rotary motion in two directions of the shaft O into rotary motion in but one direction of the shaft I, the combination of said shafts O I with the threaded longitudinally-movable shaft D, internally-threaded pulley A, through which the shaft D passes, means, substantially as described, for preventing lateral movement of said pulley, and with the intermediate shaft *g*, all arranged for operation substantially as described.

412,842. CARPET-STRETCHER. CHARLES F. COOPER, Cedar Rapids, Iowa, assignor of one-half to John W. Cooper, Mount Vernon, Dak. Filed May 16, 1888. Serial No. 274,065. (No model.)

Claim.—In a carpet-stretcher, the combination of the head A, having stirrup A', forming a bearing for the smooth upper face of the hook-bar, and lug *d* and teeth *e e*, the hook-bar B, having notches on the under side, the handle C, pivotally connected with the head, and the pawl D, pivoted to the handle above said bar, having the catch *b*, substantially as and for the purpose set forth.

412,843. DRAW-BAR STOP FOR RAILROAD-CARS. GEORGE W. COMBS, Omaha, Nebr. Filed July 27, 1889. Serial No. 318,393. (No model.)

Claim.—1. A draw-bar stop having an integral plate or body, a draw-bar pocket provided with front and back stops or abutments at its opposite ends, holes for draft-timber bolts in front and in rear of said stops, and a tenon or projection formed on the side of the plate which abuts against the draft-timber and constituting the inner wall of the draw-bar pocket, substantially as set forth.

2. A draw-bar stop having an integral plate or body, and a draw-bar pocket provided with front and back stops or abutments at its opposite ends, and a draw-bar-guide face at its top, substantially as set forth.

3. A draw-bar stop having an integral plate or body, a draw-bar pocket provided with front and back stops or abutments at its opposite ends, holes for draft-timber bolts in front and in rear of said stops, and upper and lower horizontal ribs, substantially as set forth.

412,844. WATCH-BOW FASTENER. HENRY RABY and FRED L. TURNER, Birmingham, County of Warwick, England. Filed Sept. 3, 1888. Serial No. 284,484. (No model.)

Claim.—In combination, a watch-bow having headed ends integral therewith, a pendant provided with side slots extending from the edge thereof and adapted to engage the necks of the bow, and a removable filling-up piece fitting in the pendant and provided with projecting parts which fit in the side slots and secure the end of the bow therein, all substantially as set forth.

412,845. PUSH-BUTTON. GEORGE R. BLY, Rochester, N. Y., assignor to Louis T. Riggs, same place. Filed Mar. 6, 1889. Serial No. 302,053. (No model.)

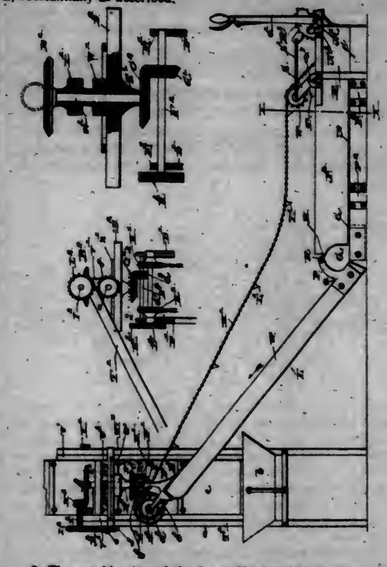
Claim.—1. As an article of manufacture, a button adapted for use in electrical push-buttons, constructed of two sheet-metal sections, one having a rib or projection at the sides for co-operating with the casing, and the other sliding within the former and secured to it at the side below the operating portion by readily-fusible material, and a spring under compression contained within and between said sections, substantially as described.

2. As a new article of manufacture, a button adapted for use in electrical push-buttons, constructed of two telescoping sections, the outer one having a projection or rib for co-operating with the casing, and having a slot in the side, a spring under tension between the sections, and fusible solder connecting the sections placed in the slot in the outer one, substantially as described.

3. The combination, with the stationary and spring contacts forming the terminals of an electrical circuit and the casing for the same having an opening therein, of the button constructed in two parts, the outer one having a projection on its sides arranged to co-operate with the sides of the casing-aperture, and the inner one operated upon by the contact-spring and connected to the side of the other by fusible solder, and a spring under compression between the two sections, substantially as described.

4. As an article of manufacture, a button for use in electrical push-buttons, consisting of the two sections, one having a projection at the sides for co-operating with the casing, and the other adapted to slide within it having the rib or projection with which the first-mentioned section co-operates, said sections being connected at the side by fusible solder, and a spring under compression arranged within and between said sections, substantially as described.

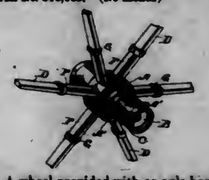
412,846. ATTACHMENT FOR JOB-PRESSES. DAVID W. GLENDENNING and FRANK W. GLENDENNING, Leavenworth, Kans., assignors to said David W. Glendenning and Princess H. Fay, same place. Filed Mar. 29, 1889. Serial No. 305,204. (No model.)



Claim.—1. The herein-described throw-off and impression regulator for printing-presses, consisting of the throw-off lever, the two-part adjustable connecting-rod, the handle for adjusting said parts, the rock-shaft connected to one of said parts, and the bell-crank lever and eccentric arranged and operating substantially as and for the purpose described.

2. The combination, with the throw-off mechanism of a printing-press of the character described, of an impression-regulator consisting of the two-part connecting-rod Q U, screw-threaded together, as described, and provided with the swiveled block *b*, the throw-off lever connected to said block, and the regulating-handle for adjusting the rod Q U, substantially as and for the purpose described.

412,847. CORN-CONVEYER. JOHN HEALEA and GEORGE G. HEALEA, La Rey, Ill., assignors of one-half to William Hammond, same place. Filed Oct. 3, 1888. Serial No. 287,048. (No model.)



Claim.—1. The combination of the trough A, the wheels Y at the outer ends thereof, the wheels Z, journaled at the inner end of said trough, the trough L, hinged to the inner end of trough A, the wheels H' at the outer end of trough L, the pivoted standards S near the outer end of trough A, the wheels W, having their bearings in the said standards, the endless carrier connecting the wheels Y, Z, H', and W, and the lever connected to the standard S, whereby the latter may be inclined to any desired position to tighten or loosen the endless carrier, and thereby adjust the latter to suit the inclination of the trough L, substantially as described.

2. The combination of the frame U, adapted to be secured to a corn-shelling machine, the beam or plate D^2, pivoted to said frame and having the bearings E^2, the shaft F^2, having the wheel H^2, the vertical shaft A^2, journaled in frame U and geared to the shaft F^2, the shaft I^2, journaled in frame U and geared to the shaft A^2, the troughs A L, hinged together, the latter having the standards or arms D', adapted to be hinged to shaft F^2, the shaft G' in bearings in the outer end of trough L and having the sprocket-wheels H' and the gear I', the latter meshing with wheel H^2, the wheels Z at the inner end of trough A, the wheels Y at the outer end thereof, the pivoted arms S, the wheels W, having their bearings in said arms, the endless chains connecting the wheels H', Y, Z, and W, the flights connecting said chains, and means, substantially as set forth, to adjust the arms or standards S to any desired position, substantially as described.

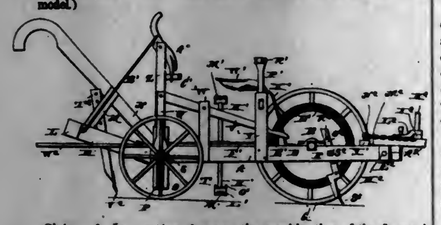
3. The combination, with the shaft I^2, journaled in the corn-sheller frame and connected to the driving-shaft of the sheller, the shaft A^2, geared to the shaft I^2, the beam D^2, swiveled on said shaft, and the bearings E^2, of the shaft F^2, journaled in said bearings and geared to the shaft A^2, and the corn-conveyer having one end hinged to the bearing E^2 and having the endless carrier, the latter being geared to and operated by the shaft F^2, substantially as described.

412,848. WHEEL. WILLIAM J. HOLLAND, Bra, Tex. Filed July 6, 1889. Serial No. 316,663. (No model.)

Claim.—1. A wheel provided with an axle-box having the lateral flanges *b* at its sides and the annular flanges *b'* at its ends, substantially as described.

2. The combination, in a wheel, of the hub, the spokes, the metal braces arranged on each side of the spokes and having enlarged or wedge-shaped lower ends, and bands securing the upper ends of the braces, substantially as described.

3. A wheel comprising the sectional hub, the bands securing the sections together, the axle-box having the annular flanges *b'* and the lateral flanges *b*, wedge-shaped in cross-section, and the spokes wedged from the inside of the hub, and the metal braces having their lower ends enlarged, substantially as described.

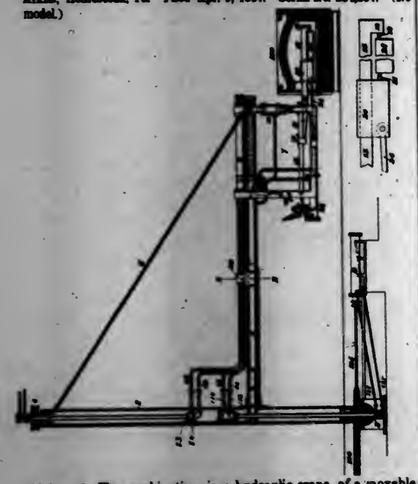


412,849. LUBRICANT BEARING. PHILIP H. HOLMES, Gardiner, Me. Filed Mar. 6, 1889. Serial No. 302,125. (No specimens.)

Claim.—1. The herein-described composition of matter, consisting of plumbago, combined with wood fiber, in substantially the proportion specified, to form one homogeneous mass, substantially as set forth.

2. The herein-described composition of matter, consisting of plumbago, wood fiber, and sulphuric acid, substantially as set forth.

3. The herein-described composition of matter, consisting of plumbago, combined with wood fiber, sulphuric acid, and sizing, substantially as set forth.



412,850. COTTON CHOPPER AND CULTIVATOR. GEORGE W. HUTTO, Granbury, Tex. Filed Mar. 5, 1889. Serial No. 301,900. (No model.)

Claim.—1. In a cotton-chopper, the combination of the frame A B C, the forwardly-extending side bars D, the axle journaled on the latter and having a bevel-wheel, the longitudinal shaft journaled in a pivotal bearing upon the rear frame-beam and having its front end journaled in a box sliding upon the front frame-beam, mechanism for adjusting said sliding box, a pinion upon the front end of the longitudinal shaft, the chopping-hoes mounted upon the latter, and the frame jointed to the rear frame-beam and carrying the plows, substantially as set forth.

2. The combination, with the frame, of the beams D, projecting forward therefrom, the cross-bar Y', connecting said beams and having the hook Z' on its front side, the tongue having the recess and cross-pin engaging said hook, the cross-bar D^3, and the draft-irons E^2, attached to said cross-bar and having the ears F^2 and the bolts pivoting said ears to tenons on the front ends of the beams D, substantially as set forth.

412,851. HYDRAULIC CRANE. JULIAN KENNEDY and HENRY AIKEN, Homestead, Pa. Filed Apr. 9, 1887. Serial No. 234,297. (No model.)

Claim.—1. The combination, in a hydraulic crane, of a movable racking-cylinder mounted on the jib, a carriage provided with lifting devices suspended on the racking-cylinder, and valves for controlling the movements of the racking-cylinder mounted on the carriage, substantially as and for the purposes described.

2. The combination, in a crane, of a hydraulic motor comprising a racking-cylinder and plunger mounted on a jib, a carriage moved along said jib with the moving element of the motor, lifting devices carried by the carriage, and valve-operating mechanism also carried thereby and controlling the racking-cylinder, substantially as and for the purposes described.

3. The combination, in a crane, of a hydraulic motor comprising a racking-cylinder and plunger mounted on a jib, a carriage moved with the moving element of the motor, hydraulic lifting devices carried by the carriage, and valves also carried by the carriage and controlling the lifting devices and the racking-cylinder, substantially as and for the purposes described.

4. The combination, in a hydraulic crane, of a cylinder and mechanism operated thereby for rotating the crane, a jib, a carriage mounted upon said jib, circulating-pipes extending from the cylinder to the carriage and return, and a valve for said circulating-pipes located upon the carriage, substantially as and for the purposes described.

5. The combination, in a hydraulic crane, of a mast and jib, a carriage supported on the jib, lifting devices mounted on the carriage, a hydraulic cylinder for raising and lowering said lifting devices, a hydraulic cylinder for advancing and withdrawing them, valves mounted on the carriage for controlling said cylinders, and circulating-pipes extending along the jib to said valves and connecting the same with the source of supply and with the exhaust, substantially as and for the purposes described.

6. The combination of the jib, the stationary piston, the movable racking-cylinder, a carriage supported on the racking-cylinder, a valve to control the racking-cylinder placed on the carriage, and circulating-pipes extending from said valve to the opposite ends of the cylinder, substantially as and for the purposes described.

7. The combination of the jib, the stationary piston and stationary main circulating-pipes supported on the jib, a movable racking-cylinder having also chambers through which the circulating-pipes extend and with which they communicate, a carriage moved with the racking-cylinder and supporting the valve thereof, pipes connecting said valve with said chambers, and pipes connecting the valve with the opposite ends of the racking-cylinder, substantially as and for the purposes described.

8. The combination of the rotating mast, the jib, the movable racking-cylinder on the jib, having also four chambers or water-channels through which the circulating-pipes extend, a stationary piston and four stationary circulating-pipes, a cylinder at the foot of the mast for turning the same, circulating-pipes extending from the opposite ends of the turning-cylinder to two of the stationary circulating-pipes on the jib, main circulating-pipes extending to the other two stationary pipes, a carriage moved with the racking-cylinder and supporting the valves which control the mast-turning cylinder and the racking-cylinder, pipes connecting said valves with the chambers in the racking-cylinder, and pipes connecting one of the valves with the opposite ends of the racking-cylinder, substantially as and for the purposes described.

9. The combination of the mast and jib with main supply and waste pipes leading down the mast and out along the jib, a racking-cylinder supported on the jib with which the said pipes connect, a carriage supported on the jib and actuated by the racking-cylinder, a valve for controlling the operation of said cylinder placed on said carriage, and lifting devices supported by the said carriage, substantially as and for the purposes described.

10. The combination, in a hydraulic crane, of the jib, a movable carriage mounted on the jib, a pivoted horizontal lifting-bar mounted on the carriage, a hydraulic cylinder for raising the lifting-bar, and a valve and suitable water-connections with the cylinder and the source of water-supply, substantially as and for the purposes described.

11. The combination of the carriage, the pivoted lifting-bar having an end projection, with a sliding gripper, and a cylinder with suitable water-connections and valve to operate such sliding gripper, substantially as and for the purposes described.

12. The combination, with a crane and the jib, of a horizontal lifting-bar upheld by the jib and having a gripper at the end thereof, power devices for lifting said bar, and power devices for moving the bar horizontally along the jib, substantially as and for the purposes described.

13. The combination, in a crane, of the pivoted lifting-bar having a lateral projection or extension at the outer end with a reciprocating slide, which projection and slide constitute the gripping mechanism of the crane and act in conjunction to seize and hold the burden between them, substantially as and for the purposes described.

14. The movable carriage having mounted thereon and in combination therewith the pivoted lifting-bar and a hydraulic cylinder for giving it a short vertical oscillation, a sliding gripper capable of acting in conjunction with the lifting-bar to grip the load, a hydraulic cylinder for actuating the sliding gripper, and valves having suitable water-connections with the source of water-supply and the said cylinders for the purposes of governing the operation of the cylinders, substantially as and for the purposes described.

15. The combination of a series of two or more double-acting hydraulic piston-valves, a single shell having individual chambers within which the valves are mounted, common waste-passages formed in the shell at each end of the valves, a common supply-passage formed in the shell, and independently-operating actuating-levers whereby any one of a number of hydraulic motors may be operated from a common supply without operating the remainder, substantially as and for the purposes described.

16. The combination, with two or more double-acting hydraulic piston-valves within a single chamber or shell and having independently-operated actuating-levers, of common supply and waste passages whereby any one of a number of hydraulic cylinders may be operated from a common supply without operating the remainder, substantially as described.

17. The combination of two or more double-acting hydraulic valves 31 within a single chamber or shell, having independently-operated actuating-levers, a common distributing inlet-passage 38, to which the common supply-pipe is connected, a common waste or exit passage 43, to which the common waste-pipe is connected, and separate annular passages 39 for each valve at opposite sides of the common passage 38, which are connected with the service-pipes of the cylinder controlled by the valve, substantially as and for the purposes described.

18. The combination of the fixed piston and movable racking-cylinder with the fixed circulating-pipes extending through longitudinal water-ways in the sides of the racking-cylinder and communicating therewith by means of perforations formed in said pipes near the limit of the inner movement of the cylinder, and suitable connections connecting the water-ways with the valve or valves by which the water is controlled, substantially as and for the purposes described.

19. In combination with the jib, the movable racking-cylinder having water-ways extending longitudinally through its sides, fixed circulating-pipes extending through said water-ways and supported beyond the ends of the cylinder, said pipes communicating with the water-ways by perforations in their sides, and suitable connections connecting the water-ways with the valve or valves by which the water is controlled, substantially as and for the purposes described.

20. In a crane, the combination, with the upright mast having a top journal, of an annular bearing having a spherical outer surface and a top steadiment having a concave seat in which the spherical bearing may move, substantially as and for the purposes described.

21. In a crane, the combination of the upright mast having a top journal, removable annular bearing having a spherical outer surface, and a top steadiment having a concave seat for the bearing, said mast having an enlargement below the top steadiment, substantially as and for the purposes described.

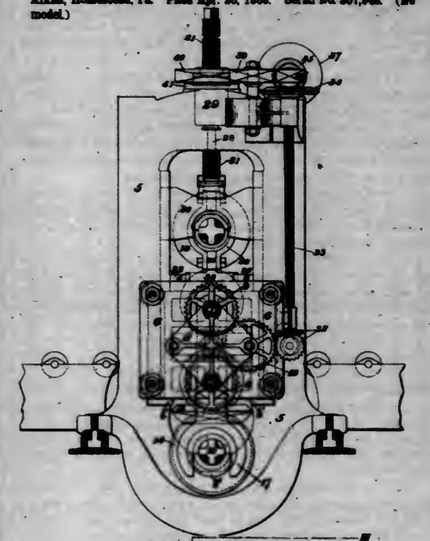
22. The combination, in a hydraulic crane, of a rotating mast having circulating-pipes extending through the same with stationary non-rotary supply and waste pipes connected therewith by intermediate chambers, substantially as and for the purposes described.

23. The combination of the rotating mast provided with circulating-pipes, one within the other, a cylinder or casing 98, having chambers 91 and 94, with which the said pipes respectively communicate, and a cupped follower 102 in the chamber 94, said follower bearing on the packing of one of the circulating-pipes and being perforate to afford passage of fluid therethrough, substantially as described.

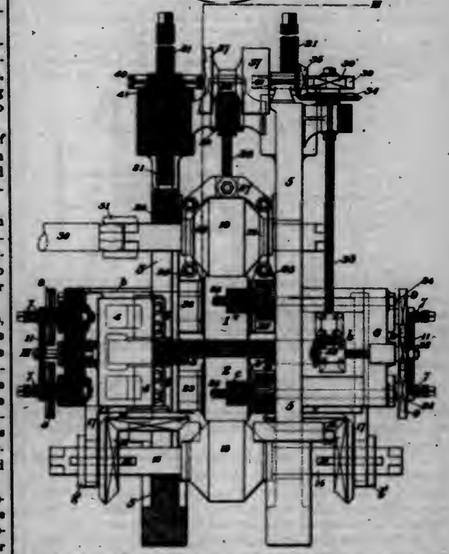
24. In a crane, an upright rotary mast having a top journal of small diameter and an adjoining thicker portion, in combination with a top steadiment having a thick metal skirt extending down around the said thicker portion, substantially as and for the purposes described.

25. The combination of the mast having a hemispherical foot in which it is stepped with a base-plate having a concave socket for receiving said foot, said socket being provided with a strong rim extending up above the foot, and a gear-wheel upon the mast, the hub of said gear-wheel extending within said rim, substantially as and for the purposes described.

26. The combination of the hollow rotating mast, the base-plate, two circulating-pipes, one within the other, rigidly attached to the base-plate, the inner and smaller one extending beyond the ends of the outer one, a cylinder attached to and rotating with the mast, chambers provided with stuffing-boxes within the cylinder, in which the ends of the pipes terminate; chambers in the base-plate in which the lower ends of the pipes terminate, pipes leading from the upper chambers to the controlling-valve, pipes leading from the lower chambers to a hydraulic cylinder, and gearing intermediate between the hydraulic cylinder and mast for rotating the latter, substantially as and for the purposes described.



27. The combination, in a hydraulic crane, of a motor comprising a racking-cylinder and plunger mounted on a jib and a carriage provided with lifting devices suspended directly from the moving element of the motor and movable therewith, substantially as and for the purposes described.



28. In a crane, the combination, with an upright mast having a top journal, of an annular bearing within which the top journal is revoluble, said annular bearing having a spherical outer surface, and a top steadiment having a concave seat within which the spherical annular bearing is rotatory, substantially as and for the purposes described.

29. In a crane, an upright mast having at the base a spherical foot set in a correspondingly-shaped socket and at the upper end a spherical bearing having a concave seat, substantially as and for the purposes described.

30. The rotatory mast having at its foot a spherical bearing in which it is revolably stepped and a concave socket in which the said bearing is journaled, substantially as and for the purposes described.

412,852. ROLLING-MILL. JULIAN KENNEDY, Latrobe, and HENRY AIKEN, Homestead, Pa. Filed Apr. 30, 1888. Serial No. 307,948. (No model.)

Claim.—1. The combination of a forming-roll, an upper driving-roll upheld thereby, and a counter-balance supporting the bearings of the forming-roll, substantially as and for the purposes described.

2. The combination of a forming-roll, an upper driving-roll upheld thereby, a counter-balance, and hangers encircling the necks of the driving-roll and connected with the bearings of the forming-roll, substantially as and for the purposes described.

3. The combination of a forming-roll, an upper driving-roll upheld thereby, a counter-balance supporting the bearings of the forming-roll, and adjusting-screws for the driving-roll, substantially as and for the purposes described.

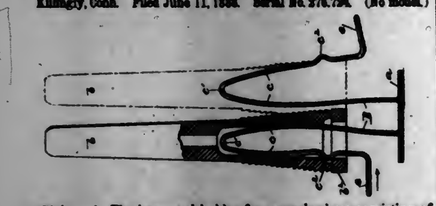
4. In a universal mill, the combination of vertical rolls, short-necked horizontal rolls, outer driving-rolls, and a counter-balance connected with the bearings of the upper short-necked roll, and supporting it, together with the driving-roll, substantially as and for the purposes described.

5. The combination of a forming-roll, an upper driving-roll upheld thereby, a counter-balance, a cross-head 27, and hangers encircling the necks of the driving-roll and connected with the bearings of the forming-roll, substantially as and for the purposes described.

6. The combination, with the housings and the rolls, of separators interposed between the housings and having between them the bearings of the rolls, substantially as and for the purposes described.

7. The combination, with the housings and the rolls, of separators interposed between the housings and having between them the bearings of the rolls, and bolts passing through the separators and housings, substantially as and for the purposes described.

8. In a universal mill, the combination of the horizontal roll-housings, side rolls and their carriers, and wings projecting from the sides of the housings, in which the said carriers are movably supported, substantially as and for the purposes described.



9. In a universal mill, the combination, with the horizontal rolls and side rolls and their adjusting-screws, of common driving mechanism which actuates the adjusting-screws of both horizontal and side rolls, and means whereby the relative speed of said adjusting-screws may be varied, substantially as and for the purposes described.

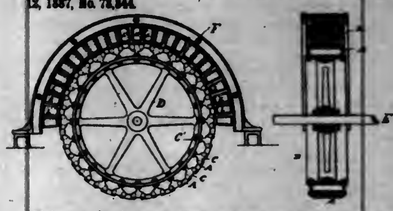
10. The combination, with the adjusting-screws 21, of a pinion 40, connected therewith by a traveling connection—such as a feather and spline—and a divided collar, by which the pinion is held to the housing, substantially as and for the purposes described.

11. The combination, with the upright housings, of forming-rolls—such as the rolls 1 and 2—having their necks entirely within the space between the housings, and vertical bars or wings *d*, between which the necks of the rolls are set, substantially as and for the purposes described.

12. The combination, with the peripherally beveled or shaped forming and reducing rolls—such as the rolls 1 and 2—one at least of which is frictionally driven, of an outer roll, against which the face of such forming and reducing roll has a bearing, and by which it is frictionally driven, substantially as and for the purposes described.

412,853. ENAMELER'S APPARATUS. SAMUEL D. KEISER, Providence, R. I., assignor to the Arnold & Barber Spool and Bobbin Company, Killingly, Conn. Filed June 11, 1888. Serial No. 276,794. (No model.)

Claim.—1. The improved holder for enamelers' use consisting of a piece of bent metal arranged to frictionally engage the interior surface of a bobbin or other article to be enameled, and having the free end of the wire terminating in a pusher, as *c*, formed by bending the free end of the wire in an outward direction, substantially as shown and set forth.



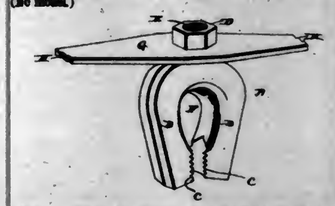
2. The enameler's apparatus hereinbefore described, consisting of a base portion, as *a*, having a series of bent wire holders secured thereto, said holders being each provided with a pusher, as *c*, and a stop for limiting the position of the bobbin, substantially as shown and set forth.

3. The combination, with a base or support, of the wire holders B, secured thereto, each having two spring-arms which are bent, as at c^2 c^3, to engage the interior surface of a bobbin, and being further bent contiguous to said base to form a stop and pusher, as *d* and *c*, respectively, substantially as shown, and for the purpose set forth.

4. The holder hereinbefore described, made of a piece of spring-wire bent to form two substantially parallel legs or sides, each having bends therein, a short bend formed in one of said legs to serve as a stop, and having an end of the wire bent outwardly at right angles to act as a pusher, substantially as shown and set forth.

5. The holder for enamelers' use, consisting of a piece of spring-wire bent to form two curved arms, one of the arms being arranged to be secured to a base and the other or free arm having a short bend or projection, as c^2, adapted to engage an interior groove or notch formed in the lower portion of the bobbin, and, further, having the free end of the arm bent to form a pusher, substantially as shown and set forth.

412,854. DYNAMO-ELECTRIC MACHINE. JOHN A. KINGDON, London, England. Filed May 20, 1889. Serial No. 276,230. (No model.) Patented in England Dec. 3, 1886, No. 15,857; in Germany Dec. 24, 1886, No. 41,795; in France Sept. 3, 1887, No. 185,719, and in Belgium Sept. 12, 1887, No. 78,944.



Claim.—1. A chain of soft-iron laminated inductors separated from one another by non-magnetic spaces, and connected by side links or equivalent disks, so as to be applicable to the periphery of a fly-wheel or drum, or to form the periphery of a drum, in combination with a series of fixed alternate primary and secondary electro-magnets K L, whose cores are composed of laminated rake-shaped plates and wholly or partially surrounding the inductor-drum.

2. In a dynamo-electric machine, the inducting-surface in the form of an endless chain of inductors A, formed of insulated plates and supported and connected by non-magnetizable links C C, so that they may be conveniently constructed and combined with the periphery of any known fly-wheel or drum, substantially as described.

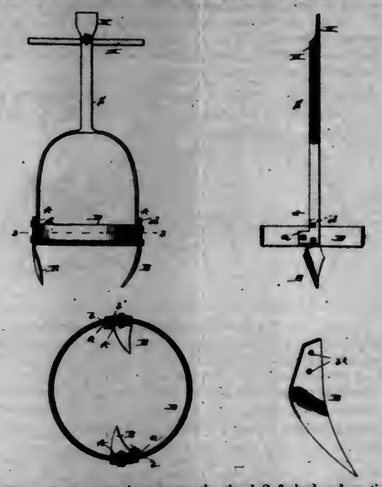
3. The cores of the primary and secondary electro-magnets in a dynamo-electric machine, composed of bundles of soft-iron plates insulated from one another and of a rake shape, breaking joint, so as to overlap one another and to give rigidity and as much magnetic continuity between adjacent cores as possible, substantially as described.

4. The inductor-plates A, having perforated lugs which project opposite their peripheral edges, in combination with bolts B, passing through said lugs to hold the plates together, and thus located so that they are not cut by the lines of magnetic force, substantially as described.

412,855. SCREW-DIE. CHARLES LEACH, Bonkleman, Notr., assignor to William R. Turner, same place. Filed Mar. 8, 1889. Serial No. 302,452. (No model.)

Claim.—1. The die having the central bore and provided with the integral arms B, and having the threaded portion C formed between the opposing outer ends of said arms, substantially as described.

2. The die having the central bore, the integral arms B, inclined toward each other and having the opening F between them, and the extension D, formed at the top and adapted to be engaged by the bar G, substantially as described.



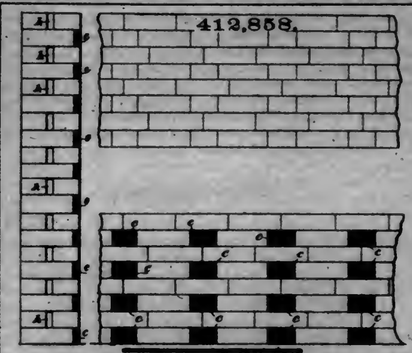
3. The die-body having the arms B, provided with the threaded portion C on their opposing sides at their outer ends said die-body having the opening F between the arms B, and the bore or opening E in line with the threaded portion C, substantially as described.

412,856. SHELL. JAMES J. HOOGE, Merryville, La. Filed Apr. 6, 1889. Serial No. 306,211. (No model.)

Claim.—In a projectile, the combination of a shell having a longitudinal bore or chamber at its rear end, a breech pin or plug at the rear end of the same, a longitudinally-movable cartridge arranged in said bore or chamber, curved springs secured in the sides of the latter and impinging against the sides of the cartridge, thereby retaining the latter in position by frictional contact with said springs, and a percussion-cartridge mounted upon a nipple at the front end of said cartridge, substantially as set forth.

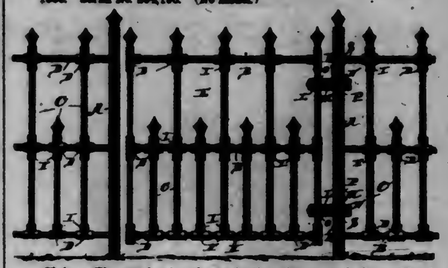
412,857. POST-HOLE AUGER. DONALD B. MCCALL, Terrelton, Tex. Filed June 20, 1889. Serial No. 314,995. (No model.)

Claim.—1. In a post-hole auger, the shank S, forked and continued in the arms A, the latter having elbows *d* at their lower ends, in combination with the ring-shaped band E, having a sharp lower edge and bolts passing through said band and arms and through said elbows and arms, substantially as described.



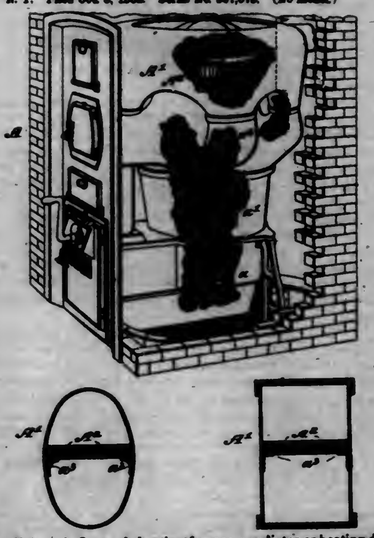
2. In a post-hole auger, the shank S, forked and continued in the arms A, the rim-shaped band D, embracing the lower ends of said arms, and the bits B, outside of said band opposite said lower ends of the arms, said parts being secured together by bolts passing through registering holes in all of them, substantially as described.

3. In a post-hole auger, the shank S, forked and continued in the arms A, the latter having lateral elbows *a* at their lower ends, the ring-shaped band D, embracing the lower ends of said arms and provided with upwardly-projecting ears *d*, and the bits B, said arms, band, and ears and bits having two registering bolt-holes one above the other, bolts for securing all said parts together, said elbows and said band remote from said bits having registering bolt-holes and bolts for securing said parts together independently of said bits, substantially as described.



412,858. BRICK WALL. JOHN MCMURRAY, Lexington, Ky. Filed Mar. 22, 1889. Serial No. 304,377. (No model.)

Claim.—A one-brick wall constructed with courses or series of adjacent courses of inside and outside stretchers, separated by a space *h* of one inch, (more or less,) and a course consisting of stretchers and headers interposed between the aforesaid courses or series of courses, the stretchers in this course being separated, as in the first-mentioned courses, the spaces left by the headers on the inside face of the wall being filled with good cement, as and for the purposes set forth.



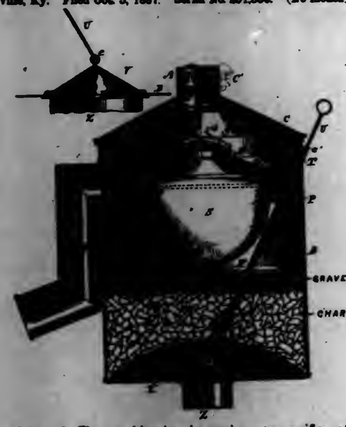
412,859. GATE. HENRY FRIDAY, Houston, Tex. Filed Dec. 30, 1888. Serial No. 294,190. (No model.)

Claim.—The post having the projecting pins or studs S, combined with the gate having the hinges L, composed of a pair of plates bolted together, the said plates being swelled outward to provide collars N which are provided with cams R, as set forth.

412,860. HOT-AIR FURNACE. DWIGHT S. RICHARDSON, Brooklyn, N. Y. Filed Oct. 3, 1888. Serial No. 287,073. (No model.)

Claim.—1. In an air-heating furnace, a radiator or heating-drum which is divided by a detachable diaphragm or flue-plate into an incoming and an outgoing flue, the body of the radiator being composed of thin quickly-radiating metal, and the diaphragm or flue-plate being composed of fire-brick or other analogous refractory material, substantially as and for the purposes set forth.

2. In an air-heating furnace, a radiator or heating-drum which is divided by a detachable diaphragm into an incoming and an outgoing flue, the body of the radiator being composed of thin quickly-radiating metal, the diaphragm being composed of fire-brick or like refractory material and serving to reverse the direction of the flow of the volatile products of combustion, substantially as described.

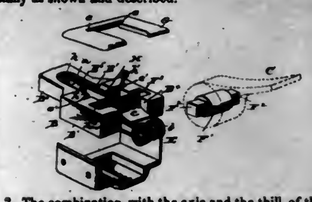


412,861. COPYING-PAD. THOMAS ROBSON, Philadelphia, Pa. Filed Jan. 31, 1887. Serial No. 225,905. (No model.)

Claim.—1. A copying-pad consisting of the bibulous sheets A, the stiffener B, having the rim C, as shown, the fabric facing D, secured to the stiffener B, the rubber backing F, having its edges which form the rim G secured to the facing D, the channel H, formed by rim C and facing D, and the stitching E, all substantially as described.

2. A copying-pad consisting of bibulous sheets, a stiffener having a rim projecting beyond the ends of the sheets, and a piece of fabric covering the face of the sheets and having its edges secured to the back of the stiffener, thereby forming a channel around the edges of the said sheets, substantially as and for the purpose set forth.

412,862. RAIN-WATER PURIFIER. WINFIELD R. SCOTT, Danville, Ky. Filed Oct. 5, 1887. Serial No. 251,536. (No model.)

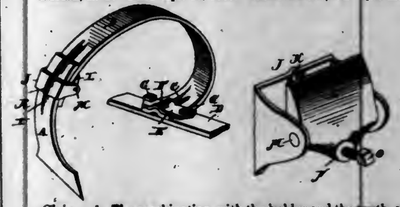


Claim.—1. The combination, in a rain-water purifier, of a main cover provided with a vertical inlet-neck, a body having within its upper end a fixed annular curb located below said neck and concentric therewith and provided with an inwardly-projecting stop-bead, a removable textile strainer having a distending wire which coacts with said stop-bead, and a filter, as of gravel and charcoal, beneath said strainer, whereby said filter is protected against contamination by soot and like impurities, substantially as hereinbefore specified.

2. The combination, in a rain-water purifier, of a main cover provided with a vertical inlet-neck, a conical inner cover having an inner inlet-neck in line with the one first named provided with a convex primary screen of wire-cloth, a wasteway surrounding said inner cover, and a waste-outlet leading from said wasteway, substantially as herein specified.

3. The combination, in a rain-water purifier, of a main cover provided with a vertical inlet-neck, an inner cover having an inner inlet-neck in line with the one first named, a waste-outlet communicating with the space above said inner cover, and a gravitating cut-off comprising a laterally-swinging cap loosely fitted to said inner neck, and a vertically-sliding crank-handle rigidly attached thereto at one edge and supported by said main cover, substantially as herein specified.

412,863. THILL-COUPLING. ALONZO DE JOHN, Louville, N. Y. Filed Aug. 10, 1888. Serial No. 280,985. (No model.)



Claim.—1. The combination, with a vehicle-axle and thill, of a chambered casting secured to the axle by means of a clip, a wire of spring metal retained within the chamber by the engagement of one of the arms of the clip-iron with a central loop in the wire, the coils *b*, formed in the wire at the front end of the chambered casting, the wearing-plate secured to the free ends of the wire adjacent to the loops, the cap-plate G, fitted over the enlarged portion of the casting and provided with central apertures and recesses, as described, and the wire H, having a central loop to engage one of the vertical arms of the clip-iron within the chamber within the casting, and having its free ends bent upwardly and engaging the recesses in the cap-plate, substantially as shown and described.

2. The combination, with the axle and the thill, of the chambered casting, and a wire spring formed at its end with a seat for the thill and formed with a coil *b* at the front end of the casting, substantially as and for the purpose specified.

3. The combination, with the axle and the thill, of the chambered casting, the wire spring having a loop, a coil *b*, and a seat for the thill, and the clip-iron having one leg passed through the loop of the spring, substantially as shown and described.

412,864. SPRING HARROW-TOOTH. FREDERICK VAN PATTEN, Auburn, N. Y. Filed Apr. 19, 1889. Serial No. 307,774. (No model.)

Claim.—1. The combination, with the holder and the tooth, of the clip passed around the same and a clamping-plate pivotally mounted in the clip and adapted to bind against the tooth, as set forth.

2. The combination, with the tooth and the holder, of the clip passed around the tooth and the holder, the clamping-plate pivotally mounted in the clamp, and a set-screw mounted in a suitable bearing on the clamping-plate and adapted to bind against the tooth, as set forth.

3. The combination, with the tooth and the holder provided with engaging longitudinal corrugations, of the clip passed around the same and having a groove engaging the corrugations in the holder, and a clamping-plate pivotally mounted in the clamp and adapted to bind against the tooth, as set forth.

4. A removable clamping device for harrow-teeth, consisting, essentially, of a clip carrying a pivoted clamping-plate provided with a set-screw, as set forth.

412,865. SPRING HARROW-TOOTH. FREDERICK VAN PATTEN, Auburn, N. Y. Filed Apr. 19, 1889. Serial No. 307,776. (No model.)

Claim.—1. The combination of the beam, the curved tooth-holder secured thereto and having ribs or flanges E at its side edges, provided with the widened portions F, the tooth fitting in the holder, the clamping-plate adapted to bear on the tooth and having an integral journal engaging one of the widened portions F, and the removable journal inserted through the other one of the widened portions F into the clamping-plate, as set forth.

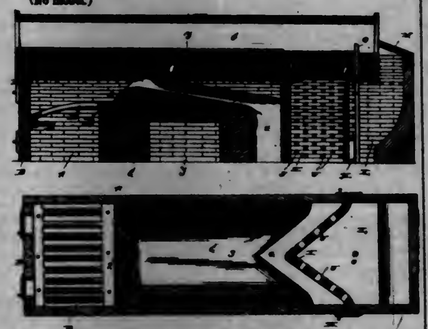
2. The tooth-holder having as a fixed part thereof a pivoted clamping-plate provided with a set-screw, as set forth.

3. The tooth-holder having as a fixed part thereof a pivoted clamping-plate having one of its journals removable, as set forth.

412,866. COMBINED CARRIAGE AND SLED. REUBEN B. WHITNEY, Gloversville, N. Y. Filed Aug. 24, 1888. Serial No. 283,572. (No model.)

Claim.—1. A combined wagon and sled consisting of a sled-body and a running-gear connected thereto, the said sled-body being inverted to form the body of the wagon, substantially as described.

2. In combination, a sled-body, a running-gear connected thereto, and removable front and end pieces, substantially as described.



3. In combination, a sled-body, a running-gear removably connected thereto, removable front and end pieces, and a pivoted seat connected to one of the pieces, substantially as described.

412,867. KEY-HOLE GUARD. CHARLES D. WILLIAMS, Philadelphia, Pa. Filed Oct. 23, 1888. Serial No. 288,941. (No model.)

Claim.—A lock having a throat in the periphery of its casing, and an inwardly-extending guard at the wall of said throat, and an oscillating guard with a shoulder adapted to abut against said inwardly-extending guard, and a tooth adapted to enter an opening in a key, and a spring adapted to close said shoulder against said inwardly-extending guard, said parts being combined substantially as described.

412,868. STEAM-BOILER FURNACE. CHARLES H. WILSON and KEVIN W. BERRY, Paducah, Ky. Filed June 20, 1889. Serial No. 314,993. (No model.)

Claim.—1. In a furnace, the herein-described fire-wall, having its front end curved upwardly and rearwardly to within a short distance of the boiler, the upper surface of said fire-wall being extended from thence in a downward and rearward direction and provided with a V-shaped recess forming an ash-pit, the upper surface of said fire-wall being curved transversely concentrically with the boiler, substantially as set forth.

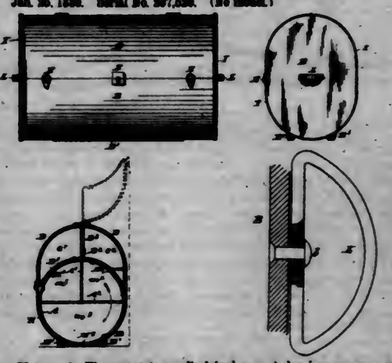
2. In a furnace, the combination, with the fire-wall having a V-shaped recess at its rear end, of the V-shaped draft regulating and equalizing wall, substantially as herein described.

3. In a furnace, the herein-described V-shaped draft regulating and equalizing wall provided with a series of longitudinal openings or passages, substantially as and for the purpose set forth.

4. The combination, in a furnace, of the fire-wall having a V-shaped recess at its rear end, the downwardly and forwardly inclined grate, and the V-shaped draft regulating and equalizing wall having longitudinal perforations or passages, as set forth.

5. The combination of the furnace walls or casing, the longitudinally-arranged fire-wall having transversely-curved upper surface and provided with a V-shaped recess at its upper end, the downwardly and forwardly inclined grate supported upon said fire-wall and upon a shoulder on the rear side of the front wall of the furnace-casing, the V-shaped draft-regulating wall having longitudinal perforations or passages, the doors in the side walls of the furnace registering with the ash-pit between the fire-wall and the V-shaped draft-regulating wall, and the vertical boiler-support located in the combustion-chamber in rear of said draft-regulating wall, substantially as and for the purpose set forth.

412,869. BURGLAR-ALARM. SAMUEL W. WILT, Clifton Mills, W. Va. Filed Mar. 6, 1889. Serial No. 302,196. (No model.)

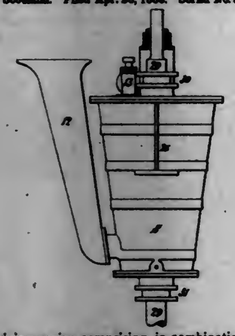


Claim.—1. The combination, with a door-lock provided with a knob-shaft, of a gun-lock mounted above the door-lock and provided with a depending lever adapted to actuate the releasing pawl or sear of the gun-lock and to be operated by the knob-shaft, substantially as specified.

2. The combination, with a door-lock provided with a knob-shaft, of a gun-lock mounted above the door-lock and provided with a depending lever connected with the releasing-pawl of the gun-lock, and a clip embracing the knob-shaft and bearing on the lever and adapted to rock the same through the medium of the shaft, substantially as specified.

3. The combination, with a door-lock, of a gun-lock arranged above the same and having a depending lever connected with its releasing-pawl, and a U-shaped clip mounted on the knob-shaft of the door-lock for operating the lever and provided with a binding-screw, substantially as specified.

412,870. TRUNK. JOHN M. WOLLENBERG, Tarrytown, N. Y. Filed Jan. 26, 1889. Serial No. 297,839. (No model.)



Claim.—1. The revolving cylindrical case A, having one or more partitions A' A^2, and doors M' M^2, adapted to revolve within a trunk-casing, in combination with a top containing compartments c' c^2, performing the double function of storing articles and protecting the revolving part, as herein specified.

2. The ovoidal casing B, having fixed end pieces extending upon as to protect the movable top, in combination with the latter, having

compartments, one of which is movable by turning upward and backward from the center of the top, and with the cylindrical case A, capable of revolving in the lower portion and having two or more doors M' M² and compartments m' m², as herein specified.

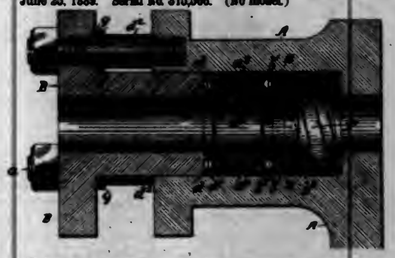
3. The trunk described, having the spring *b*, acting under the pivots to raise the cylinder for free motion and to allow it to be depressed and held, in combination with the revolving casing A, divided into compartments and equipped with doors, and with the ovoid casing B, having a portion movable, all arranged to serve substantially as herein specified.

412,871. PULPING-ENGINE. JAMES H. ARMSDALE, Fulton, County of Mid-Lothian, Scotland. Filed Apr. 26, 1889. Serial No. 308,751. (No model.)

Claim.—A pulping-engine comprising, in combination, a vertical cone-shaped casing, with its larger end uppermost and with closed ends, a feed-hopper at the side of and extending higher than the casing, with its lower end communicating with the lower part of the casing, a regulatable discharge-valve communicating through the otherwise closed top of the casing, knives fixed to the inner sides of the conical casing and distributed regularly round it, a rotating vertical cone-shaped roll provided with knives distributed regularly round it, the said roll having its knives fitted to move nearly in contact with the fixed knives of the casing, and a shaft on which the roll is fixed and which extends through stuffing-boxes in the closed top and bottom of the casing, the several parts being arranged and operating substantially as and for the purposes hereinbefore described.

412,872. REACH-COUPLING FOR VEHICLES. CHRISTOPHER C. BRADLEY, Syracuse, N. Y. Filed Jan. 13, 1887. Serial No. 224,214. (No model.)

Claim.—1. The combination, with an axle provided with a tapering opening, of a reach provided with arms embracing the upper and lower sides of the axle, a tapering stud formed on one of said arms and entering the tapering opening of the axle, a coupling-bolt passing through said stud, and a spring whereby the bolt and the stud are tightened in their seats, substantially as set forth.



2. The combination, with an axle provided with a tapering opening, of a reach provided with arms embracing the upper and lower sides of the axle, a tapering stud formed on one of said arms and entering the tapering opening of the axle, a cap secured to the opposite arm, a coupling-bolt passing through said stud, and a spring seated in said cap and bearing against the axle, substantially as set forth.

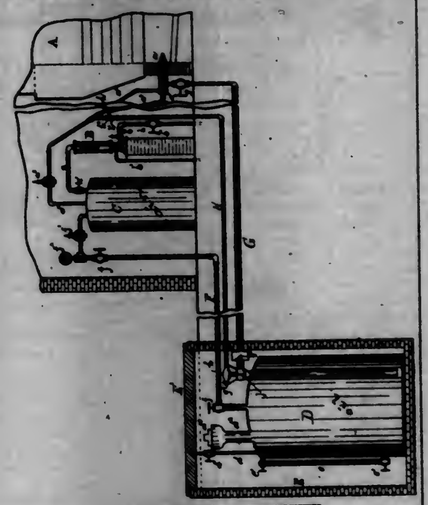
412,873. SHOE-UPPER. SAMUEL P. CARRICK, Boston, Mass., assignor of one-half to George H. Clark, same place. Filed Mar. 26, 1889. Serial No. 304,950. (No model.)

Claim.—The boot or shoe quarter or upper herein described, consisting of the piece *b*, having the slit 2 at the top, and the slit 3, cut parallel with the back line of the quarter, leading from and forming a continuation of the slit 2, to thereby obviate a rear heel-seam, and the gore or auxiliary piece *c*, shaped to fill the opening formed by the slits 2 3 when the piece *b* is crimped or made to assume proper shape, substantially as and for the purposes set forth.

412,874. ROD-PACKING. DAVID H. CHADDACK, Chicago, Ill. Filed June 25, 1889. Serial No. 315,566. (No model.)

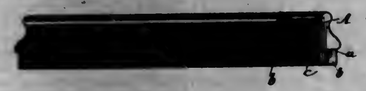
Claim.—1. A metallic packing-ring provided in its ends with annular grooves, and having channels in its outer and inner circumferential surface and leaving the narrow bearing-surfaces *b*, substantially as set forth.

2. The combination, with a metal packing-ring having inner and outer circumferential channels and the groove a^2, the cap-ring beveled on the face and engaging with said groove and bearing against the outer edges of the packing-ring, and spiral spring seated in the bottom of the stuffing-box and bearing against said cap-ring, substantially as and for the purpose set forth.



3. The combination, with the packing-ring provided in its outer end with the groove *a'*, of the packing-gland having the inner joining end beveled, so as to wedge into said groove and spread the bearing-surface of the packing-ring, substantially as and for the purpose set forth.

4. The combination, with a metal packing-ring provided exteriorly and interiorly with channels and having V-shaped grooves in the respective ends, as described, of the cap-ring beveled to wedge into said grooves, the spiral spring seated in the bottom of the stuffing-box, and the packing-gland beveled on its inner end and wedging into the companion groove in the packing-ring, substantially as and for the purpose set forth.



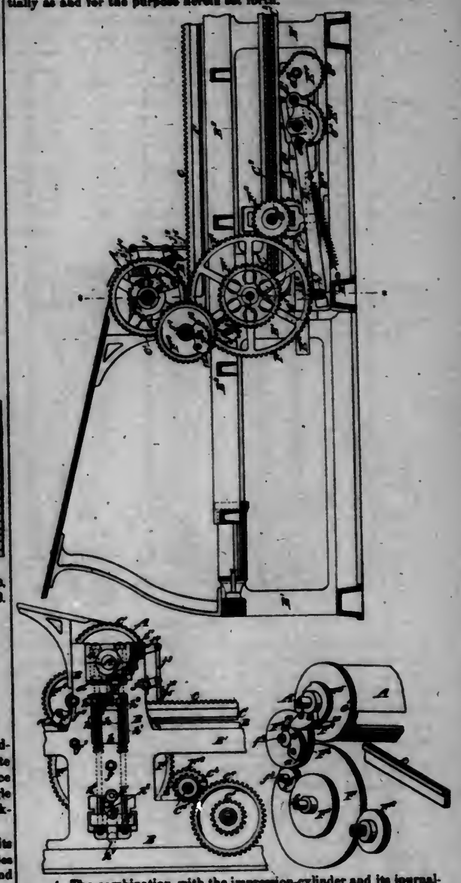
412,875. APPARATUS FOR BURNING PETROLEUM. GEORGE COLLINS and EDWARD H. WEATHERHEAD, Cleveland, Ohio. Filed Jan. 7, 1889. Serial No. 295,662. (No model.)

Claim.—1. In apparatus for burning petroleum, the combination, with an oil-burner, an oil-reservoir, and pipe-connection between the two, an air-compressor, and a pipe between the latter and said oil-reservoir, together with a pipe between the air-compressor and the oil-burner, of a spring-pressed valve which controls communication between said oil-reservoir and said oil-pipe, and air-pipe between the air-compressor and said spring-pressed valve, said latter pipe provided with an escape-valve, together with a mechanical connection between said latter valve and the valve of the oil-burner, substantially as set forth.

2. In apparatus for burning petroleum, the combination, with an oil-burner, an oil-reservoir, and pipe-connection between the two, an air-compressor, and a pipe between the latter and said oil-reservoir, together with a pipe between the air-compressor and the oil-burner, of a spring-pressed valve *j*, which controls communication between said oil-reservoir and said oil-pipe, and a continuous air-pipe H between the air-compressor and said spring-pressed valve, said latter pipe provided with a two-way escape-valve h^3, said valve provided with lever *h*, together with chain connection between said lever *h* and the valve of the oil-burner, substantially as set forth.

412,876. BLACKBOARD-ERASER. THOMAS H. COFFELD, Lake, assignor to A. H. Andrews & Company, Chicago, Ill. Filed June 20, 1889. Serial No. 315,015. (No model.)

Claim.—1. As an improved article of manufacture, a blackboard-eraser comprising a block-handle having one end extending at an acute angle to its side, and felt or other erasive material secured to the face of the block-handle, and having one end extending at an acute angle to the side and coinciding with the acute-angled end of the block-handle, substantially as described.



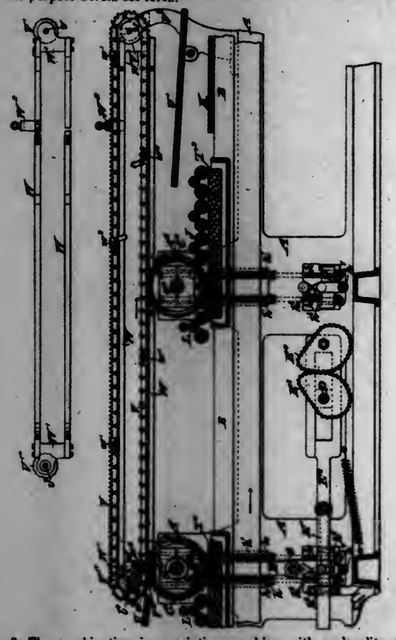
2. A blackboard-eraser comprising a block-handle having its opposite ends extending diagonally to its sides to form acute angles *a*, the parallel side erasing-strips *b*, secured to the block-handle and having diagonal ends to form acute angles coinciding with the acute angles at the ends of the block-handle, and diagonal erasing-strips *c*, secured to the block-handle between the parallel side strips, substantially as described.

412,877. CYLINDER PRINTING-MACHINE. CALVERT B. COTTRELL, Stonington, Conn. Filed Dec. 26, 1888. Serial No. 294,586. (No model.)

Claim.—1. The combination, with the main shaft and impression-cylinder, the bed having a rack for gearing with and driving the cylinder during printing, and a cam-actuated starting-lever for starting and stopping the cylinder, of eccentric gearing between and geared with the main shaft and cylinder for driving the latter at a gradually-increasing speed after it has been started by the starting-lever, substantially as herein described.

2. The combination, with the main shaft and impression-cylinder, the bed having a rack for gearing with and driving the cylinder during printing, and lift mechanism for raising the cylinder after printing, of eccentric gearing between and geared with the main shaft and cylinder for driving the latter at a gradually-increasing speed while out of gear with the bed, and a cam-actuated starting-lever for starting and stopping the cylinder, substantially as herein set forth.

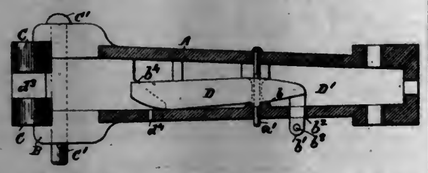
3. The combination, with the main shaft and the impression-cylinder, of the concentric sector F^3, fast to the cylinder, a gear-wheel for gearing with said sector and geared with the main shaft to drive the cylinder at printing speed, and two eccentric sectors, one fast to the cylinder and the other carried by said gear-wheel for the purpose of driving the cylinder at a gradually-accelerated velocity, substantially as and for the purpose herein set forth.



4. The combination, with the impression-cylinder and its journal-boxes, and mechanism, substantially as herein described, for raising and depressing said boxes, of locking devices consisting of toggle-levers applied directly to said boxes independently of the said raising and depressing mechanism for holding the cylinder down during printing, substantially as herein set forth.

412,878. CHROMATIC-PRINTING MACHINE. CALVERT B. COTTRELL, Westerly, R. I. Filed Mar. 25, 1889. Serial No. 304,661. (No model.)

Claim.—1. The combination of a plurality of impression-cylinders provided with receiving-grippers and geared together to rotate synchronously, a reciprocating form-bed common to all of said cylinders and adapted to carry a number of forms corresponding with the number of said cylinders, a rack on the bed for each cylinder, gears upon said cylinders gearing with said rack, and endless chains and grippers thereon arranged to run between said cylinders for the purpose of taking sheets from one of said cylinders and transferring them to another, substantially as and for the purpose herein set forth.

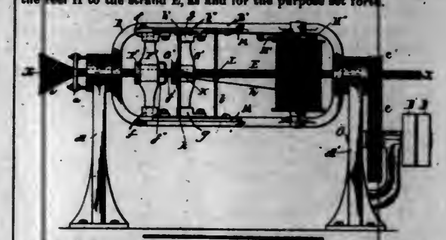


2. The combination, with a plurality of impression-cylinders provided with receiving-grippers, a reciprocating form-bed common to all of said cylinders and adapted to carry a number of forms corresponding with the number of cylinders, a rack on said bed for each cylinder, and gears on said cylinders for engaging with said rack for driving said cylinders during printing, of endless racks and gears upon said cylinders gearing with said endless racks for the purpose of transmitting motion from one cylinder to another while out of gear with the bed-rack and grippers on said endless racks for taking sheets from

one cylinder and transferring them to another, substantially as and for the purpose herein set forth.

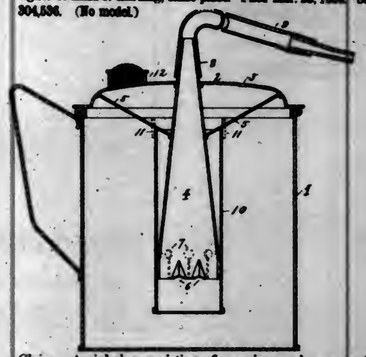
3. The combination, in a printing-machine, with a plurality of impression-cylinders having gears upon them, endless chains engaging with said gears above the said cylinders, and carrying grippers for taking sheets from said cylinders, of tracks upon which said endless chains run, pivotal supports for said tracks at one end, and upwardly-movable supports for the other end of said tracks, substantially as and for the purpose herein set forth.

412,879. CAR-COUPLING. ABRAHAM DETO and WILLIAM S. SCHROEDER, Chicago, Ill. Filed May 14, 1889. Serial No. 310,723. (No model.)



Claim.—1. The combination, with the draw-bar, of the locking-lever chambered therein and provided near the back end with an elongated aperture, the pivot-pin passing through said aperture and the link secured to said lever and projecting through the under side of the draw-bar, substantially as and for the purpose set forth.

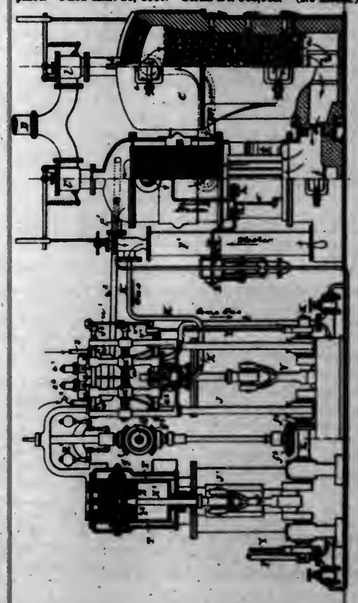
2. The combination, with the draw-bar provided on the inside with the raised rounded seat and inwardly-projecting lugs, of the locking-lever chambered in said draw-bar, whereby said lever is adapted to have a rocking movement in a vertical plane, but prevented from moving laterally, substantially as and for the purpose set forth.



412,880. TIE-YARN MACHINE. CHARLES H. EVERSON, Plymouth, Mass., assignor to the Plymouth Cordage Company, of Massachusetts. Filed Aug. 10, 1889. Serial No. 320,333. (No model.)

Claim.—1. The tie-yarn machine as described, consisting of the frame A A' and the rotary flier B, journaled therein, combined with a perforated guide *a*, tubes F G, binder-yarn reel H, tension-rollers K L, and guide-roller *f'*, substantially as and for the purpose set forth.

2. In a tie-yarn machine, the rotary flier B and the arms or cross-bars F' G', journaled thereon, and having detachable tubes F G, as described, combined with the reel H, the longitudinally-adjustable rollers K L, and guide-roller *f'*, for conducting the binder-yarn A from the reel H to the strand E, as and for the purpose set forth.



412,881. INHALER. WILLIAM J. FAIRFIELD, Denver, Colo., assignor to Elias J. Harding, same place. Filed Mar. 23, 1889. Serial No. 304,536. (No model.)

Claim.—An inhaler consisting of a main vessel, a cover therefor having apertures for the passage of air therethrough, and having a depending inhalation-tube secured thereto, and a medicine-receptacle adapted to slide over and be held by such inhalation-tube, substantially as set forth.

412,882. THERMIC MOTOR. CIPRIAN F. L. GARDIE, Hendon, France, assignor to the Société Anonyme des Moteurs Thermiques Gardie, same place. Filed Mar. 30, 1889. Serial No. 305,962. (No model.)

Claim.—1. In a thermic motor operating by the combustion and expansion of a mixture of gas and air, the combination of two motor-cylinders and their pistons with admission and exhaust valves at one end of each cylinder to constitute it a power-cylinder and compressor-valves at the other end of the cylinder to constitute the portion thereof on that side of the piston a compressor, and with a gas-inlet pipe leading to one compressor and an air-inlet to the other compressor, whereby the air and gas are compressed separately in the two cylinders.

2. In a thermic motor operating by the combustion and expansion of a mixture of gas and air, two cylinders and their pistons with admission and exhaust valves at one end of each cylinder to constitute it a power-cylinder and compressor-valves at the other end of each cylinder to constitute the portion thereof on that side of the piston a compressor, a gas-inlet leading to one compressor, and an air-inlet to the other compressor, whereby the air and gas are compressed separately in the two cylinders, respectively, in combination with two regenerators, pipes leading from the compressor ends of said two cylinders to said two regenerators, respectively, whereby the compressed air and gas are separately heated, pipes leading from both regenerators to the power end of each cylinder to convey both heated gas and heated air to the power end of each cylinder, and exhaust-pipes leading from the power ends of said cylinders to said regenerators, respectively, whereby the burned gases from one cylinder are utilized for heating one regenerator and the burned gases from the other motor-cylinder are utilized for heating the other, substantially as set forth.

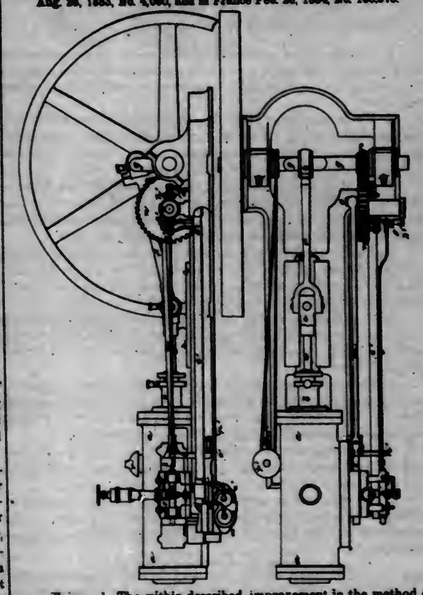
3. In a thermic motor, the combination, with the motor-cylinder with separate air and gas inlet valves, of passages between the chambers of said valves and the interior of the cylinder, constructed to communicate with the latter through numerous contracted openings over a certain area, and the gas and air inlet openings both distributed over said area, whereby the gas and air are thoroughly subdivided and commingled.

4. In a thermic motor, the combination, with the motor-cylinder with separate air and gas inlets, of parallel plates with their intervening spaces in communication alternately with the air and gas inlets, whereby the air and gas are introduced to the cylinder in alternated thin layers.

5. In a thermic motor, the motor-cylinder thereof having its portion in which the burning of the gases takes place lined with segments of thick metal, the adjoining edges of each two adjacent segments being separated by an expansion-space to provide for the expansion of said segments, substantially as set forth.

6. In a thermic motor, the motor-cylinder having its portion in which the burning of the gases takes place lined with segments of thick metal, the adjoining edges of each two adjacent segments being separated by an expansion-space to provide for their expansion, and with a layer of non-conducting material between said segments and the wall of the cylinder, substantially as set forth.

7. In a thermic motor, a compressor in which the gas is compressed, a regenerator, a pipe or passage leading from said compressor to said regenerator whereby said compressed gas is heated, a motor-cylinder, a pipe leading from said regenerator to said motor-cylinder whereby heated and compressed gas is supplied to said motor-cylinder, and an exhaust-pipe leading from said motor-cylinder to said regenerator whereby said regenerator is heated by the burned gases from said motor-cylinder, in combination with a valve arranged to effect direct admission of gas and air to said motor-cylinder independently of said compressor and said regenerator, and a valve for affording direct escape of the products of combustion from said motor-cylinder independently of the valve-gear, whereby by opening said valves a stream of burning gases may be caused to flow through the cylinder in order to heat the latter before starting the engine, substantially as set forth.



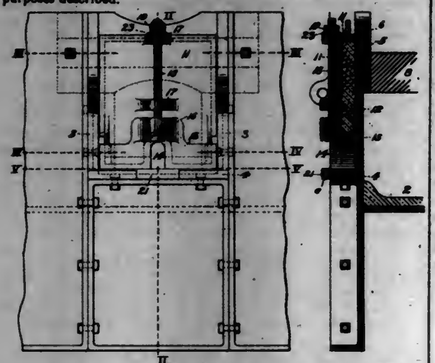
8. In a thermic motor, a motor-cylinder and a compressor-cylinder arranged in line and having a common piston, in combination with an inlet-valve for the compressor, an inlet-valve for the motor-cylinder, a passage for the compressed gas leading from the outlet from the compressor to the inlet-valve of the motor-cylinder, and a valve-gear for opening said respective valves, constructed to establish an invariable mechanical connection between them, whereby at all speeds a constant ratio is maintained between the gas supplied to the motor-cylinder and that supplied to the compressor, substantially as set forth.

9. In a thermic motor operating by the combustion and expansion of a mixture of gas and air, the combination, with the power-cylinder, of separate gas-inlet and air-inlet valves and a valve-gear for operating them, constructed to delay the closing of the air-inlet valve until after the closing of the gas-inlet valve, in order to introduce air after the introduction of the gaseous mixture, and thereby to dilute the latter and reduce the temperature due to its combustion.

10. In a thermic motor operating by the combustion and expansion of a mixture of gas and air, the combination, with the power-cylinder, of separate gas-inlet and air-inlet valves, cams for operating said valves, formed with cam projections varying in height longitudinally and movable longitudinally to bring portions thereof of different heights into engagement with the valves, arms engaging said cams and movable to determine the longitudinal displacement thereof, and a screw engaging said arms, whereby by the turning of said screw the cams are displaced to determine the action of the valves.

11. In a thermic motor operating by the combustion and expansion of a mixture of gas and air, the combination, with the power-cylinder, of separate gas-inlet and air-inlet valves, cams for operating said valves, formed with cam projections varying in height longitudinally and movable longitudinally to bring portions thereof of different heights into engagement with the valves, a screw, and mechanical connections between the latter and said cams, whereby the turning of the screw in one direction or the other displaces the cams longitudinally, a governor, and a clutch operated by said governor for connecting said screw to a revolving part in either of two opposite directions, whereby the engine is governed automatically.

412,888. METHOD OF OPERATING GAS-ENGINES. SAMUEL GRIFFITH, Kingston Iron Works, Bath, County of Somerset, England. Filed June 10, 1886. Serial No. 204,818. (No model.) Patented in England Aug. 28, 1883, No. 4,080, and in France Feb. 26, 1884, No. 160,573.



Claim.—1. The within-described improvement in the method of working gas-motor engines, whereby each complete operation of the piston in the cylinder is made to consist of a cycle of six strokes, as follows: first, a stroke in one direction in which during the first part the explosive compound of gas and air is drawn into the cylinder and during the latter part pure air is drawn thereinto; second, a return-stroke in the opposite direction, by which not only the air drawn in during the latter part of the previous stroke, but the products of combustion or air previously contained in the cylinder, are displaced by the air drawn in during the latter part of that stroke; third, a stroke in the first-mentioned direction for drawing in a full charge of the explosive compound; fourth, a return-stroke for the compression of the explosive compound in the cylinder; fifth, a third stroke in the first-mentioned direction produced by the ignition of the explosive compound in the cylinder; sixth, a return-stroke for the discharge of the products of bustion, all as herein described.

2. The within-described improvement in the method of working gas-motor engines, consisting in admitting the explosive compound to the cylinder during the first portion of one stroke of the piston in one direction, and during the whole of the succeeding stroke in the same direction, substantially as and for the purpose herein set forth.

412,884. FURNACE-DOOR. JOHN HEATLEY, Pittsburg, Pa., assignor of one-half to Thomas B. Vennare, same place. Filed Feb. 11, 1889. Serial No. 299,418. (No model.)

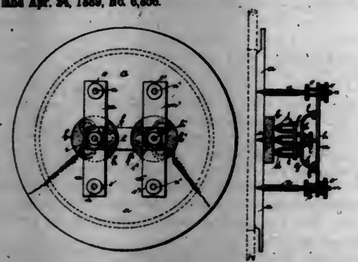
Claim.—1. The furnace-door comprising the frame 11, an extensible foot, and an interposed backing 12, substantially as and for the purposes described.

2. The furnace-door comprising the frame 11, an extensible foot, an interposed backing 12, and a bolt connecting the frame and foot for drawing the same together, substantially as and for the purposes described.

3. The furnace-door comprising the frame 11, an extensible foot, an interposed backing 12, a bolt connecting the frame and foot for drawing the same together, and lugs 16 and 17, through which the bolt passes, substantially as and for the purposes described.

4. The doorway-frame having vertical sides and cross-pieces at the top and bottom, the cross-piece at the top being secured to the furnace-wall and the cross-piece at the bottom being secured to the cinder-plate, substantially as and for the purposes described.

5. The combination, with the doorway-frame having at the base a cross-piece flanged, as at *h*, of a fore plate which fits on the cross-piece and is provided with a projecting retaining flange or shoulder *c*, substantially as and for the purposes described.



6. The combination, with the doorway-frame having a cross-piece at the upper end thereof, of a reversible back plate having a recessed portion *b*, which fits over the cross-piece, substantially as and for the purposes described.

7. The combination, with the doorway-frame having a cross-piece at the upper end thereof, of a reversible back plate having a recessed portion *b*, which fits over the cross-piece and is provided with projecting arms *c*, substantially as and for the purposes described.

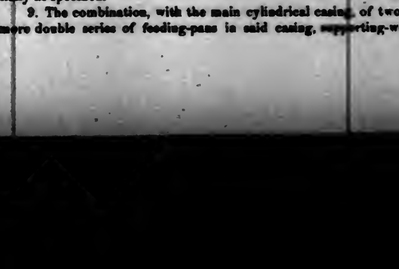
8. The furnace-door comprising the frame 11, an extensible foot, and an interposed backing 12, said foot being provided with guide ribs or lugs 20, substantially as and for the purposes described.

9. The furnace-door comprising the frame 11, an extensible foot, and an interposed backing 12, said foot being provided with a work-hole 14 and a lining-block 15, substantially as and for the purposes described.

412,885. MICROPHONE. Eduard F. Hetzler, Dresden, Germany. Filed May 8, 1889. Serial No. 310,042. (No model.) Patented in England Apr. 24, 1889, No. 6,856.

Claim.—1. In a microphone, the combination, with a diaphragm having two connected contact-plates thereon, of two contacts connected by an elastic connection with the diaphragm, each of said contacts being connected with one terminal of the circuit, substantially as described.

2. In a microphone, the combination, with the diaphragm and the two connected carbon plates thereon, of two carbon contacts and a spring-support therefor, each of said contacts adapted to co-operate with one of the plates on the diaphragm, said contact-supports being connected to the diaphragm, substantially as described.



3. In a microphone, the combination, with a diaphragm and two connected contact-plates thereon, on two contacts mounted on the diaphragm and arranged to co-operate with said plates, each contact consisting of a plurality of contact-points, substantially as described.

4. In a microphone, the combination, with a diaphragm and two connected contact-plates thereon, of the standards on the diaphragm and the contacts connected thereto by an elastic connection, each arranged to co-operate with one of the contact-plates, substantially as described.

5. In a microphone, the combination, with the diaphragm and a contact-plate thereon, of the standards secured to the diaphragm, a plate adjustable on the standards, and a spring carrying a contact connected to the said plate, substantially as described.

6. In a microphone, the combination, with the diaphragm and the contact-plate thereon, of the standards on the diaphragm, the plate, the bowed spring connected thereto, and the contact connected to the center of the spring and co-operating with the contact on the diaphragm.

412,886. FEED-WATER HEATER AND PURIFIER. John J. Hoppe, Springfield, Ohio, assignor to the Hoppes Manufacturing Company, same place. Filed July 10, 1888. Serial No. 317,086. (No model.)

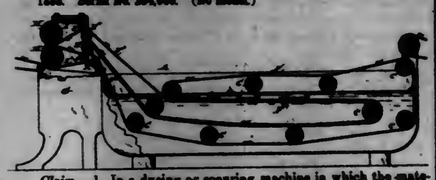
Claim.—1. In a purifier, a double series of heating-pans, in combination with an upper pan having longitudinal ribs or projections adapted to deflect the water from the bottom of said pan into the respective series, substantially as specified.

2. The combination, with the double series of pans and an upper feeding-pan having the deflecting-strips, of the branched supporting-standards to support the inner ends of said standards and permit the upper pan to be removed, substantially as specified.

3. The combination, with a heating-pan and a feed-pipe adapted to extend below the water-line therein, of ways on which said pan is supported, said ways being provided with depressions opposite said feeding-pipe, substantially as and for the purpose set forth.

4. The combination, in a purifier, of an upper pan having a curved or inclined bottom and longitudinal edges over which the water is adapted to flow so as to pass along said bottom, and deflecting-strips on said bottom, substantially as specified.

5. The combination, with a feed-pan having a curved or inclined bottom and horizontal edges over which the water is adapted to flow so as to pass along said bottom, and a feed-pipe extending below the overflow-edges in said pan, of ways on which said pan is supported, said ways being provided with depressions opposite said feed-pipe to permit the end of said pan to pass under the feed-pipe when said pan is withdrawn, substantially as specified.



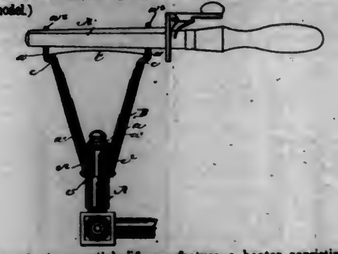
6. The combination, with the double series of heating-pans, of an upper pan having overflow-edges and a curved or inclined bottom with deflecting ribs or projections on the bottom of said pan, and a feed-pipe projecting into said pan below the overflow-edges, and the guides or ways having the depressions opposite said feed-pipe, substantially as specified.

7. The combination, with a double series of heating-pans, each provided with longitudinal overflow-edges and a curved or inclined bottom, of ways on which said pans are adapted to slide, an upper feeding-pan having deflecting projections in the bottom thereof to deflect the water into the respective series of said pans, and central supporting-standards to support the inner ways of each series of pans, said standards being branched to pass around the upper feeding-pan, substantially as specified.

8. In a purifier, a pan provided with overflow-edges and a feed-pipe projecting into said pan below said overflow-edges, and supporting-ways on which said pan is supported, said ways being provided with depressions opposite said feed-pipe to permit the end of the pan to drop down so as to pass under said pipe when withdrawn, substantially as specified.

9. The combination, with the main cylindrical casing, of two or more double series of feeding-pans in said casing, supporting-ways for said pans, central supporting-standards for said ways, an upper feed-pan for each series having overflow-edges and deflecting-strips, a feed-pipe having branched portions extending into the respective feed-pans below the overflow-edges thereof, and guides or ways on which said feed-pans are supported provided with depressions opposite the respective branches of said feed-pipe, substantially as specified.

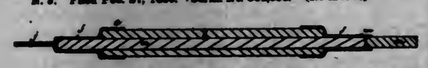
412,887. DYEING-MACHINE. Walter A. Lorimer, Philadelphia, Pa., assignor of one-half to John H. Lorimer, same place. Filed Dec. 26, 1888. Serial No. 294,609. (No model.)



Claim.—1. In a dyeing or scouring machine in which the material treated is carried through the liquor by suitable carriers incapable of passing between the squeeze-rollers, the combination, with said carriers, of squeeze-rollers, an idler-roller arranged close to the delivery end of said carriers, and an endless band or apron passing about said idler-roller and the lower of said squeeze-rollers, adapted to act as a stripper for the carriers of the dyeing or scouring machine.

2. In a dyeing or scouring machine in which the material to be treated is carried through the liquor by aprons or carriers incapable of passing between the squeeze-rollers, the combination, with said aprons or carriers, of squeeze-rollers, idler-rollers located close to the delivery end of said aprons or carriers and respectively above and below them, and short endless aprons passing over said squeeze and idler rollers and adapted to act as strippers for the carriers or aprons of the dyeing-machine.

3. In a dyeing or scouring machine in which the material to be treated is carried through the liquor by aprons or carriers incapable of passing between the squeeze-rollers, the combination, with said aprons or carriers, of squeeze-rollers, idler-rollers located close to the delivery end of said aprons or carriers and respectively above and below them, short endless aprons passing over said squeeze and idler rollers and adapted to act as strippers for the carriers or aprons of the dyeing-machine, and a guide roller located near the delivery end of the lower of said carriers or aprons of the dyeing-machine to guide said apron or carrier away from the lower of said idler-rollers.



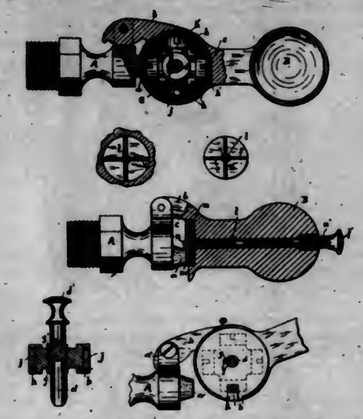
412,888. CURLING-IRON HEATER. Herbert J. Mayer and Gustave Burkhardt, Chicago, Ill. Filed July 1, 1889. Serial No. 316,164. (No model.)

Claim.—1. As an article of manufacture, a heater consisting of a funnel-form casing flattened at the top and provided with rings a^2 a^3, for holding a curling-iron directly over the long narrow opening thus formed at the top of said casing, an opening at the bottom affording bearing-points, as at *a a'*, for attaching the same to a gas-burner, and openings a^5, for affording a draft of air, as specified.

2. The heater composed of the frame *a a'* a^3, and the casing B, being a funnel-form tube flattened at the top and having the opening at the bottom for attaching it to a gas-burner, and air-holes, substantially as shown and described.

412,889. ELECTRIC TERMINAL. Charles McIntire, Newark, N. J. Filed Feb. 27, 1889. Serial No. 301,331. (No model.)

Claim.—1. In combination with the insulated conducting-wire, a cap *c*, for protecting the insulation, and teeth *e*, to bite into said insulation, substantially as and for the purpose set forth.



2. In combination with the insulated conducting-wire, a cap *c*, having perforation *d*, through which latter the wire extends, and the cap covering the insulation, the edges of said cap biting into said insulation, as at *e*, substantially as and for the purpose set forth.

3. The improved terminal herein described, combined with a cap *c*, adapted to cover the insulation of a conducting-wire, a seamless tubular extension *f*, secured to said cap and reduced in size to engage the uncovered end of said conducting-wire, and adapted to be indented or impressed into holding engagement with said wire, substantially as set forth.

4. In combination with the insulated conducting-wire, a cap *c*, having the reduced tubular extension *f* and eye-plate *j*, the said parts being arranged and adapted to operate substantially as and for the purpose set forth.

5. The improved electric terminal herein described, combining a cap, a reduced tubular extension, and an eye-plate, substantially as and for the purpose set forth.

412,890. GAGE-COCK. David G. Hoagg, Cleveland, Ohio. Filed Apr. 25, 1888. Serial No. 308,615. (No model.)

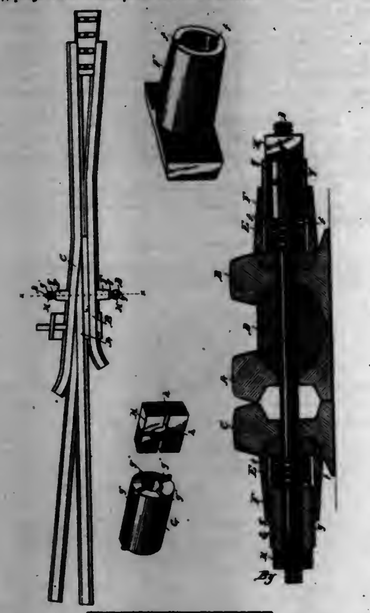
Claim.—1. In a gage-cock, a rotary packing-holder provided with two or more independent removable seats, substantially as set forth.

2. In a gage-cock, the combination, with a rotary packing-holder, of a spindle engaging therewith, said spindle extending beyond the side of said gage-cock, whereby it may be turned, substantially as set forth.

3. In a gage-cock, the combination, with a rotary packing-holder, of a spring-pressed spindle engaging with said packing-holder, said spindle having a projecting portion, whereby it may be turned, and being spring-pressed, whereby it may be held in position, substantially as set forth.

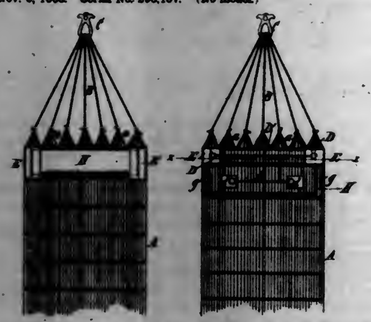
4. In a gage-cock, the combination of a rotary packing-holder having one or more seats, a spindle having engagement therewith and provided with a thumb-nut, and a spring engaging with said spindle, substantially as set forth.

5. A gage-cock provided with a rotary nipple-engaging device having a series of faces located angularly to each other, substantially as set forth.



6. In a gage-cock, the combination, with a discharge-pipe, of a weight having pivotal engagement with said discharge-pipe and provided with a seat adapted to engage with said pipe, said discharge-pipe provided with a downwardly-inclining discharge-orifice, whereby as the weight is raised the issuing water will clear said seat, substantially as set forth.

7. In a gage-cock, the combination of a weight provided with a recess, a spindle pivoted in the walls of said recess, a rotary packing-holder provided with sockets secured to said spindle, seats fitting in said sockets, said spindle provided with a thumb-nut, whereby it may be turned, spring-locking mechanism that holds said packing-holder in stationary position, and a discharge-nipple to which said weight is journaled, substantially as set forth.



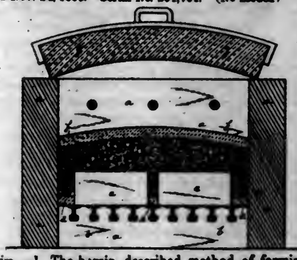
412,891. SPRING-FROG. Alonzo W. Paine, Chicago, Ill. Filed July 13, 1889. Serial No. 317,366. (No model.)

Claim.—The combination, in a spring-frog, of a spring operating the movable rail, a nut for adjusting the tension of said spring, and a non-rotatable follower interposed between said spring and nut, the

adjacent surfaces of the follower and nut being provided with corresponding projections and depressions, as described.

412,892. **HAMMOCK.** ISAAC R. PALMER, Middletown, Conn. Filed Nov. 6, 1888. Serial No. 290,137. (No model.)

Claim.—1. In a hammock, the combination, with a body portion, of two pockets made independent of the hammock and secured upon the face of the body portion of the hammock near one end of the latter and also near opposite side edges thereof, said pockets having their mouths or open ends toward each other and being adapted to receive a stretcher, substantially as specified.

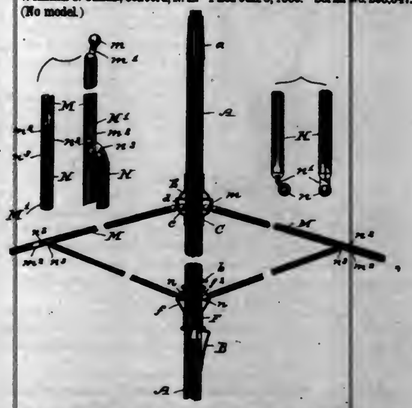


2. In a hammock, the combination, with a body portion, of two pockets made independent of the hammock and secured upon the face of the body portion of the hammock near one end of the latter and also near opposite side edges thereof, said pockets having their mouths or open ends toward each other, and re-enforcing pieces for the pockets at their closed ends, said pockets being adapted to receive a stretcher, substantially as specified.

3. In a hammock, the combination, with a body portion, of two pockets made independent of the hammock and secured upon the face of the body portion of the hammock near one end of the latter and also near opposite side edges thereof, said pockets having their mouths or open ends toward each other, and re-enforcing pieces for the pockets at their closed ends, said re-enforcing pieces overlapping the side edges of the hammock and the adjacent ends of the pockets, and said pockets being adapted to receive a stretcher, substantially as specified.

4. In a hammock, the combination, with a body portion, of four pockets made independent of the hammock and secured upon the face of the body portion of the hammock near one end of the latter, two of said pockets being secured to the hammock near opposite side edges thereof and two being secured to the hammock farther inward from the side edges of the hammock than the others and farther from the adjacent ends, the pockets of each pair having their mouths or open ends toward each other, said pockets being adapted to receive stretchers, substantially as specified.

5. In a hammock, the combination, with a body portion, of two pockets secured thereto near one end thereof and having their mouths or open ends toward each other, and a stretcher made in two sections secured together and adapted to be arranged in said pockets, substantially as specified.



412,893. **PROCESS OF MANUFACTURING STEEL BODIES HAVING LAYERS OF DIFFERENT CARBONS.** JOHN PRODER, Pittsburg, Pa. Filed Nov. 24, 1888. Serial No. 291,761. (No model.)

Claim.—1. The herein-described method of forming bodies of steel having strata containing different proportions of carbon, consisting in maintaining the lower surface of a steel ingot, bloom, or slab at a temperature below that at which carburization or decarburization can take place, covering the upper surface of the bloom with carburizing or decarburizing materials, forming a covering of loam or like substance over the bloom and treating materials, and generating a high heat above such covering, substantially as and for the purposes set forth.

2. The herein-described method of forming bodies of steel having strata containing different proportions of carbon, consisting in exposing to the atmosphere the lower surface of a steel ingot, bloom, or slab, covering the upper surface of the bloom with carburizing or decarburizing materials, forming a covering of loam or like substance over the bloom and treating materials, and generating a high heat above such covering, substantially as and for the purpose set forth.

412,894. **UMBRELLA OR PARASOL.** RICHARD E. PETERS and WILLIAM T. GREEN, Concord, N. H. Filed Jan. 3, 1889. Serial No. 295,347. (No model.)

Claim.—1. In an umbrella-frame comprising ball-and-socket connections for the ribs and their braces, the ribs and their fixed support, and braces and runner, the tubular ribs having at one end a ball-journal connected by a slim rectangular neck to said ribs, and a slot at the proper point for admitting the ball-journal of either of said braces to the interior of said tubular ribs.

2. An umbrella-frame comprising tubular ribs, each containing a slot m^3 and provided at one end with a ball-journal, suitable braces having at each end a slim rectangular neck carrying a ball-journal, a fixed cap having at one end an annular slotted enlargement for carrying one end of said ribs, and a cap or cover shutting part way over said slots, and a suitable runner formed in one piece having an annular enlargement and slots therein for carrying one end of said braces, all substantially for the purpose set forth.

412,895. **SIGNAL-LANTERN.** ADOLPH F. PRAHL, Indianapolis, Ind. Filed Mar. 5, 1889. Serial No. 301,949. (No model.)

Claim.—1. In a signal-lantern, the combination of a casing having a side opening, a lamp arranged within said casing, a door having a lens mounted therein and arranged to close said opening, an open frame hinged to one side of the opening and arranged between the door and the lamp, and a transparent colored screen detachably secured in said open frame, all substantially as specified.

2. In a signal-lantern, the combination, with the reduced top R of the main casing having ventilating-tubes S S, of the exterior perforated casing T, arranged to rotate on said top and having openings *s*, adapted to register with the tubes, substantially as and for the purpose specified.

412,896. **SPRING-HEEL BOOT OR SHOE.** FREDERICK F. RAYBOLD, 2d, Newton, Mass. Filed Jan. 19, 1888. Serial No. 261,236. (No model.)

Claim.—The combination, in a boot or shoe, of the insole, the outsole, a spring-heel having the line of metal nails or slugs *c* placed closely to the edge thereof and adapted to form a wearing-surface and an ornamental finish thereto, but not to attach it, and the line *d* of attaching-nails for securing the spring-heel to the insole, placed inside the line of wearing nails *c*, with considerable space between each nail, as set forth, substantially as described.

412,897. **DEVICE FOR DETACHING HORSES.** CHARLES L. RICE, East Grande Falls, Minn. Filed May 26, 1889. Serial No. 312,393. (No model.)

Claim.—1. In combination with a reversible whiffletree, automatic trace hooks or loops secured to the ends thereof, and provided each with a pin or stud to enter the eye of the trace, all substantially as shown, whereby when the whiffletree is reversed the traces will be positively detached from the pins or studs.

2. In combination with a hinged or pivoted whiffletree, (or doubletree,) an automatic locking device therefor and automatic trace-hooks applied to the ends thereof.

3. In combination with a reversible doubletree, an automatic releasing device therefor, whiffletrees secured to the doubletree, and automatic trace hooks or loops secured to the ends thereof.

4. In combination with plate C, plate D, provided with a bolt or stem, and iron G, hinged to the plate C.

5. In combination with perforated plate C, plate D, provided with a stem or bolt, iron G, hinged to the plate C, and a bolt F, passing through the plates C D.

6. In combination with plate B, plate C, fitting thereon and provided with a curved slot, plate D, provided with a bolt or stem, iron G, hinged to the plate C, and a bolt F, passing through the plates.

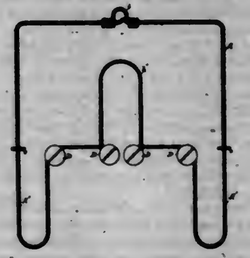
7. In combination with plate C, having a slotted pin, iron G, provided with a stud and pivoted or hinged to plate C, and a weight having a slotted hub.

8. In combination with plate C, having lugs *h* and *g*, the former slotted, as shown, and provided with a slotted pin *i* and a recess *k*, iron G, provided with a flattened stud *m* and hinged to the lug *g*, and a weight provided with a slotted hub *l*.

9. In combination with the socket-piece K, provided with sockets *n o*, and a rigid draw-pin *g*, the loop or hook L, having the inclined slots *r*, and a pin or stud *s*, working in the slots.

10. In combination with a socket-piece, as K, provided with a draw-pin *g*, and pin or stud *s*, the trace loop or hook provided with spiral slots and mounted and free to slide upon the draw-pin.

412,898. **STAIRWAY.** PETER RIEBECK, Allegheny, Pa. Filed June 13, 1887. Serial No. 241,222. (No model.)



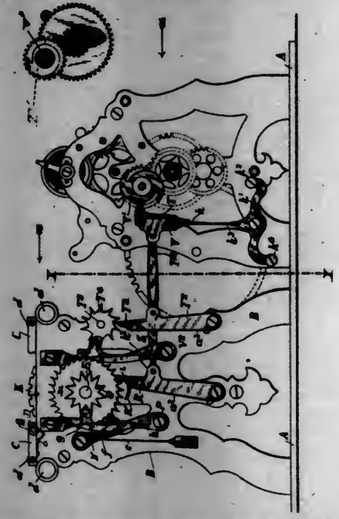
Claim.—1. In a stairway, the combination, with the supporting-columns, of two sets of stairs composed of flights arranged at right angles to each other around the columns and provided with platforms at the angles, substantially as specified.

2. The combination, in a stairway, of the supporting-columns, the flights extending around the columns and arranged at right angles to each other, and the platforms located at the angles of the flights, the upper platforms of each flight being arranged to connect with different stories of a building, substantially as specified.

3. The combination, in a stairway, of the supporting-columns, the independent stairways located on opposite sides of the columns and consisting of a series of flights at right angles to each other, and a series of platforms at the angles of the flights, the flights and platforms being provided with hand-rails and balusters, the inner hand-rail being bent around and secured to the columns, substantially as specified.

412,899. **RAILWAY-CAR CARD-CLIP.** FRANK ROBINSON, Climax, Mich. Filed June 27, 1889. Serial No. 315,768. (No model.)

Claim.—1. A railway-car card clip or holder constructed of a single piece of wire bent to form spring-arms projecting downward from its lower corners, loops or coils at the upper ends of said arms for the reception of fastening means, and a finger-lift at the upper end of the holder.



2. A railway-car card-clip or label-holder constructed of a single piece of wire bent to form spring-arms projecting downward from its lower corners, a label-rest projecting upward from the lower side of the holder, and a finger-lift at the upper side of the holder.

3. A railway-car card-clip or label-holder constructed of a single piece of wire bent to form spring-arms projecting downward from its lower corners, coils for the reception of fastening means at the inner ends of said arms, a label-rest projecting upward from the lower side

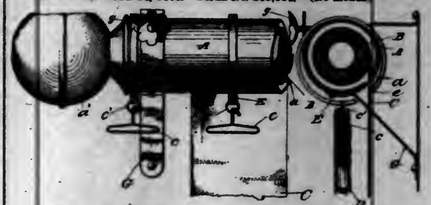
of the holder, and a finger-lift and a spur or spurs at the upper side of the holder.

4. A railway-car card-clip or label-holder constructed of a single piece of wire, the extreme ends of which are sharpened and bent to form spurs, and the adjacent portions wound around each other and bent upward and outward to form a finger-lift or handle, the said wire being also bent to form spring-arms projecting downward from its lower corners, coils or loops at the upper ends of said arms, a label-rest projecting upward from the lower side of the holder, and coils or loops at the lower corners of said label-rest.

412,900. TIME-STAMP. REDFIELD H. ROGERS, Jr., New York, N. Y., assignor to the Rogers Automatic Time Stamp Company. Filed July 16, 1887. Serial No. 244,446. (No model.)

Claim.—1. In combination, a frame, a cam mounted to turn therein, an arm pivoted or fulcramed to said frame and carrying at one end a spring-pawl bearing upon the cam, and an adjustable conical screw in said frame bearing upon the free end of the arm to regulate the force with which the spring-pawl shall bear upon the cam.

2. In a time-stamp, the combination of the time mechanism, the indicator mechanism, including the ratchet-wheel M, a deer-foot pawl R, mounted in the frame of the indicator mechanism in position to engage the wheel M, and connected with the time mechanism, to be oscillated thereby, the said pawl having a toe *i* and curved extension R', substantially as shown, and for the purpose stated.



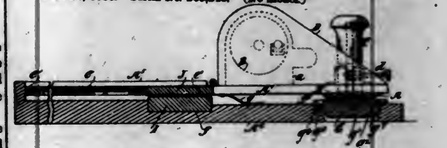
3. A time-stamp having the shaft E, the indicator-wheel F and ratchet fixed thereon, the wheels I and G, provided with sleeves also provided with ratchets, the said wheels being arranged on the shaft on opposite sides of the wheel F, the sectors H and K, turning on the sleeves of the wheels I and G, and the sector L, means, substantially as described, for operating the sector K from the wheel I, combined with time mechanism, with cams and pawls mounted upon the frames of the indicator and time mechanisms, and suitable connections between them, whereby the indicator wheels and sectors are operated from the time mechanism, as described.

4. The combination, with time mechanism, of time-indicator mechanism comprising a main shaft, time-indicators supported upon said shaft, ratchets and pawls for operating said indicators mounted upon the time-indicator frame, ratchets and pawls mounted upon the frame for the time mechanism, connections between said pawls, arms upon which said pawls are borne, and adjusting devices acting on said arms for varying the resistance of the pawls, substantially as specified.

5. The combination, with time mechanism, of time-indicator mechanism, ratchets and pawls for the indicator mechanism, and suitable connections between the time mechanism and the time-indicator mechanism, whereby the latter may be operated by the former, and a setting device consisting of a shaft having a turning head and a pinion to engage a gear on the hour-shaft, by which both the time mechanism and time-indicator mechanism may be set in unison, substantially as specified.

6. The combination, in a hand-stamp, of the shaft E, sleeved day or type wheel I, ratchet-wheel M, and a self-adjusting deer-foot pawl provided with an extension adapted to catch the said ratchet-wheel M when another pawl is being released therefrom.

412,901. CURTAIN-POLE. HERMAN J. SCHRADER, Poughkeepsie, N. Y. Filed Oct. 24, 1888. Serial No. 289,081. (No model.)



Claim.—1. A hollow slotted curtain-pole, in combination with an interior roller, a shade attached to the roller and passing through the slot of the pole, and a series of slotted rings hung upon the pole for the purpose of conveniently attaching a curtain and allowing the shade to pass through the slots of the rings, as described.

2. A shade and curtain fixture consisting of a hollow slotted curtain-pole, a spring-roller within the pole, a shade supported on the roller and passing through the slot of the pole, and a series of slotted rings having their opening directly below the slot of the pole, so as to support a curtain without hindering the passage of the shade C from the interior of the pole A, substantially as set forth.

3. A hollow slotted curtain-pole, in combination with a roller B, the removable end blocks F, supported within the curtain-pole, the shade C, attached to the roller B, and the slotted rings E, having their openings below the slot of the pole for the passage of the shade C, substantially as described.

4. A combined curtain-pole and shade-roller, consisting of a hollow slotted pole, a spring-roller B, contained within the pole and working in bearings of the end blocks F, the shade C, supported on the roller B, the curtain D, the end blocks F, the slotted curtain-rings E, for supporting the curtain D and allowing the shade C to pass downward from the slot through the rings, and the brackets G for holding the pole in position, all arranged as and for the purpose specified.

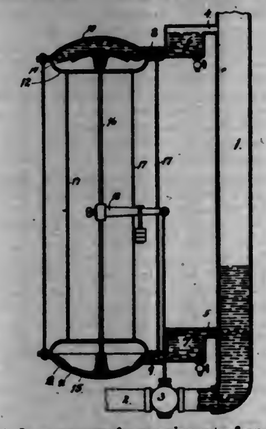
412,902. TIME-STAMP. CHARLES H. SHAW, Brooklyn, N. Y. Filed Feb. 24, 1888. Serial No. 265,213. (No model.)

Claim.—1. In a time-stamp, the combination, with time mechanism, of an endless traveling band moved substantially continuous by said time mechanism and bearing letters, figures, or characters to indicate the time of day, substantially as specified.

2. In a time-stamp, the combination, with time mechanism, of a wheel rotated thereby and making a complete rotation every twelve hours and an endless band bearing letters, figures, or characters to indicate the time of day, moved by said wheel, of such length that it will make one substantially continuous and complete traverse every twenty-four hours, substantially as specified.

3. In a time-stamp, the combination, with a stamp for indicating divisions of time greater than parts of a day, of time mechanism, an endless traveling band moved substantially continuous by said time mechanism and bearing letters, figures, or characters to indicate the time of day, and a fixed indicator or pointer adjacent to said traveling band, substantially as specified.

4. In a time-stamp, the combination, with a base-piece upon which the stamp is supported, of a sliding piece hinged to said base-piece, a support for the sliding piece, and an inking-pad below said sliding piece, substantially as and for the purpose specified.

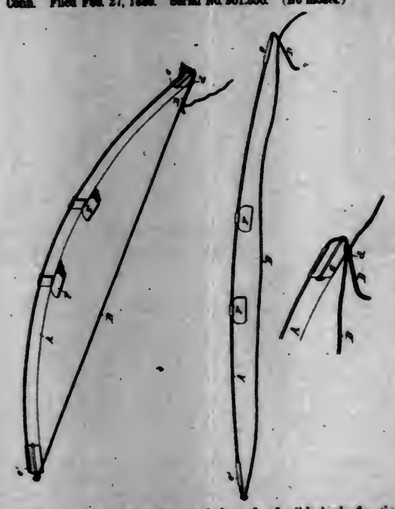


5. The combination, with a time mechanism, of an endless band having a twenty-four-hour movement requiring one traverse of said band, said band being provided with printing-characters indicating the divisions M., A. M., and P. M and divisions indicating hours and fractions thereof, substantially as specified.

6. In a time-stamp, the combination of an endless band having printing-characters thereon moved by time mechanism and a hand-stamp having printing-characters thereon, the said endless band and hand-stamp having a common yielding support, substantially as specified.

7. In a time-stamp, the combination of an endless band moved by time mechanism and having printing-characters thereon, and a hand-stamp having printing-characters, the said endless band and hand-stamp being mounted on a common support, substantially as specified.

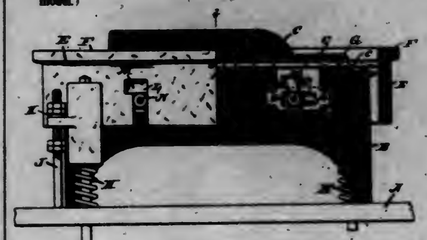
8. In a time-stamp, an endless movable band having an extended printing portion indicating hours of the day and fractions thereof, substantially as specified.



412,908. STEAM-TRAP. WILLIAM P. THOMPSON and ROBERT P. THOMPSON, Philadelphia, Pa. Filed Apr. 3, 1888. Serial No. 268,532. (No model.)

Claim.—1. In an apparatus for removing water from steam pipes, the combination of the connected diaphragms 12 and 13, placed and connected in fluid communication at different levels with the pipe 1 to be drained, with a valve controlling the discharge of water from the pipe 1, substantially as described.

2. In an apparatus for draining condensed water from steam-pipes, the combination of connected diaphragms presenting surfaces to pressure from fluid at different points in height of the vessels to be drained, with a valve controlling the water-discharging or steam pumping apparatus, substantially as set forth.



412,904. FLEXIBLE RULER. BENJAMIN H. TOQUET, Westport, Conn. Filed Feb. 27, 1889. Serial No. 301,350. (No model.)

Claim.—1. A flexible ruler consisting of a flexible body forming the ruler proper and a flexible cord secured to one end of the said flexible body, which has at the other end gripping-jaws consisting of a double wire with an eye for the passage of the cord, all substantially as set forth.

2. A flexible ruler consisting of a flexible body forming the ruler proper and a flexible cord connected to one end of said flexible body, which has at the other end jaws for the cord and a foot-piece or foot-pieces upon the body, all substantially as and for the purpose set forth.

412,905. METAL-FOUNDING APPARATUS. GEORGE W. VAN TINE, Elizabeth, N. J. Filed Jan. 4, 1889. Serial No. 295,412. (No model.)

Claim.—1. In metal-founding apparatus, the combination, substantially as set forth, of a table for the support of the pattern, a sand-box surrounding the same and adapted for vertical motion with reference thereto, springs supporting the sand-box, a stripping-plate fitting the sand-box and pattern and supported normally by said table, and a latchment adapted for uniting the stripping-plate to the sand-box.

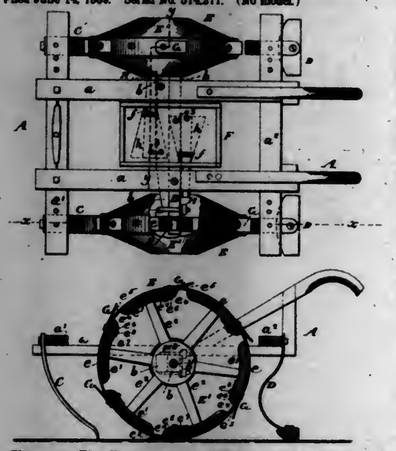
2. In metal-founding apparatus, the combination, substantially as set forth, of a table for the support of the pattern and provided with upwardly-projecting pins, a sand box surrounding the table and fitted for vertical motion with reference thereto, springs supporting the sand-box, a stripping-plate fitting the sand-box and pattern and supported normally by the pins on the table, and a latchment adapted for uniting the stripping-plate to the sand-box.

3. In metal-founding apparatus, the combination, substantially as set forth, of a table for the support of the pattern, a sand-box surrounding the same and adapted for vertical motion with reference thereto and provided with upwardly-presenting shoulders adapted to be engaged by rollers, springs for supporting the sand-box, a stripping-plate fitting the sand-box and pattern, rollers attached to the stripping-plate and arranged for horizontal movement with reference thereto and adapted to engage the before-mentioned shoulders of the sand-box, springs urging said rollers in the direction to engage said shoulders, and lugs upon the table arranged to move said rollers out of engagement with the shoulders.

4. In metal-founding apparatus, the combination, substantially as set forth, of a table for the support of the pattern, a sand-box surrounding the same and adapted for vertical motion with reference thereto and provided with horizontal shoulders adapted to be engaged by rollers, springs for supporting the sand-box, a stripping-plate fitting the sand-box and pattern and supported normally by said table, hangers projecting from the stripping-plate and provided with rollers, springs urging said rollers in the direction to engage the before-mentioned horizontal shoulders of the sand-box, bolts projecting from the roller-blocks, and lugs upon the pattern-table adapted to engage said bolts and urge the rollers out of engagement with said shoulders.

5. In metal-founding apparatus, the combination, substantially as set forth, of a table for the support of the pattern, a sand-box surrounding the same and adapted for vertical motion with reference thereto, springs for supporting the sand-box, stops for limiting the vertical motion of the sand-box, a stripping-plate fitting the sand-box and pattern and supported normally by said table, and a latchment adapted for uniting the stripping-plate to the sand-box.

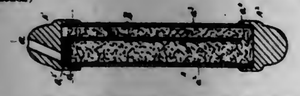
412,906. POCKET-FASTENER. BEDFORD WOODFORD, Chelsea, London, England. Filed Apr. 20, 1889. Serial No. 308,123. (No model.)



Claim.—1. In a pocket-fastener, the combination, with the back plate A and the front plate A', of the bowed plate c, secured to the front plate, the frame A^2, secured behind the back plate, and the locking-hook pivoted to said frame and adapted to engage with the front plate, substantially as set forth.

2. In a pocket-fastener, the combination, with the back plate A and the front plate A', of the frame A^2, secured behind the back plate, and the locking-hook pivoted to said frame at its lower end and pro-

vided with a rearward projection *b'* at its upper end adapted to press against the body of the wearer and give warning when the pocket is being opened, substantially as set forth.

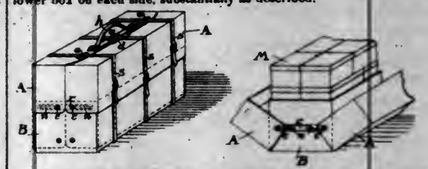


412,907. SEED-PLANTER. JAMES E. ATKINS, Mayesville, S. C. Filed June 14, 1889. Serial No. 314,271. (No model.)

Claim.—1. The distributing-wheel E, formed of the tire *e*, fellies *e'*, spokes *e²*, and hub *e³*, the fellies being cut out to form cups *e⁴*, the tires being provided with a hole *e⁵* under each cup, and an angle-plate *e⁶* being arranged over each tire-hole, substantially as shown and described.

2. The dropping-wheel of a planter, provided with a hole *e⁵* in the tire, a seed-cup *e⁴* in the fellies, and an adjustable angle-plate *e⁶*, all constructed and arranged substantially as shown and described.

412,908. INHALER. GEORGE W. BURGE, Detroit, Mich., assignor to George H. Nelson, same place. Filed Jan. 11, 1889. Serial No. 296,050. (No model.)



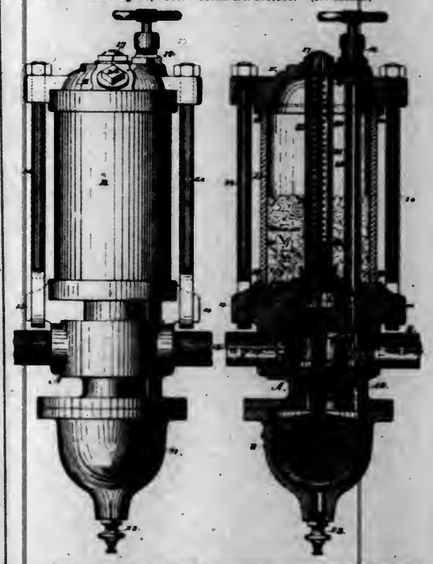
Claim.—1. In combination, a casing provided with an air-inlet and an air-outlet opening, a deflecting-partition within the casing projecting between said air inlet and outlet openings, and a combined nozzle and cap fitted to the air-outlet end of the casing, the base of the nozzle-cap within the casing having an engagement with the deflecting-partition to close the opening through the nozzle, and the base of the nozzle-cap exterior to the casing having an engagement with the casing to close the air-inlet opening, substantially as set forth.

2. In combination, a casing having an air-inlet and an air-outlet opening, a partition between said openings, a plug to close an opening in the partition at the air-outlet opening of the casing, and a combined cap and nozzle fitted to the end of the casing and having an engagement at its base with the plug and with the casing about the air-inlet opening, whereby the said openings may be simultaneously closed, substantially as set forth.

3. In combination, a casing having an air-inlet and an air-outlet opening, a partition between said openings, and a combined cap and nozzle, the opening in the nozzle being oblique to the axis of the nozzle, the base of the cap-nozzle having an engagement with the partition and with the casing about the air-inlet opening, whereby the lower end of the nozzle-opening may be swung over the air-outlet in the casing to afford a free passage of air, and over the partition to shut off the passage of air, substantially as set forth.

412,909. TELESCOPE BAG. JACOB W. BEYER, Schenectady, N. Y. Filed July 19, 1889. Serial No. 317,997. (No model.)

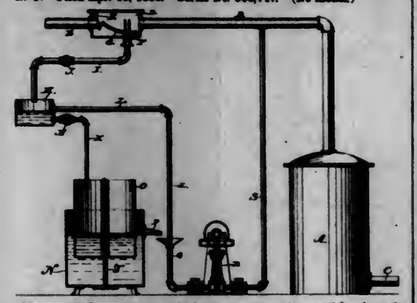
Claim.—1. A telescope bag composed of a lower oblong-shaped box open at the top, with a larger oblong-shaped box open at the bottom passing partly over the smaller box, the said upper box being divided laterally into two sections connected near the lower part of each end by means of pins passing through the ends near the adjacent edges into a longitudinal slot in a connecting-bar, said upper portion capable of being separated and opened by passing off from the lower box on each side, substantially as described.



2. A telescope bag composed of a lower oblong-shaped box open at the top, with a larger oblong-shaped box open at the bottom passing partly over the smaller box, the said upper box being divided laterally into two sections connected near the lower part of each end by means of pins passing through the ends near the adjacent edges into a longitudinal slot in a connecting-bar, the edge of one of the sections of the top overlapping the adjacent edge of the other section, substantially as described.

3. A telescope bag composed of a lower oblong-shaped box open at the top, with a larger oblong-shaped box open at the bottom passing partly over the smaller box, the said upper box being divided laterally into two sections connected near the lower part of each end by means of pins passing through the ends near the adjacent edges into a longitudinal slot in a connecting-bar, the adjoining edge of the top of one section overlapping and resting upon the edge of the other section, the said overlapping edge passing into a clasp composed of a metallic plate provided with two parallel horizontal surfaces attached to the section opposite the overlapping edge, with a handle attached to the upper portion of the bag, all substantially as described.

4. A telescope bag composed of a lower oblong-shaped box open at the top, with a larger oblong-shaped box open at the bottom passing partly over the smaller box, the said upper box being divided laterally into two sections connected near the lower part of each end by means of pins passing through the ends near the adjacent edges into a longitudinal slot in a connecting-bar, with the straps passing around both upper and lower parts of the bag, substantially as described.



412,910. AUTOMATIC FEEDER. JAMES H. RENWICK, Albany, N. Y. Filed May 26, 1888. Serial No. 275,169. (No model.)

Claim.—1. In an automatic coagulating and pressure-reducing attachment for water-purifying apparatus, the combination of a valve-casing having a cylindrical valve-chamber and provided with inlet and outlet water-passages, which communicate through corresponding induction and eduction ports with said valve-chamber, said inlet water-passage having constantly-open branch passages—one leading into a coagulant-chamber and the other into a chamber beneath the lower open end of said valve-chamber—a water-controlling valve fitted to reciprocate freely in said valve-chamber, a coagulant-chamber that is connected to the inlet water-opening by a pipe having a shut-off valve, and a spring-actuated valve that is contained in said coagulant-chamber and is fitted to close the opening between said chamber and the valve-chamber, the lower end of said spring-actuated valve lying in the path of motion of said water-controlling valve, as and for the purpose herein specified.

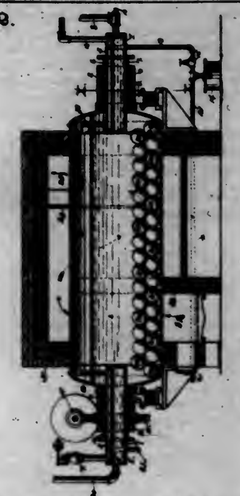
2. An attachment for automatically controlling the supply of liquid coagulant fed into a water-purifying apparatus, the same consisting of a valve-chamber, which contains an automatic water-controlling valve, and a coagulant-chamber provided with an opening which leads into said valve-chamber, and with a spring-actuated valve, which is fitted to close said opening, and which extends downward into said valve-chamber, said water-controlling valve being actuated by the water-pressure, and said spring-actuated valve being governed by the movement of the water-controlling valve, as and for the purpose herein specified.

412,911. COAGULANT-FEEDER. JAMES H. RENWICK, Albany, N. Y. Filed Apr. 10, 1888. Serial No. 270,747. (No model.)

Claim.—1. In a water-purifying apparatus, the combination of a filter whose supply-pipe is provided with an automatic inlet-valve which is connected to an outlet-valve that controls a discharge-opening from said supply-pipe into a discharge-pipe which branches therefrom, said inlet and outlet valves being fitted to move coincidently in their opening and closing movements, a tank arranged to receive the water from said branch discharge-pipe and provided with a drip-pipe and outlet-pipe, a coagulant-tank provided with an outlet-spout and containing an open-top float, said float being adapted to receive the water that trickles from said drip-pipe, and a pump connected so as to force the coagulant emitted from said coagulant-tank into said supply-pipe, as and for the purpose herein specified.

2. In a water-purifying apparatus, a supply-pipe provided with an inlet-valve adapted to be opened by the force of the water-current which passes through said pipe, said inlet-valve being connected to and fitted to move coincidently with an outlet-valve which controls the discharge of water from a pipe which branches from said supply-pipe, as and for the purpose herein specified.

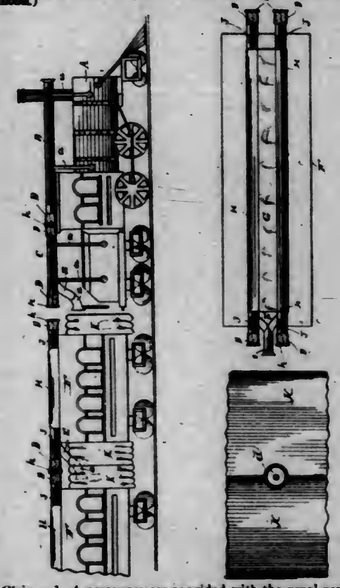
412,912. APPARATUS FOR HEATING AND PURIFYING FEED-WATER. JAMES H. RENWICK, Albany, N. Y. Filed May 15, 1888. Serial No. 310,794. (No model.)



Claim.—1. In an apparatus for heating and purifying feed-water for steam-boilers, a revolving heater containing a series of balls or rollers and provided with inlet and outlet water-pipes, said heater being fitted to rotate over the fire of a furnace, as and for the purpose herein specified.

2. The combination, with a steam engine and boiler, of a water-feeding device, a heater in which the feed-water is primarily heated by the exhaust-steam from said engine, a revolving reheater which is exposed to the action of a fire, and a filter fixed between said reheater and boiler, as and for the purpose herein specified.

3. The combination, with a steam engine and boiler, of a water-feeding device, a heater in which the feed-water is primarily heated by the exhaust-steam from said engine, a revolving reheater containing a series of balls or rollers and exposed to the action of a fire, and



412,912.

a filter fixed between said reheater and boiler, as and for the purpose herein specified.

412,913. CAR-VENTILATION. H. PARMLY BROWN, Flushing, N. Y. Filed Feb. 16, 1884. Renewed Apr. 6, 1889. Serial No. 306,259. (No model.)

Claim.—1. A passenger-car provided with the usual ventilating-roof, in combination with the inclosing-pieces H, whereby air-ducts are formed at the sides of said roof, the pipes J and branch pipes E E e, connecting with said air-ducts, and means whereby pure air is supplied to said air-ducts, substantially as set forth.

2. The ventilating air-duct having a flexible end consisting of canvas or like material, a spiral spring, and a stiffening-ring, substantially as and for the purpose set forth.

412,914. BAND-SECURING MECHANISM FOR GRAIN-BINDERS. JOHN S. DAVIS, Toledo, assignor to Adam E. Sumner, Cleveland, Ohio. Filed Aug. 7, 1888. Serial No. 282,003. (Model.)

Claim.—1. The combination of the knotter-shaft, a knotter-head

having a reduced neck formed on the end of the shaft, and a bill-hook pivoted upon one side of the shaft and vibrating in a plane parallel to the axis thereof and at a right angle to a radial line therefrom, its outer curved end when closed lying over the neck and gradually merging into the plane of the end of the knotter-head, substantially as and for the purpose hereinbefore set forth.

2. The combination of a knotter-head having a reduced neck formed on the end of the knotter-shaft, a bill-hook pivoted upon one side of the shaft and vibrating in a plane parallel to its axis and at a right angle to a radial line therefrom, with a bar reciprocating longitudinally in a groove in the shaft and provided with two lugs which embrace the curved tail of the bill-hook, substantially as and for the purpose hereinbefore set forth.

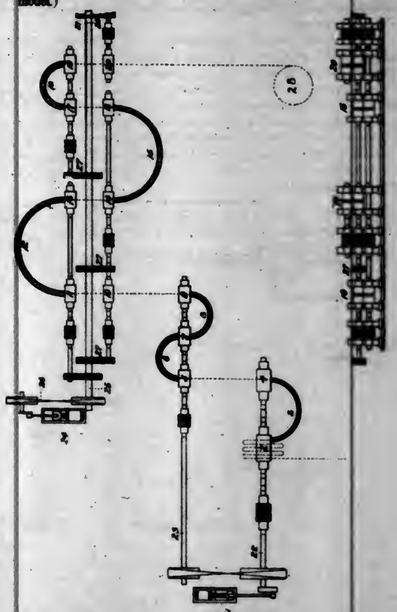
3. The combination of a knotter-head having a reduced neck formed upon the end of the knotter-shaft, a bill-hook pivoted upon one side of the shaft, and push-fingers reciprocating in longitudinal grooves in the shaft, one of them being provided with lugs which embrace the curved tail of the bill-hook to vibrate it when the fingers are reciprocated, substantially as and for the purpose hereinbefore set forth.

4. The combination of a knotter-head having a reduced neck formed upon the end of the knotter-shaft, a bill-hook pivoted to one side of the shaft, push-fingers reciprocating in grooves in the shaft, one of said fingers controlling the movement of the bill-hook, and a sliding collar on the shaft, to which the push-fingers are attached, substantially as and for the purpose hereinbefore set forth.

5. The combination of the knotter-shaft, the vibrating bill-hook, reciprocating push-fingers, a sliding collar to which said push-fingers are attached, a spring for moving said collar outwardly to open the bill-hook, with means for retracting said collar against the stress of the spring and holding the bill-hook closed positively across the neck of the knotter during the tying operation, substantially as described.

6. The combination of a revolving knotter-shaft, a pivoted bill-hook and reciprocating push-fingers mounted thereon, a sliding collar to which the push-fingers are attached, a fixed bearing in which the shaft revolves provided with projecting flanges, and a lug on the reciprocating collar which takes in the space between the flanges in the bearings when the collar is thrust outwardly and the bill-hook opened to positively lock the shaft against rotation until the collar is retracted and the hook closed, substantially as described.

7. The combination of a knotter-shaft, a bill-hook and reciprocating push-finger mounted on said shaft and actuated by a sliding collar which also locks the shaft against rotation, a looping-hook also controlled by a sliding collar on the shaft, and a spiral spring wound round the shaft and bearing against both collars, with means for retracting the first-mentioned collar to close the bill-hook, unlock the shaft, and put the spring under compression, substantially as and for the purpose hereinbefore set forth.



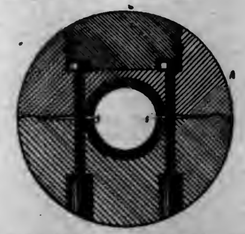
8. The combination of a knotter-shaft, a bill-hook mounted thereon, a sliding collar provided with means for actuating the bill-hook and locking the knotter-shaft, substantially as described, a sliding plate having a forked projection which embraces the collar and bears against a flange thereon, a link-rod connecting the plate to a lever, and a master-wheel provided with a cam-ledge which bears against the lever to vibrate it on its pivot and retract the sliding collar on the shaft, substantially as and for the purpose described.

9. The combination of a knotter-shaft, a bill-hook, and push-finger positively controlled by a sliding collar, a sliding plate for retracting said collar, and a link-rod connecting said plate with a positively-actuated lever, with a spring or block of elastic material interposed between the link and the sliding plate, substantially as and for the purpose hereinbefore described.

10. The combination of a knotter-shaft and the pinion attached thereto and a bill-hook mounted thereon, a sliding collar provided with means, substantially as described, for locking the shaft against rotation, a master-wheel provided with a cam for actuating the collar through suitable means, and also a sector-gear which engages the pinion, substantially as and for the purpose hereinbefore described.

11. The combination of a knotter-shaft, a reciprocating looping-hook mounted thereon and controlled by a sliding collar, and a spring normally bearing with slight pressure against said collar, with cams, substantially as described, which give the spring its greatest compression when the hook is projected to catch the loop and then relieve it almost wholly of pressure after the hook is retracted, substantially as and for the purpose hereinbefore described.

412,915. ROD-ROLLING MILL. ANDREW J. DAY and HENRY ROBERTS, Pittsburg, Pa. Filed June 6, 1889. Serial No. 313,170. (No model.)

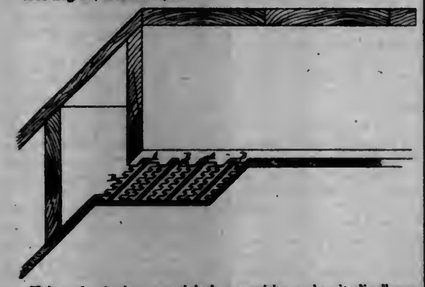


Claim.—1. In a rod-rolling-mill plant, rolls arranged in two or more adjacent series—such as the series of rolls 10 and 11, 13 and 14, 16 and 17, and 19 and 20—connected by repeaters, the grooves of the delivery-rolls of each series being shaped to impart a substantially square or round section to the rod, and the last pair in order of the rolls forming a finishing pass for the rod, substantially as and for the purposes described.

2. In a rod-rolling-mill plant, rolls arranged in two or more adjacent series—such as the series of rolls 10 and 11, 13 and 14, 16 and 17, and 19 and 20—roughing-rolls, and two or more intermediate sets of rolls—such as the rolls 4, 5, 7, and 9—substantially as and for the purposes described.

3. In a rod-rolling-mill plant, rolls arranged in two or more adjacent series—such as the series of rolls 10 and 11, 13 and 14, 16 and 17, and 19 and 20—connected by repeaters, the grooves of the delivery-rolls of each series being shaped to impart a substantially square or round section to the rod, and the last pair in order of the rolls forming a finishing pass for the rod, roughing-rolls, and two or more intermediate sets of rolls—such as the rolls 4, 5, 7, and 9—substantially as and for the purposes described.

412,916. PULLEY. WALLACE H. DODGE, Mishawaka, Ind. Filed June 5, 1889. Serial No. 313,154. (No model.)

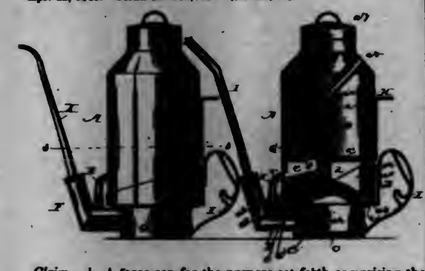


Claim.—1. A solid pulley separable on a line substantially in the plane of the axis, provided with clamping-bolts transverse to said line of separation, and one or more removable sections *b* to cover and conceal the nuts of said clamping-bolts, said sections *b* having such boundary-lines that they may be keyed in place by fastenings inserted from the ends, combined with the fastening-pins *d*, substantially as set forth.

2. A solid pulley separable on a line in the plane of the axis, or thereabout, having the opposing surfaces slightly separated, except near the periphery, clamping-bolts transverse to said line of separation, one or more removable sections of the periphery to cover and conceal said bolts, and removable fastenings inserted in the ends to retain said sections, substantially as set forth.

3. The pulley A, divided substantially in the plane of the axis, with its opposing surfaces slightly out of contact, except near the periphery, provided with one or more removable pieces *b* and dowel-keys *d*, the direction of the boundaries of said piece *b* being such that it cannot move from its place when said key is in place, substantially as set forth.

4. A pulley A, provided with a removable peripheral section *b* and retaining-keys *d*, inserted from the end, substantially as set forth.

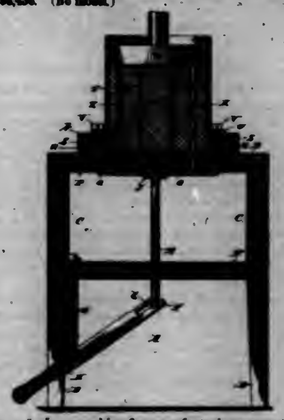


412,917. METAL LATH. GEORGE M. EDWARDS, London, England. Filed May 14, 1888. Serial No. 273,862. (No model.) Patented in England Aug. 27, 1883. No. 4,127.

Claim.—1. A sheet-metal lath comprising a longitudinally-extending projecting rib having a flat attaching-web, and laterally-extending notched flanges extending in a plane different from that of the attaching-web but parallel therewith, substantially as set forth.

2. A metallic lath, having a longitudinally-extending dovetailed projecting rib having a flat attaching-web, and laterally-extending notched flanges extending in a different plane from that of the attaching-web but parallel therewith, substantially as set forth.

412,918. FORCE-CAN. EMANUEL H. REITEMAN, Pullman, Ill. Filed Apr. 12, 1889. Serial No. 307,066. (No model.)



Claim.—1. A force-can for the purpose set forth comprising the reservoir-chamber *a*, the ejecting-chamber c^1, the chamber a^2, intervening between said two chambers, the flexible diaphragm B, arranged to normally rise within said intervening chamber, the vertically-sliding piston arranged to bear upon the flexible diaphragm, a thumb-slide for operating the piston, a valved passage leading from the reservoir-chamber to the ejecting-chamber, and a spout connected with the ejecting-chamber by a lateral passage, said members being combined and organized for operation, substantially as set forth.

2. The combination, with the can provided with an ejecting-chamber, a flexible diaphragm, and a piston, for the purpose set forth, of the spout connected with the ejecting-chamber and having a widened discharge end *l*, provided with a set of spray-regulating devices M, each consisting of a conical tube *m*, having an inlet *m'*, and containing a screw m^2, arranged so that its head can be set with reference to the larger outer end of the tube, substantially as and for the purpose set forth.

3. The combination, substantially as hereinbefore set forth, of the body of the can containing a reservoir-chamber, the cap C, provided with a spout and an ejecting-chamber and detachably applied to the body of the can, the piston and flexible diaphragm for forcing liquid from the ejecting-chamber, and a valved passage connecting the reservoir-chamber with the said cap and consisting of the tube E and a coupling for detachably connecting said tube with the cap, for the purpose described.

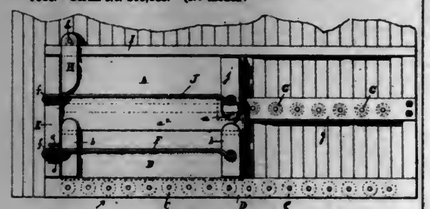
412,919. MACHINE FOR MANUFACTURING CONVERTER-BOTTOMS. WILLIAM L. GROFF, Steelton, Pa. Filed Feb. 2, 1889. Serial No. 298,436. (No model.)

Claim.—1. In a machine for manufacturing converter-bottoms in a single piece, the combination of a suitable frame, a ring or head secured detachably to the upper bed-plate of said frame, and the mold having a flange, whereby it is attached to the said ring, substantially as set forth.

2. In a machine for manufacturing converter-bottoms in a single piece, the combination, with a suitable frame, of a ring or head secured detachably to the upper bed-plate of said frame, the inner side of said ring being beveled, as herein described, and a mold provided with a flange, whereby it is connected to the said ring by means of set-screws, substantially as and for the purpose set forth.

3. In a machine for manufacturing converter-bottoms in a single piece, the combination of the frame, a ring having a beveled inner side and secured detachably to the upper bed-plate of said frame, a series of stems sliding vertically in the latter and through a sheet-metal plate interposed between the said ring and the upper bed-plate, a mold secured detachably to the said ring, and a follower arranged to slide in the said mold, substantially as and for the purpose set forth.

4. In a machine for manufacturing converter-bottoms in a single piece, the combination of the frame, a ring having a beveled inner side and secured detachably to the upper bed-plate of said frame, a sheet-metal plate interposed between said bed-plate and ring and secured detachably to the latter, a mold secured detachably to the ring, the vertically-sliding stems, and the follower sliding within the mold, substantially as set forth.

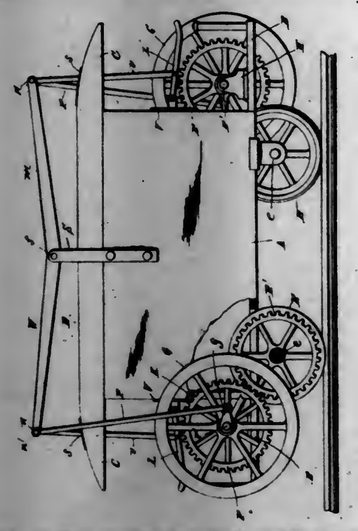


412,920. DENTAL ENGINE. JOHN HOOD and STEPHEN H. REYNOLDS, Boston, Mass. Filed Dec. 19, 1888. Serial No. 294,060. (No model.)

Claim.—1. In an arm for dental engines, the flexible coupling B, provided with coupling-pieces at each end, in combination with their connected shafts A and A', screwed into said coupling-pieces, and set-screws, whereby said shafts are firmly fastened thereto, substantially as shown and described.

2. As an improvement in arms for dental engines, the shafts A A' the flexible coupling B, and case F, consisting of the coiled spring *d* and an outer covering, in combination with ferrules *e e* and set-screws *d' d'*, all arranged substantially as and for the purpose set forth.

412,921. DOOR. DANIEL W. HOWARD, Cain, Kans. Filed Dec. 10, 1888. Serial No. 293,085. (No model.)



Claim.—1. The combination, in a car, of the lower and upper guide-rails and the intermediate short guide-rail with a door composed of two independent parts, the lower part being supported and guided by the lower guide-rail and intermediate rail, and the upper part having a hanger engaging the upper guide-rail and supported on the intermediate rail, and the securing devices for said parts, all constructed substantially as specified.

2. The combination of a car having a bottom guide-rail and friction-rollers, and an intermediate short guide-rail and friction-rollers, with the door composed of independent parts A and B, part B being supported on the lower friction-rollers and guided by the intermediate rollers, and part A being supported and guided on the intermediate rollers and by a hanger on its upper front end, all substantially as and for the purpose specified.

3. The combination of the lower horizontal series of rollers C C, the intermediate horizontal series of rollers G G, the grooved block *a*, and the upper guide track-rail with a door composed of two parts A and B, part A being supported by the rollers G G and by a hanger engaging the guide track-rail, and part B being supported on rollers C and guided by rollers G, and the fastening devices for the door, all substantially as set forth.

412,922. HAND-POWER MOTOR FOR STREET-CARS. JAMES H. JOHNSON, Decatur, Ill. Filed June 20, 1889. Serial No. 314,067. (No model.)

Claim.—1. The hand-power mechanism for propelling cars, consisting of the lever-frame W, pivoted by its middle portion to standards projecting above the car-top, the driving-shafts, their fly-wheels, gear-wheels, and cranks, the gear-wheels of the carrying-axles, the vertical pitmen connecting the cranks of the driving-shafts to the lever-frame, and the operating-levers pivoted to plates secured to the car-frame and connected by rods to the ends of the lever-frame, substantially as specified.

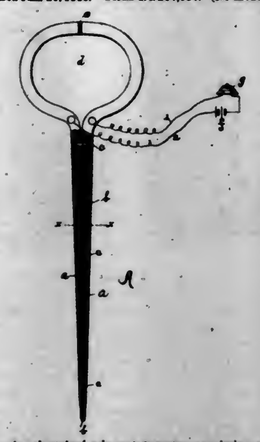
2. The combination, with the slotted end of a car, its top having fulcrum-standards projecting above its surface, and its platforms, of the lateral driving-shaft, their cranks, fly-wheels, and gear-wheels, the cogged wheels of the carrying-axles, the operating-levers at the ends of the car, the vibratory lever-frame above the car-top, and its connections to the cranks of the driving-shafts and the operating-levers, substantially as specified.

412,923. NECKTIE-FRAME. JOSEPH KAISER, San Francisco, Cal. Filed July 1, 1889. Serial No. 316,255. (No model.)

Claim.—1. A necktie-frame consisting of a plate having on its back center spaced parallel bars raised from the plate to permit the passage of the tie ends in opposite directions, substantially as described.

2. A necktie-frame consisting of a curved plate having on its back center the spaced parallel bars extending diagonally and raised from the plate to permit the smooth folding of the tie ends and their passage in opposite directions, substantially as described.

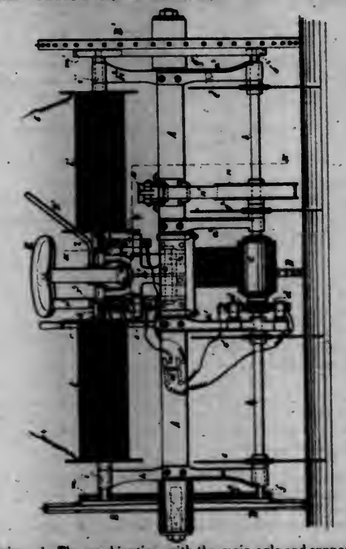
3. A necktie-frame consisting of a curved plate having an enlarged center and spaced parallel bars on the back of said center and raised therefrom to permit the passage of the tie ends in opposite directions, substantially as described.



4. The necktie-frame consisting of a curved plate having on its back center the spaced parallel bars raised from the plate to permit the passage of the tie ends in opposite directions, and the tongues D on the back of said plate, for holding the tie, substantially as described.

5. A necktie-frame consisting of a plate having on its back center the spaced parallel bars raised from the plate to permit the passage of the tie ends in opposite directions, and the spring-hook E, secured to one end of the plate for attaching it to the collar-button and having a coil *e*, substantially as described.

6. A necktie-frame consisting of the plate having on its back center the spaced parallel bars raised from the plate to permit the passage of the tie ends in opposite directions, the spring-hook attached to the end of the plate to attach it to the collar-button, and the spring-arms C, attached to the plate center for holding the frame in place, substantially as described.



7. A necktie-frame consisting of the plate having on its back center the spaced parallel bars raised from the plate to permit the passage of the tie ends, the tongues D on the back of the plate, for holding the tie, and the spring-hook E, for attaching the plate to the collar-button, said hook having a coil *e* at its plate end, serving with the tongues to hold the tie, substantially as described.

412,924. ELECTRICAL METAL-DETECTOR. JAMES F. KISTER, Terre Haute, Ind., assignor of one-fourth to Owen R. Duffy, Washington, D. C. Filed Jan. 29, 1889. Serial No. 297,957. (No model.)

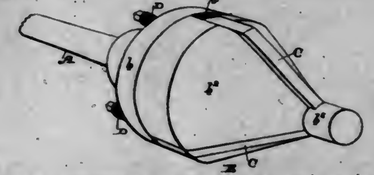
Claim.—An electrical mineral-detector consisting of a solid elongated tapering blade composed of a pair of metal strips riveted securely together throughout their length and having their upper ends extended to form a handle, said strips and extended ends being insulated from each other and the rivets insulated from the strips, the edges of the strips projecting beyond the insulating material, so that a circuit can be closed between the same, said strips adapted to form the terminals of a normally-open circuit, including an indicator, substantially as described.

412,925. ELECTRICALLY-OPERATED ICE-CUTTING MACHINE. FRANK R. KINSMAN, Plainfield, N. J. Filed Nov. 2, 1888. Renewed Sept. 7, 1889. Serial No. 323,232. (No model.)

Claim.—1. The combination, with the main axle and supporting-wheels, of a shaft and saws on such shaft, and an electric motor for rotating the shaft and saws, and gearing connecting the shaft and the supporting-wheels, substantially as specified.

2. The combination, with the main axle and supporting-wheels, of a shaft and gang of saws, and electric motor for rotating said shaft and saws, and pinions upon the ends of the saw-shaft, and toothed rings upon the main wheels meshing with each other for revolving the main wheels, substantially as specified.

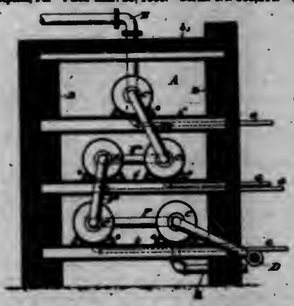
3. The combination, with the main axle and supporting-wheels, of hangers connected to the main axle and extending downwardly and provided at their ends with bearings, an electric motor supported from the main axle, the shaft of whose armature is extended at one or both ends and supported in the bearings of the hangers, saws forming a gang mounted upon the armature-shaft, arms extending above the main axle, shafts and drums or reels supported by said arms, electric conducting-wires 4 5, leading from a source of supply to and around said drums, and electric connections from said wires to the electric motor, substantially as set forth.



4. The combination, with the main axle and supporting-wheels and an electric motor *c*, supported by said axle, of the armature-shaft *b*, the gang of saws connected therewith, and bearings for said shaft the pinions *f f'*, the toothed rings *g g'*, connected to the main wheels the shafts *i i'* and supports for the same, the drums *l l'*, and the pinions *m m'*, whereby the rotation of the electrically-revolved shaft turns the main wheels and the electric-conductor drums, substantially as set forth.

5. The combination, with the main axle and supporting-wheels, of the electric motor and a switch, a gang of saws mounted upon the armature-shaft, a spine C, pivoted to the main axle, a steering-wheel and lever-handle, a lever and friction-wheel for stopping the armature-shaft, and a hand-lever for elevating the gang of saws by giving a partial rotation to the axle, substantially as set forth.

6. The combination, with the main axle and wheels, the electric motor, and the drums and the electric conducting-wire, of the insulated sleeves 6 7, the metal plates 8 9, the switch 10, and the conducting-wires connecting the insulated sleeves and the electric motor, and the gearing for connecting the drums to the supporting and propelling wheels, substantially as set forth.



412,926. ADJUSTABLE CONE-CENTER FOR LATHES. JOHN KINSEY, San Francisco, Cal. Filed June 7, 1889. Serial No. 313,516. (No model.)

Claim.—1. In a cone-center for lathes, the combination of a plate *b*, the conically-shaped piece b^3, bolted thereto and having radial grooves e in its periphery or face, said plate and piece being centrally perforated to receive the lathe-center, the movable jaws C, seated in said grooves and adapted to be projected from the periphery or face of the conically-shaped piece and retracted, and the screws D, seated in the plate and engaging the jaws, whereby they are operated, substantially as described

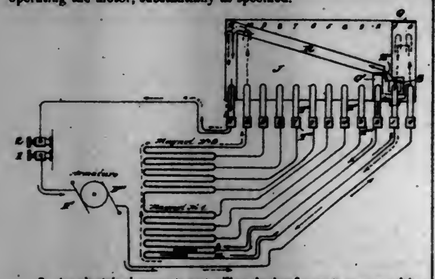
2. In a cone-center for lathes, the conically-shaped body thereof having a cylindrical point or extension b^3 and provided with grooves in radial planes, as described, in combination with the sliding jaws C, mounted in said grooves and having their forward ends guided by the cylindrical extension of the cone-shaped body, and the screws seated in said body and engaging the rear ends of the jaws for operating them, substantially as described.

412,927. FEED-WATER HEATER. FREDERICK D. LAPOINTE, Philadelphia, Pa. Filed Mar. 20, 1888. Serial No. 305,211. (No model.)

Claim.—1. A feed-water heater consisting of a number of drums arranged one above the other, pipes connecting said drums at their ends in a continuous series, said pipes being located above the bottoms of the drums, so that the lower portions of the latter shall serve as settling-chambers, a water-exit pipe leading from the last or uppermost drum of the series, and a water-supply pipe leading to the first or lowermost drum thereof, substantially as described.

2. A feed-water heater consisting of a number of drums arranged one above the other, pipes connecting said drums at their ends in a continuous series, said pipes being located above the bottoms of the drums, so that the lower portions of the latter shall serve as settling-chambers, a water-exit pipe leading from the last or uppermost drum of the series, and a water-supply pipe leading to the first or lowermost drum thereof, and blow-off pipes at the bottom of the several drums, substantially as described.

3. The combination, with the flue A, of cross-pieces or girders one above the other therein, saddles *c*, located upon said girders, and a series of drums supported in said saddles and connected end to end in a continuous series and provided with a water-supply pipe and a water-exit pipe, substantially as described.



4. A feed-water heater consisting of a number of drums located in pyramid arrangement within a heating-flue, a water-supply pipe connected to one of the lower drums and a water-exit pipe to the uppermost drum, and pipes connecting said drums in a continuous series, said pipes opening into the heads of the drums at substantially the center of said heads, substantially as described.

412,928. GOVERNOR OR REGULATOR FOR ELECTRIC MOTORS. RODERICK MACRAE, Baltimore, Md. Filed July 25, 1889. Serial No. 318,389. (No model.)

Claim.—1. The combination, with an electric motor, of a mechanical speed-governor, an oscillating current-controller connected with the speed-governor, and a counter oscillating spring adjustably connected with the current-controller, substantially as specified.

2. The combination, with an electric motor, of a mechanical speed-governor and an oscillatory current-controller having conducting and non-conducting surfaces at opposite ends, an intermediate diagonal or spiral conducting-surface, and contact-points electrically connected

with the main circuit at the extremities of the controller and with the several coils of the field-magnet, whereby variations of speed in the motor cause changes in the extent of the field-magnets employed in operating the motor, substantially as specified.

3. An electrical current-controlling device for motors, comprising a cylinder having mainly a non-conducting periphery provided with conducting-surfaces, of which one extends completely around the cylinder at one end, another extends spirally from the said complete surface to or near to the opposite end of the cylinder, where it is electrically connected with an insulated conducting-plate and surrounded, but disconnected electrically from a third conducting plate or surface, substantially as specified.

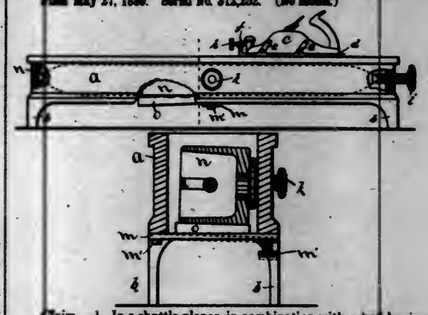
4. A current-controller for electric motors, comprising a cylinder having end peripheral conducting-surfaces, a spiral conducting-surface electrically connected with an electrically-separated conducting-surface surrounded by and electrically disconnected from an opposite terminal conducting-surface, and a series of contact-points arranged to bear upon the periphery of the cylinder and electrically connected with the field-magnets of the motor and with the main circuit thereof, substantially as specified.

5. A current-controller for electric motors, consisting of a cylinder of the character described, and electrically connected with the field-magnets, and mechanically connected with the speed-governor operated by the motor, a cam adjustably mounted for oscillation with the cylinder and connected by a chain with an adjustable counter oscillating spring, substantially as specified.

6. The combination, with an electric motor, of a current-controlling cylinder mounted in a frame arranged parallel with the field-magnets, and provided with devices for mechanically connecting the same with a speed-governor mounted on the armature-shaft of the motor, substantially as specified.

7. The combination, with an oscillatory current-controller, of a cam mounted for oscillation with said controller, means for adjusting the cam to and from the center of oscillation, a chain connected with and extending along said cam and connected with an adjustable spring, substantially as specified.

412,929. **AUTOMATIC LAMP-EXTINGUISHER.** LYMAN R. MELIUS, Copake Iron Works, assignor to himself, and JAMES M. HALSTED, New York, N. Y. Filed Dec. 27, 1888. Serial No. 295,108. (No model.)



Claim.—1. The combination, with a frame arranged to engage a wick-tube and provided with laterally-extending arms, of hood-sections pivotally connected to the frame and a weighted frame supported by the arms, substantially as described.

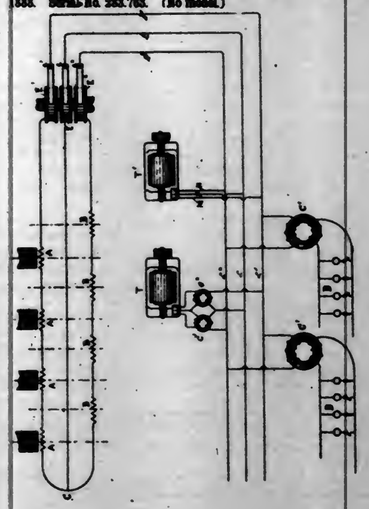
2. The combination, with a frame arranged to engage a wick-tube and provided with laterally-extending arms, of hood-sections pivotally connected to the frame and provided with laterally and outwardly extending lugs or ears, and a weighted frame supported by the laterally-extending arms of the hood-supporting frame, substantially as described.

3. The combination, with a sleeve 10, provided with arms 12 and with pivot-pins 13, the whole constituting a frame, of hood-sections 14, mounted upon the pivot-pins 13 and formed with lugs or ears 15 and 16, a frame made up of wires 17, bent as described, and weights 18, carried by said wires, said frame being mounted upon the arms 12, substantially as described.

4. The combination, with a frame arranged to engage a wick-tube and provided with laterally-extending arms, of hood-sections pivotally connected to the frame and a frame provided with downwardly-extending weighted arms, said frame being supported by the laterally-extending arms of the hood-carrying frame, substantially as described.

412,930. **SHUTTLE-PLANER.** JOHN M. HEWTON, Norwich, Conn. Filed May 27, 1889. Serial No. 312,252. (No model.)

Claim.—1. In a shuttle-planer, in combination with a bed having centers, as set forth, for supporting a shuttle, a cross-bar secured to the under side of said bed, and a wedge inserted between said bar and the shuttle, substantially as and for the purpose specified.



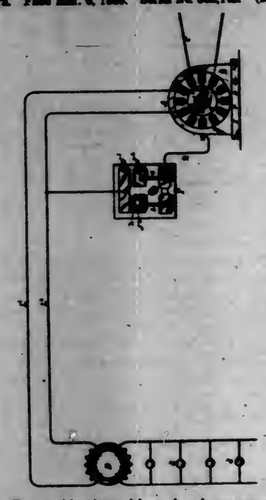
2. A bed having centers, as set forth, for supporting a shuttle, and a cross-bar attached to the under side of said bed and having one end vertically adjustable, as described, in combination with a wedge inserted between the said cross-bar and shuttle, substantially as and for the purpose specified.

412,931. **PROCESS OF PURIFYING ALCOHOL.** CARL M. PIEPENBROCK, London, County of Middlesex, England. Filed Aug. 4, 1888. Serial No. 281,969. (No specimens.)

Claim.—1. The herein-described process of purifying alcohol, which consists in diluting the same, then adding an oxidizing agent, then adding an alkaline solution, thereby setting up voltaic action between suitable voltaic elements immersed in the mixture, then adding a hydrocarbon, then heating the mixture and agitating the same, and then separating the pure alcohol by gravity.

2. The herein-described process of purifying alcohol, which consists in diluting the same, then adding an oxidizing agent, then adding an alkaline solution in presence of voltaic elements immersed in the mixture, thereby setting up voltaic action between said elements under the influence of the alkaline solution, and creating an electric current in the alcohol to be purified.

412,932. **SYSTEM OF DISTRIBUTION BY ALTERNATING ELECTRIC CURRENTS.** OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Aug. 26, 1888. Serial No. 283,763. (No model.)



Claim.—1. The combination of an alternating-current generator having armature-coils producing currents differing in phase and connected in series, translating devices connected across the extremities of these coils, and motor-circuits derived, respectively, from the portions of the winding included between the extremities and a point intermediate thereto.

2. The combination, with an alternating-current generator adapted to deliver two currents differing in phase, of translating devices deriving currents due to their resultant action and other translating devices deriving currents due to their independent action.

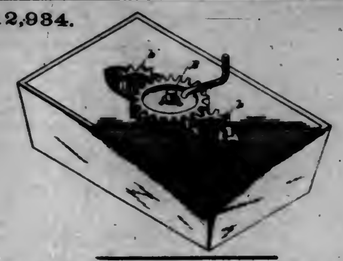
3. The combination of two sources of alternating electric currents of non-synchronous phases, a circuit in which said sources are connected in series, a conductor leading from a point in the circuit between said sources, translating devices connected in series with the two sources, and electrical devices connected in series with each of the respective sources.

412,933. **DISCHARGE DEVICE FOR DYNAMOS.** OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Mar. 6, 1889. Serial No. 302,142. (No model.)

Claim.—1. The combination, with an electric generator, of main-line conductors leading therefrom, a discharge-plate connected with one of the main-line conductors, and a discharge-plate electrically connected with the generator.

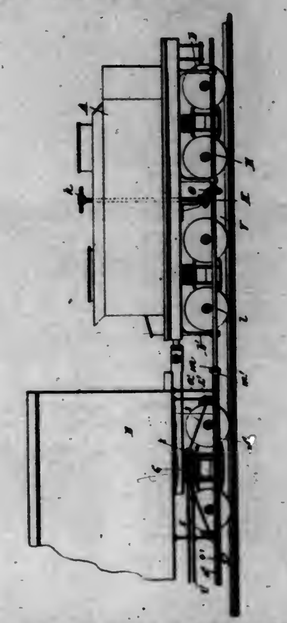
2. The combination, with the armature of an electric generator and its contact-brushes, of discharge-plates electrically connected with the armature-circuit and a discharge-plate directed toward the same, but insulated therefrom and electrically connected with the body of the armature, substantially as described.

3. The combination, with the armature of an electric generator and its circuit, of a discharge-plate connected with the circuit, a second discharge-plate directed toward but insulated from the same and electrically connected with the body of the armature, and a fusible strip in circuit with one of the plates, substantially as described.



4. The combination, with an electric generator, of a discharge-plate in proximity to the armature-circuit and electrically connected to the frame of the generator.

5. The combination, with the armature of an electric generator and its contact-brushes, of a discharge-plate electrically connected with the armature-circuit, a discharge-plate directed toward the same, but insulated therefrom and electrically connected with the body of the armature, a reserve discharge-plate directed toward a different portion of the first plate, and means for connecting it with the armature.



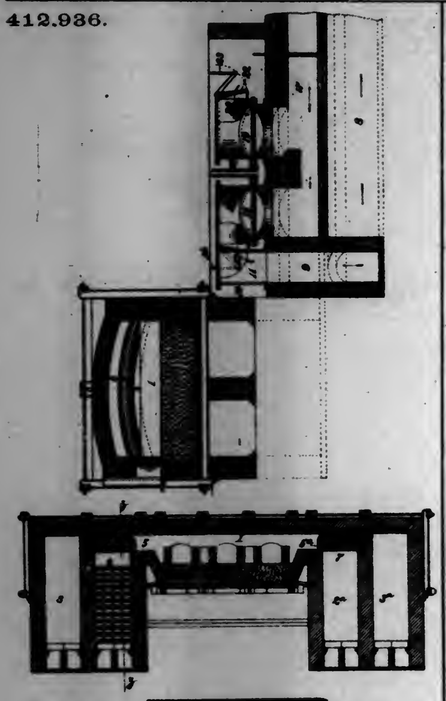
412,934. **CHURN.** WILLIAM H. SNOW, Middlebury, Ind. Filed Apr. 6, 1889. Serial No. 306,251. (No model.)

Claim.—The combination, with the rectangular body, of two elliptically-shaped dashers set at right angles to each other and arranged to rotate in opposite directions, and having an opening in each end of each dasher, one of such openings being provided with a rotary wheel, while the other is covered by a wire screen, and cog-wheels *b b* and B, connected to the dashers by proper shafting, all substantially as described, and for the purpose named.

412,934.

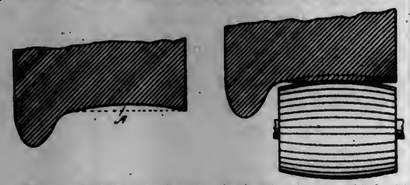
412,935. **CAR-BRAKE.** FRANK M. SHILEY, Goshen, Ind. Filed May 20, 1889. Serial No. 311,378. (No model.)

Claim.—1. In car-brake-operating mechanism, the sliding bar of the engine-tender having a worm-thread, and the internally-threaded pinion, the squared bearing, and the operating gear-wheel engaging said pinion, substantially as specified.



2. In car-brake mechanism, the combination, with the reciprocating operating-bar of the engine-tender, of the reciprocating longitudinal brake-bar under the car engaging the vertical brake-lever, the horizontal transverse lever of the truck connected to the brake-beams, its sliding connection with said vertical lever, the middle transverse lever of the car, its connection to said vertical lever, and its sliding connection to the transverse lever of the truck, substantially as specified.

3. The car-brake-operating mechanism, consisting of the worm-threaded bar of the tender and its operating-gear, the swinging longitudinal brake-bars under the cars abutting against each other in series, their vertical swinging levers, the transverse levers connected to the brake-beams, the transverse reversing-levers, and the sliding connection of said levers, substantially as specified.



412,936. **HEATING-FURNACE.** HENRY SWINDELL, Allegheny, Pa. Filed Apr. 2, 1889. Serial No. 305,876. (No model.)

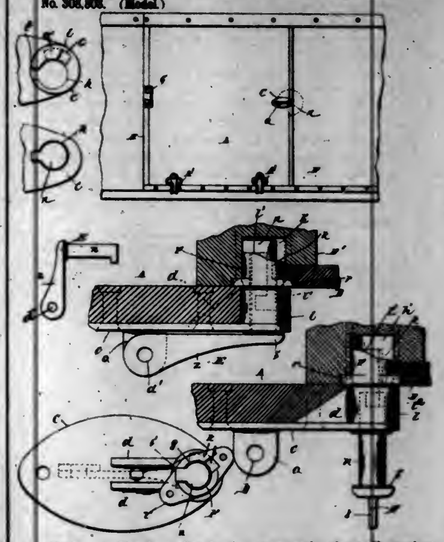
Claim.—In a furnace, the combination of a hearth having charging-doors on one side thereof, gas and air regenerative chambers arranged at opposite ends of the hearth, and flues connecting the hearth with said chambers, said flues being made of a width approximately equal to the width of the hearth and of a height greater at the front side of the furnace than at the opposite side, substantially as set forth.

412,936.

412,937. DRIVING-WHEEL. Charles E. Swinerton, New York, N. Y. Filed Jan. 31, 1889. Serial No. 298,309. (No model.)

Claim.—A driving-wheel having its bearing-face provided with facets concaved transversely to the tread of the wheel to approximately conform to the surface of the rail, substantially as set forth.

412,938. RAZOR-STROP. Lewis C. Tower, Rochester, N. Y., assignor to the Electric Cutlery Company, of New York. Filed Apr. 15, 1889. Serial No. 307,253. (No model.)

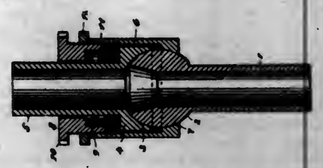


Claim.—1. In a strop, the combination, with the base or support having the flanges or ledges at the sides, of the thin elastic strip supported thereon at the ends only, the stropping-cushion on said strip, and the covering for the same fastened to the sides below said flanges, substantially as described.

2. In a strop, the combination, with the base or support having the flanges at the sides, of the thin elastic strip supported thereon at the ends only, and the stropping-cushion on the strip projecting over the flanges on the support, substantially as described.

3. In a strop, the combination, with the base or support having the flanges at the sides, of the strip, the stropping-cushion thereon, and the covering material for the cushion secured to the strip below the flanges on the support, substantially as described.

412,989. TIGHTENING AND FASTENING DEVICE FOR CAR-DOORS. John C. Wabbe, St. Louis, Mo. Filed Apr. 27, 1889. Serial No. 308,803. (Model.)

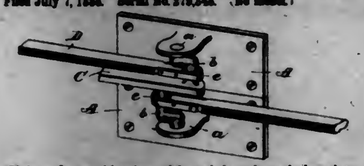


Claim.—1. The door-plate having at one end an inwardly-projecting slotted or notched barrel provided with an offset notch, in combination with a bevel-edged thimble secured to the door-jamb, and the fastening or tightening bolt having a lug engaging said barrel and thimble, substantially as set forth.

2. In a car-door fastening, the combination, with the door-plate having at one end a perforated stop-lug and at the other end an inwardly-projecting slotted or notched barrel, of the bevel-edged thimble bolted to the door-jamb, and the tightening-bolt having a lug on one end and the perforated handle on the other, substantially as specified.

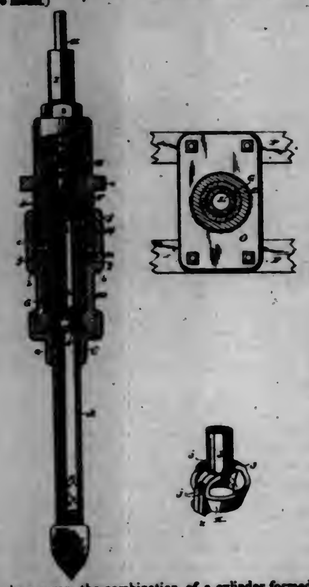
3. The car-door-tightening devices and fastening, consisting of the keeper-plate on the middle portion of the front jamb, the bevel-edged thimble on the middle portion of the rear jamb, the door-plate having the slotted or notched barrel and the perforated stop-lug, and the fastening or tightening bolt having a toe-lug engaging an angular notch or groove of the barrel of the door-plate, and a perforated lever-handle adapted to be locked or sealed to said stop-lug of the door-plate, substantially as specified.

412,940. BALL-AND-SOCKET PIPE-COUPLING. Thomas Aldcorn, New Durham, N. J. Filed June 15, 1889. Serial No. 314,329. (No model.)



Claim.—1. A pipe-coupling joint consisting of a casing with a bevel-edged opening at one end and a cylindrical screw-head at the other end, a pipe having a ball at its end resting within the bevel-edged opening, a pipe extending through the cylindrical head and having a socket fitting against the ball within the casing, and a coiled spring mounted on the pipe extending through the cylindrical head and located between the cylindrical head and the head of the pipe, substantially as shown and described.

2. A pipe-coupling joint consisting of a casing with a bevel-edged opening at its outer end, an externally-screw-threaded cylindrical head screwing into the casing at its inner end, a collar screwed on the cylindrical head, a ball-and-socket pipe-joint located in the casing with the ball resting within the bevel-edged opening, and a coiled spring mounted on the pipe, having the socket end between its head and the cylindrical head, substantially as shown and described.

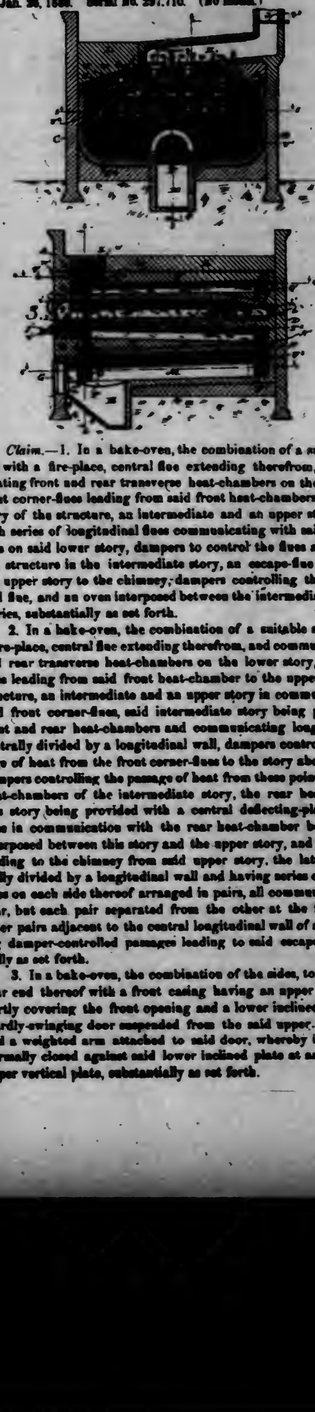


3. A pipe-coupling joint consisting of the casing 6, with an opening at its outer end having a beveled edge 7, a pipe 1, having a ball 2 at its end resting within the beveled edge 7, a cylindrical externally-threaded head 8, screwing into the inner end of casing 6 and formed with a chamber 9 at its inner end and a notched flange 10 at its outer end, a pipe 5, extending through the cylindrical head 8 and having a head 4, with a socket 3, fitting against the ball 2, a coiled spring 11, mounted on pipe 5, between its head 4 and the top of chamber 9, and a ring 12, screwed on the cylindrical head 8, substantially as shown and described.

412,941. END-BOARD FASTENING FOR WAGONS. Robert Allen, Arbela, assignor of one-half to John L. Richardson, Tuscola, Mich. Filed July 7, 1888. Serial No. 279,548. (No model.)

Claim.—In combination with end-boards and the plates A A, the lever C, with its cranks *b b*, the slotted rods D D, and the screw-shanked hooks *f f*.

412,942. PUMP. Ezra S. Babcock, Milton, Wis., assignor of one-half to Paul M. Green, same place. Filed May 31, 1889. Serial No. 312,993. (No model.)



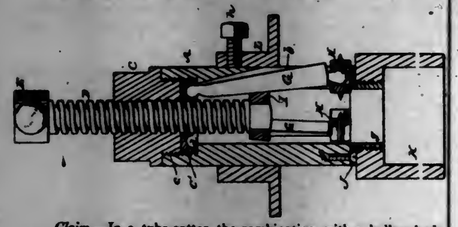
Claim.—1. In a pump, the combination of a cylinder formed in two parts only, one screwing into the other, with packing interposed between their opposing interior faces, a pump-rod passing down through the upper part and carrying a valved plunger passing through the packing and in contact therewith, and a wrench-bearing formed on top of and integral with the upper part of the cylinder, which screws directly within the lower part of said cylinder, whereby the same may be screwed down as the packing wears away and the cylinder thereby tightened without detaching any of the parts of the pump, substantially as set forth.

2. In a pump, the combination of a two-part cylinder, one part screwing into the other and each part partially bored out, with glass thimbles fitting into said bored-out portions and having horizontal flanges and rings or layers of packing interposed between the opposing faces of the said thimble-flanges, substantially as set forth.

3. In a pump, the combination, with a cylinder having a centrally-arranged packing, of a pump-rod and a split rod united to said pump-rod by a coupling and terminating in a spider-cage, and an inclined clamping-ring, a hollow plunger having an inclined contracted neck held by said clamping-ring, and a ball-valve within said spider-cage and another valve below said plunger at the bottom of the cylinder, substantially as set forth.

4. In a pump, the combination of a two-part cylinder, one part screwing into the other and each provided with glass thimbles having opposing horizontal flanges, rings or layers of packing interposed between said flanges, pump-tubes above and below said cylinder, a pump-rod passing down through the upper part of the cylinder, a split rod coupled to said pump-rod and carrying a ball-valve cage and inclined clamping-ring, a glass plunger with inclined contracted neck held by said inclined ring, and provided with a ball-valve, and passing through and in contact with said packing a wrench-bearing formed on the upper part of the cylinder, and a ball-and-cage valve located at the bottom of the cylinder below the plunger, substantially as set forth.

412,943. BAKE-OVEN. John D. Barnhill, Milwaukee, Wis. Filed Jan. 26, 1889. Serial No. 297,710. (No model.)



Claim.—1. In a bake-oven, the combination of a suitable structure with a fire-place, central flue extending therefrom, and communicating front and rear transverse heat-chambers on the lower story, front corner-flues leading from said front heat-chambers to the upper story of the structure, an intermediate and an upper story provided with series of longitudinal flues communicating with said heat-chambers on said lower story, dampers to control the flues at the front of the structure in the intermediate story, an escape-flue leading from the upper story to the chimney, dampers controlling the openings to said flue, and an oven interposed between the intermediate and upper stories, substantially as set forth.

2. In a bake-oven, the combination of a suitable structure with a fire-place, central flue extending therefrom, and communicating front and rear transverse heat-chambers on the lower story, front corner-flues leading from said front heat-chamber to the upper story of the structure, an intermediate and an upper story in communication with said front corner-flues, said intermediate story being provided with front and rear heat-chambers and communicating longitudinal flues centrally divided by a longitudinal wall, dampers controlling the passage of heat from the front corner-flues to the story above, and other dampers controlling the passage of heat from these points to the front heat-chambers of the intermediate story, the rear heat-chamber of this story being provided with a central deflecting-plate, but otherwise in communication with the rear heat-chamber below, an oven interposed between this story and the upper story, and an escape-flue leading to the chimney from said upper story, the latter being centrally divided by a longitudinal wall and having series of longitudinal flues on each side thereof arranged in pairs, all communicating at the rear, but each pair separated from the other at the front, and the inner pairs adjacent to the central longitudinal wall of said story having damper-controlled passages leading to said escape-flue, substantially as set forth.

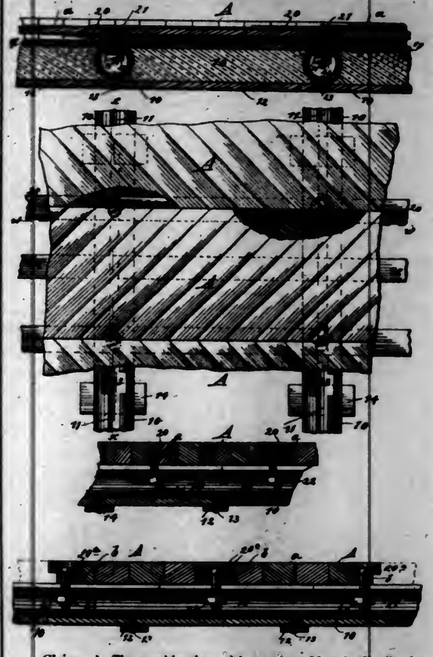
3. In a bake-oven, the combination of the sides, top, bottom, and rear end thereof with a front casing having an upper vertical plate partly covering the front opening and a lower inclined plate, an inwardly-swinging door suspended from the said upper vertical plate, and a weighted arm attached to said door, whereby it will be held normally closed against said lower inclined plate at an angle to said upper vertical plate, substantially as set forth.

4. In a bake-oven, the combination of a suitable structure, fire-place, and flues and heat-passages, an oven, a steam-boiler with a pipe leading to said oven and extending through the front wall thereof and having a suitable valve outside of the oven, a branch pipe leading from said first-named pipe between said valve and said steam-boiler and having also a suitable valve, and an escape-pipe leading from the rear of said oven, above the same, to the smoke-escape flue and terminating in a valve, with an operating-rod projecting through the wall of the main structure, substantially as set forth.

412,944. TUBE-CUTTER. PATRICK H. BERADS, Punxsutawney, Pa. Filed Dec. 5, 1888. Serial No. 292,602. (No model.)

Claim.—In a tube-cutter, the combination, with a hollow body A, having longitudinal slots *b* and transverse openings *c*, the screw-box C, and a recessed ring C', of the cutter-bars G, having their outer ends fitting in the recess of the ring, the cutters H, connected by a ball-and-socket joint with the inner ends of the bars G, and the screw D, provided with the roller I on its end, substantially as herein shown and described.

412,945. SIDE-HILL PLOW. JOHN D. BURKHART, Dayton, Wash. Filed Mar. 6, 1889. Serial No. 302,195. (No model.)



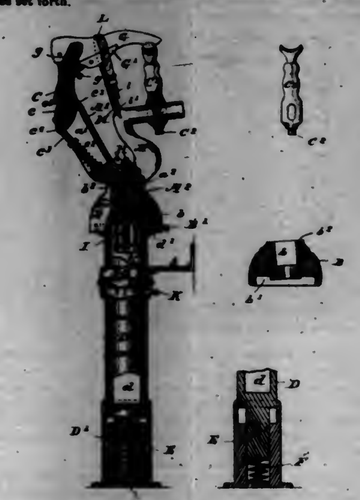
Claim.—1. In a hillside-plow, the combination, with a beam, of the double-pointed plow having the standard formed in two pieces, and the top plate, the vertical pivot-bolt passing through the beam, the hinged locking-stirrups, the locking-lever, the link, the link-arms, the pivot-bolt connecting the same and having the enlarged head, and the vertical guideway, substantially as set forth.

2. The combination, with the beam, of the handles, the V-shaped casting pivoted on the beam, the perforated rear casting secured to the handles, the guard, the locking-bar and its pin, and the pivoted brace-rod connecting the handles and the beam, substantially as set forth.

3. The combination, with a plow-beam, of a clevis pivotally secured thereto, a clip extending over the clevis, the centrally-pivoted cross-bar, the wedges pivoted to the ends of the cross-bar, and an operating-rod, substantially as set forth.

412,946. FLOORING. THOMAS CANTWELL, Brooklyn, assignor, by direct and mesne assignments, to the Nightingale Floor Company, New York, N. Y. Filed Dec. 17, 1888. Serial No. 293,052. (No model.)

Claim.—1. The combination, with a series of longitudinally-slotted tubes, of a series of floor-sections, tie-bars or retaining-strips bearing on shoulders formed at the edges of said floor-sections, and fastening devices which connect the tie-bars and the tubes, substantially as described.

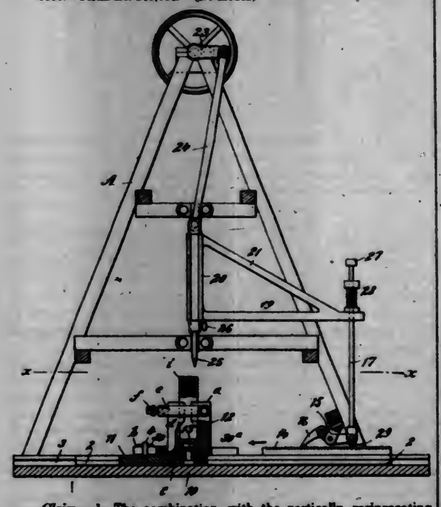


2. The combination, with a series of longitudinally-slotted tubes, of uniting-strips 12, connected to the tubes, floor-sections having shoulders, tie-bars or retaining-strips which rest upon said shoulders, bolts passing through the tie-bars or retaining-strips and the slots of the tubes, and nuts arranged within the tubes, which nuts the bolts engage, substantially as described.

3. The combination, with a series of spaced and longitudinally-slotted tubes having enlarged apertures 23, of floor-sections, tie-bars or retaining-strips which engage shoulders formed on the floor-sections, and bolts passing through the retaining-strips and the slots of the tubes to engage nuts arranged within the tubes, substantially as described.

4. In an attaching device for floors, the combination, with a series of longitudinally-slotted tubes, of bars by which said tubes are connected and spaced, anchor-plates connected to the tubes, and bolts 21, which extend through the tube-slots, substantially as described.

412,947. LASTING-JACK AND SUPPORT. SAMUEL CLARK, Rochester, N. H. Filed June 20, 1888. Serial No. 314,909. (No model.)



Claim.—1. A lasting-jack and its support combining the following elements: a pivoted adjustable heel-block provided with a spindle for mounting a last and shoulders for limiting its motion by contact with the arm of the jack to which it is pivoted, a horizontal arm and an adjustable toe-rest provided with a set-screw for securing it at any desired point upon said arm, a strap provided with a buckle and connected by set-screw to said arm, a jack-block to which said jack is swiveled, as shown, and provided with an annular flange at its bottom, a vertically-adjustable support fitting within the flange of said jack-block and provided with an annular groove in its side, and two or more set-screws threaded to the flange of said jack-block and adapted to enter and rest in the groove of said support, all substantially for the purpose set forth.

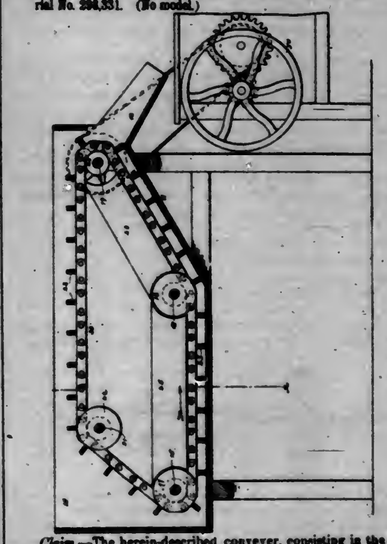
2. The combination, with an adjustable hollow support having an annular groove near its top, of a jack-block having its bottom chambered to receive said hollow support, provided with set-screws in its sides to enter the groove therein, and a socket in its top, a lasting-jack having a turned portion fitting the socket in said jack-block, and a bolt passing through both said jack and jack-block, provided with a helical spring upon its lower end operating expansively against said jack-block.

3. In a lasting-jack, a hollow adjustable support, a jack-block mounted and capable of adjustment in a rotative course thereon, having its top surface inclined and provided with a socket sunk at right angles therewith, a lasting-jack having a turned portion fitting the socket in said jack-block, and a bolt passing through both jack and jack-block, provided with a helical spring operating expansively against the latter, all substantially for the purpose specified.

412,948. SCRUB-BRUSH MACHINE. ADDISON M. COOK, Bridgehampton, assignor to Arthur S. French, Brooklyn, N. Y. Filed Nov. 1, 1888. Serial No. 289,711. (No model.)

Claim.—1. The combination, with the vertically-reciprocating cutter or knife, of a horizontal slide thereunder, provided with a vise or holder and a rack, a pawl engaging said rack, a lever to which said pawl is pivoted, and an operating-rod connected to said lever, substantially as set forth.

2. The combination, with the vise-carrying slide and its rack, of a lever having a stop projection and a pivoted pawl engaging said rack, and an operating-rod connected to said lever, substantially as set forth.



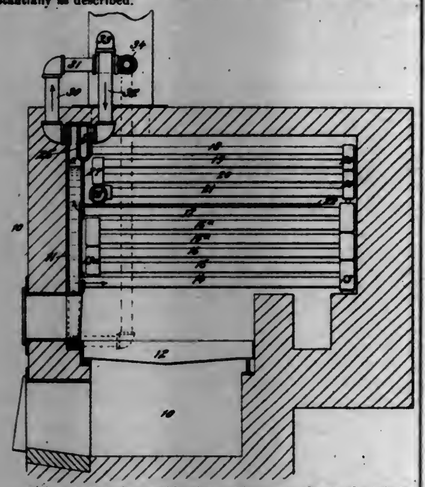
3. The combination, with a vertically-reciprocating arm having an aperture in its outer end, a vertical rod extending through said aperture and having a head at its upper end, and a cushioning-spring between the head and arm, of the vise-carrying slide having a rack, and a lever connected to the lower end of the rod and having a pawl engaging said rack, substantially as set forth.

4. The combination, with the reciprocating cutter, of the slide thereunder, a vise mounted on said slide and provided with vertical fixed jaw, a horizontal plate to which said jaw is rigidly secured, provided with a vertical recess in front of said fixed jaw, a movable jaw stepped at its lower end in said recess, and a stirrup pivoted to the upper end of the fixed jaw and having a set-screw to bear against the movable jaw when the outer end of the stirrup is swung thereover, substantially as set forth.

5. The combination, with a base-plate, of a slide mounted thereon, a vise carried by the slide, stops, as 30 and 30ª, arranged in connection with the vise, a rack carried by the slide, a pawl-carrying lever arranged above the rack, a vertically-reciprocating slide, a knife carried thereby, an arm extending outward from the slide, and a rod connecting said arm and the pawl-carrying lever, as and for the purpose stated.

6. The combination, with a base-plate, of a slide 11, a vise 12, connected thereto by a bolt 13, stops 30 and 30ª, carried by the slide, a rack 14, a lever 15, provided with a pawl 16 and with a tooth 29, a reciprocating slide 20, a knife 25, carried by the slide, an arm 19, extending outward from the slide, and a rod 17, connected to the lever 15 and to the arm 19, substantially as described.

412,949. CONVEYER. WILLIAM R. CROW, Buffalo, assignor to himself and Edward R. Ulrich, Jr., Springfield, Ill. Filed Feb. 1, 1889. Serial No. 298,331. (No model.)

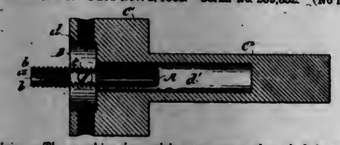


Claim.—The herein-described conveyer, consisting in the casing 10, having a discharge-chute 12 and an upwardly-inclined floor-section 11, wheel 20 at the upper end of said section, wheel 18 at the lower end, lower and upper wheels 17 and 22 at the opposite end of the casing, the wheel 22 being in advance of the wheel 17, a shield between wheels 17 18, an inclined shield between wheels 18 19, and the endless chain passing around said wheels and under the shields provided with transverse flights or blades 23, substantially as set forth.

412,950. STEAM-BOILER. HARRY A. R. DEUTNER, South Bethlehem, Pa. Filed Feb. 7, 1889. Serial No. 299,949. (No model.)

Claim.—1. In a boiler, the combination, with a water-front, of a tubular steam-generating section arranged in connection therewith, a pipe or tube leading upward from the steam-space of the water-front,

and then downward to a steam-receiving chamber, and a superheating-section communicating with said steam-receiving chamber, substantially as described.

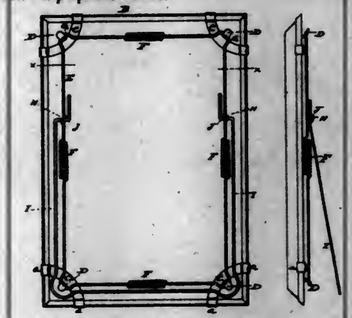


2. In a boiler, the combination, with a water-front, of a tubular steam-generating section, a pipe or pipes leading upward from the steam-space of the water-front, horizontal pipes connected to the upwardly-extending pipes, arched connections which establish communication with the horizontal sections and downwardly-extending sections, said downwardly-extending sections, and a superheating-section, with which the downwardly-extending sections communicate, substantially as described.

3. In a boiler, the combination, with a water-front having compartments *a* and *b*, of upwardly and then downwardly extending pipes, by which said compartments are placed in communication, a steam-generating section arranged in connection with the water-front, and a steam-superheating section which communicates with the chamber *b* and with a steam-distributing pipe 28, substantially as described.

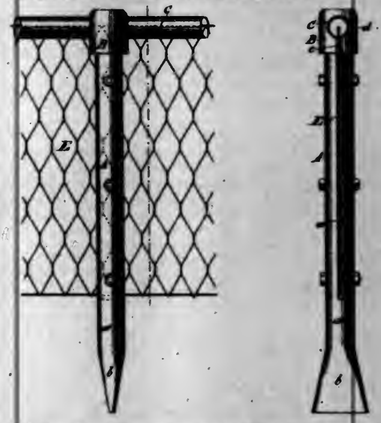
412,951. PROCESS OF TREATING CEREALS. FRANKLIN DORR, Baltimore, Md. Filed July 25, 1889. Serial No. 318,666. (Specimens.)

Claim.—The process herein described of preparing cereals, consisting in first cooking the grains, then partially drying and cooling the same, then crushing the grains by a prolonged frictional grinding, and in the same operation drying the product and also stimulating chemical changes by the frictional heat generated by the prolonged grinding, substantially as described.



412,952. TAP AND HOLDER THEREFOR. CHARLES ELTERICH, New York, N. Y. Filed Nov. 2, 1888. Serial No. 289,852. (No model.)

Claim.—The combination, with a tap screw-threaded throughout its length, of a holder having a cavity and the hollow shank, a block smooth on its periphery and having a threaded hole to receive the tap, and a screw or pin fitted in the block and engaging with the tap, substantially as specified.

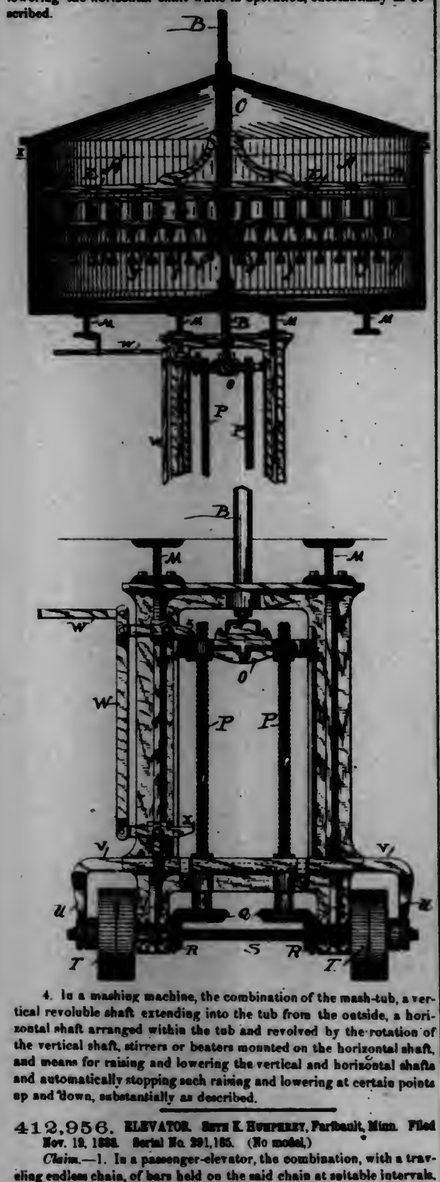


412,953. MOUNT FOR PHOTOGRAPHS. HERBERT N. GALE, Bristol, Conn., assignor of one-half to John H. Twisden, Boston, Mass. Filed June 4, 1889. Serial No. 313,035. (No model.)

Claim.—1. The herein-described mount for photographs, consisting of a metal border for the glass composed of the U-shaped sides B, combined with clips C, the two ends of the clips bent to form hooks *a*, to engage the adjacent sides of the respective angles, and also constructed with an outwardly-turned hook D, and a binder made from wire, its angles adapted to engage the said hooks D of the clips, and the sides of the binder between the said clips coiled to form a spiral spring, two opposite sides of the binder constructed with eyes H, and a U-shaped wire brace, the ends of the legs bent at right angles and extending through the said eyes H to form pintles J, substantially as and for the purpose described.

2. The combination of the glass A, the clips C, the two ends of the said clips bent to form hooks *a*, and adapted to embrace the edges of the glass, the said clips also constructed with a hook D, and an elastic binder made from wire, bent corresponding to the shape of the glass, the angles of the wire forming loops G, to engage said hooks D, and the said wire between the said angles coiled to form spiral springs F, substantially as described.

412,954. FENCE-POST. EDWIN GILBERT, Georgetown, Conn., assignor to the Gilbert & Bennett Manufacturing Company, same place. Filed Feb. 25, 1889. Serial No. 301,048. (No model.)



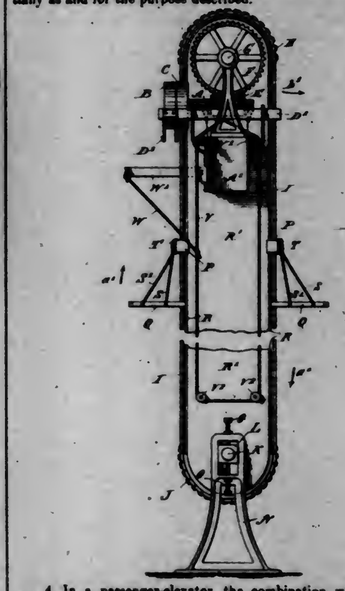
Claim.—The combination, with a fence-post made of a single tube slotted longitudinally to receive a wire-fence web, of a cap for said post, also slotted to receive the wire web and provided with an aperture to receive a top rail, substantially as specified.

412,955. MASHING-MACHINE. MATHIUS GOTTFRIED, Chicago, Ill. Filed Apr. 12, 1886. Serial No. 198,543. (No model.)

Claim.—1. In a mash-tub, the combination of a horizontal arm centrally mounted and rotated in a horizontal plane, stirrers or beaters carried by said horizontal arm and operated by such rotation, and means for raising and lowering said horizontal arm while in rotation and automatically stopping said raising and lowering at predetermined limits, substantially as described.

2. In a mashing-machine, the combination of a mash-tub, a vertical revoluble shaft, a horizontal shaft arranged within the tub and revolved by the rotation of the vertical shaft, stirrers or beaters mounted on the horizontal shaft, and means for raising and lowering the vertical and horizontal shafts and stopping such raising and lowering at points up and down while the same are revolving in use, substantially as described.

3. In a mashing-machine, the combination of a mash-tub, a vertical revoluble shaft, a horizontal shaft within the tub, revolved by the rotation of the vertical shaft, stirrers or beaters mounted on the horizontal shaft and operated by such rotation, and means for raising and lowering the horizontal shaft while in operation, substantially as described.

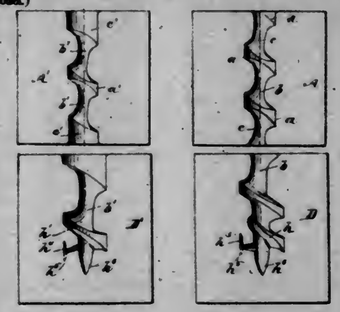


4. In a mashing machine, the combination of the mash-tub, a vertical revoluble shaft extending into the tub from the outside, a horizontal shaft arranged within the tub and revolved by the rotation of the vertical shaft, stirrers or beaters mounted on the horizontal shaft, and means for raising and lowering the vertical and horizontal shafts and automatically stopping such raising and lowering at certain points up and down, substantially as described.

412,956. ELEVATOR. SETH E. HUMPHREY, Faribault, Minn. Filed Nov. 19, 1888. Serial No. 291,185. (No model.)

Claim.—1. In a passenger-elevator, the combination, with a traveling endless chain, of bars held on the said chain at suitable intervals, rods pivoted on each of the said bars, one above the other, and a platform pivoted on the lower ends of the said rods, substantially as shown and described.

2. In a passenger-elevator, the combination, with a traveling endless chain, of bars held on the said chain at suitable intervals, rods pivoted on each of the said bars, one above the other, platforms pivoted on the lowermost ends of the said rods, and fixed guide-plates, against which one end of each of the said platforms rests, substantially as shown and described.



3. In a passenger-elevator, the combination, with the traveling endless chain, the vertical guide-bars, and the transverse bars hung on the endless chain at suitable intervals, said transverse bars provided with guide-lips projecting over the outer edges of the vertical guide-bars, of rods pivoted one above the other on each of said transverse bars, and a platform pivoted on the lower ends of said rods, substantially as and for the purpose described.

4. In a passenger-elevator, the combination, with a traveling chain, of bars held on the said chain at suitable intervals, a self-reversing platform hung on each of said bars, fixed guide-plates, against which rest one end of each of the said platforms, and gravity-catches pivoted on the inner end of each of said transverse bars, said catches having cam-faces adapted to normally engage the fixed guide-plates on the ascending side of the elevator, and adapted to swing from contact with the guide-plates when on the descending side, all arranged substantially as and for the purpose described.

5. In a passenger-elevator, the combination, with the upper and lower drive-shafts carrying sprocket-wheels, an endless chain passing over said sprocket-wheels, said chain carrying self-reversing platforms, a worm secured on the upper drive-shaft, a worm-wheel meshing into said worm, a shaft carrying said worm-wheel provided with a loose and fast pulley, and the stopping and starting rope, of a belt-shifter operating over the said fast and loose pulleys, a rope connecting the said shifter and starting and stopping rope, a lever pivoted to the frame of the elevator, projected over the path of the platforms, and a rope connecting the free end of said lever with the starting and stopping rope, said lever arranged for contact with the body of the ascending passenger, substantially as and for the purpose described.

412,957. AUGER-BIT DIE. CHARLES H. IRWIN, FRANCIS I. HOSFLR, and JAMES W. STEBBINS, Wilmington, Ohio; said Hosfle and Stebbins assignors to said Irwin. Filed Aug. 27, 1889. Serial No. 322,140. (No model.)

Claim.—1. In dies for forging auger-bits, the bit-body dies made with adjacent inclined spiral-blade-forming concavities, and with contiguous diagonally-ranging semi-spiral center-stem-forming depressions made shallow at their center parts and gradually deeper and broader toward their ends, which merge into the spiral-blade-forming concavities, substantially as described, whereby the dies will produce a bit-body having a spiral blade or flange surrounding the central stem, which itself has a spiral form between the convolutions of said blade or flange, as set forth.

2. In dies for forging auger-bits, the bit-heading dies provided with concavities and depressions receiving the outer parts of the central stem of the blank and its surrounding main spiral blade or flange, and provided, also, with semi-spiral flange-forming depressions at or between the concavities and depressions producing the last convolution of the main spiral flange of the bit, substantially as described, whereby the bit-blank will have support at its outer part in the die while an auxiliary semi-spiral flange is produced on it by the dies within the last convolution of the main spiral flange of the bit, as set forth.

3. In dies for forging auger-bits, the bit-head-forming dies provided with concavities and depressions receiving the outer parts of the center stem of the bit-blank and its surrounding main spiral blade or flange, and provided, also, with semi-spiral flange-forming depressions at or between the concavities or depressions forming the last convolution of the main spiral flange of the bit, and provided, also, with an extension of the center-stem-forming depressions beyond those forming the main and auxiliary spiral flanges, substantially as described, whereby the bit-blank will have support at its outer part in the dies while an auxiliary semi-spiral flange and a central gimlet-point-stud blank is produced on it by the dies, as set forth.

4. In dies for forging auger-bits, the bit-point and cutter-forming dies provided with concavities and depressions receiving the outer parts of the central stem of the blank and its surrounding main spiral blade or flange, and also receiving the auxiliary semi-spiral flange formed within the last convolution of the main spiral flange, and provided, also, with depressions producing cutting-edges at the extremities of the main and auxiliary flanges, and provided, also, with depressions forming from the projecting end of the center stem the tapering gimlet-point stud of the bit, substantially as herein set forth.

5. In dies for forging auger-bits, the bit-body dies A A′, formed with adjacent inclined spiral-blade-forming concavities *a a′ a″*, contiguous diagonally-ranging semi-spiral center-stem-forming depressions *b c b′*, which are shallow at their center parts and gradually deepen and broaden toward their ends, which merge into the spiral-blade-forming concavities and end depressions *c′ c″ d*, substantially as described, for the purposes set forth.

6. In dies for forging auger-bits, the heading-dies B B′, provided with inclined spiral-blade and center-stem receiving depressions *a a a′ b b′*, and provided also, with depressions b^3 b^3, forming on a bit-blank an auxiliary cutter-supporting flange within the last convolution of the main spiral blade or flange, and provided, also, with a depression b^4, forming the gimlet-point-stud blank, substantially as herein set forth.

7. In dies for forging auger-bits, the bit-pointing dies C C′, formed with concavities *a a a′ a″*, depressions *b c b′* b^3 b^3, receiving the main spiral blade, the center stem, and the auxiliary flange of the bit, and provided, also, with gimlet-point-forming depressions *d′ d″* and cutter-forming depressions d^3 d^3 d^3, substantially as herein set forth.

412,958. CENTRAL-DRAFT LAMP. JOSEPH JAUCH, Meriden, Conn., assignor to the Bradley & Hubbard Manufacturing Company, same place. Filed Apr. 22, 1889. Serial No. 308,135. (No model.)

Claim.—1. In a central-draft lamp, the combination, with the central tube, of a concentric sleeve C, removably set in the upper end of said central tube, and a perforated tube D, attached by its lower end to said sleeve, the said tube of conical shape, diminishing in diameter from its lower end upward within the said sleeve, and terminating at its upper end in a perforated air-distributer above the upper end of said tube A, substantially as described.

2. In a central-draft lamp, the combination of the perforated concentric conical tube D, arranged within the central-draft tube, terminating at its upper end in a distributer composed of a perforated body F and perforated crown G, with a concentric partition J between the said crown and body, substantially as and for the purpose described.

3. In a central-draft lamp, the combination of a conical perforated tube D, arranged concentrically in the central tube, terminating at its upper end in a distributer composed of a body F and crown G, the body F springing from and of larger diameter than the upper end of the conical tube D, the under surface of the said body perforated, the upper edge of the body turned outward to form an annular flange I of larger diameter than the central tube, the crown G receding from the said flange I, and its surface adjacent to the flange perforated, with a concentric partition J between the said crown and body, substantially as described.

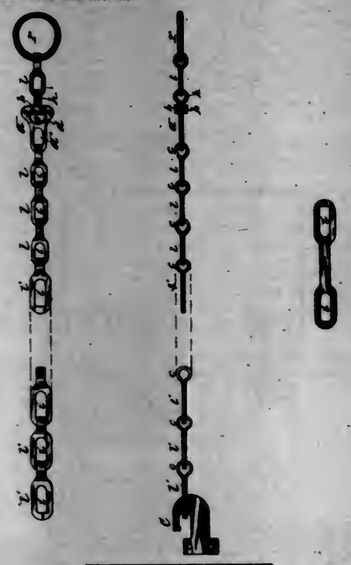
4. In a central-draft lamp, the combination of the sleeve C, adapted to set into the central tube and be supported thereby, a concentric conical tube D, attached by its lower and larger end to the said sleeve below its upper end, the said conical tube terminating in an air-distributer above the upper end of the central tube, the said distributer expanded from the conical tube to form a flange I of larger diameter than the central tube, the sides of the distributer below the said flange perforated, and the distributer above the said flange receding and perforated adjacent to the flange, substantially as described.

5. An air-distributer for central-draft lamps, composed of the body F and the crown G, the body F expanding to form an annular flange I of larger diameter than the central-draft tube, the body perforated below the said flange, the crown G receding from said flange and forming a series of annular shoulders, each presenting a substantially vertical and horizontal surface, and the said vertical and horizontal surfaces perforated, with a partition J between the said body F and the crown, substantially as and for the purpose described.

6. An air-distributer for central-draft lamps, composed of the body F and the crown G, the body F expanding to form an annular flange I of larger diameter than the central-draft tube, the body perforated below the said flange, the crown G receding from said flange, and the surface of the said crown adjacent to the flange perforated, with a partition J between the crown and body, substantially as described.

412,959. BUNG-BUSHING OR FAUCET-SOCKET. FRANK H. KANE, Riverside, assignor of one-half to George R. Messmer, Cincinnati, Ohio. Filed May 31, 1889. Serial No. 312,694. (No model.)

Claim.—1. A bung-bushing or faucet-socket having cut on its outer surface a screw-thread which increases in height toward the flange on the outer end of the bushing and a recess at 11 between screw-thread and flange 5, thereby allowing a full and close insertion of the whole into the wood without breaking or otherwise injuring the same, as shown and described.



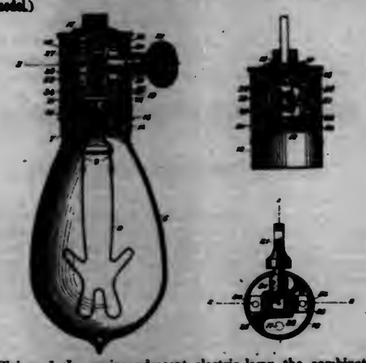
2. In combination with a bung-bushing or faucet-socket having cut on its outer surface a screw-thread which increases in height toward the flange on the outer end of the bushing and a recess at 11 between the screw-thread and flange 5, the inside wooden lining 12 inserted for the purpose of protecting the inner metallic surface of the bushing and forming a packing for the faucet, as explained.

3. A bung-bushing or faucet-socket having cut on its outer surface a screw-thread which increases in height toward the flange on the outer end of the bushing, a recess at 11 between screw-thread and flange 5, an inwardly-increasing diameter, and a flange 13, in combination with a wooden lining 12, being compressed into the space formed by the inwardly-increasing diameter of the bushing and by flange 13, all as shown, and for the purpose described.

412,960. TRACE-CHAIN. MYRON H. KINSLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed June 3, 1889. Serial No. 312,946. (No model.)

Claim.—As an improved article of manufacture, a trace-chain composed of the links *l l*, each consisting of an elongated strip perforated at its ends and bent into the loop *c*, embracing the end cross-bars of the perforated portions of one of the adjacent links, and the other adjacent link embracing by its loop the end cross-bars of the perforated portions of the first-named link, and a swivel *a* between two of the links at one end, and also composed of sheet metal, the above member of said swivel consisting of two plates lying one upon the other and provided with coinciding perforations *a′* at one end, semi-cylindrical bends *b b* at the opposite ends, and openings *d d* back of said bends, rivets uniting said plates, and the headed member of said swivel, consisting of a sheet-metal strip bent into the loop A and provided with heads *e e*, lying one upon the other and embraced

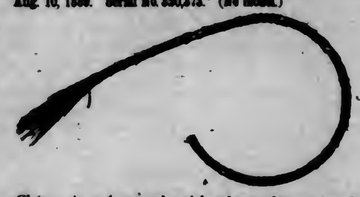
back of the heads by the bends *b b* of the sleeved member, substantially as described and shown.



412,961. BUTTON. WILLIAM J. LESKIE, 2d, Boston, Mass. Filed Mar. 27, 1889. Serial No. 305,008. (No model.)

Claim.—As an improved article of manufacture, a button comprising a head 10, an integral shank 11, reduced at its outer end and externally screw-threaded, a sleeve 13, secured on the said shank above the screw-threaded part thereof, resting against the under side of the head, and having an outward-projecting flange 13ª in line with shoulder 12, and provided with peripheral teeth 14, extending toward the threaded end of the shank, and a thumb-nut 15 on the threaded end of the shank, substantially as set forth.

412,962. INCANDESCENT-LAMP SOCKET. GEORGE P. LOCKIE, Somerville, Mass., assignor to the Locnite Electric Manufacturing Company, New York, N. Y. Filed Sept. 3, 1888. Serial No. 284,396. (No model.)



Claim.—1. In an incandescent electric lamp, the combination, with the lamp-stem 7, having the lamp-terminals 11 and 12 mounted thereon and connected to the leading-in wires and projecting from the face of the lamp-stem, of a lamp-socket 13, adapted to receive and hold the said lamp-stem, and provided with the guide-plate 19, presenting an insulating surface or face toward the lamp-stem, said guide-plate formed with suitable perforations 32 and 34, for receiving the lamp terminals 12 and 11, respectively, and the spring-contacts 31 and 33, mounted within the lamp-socket 13 and connected to line, the said contacts arranged to the opposite side of said guide-plate from where the lamp-terminals are entered and having their free ends disposed so as to extend transversely across the perforations 32 and 34 of the guide-plate 19 and near thereto, so as to engage with spring-pressure the flat ends of the lamp-terminals 11 and 12, respectively, when the lamp is put together, substantially as and for the purpose set forth.

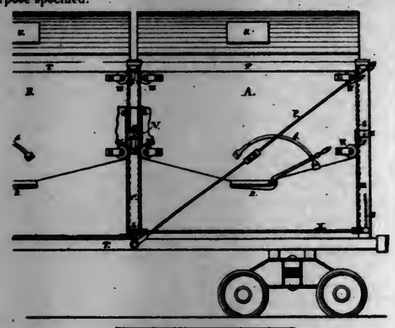
2. In an incandescent electric lamp, the combination, with a pair of suitably-spaced spring contact-fingers 27 and 28, connected to line, of a switch-key 21, mounted to rotate in its bearings and having its shank formed with a transverse opening 23, a switch-block 22, made of insulating material and loosely mounted on the shank of the key 21 and covering the opening 23 thereof, a fixed metallic pin 24, extending transversely through the block 22 and passing through the opening 23 of the key-shank, the diameter of the pin 24 being considerably less than that of opening 23 to give the necessary lost motion to the switch-block, and the contact-plates 25 and 26, mounted, respectively, upon opposite sides of the switch-block and in electric communication through means of the pin 24, the said block being embraced by the said contact-fingers 27 and 28, substantially as and for the purpose set forth.

3. In an incandescent electric lamp, the combination, with the lamp-stem 7, having the lamp-terminals 11 and 12, of the lamp-socket 13, adapted to receive and sustain the said stem in position, the non-conducting guide-plate 19, formed with the guide-perforations 32 and 34, the contacts 31 and 33 for the lamp-terminals, such contacts being secured to the guide-plate by screws 30 and 36, respectively, and the screws having their heads embedded in the said plate, so as not to be exposed upon the outer face thereof, substantially as and for the purpose set forth.

4. In an incandescent electric lamp, the combination, with the lamp-stem 7, having the lamp-terminals 11 and 12 projecting therefrom, of the lamp-socket 13, adapted to receive said lamp-stem, a lock for uniting the socket and stem, such lock operated by turning said stem on its axis, the insulating guide-plate 19, located within said socket and provided with the perforations 32 34, arranged to correspond with the disposition of said lamp-terminals which enter therethrough and having a diameter considerably greater than the diameter of said terminals, whereby the lamp-stem may be turned on its axis to lock and unlock the stem and socket, and the spring-contacts 31 33, engaging with firm spring-pressure the said lamp-terminals when the same are entered through the perforations of the guide-plate and the stem and socket are united, substantially as and for the purpose set forth.

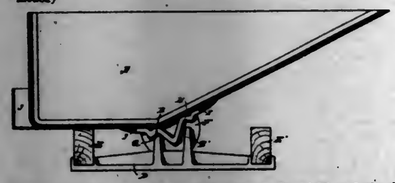
412,963. TWINE FOR BINDING GRAIN. GEORGE A. LOWRY, Des Moines, Iowa, assignor of one-half to William L. May, same place. Filed Aug. 10, 1889. Serial No. 320,373. (No model.)

Claim.—As an improved article of manufacture, a twine made of grass, hay, or straw, twisted together and wrapped with a thread made of cotton or other suitable material, substantially as shown and described, for the purposes stated.



412,964. RAILWAY FREIGHT-CAR. CHARLES MACKELL, Baltimore, Md. Filed June 26, 1889. Serial No. 315,561. (No model.)

Claim.—1. The combination, in a freight railroad-car for hauling material in bulk on railroads, of a horizontal shaft secured to frame-work, with worm and ratchet lever communicating and transferring power to worm-wheels, and upright screws revolving in nuts secured to hoppers or detached bodies of cars independent of each other and unattached to the frame-work of the car, except by the aforesaid screws, permitting vertical motion only.



2. In a dumping freight-car where the hoppers are independent of the frame-work, the combination of anti-friction grooved and plain wheels secured to hoppers and guides secured to parts, with elevating-screws, nuts, thrust-bearing boxes secured to cross-beams, and worm-wheels, worms, shaft, and ratchet, all substantially as set forth.

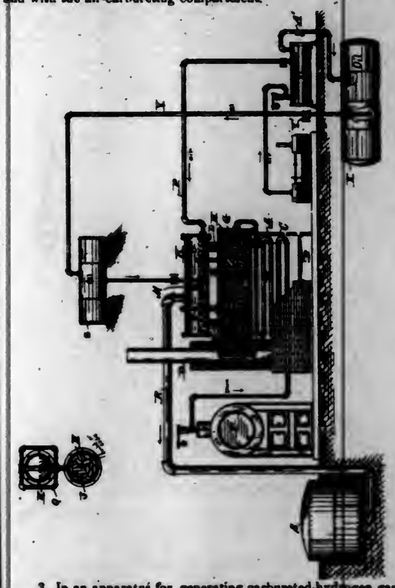
3. The slide in the bottom of a dumping-door, in combination with and attached to a dumping-hopper car, the hopper being con-

fixed in a frame-work attached to the sills of a car, but being independent therefrom, with the dump-door shaft and toothed arc, for the purpose specified.

412,965. AUTOMATIC SEWER-FLUSHING TANK. EDWIN R. MARTICK, Alameda, Cal. Filed Jan. 11, 1889. Serial No. 296,099. (No model.)

Claim.—1. The fulcrum or fulcrum-posts B and B', and the depressions or channels formed in the bottom or base of a tank having the bottom formed of a horizontal and inclined portion, in combination with the standards or supports E and E', placed beneath opposite ends of the tank so as to support it in conjunction with one or the other of the fulcrums, substantially as and for the purpose herein described.

2. The fulcrum or fulcrums and the standards E and E', standing in line, in combination with the tank, the bottom of which forms an obtuse angle, and depressions or points of support upon said bottom, about which it may turn upon the fulcrum or fulcrums, so as to be supported alternately upon the fulcrum and standard E and the fulcrum and the standard E', substantially as and for the purpose herein described.



3. The tank having the bottom formed of two planes meeting each other at an obtuse angle, and the variable fulcrum and standards upon which the tank turns and is supported, in combination with the channeled or grooved plates having the flanges or disks F to retain the tank in place, substantially as and for the purpose herein described.

4. A tank so shaped that its center of gravity will be changed as it is filled or discharged, and a fulcrum or fulcrums with varying points of rest beneath its bottom, about which it turns to discharge or right itself automatically, substantially as and for the purpose herein described.

412,966. APPARATUS FOR MANUFACTURING GAS. JAMES R. MENDENHALL, Springfield, Ohio. Filed Apr. 25, 1889. Serial No. 308,581. (No model.)

Claim.—1. In an apparatus for manufacturing carbureted-hydrogen gas, the combination, with a furnace, steam-pipes, and a retort containing a refractory material, the said pipes and retort being in and over the fire-box proper, and one end of the pipes connecting with a steam-supply and the other discharging into said retort, of a chamber divided into air-carbureting and gas-carbureting compartments, pipes connecting said compartments respectively with the retort, a compressed-air tank, an oil-tank connected therewith and with the air-carbureting chamber, the compressed air acting to deliver the oil from the oil-tank to the air-carbureting chamber, a pipe connecting the air-tank with said carbureting-tank, and a gas-exit pipe for the gas-carbureting compartment.

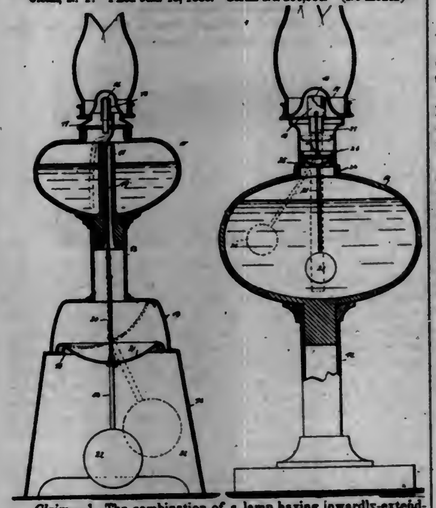
2. An apparatus for generating carbureted-hydrogen gas, consisting of a furnace, steam-pipes, and a retort containing refractory material, the pipes and retort being in and over the fire-box, a steam-generator connected to one end of the pipes and the other end connected with the retort, an oil-chamber divided into air-carbureting and gas-carbureting compartments, a pipe leading from one of said compartments into the retort, and from the retort into the other of said compartments, an exit-pipe leading from the latter, an air-pump, a compressed-air tank connected with the pump and with the air-carbureting compartment, a buried oil-tank connected with the air-tank, and an intermediate elevated oil-tank connected with the buried tank and with the air-carbureting compartment.

3. In an apparatus for generating carbureted-hydrogen gas, the combination, with a furnace, steam-pipes within the fire-box thereof, a retort connected with one of said pipes and located above the said fire-box and containing refractory material, and a steam-generator connected with the other end of said pipes, of a chamber divided by a perforated partition into air and gas carbureting compartments, an air-supply for the former compartment, a pipe leading from the said compartment to the retort, a pipe leading from the retort to the gas-carbureting compartment, and an exit-pipe leading from the latter compartment.

4. In an apparatus for generating carbureted-hydrogen gas, a chamber divided by a perforated partition into two compartments, a pure-air pipe connected to one of the compartments below the surface of the oil-supply contained therein, a carbureted-air pipe leading from said compartment, an oil-supply pipe discharging into said compartment, a gas-pipe discharging into the other compartment below the surface of said oil-supply and the gas-discharge pipe, and a retort connected with the carbureted-air pipe and the gas-pipe.

412,967. SURFACE CATTLE-GUARD. PARKER MERRELL, St. Louis, Mich. Filed Aug. 12, 1889. Serial No. 320,510. (No model.)

Claim.—1. A surface cattle-guard comprising sections between and outside of the rails of the track, said sections being composed of transverse bars bent from stripe of metal, so as to have their sides converge from the base to the apex, and separated rods in two parts connected by turn-buckles, the ends of said rods being detachably attached to the transverse bars at the ends of the sections, substantially as set forth.



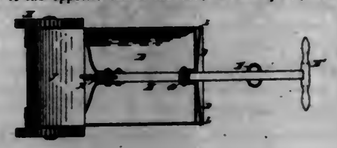
2. A surface cattle-guard comprising sections between and outside of the rails of the track, said sections being composed of strips of metal bent to form the transverse bars having their sides converging from the base to the apex, the ends of said bars contiguous to the rails being attached to said rails, said bars at the ends of the sections having a row of holes at or near the apex, and the separated rods made of two parts connected by turn-buckles, the ends of said rods being bent to form hooks which are detachably caught into said holes, substantially as set forth.

3. A surface cattle-guard comprising sections between and outside the rails of the track, said sections being composed of transverse bars having converging sides, the ends of said bars next to the rails being attached to the flanges of the rails by bolts attached to the sides of the bars at the end, and a clip-plate beneath the rails, through which said bolts pass, and separated rods supported by said bars, substantially as set forth.

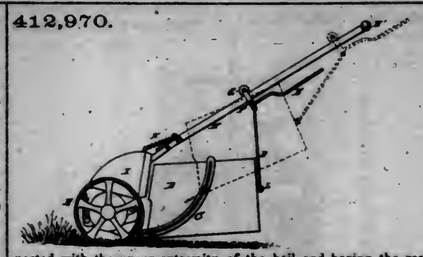
412,968. MAKING COMPRESSED YEAST. CHARLES MILDENBERGER, New York, N. Y. Filed Jan. 26, 1889. Serial No. 297,967. (No specimens.)

Claim.—The process herein described of making compressed yeast, consisting in washing a quantity of ale-yeast with a bath of a solution of bicarbonate of soda, so as to remove the hop-bitter from the same; second, mixing the washed ale-yeast with a sweet wash, freed from alkalies; next, skimming off the lighter yeast or froth, and then drawing off the liquid from the heavier yeast, mixing the froth or lighter yeast with the heavier yeast, and washing the mixture and subjecting the washed mass to pressure, whereby the moisture is removed and cakes are formed, substantially as described.

412,969. LAMP-EXTINGUISHING APPARATUS. JOSEPH MILLER, Olean, N. Y. Filed Jan. 16, 1889. Serial No. 296,381. (No model.)



Claim.—1. The combination of a lamp having inwardly-extending annular shoulder or flange, a loose disk resting upon said shoulder or flange, and a pendulum-weight secured rigidly to the center of the disk, with a movable extinguisher on the burner-tube and a rod depending therefrom and operated by the tilting of the disk, substantially as set forth.



2. The combination, with a lamp provided with a vertical tube attached to the bottom of the body, a disk loosely supported in the lamp below the said tube, and a sleeve adjustably held upon the wick-tube above the body-tube, of a pendulum-weight attached to the under side of the disk and a jointed rod connecting the disk and the wick-tube and passing upward from the body-tube of the lamp, all combined for operation as and for the purpose specified.

412,970. LAWN-MOWER. HORACE G. MILLER, Mount Vernon, Iowa. Filed July 6, 1889. Serial No. 316,702. (No model.)

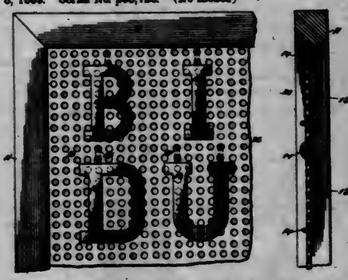
Claim.—In a grass-gathering device for lawn-mowers, the combination, with the mower, of the slotted segmental arms C, the box B, suspended therefrom by suitable bolts or studs, the bail D, connected to the opposite end of the box, the stirrup F, pivotally con-

412,970.

nected with the upper extremity of the bail and having the rearwardly-extending handle E, the mower-handle H, and the roller G, mounted in said stirrup and adapted to ride on said handle H, all substantially as and for the purpose set forth.

412,971. FIRE-ALARM BOX. GEORGE F. MILLIKEN, Boston, Mass. Filed Aug. 7, 1889. Serial No. 320,000. (No model.)

Claim.—1. A fire-alarm box provided with a keyless self-locking door or cover and an aperture covered with a plate of easily-fractured material, substantially as and for the purposes set forth.



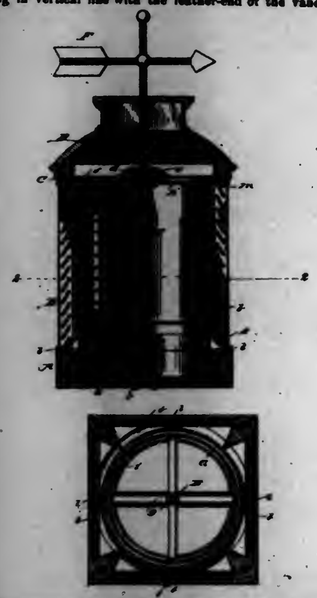
2. In a fire-alarm box, the combination of the box with a keyless self-locking door or cover having an aperture covered with a plate of easily-fractured material, substantially as and for the purposes set forth.

3. A fire-alarm box provided with a keyless self-locking door or cover, the means for locking and unlocking being upon the inside of the said box and door or cover, and an aperture covered with a plate of easily-fractured material, substantially as and for the purposes set forth.

4. In a fire-alarm box, the combination of the box with a keyless self-locking door or cover, the means for locking and unlocking being upon the inside of the said box and door or cover, having an aperture covered with a plate of easily-fractured material, substantially as and for the purposes set forth.

5. In a fire-alarm box, the combination of the box with a removable keyless self-locking door or cover, the means for locking and unlocking being upon the inside of the said box and door or cover, and an aperture covered with a plate of easily-fractured material, substantially as and for the purposes set forth.

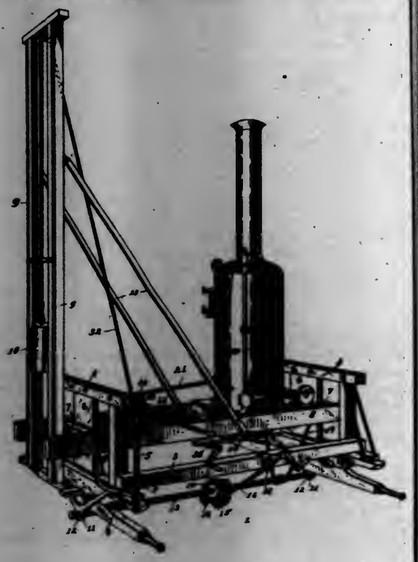
412,972. SIGN. FREDERICK MITCHELL, Yonkers, N. Y. Filed Jan. 8, 1889. Serial No. 295,736. (No model.)



Claim.—1. The combination, with the sign-plate having a series of perforations one above another, of a letter having a fixed curved stud or prong on its back, which is adapted to pass freely through said perforations, as shown and described, whereby said letter may be attached and held suspended against the face of the plate, and also detached, as specified.

2. As an article of manufacture, a letter having a fixed curved prong on its back, as and for the purpose specified.

412,973. VENTILATOR. CARL MIELENTZ, Dunning, Ill. Filed Feb. 5, 1889. Serial No. 299,776. (No model.)

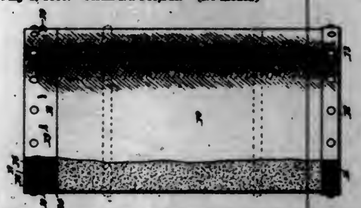


Claim.—1. In a ventilator, the combination, with a slatted cupola, of a shaft E, extending vertically through it, a drum G, and vane F, secured upon the shaft, said drum having a segmental opening *i*, cor-

responding in vertical line with the feather-end of the vane, as set forth.

2. In a ventilator, the combination, with a cupola having blind-slats on its sides and a closed roof and provided with a cross-brace *f*, having the anti-friction rollers *d* and *e*, and an inclined ring *h* and upright ring *j* at the base thereof, of a shaft E, extending vertically through the ventilator, and a drum G, secured to the shaft, having its lower edge projected into the space between the flanges or rings *h* and *j*, and provided with a segmental opening *i* and a vane on top of the shaft, as set forth.

412,974. **POST OR PILE DRIVING MACHINE.** MARTIN L. MOWERS and GEORGE W. MOWERS, Lucas, Ohio. Filed May 4, 1889. Serial No. 309,591. (No model.)



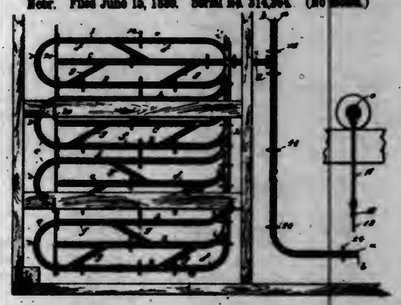
Claim.—1. In a post or pile driving machine, the combination, with the running-gear, of the frame mounted thereon, the tilting frame pivoted to said frame, the chains connected to the pivoted frame, and the shaft for drawing the chains and tilting the pivoted frame, substantially as and for the purpose described.

2. In a post or pile driving machine, the combination of the running-gear, the yokes depending therefrom, the shaft mounted in said yokes, the gear-wheel and worm for rotating said shaft, the frame mounted on the running-gear, the frame pivoted in said frame, and the chains connecting the pivoted frame with the shaft, substantially as and for the purpose described.

3. In a post or pile driving machine, the combination of the frame, the frame pivoted in said frame, the chains and shaft for tilting the pivoted frame, the derrick pivoted in the pivoted frame, the inclined bars connected to said derrick, the cross-bar connected to the inclined bars, and the sprocket chains and wheels for moving said cross-bar, substantially as and for the purpose described.

4. In a post or pile driving machine, the combination of the tilting frame, the motor mounted thereon, the band driven by said motor, the shaft rotated by said band, the shaft rotated by said shaft, the drum on the latter shaft, the clutch on the drum and shaft, the lever engaging the drum for shifting the same, the rope or chain passing around the drum, the weight connected to said rope, and the derrick for guiding said weight, all arranged and operating substantially as and for the purpose described.

412,975. **BARREL.** THOMAS I. NORMAN, West Point, Ga. Filed July 1, 1889. Serial No. 316,242. (No model.)



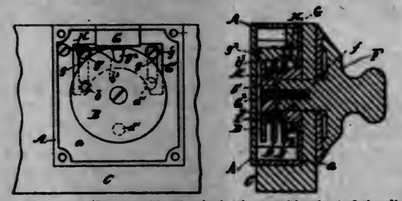
Claim.—1. As an improved article of manufacture, a barrel or package formed of fabric and having its upper edge turned inward, separable and removable inner and outer rigid head-sections between which said inturned portion extends, and removable fastenings extending down through the outer head-section and the inturned portion into the inner head-section, thereby connecting the outer head-sections together and to the said inturned portion, substantially as set forth.

2. As an improved article of manufacture, a barrel having its upper edge turned inward, separable and removable inner and outer head-sections between which said inturned portion is clamped, a hoop or band covering the joint between and secured to both of said two sections, substantially as set forth.

3. In a barrel, the combination, with a fabric body having a head fixed at one end, of an upper intermediate head and upper outer head, a hoop or band secured to the upper outer head, and staples uniting the intermediate and outer head and the body, substantially as shown and described.

4. In a barrel, the combination, with a seamless fabric body, a head fixed at one end, and an upper intermediate head upon which the upper end of the body is folded, of an upper outer head united to the upper face of the intermediate head, a band or hoop attached to the upper outer head, and staples uniting the two upper heads and body at the sides, substantially as shown and described.

412,976. **CARRYING APPARATUS.** JOHN O'BRIEN, Canada, Heir. Filed June 15, 1889. Serial No. 314,304. (No model.)



Claim.—1. In a meat-carrying apparatus, a set of parallel storage-tracks A B C, and a track A, with which the outer ends of all of said tracks communicate, as at *i*, stationary switch-tracks *g*, rigidly connecting the inner rails of the tracks A B with the rails of the intermediate track, substantially as set forth.

2. In a meat-carrying apparatus, the set or group of double-rail tracks A B C, communicating at their ends, as at *i*, with a track A, the opposite ends of the tracks A B being connected to form a continuous track, and the double-rail switch-tracks *g* between the rails of the inner track C and the inner rails of the outer tracks A B, substantially as set forth.

3. A meat-carrying apparatus consisting in the receiving and distributing track consisting in the parallel rails *a b*, the track A, the rails *c d*, connecting said tracks, and the series of storage-tracks, each comprising a set or group of double-rail tracks A B C, the rails of tracks A B being connected at their inner ends by a curved section and at their opposite ends communicating with the track A, as at *i*, and the central tracks of each group having switch-tracks *g* connecting with the rails of tracks A B, and communicating at their outer ends with the track A, the hangers suspending said tracks from the outer sides of their rails, and the carriers having flanged wheels and rods 11, passed between the rails, the switch and other rails being rigidly connected, substantially as set forth.

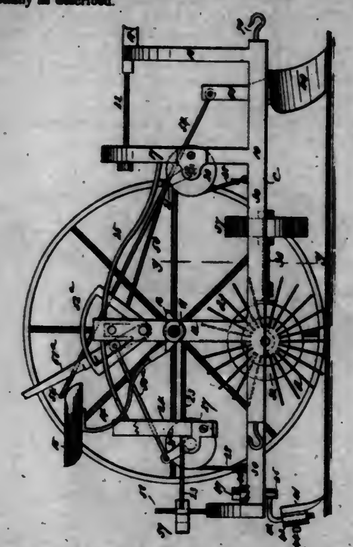
412,977. **PERMUTATION-LOCK.** WILLIAM F. PIPPEN, Cincinnati, Ohio. Filed Sept. 17, 1888. Serial No. 285,696. (Model.)

Claim.—1. In a combination-lock, the combination of the dial-stem *f*, having at its end the lug *f'*, and the tumbler-disk B, having hub *b'*, provided with groove *b²*, the lug *f'*, engaging any one of said grooves at will, and screw G^2, passing through tumbler B and screwed to stem *f* and binding the same together, and having its head at the rear side of the tumbler B, substantially as and for the purpose specified.

2. In a combination-lock, the combination of the stem-dial *f*, provided with end lug *f'*, and tumbler-disk B, having hub *b'*, carrying groove *b²* for receiving the lug *f'*, securing-screw G^2, hollow sleeve or hub A', provided with shoulder *a'* and inclosing stem *f*, and hub *b* of tumbler-disk B, and one or more tumblers D, rotatable on sleeve A' and held from lateral displacement by the tumbler B and shoulder *a'*, substantially as and for the purpose specified.

3. The combination of the casing A, having drum A', the bolt G, guide-frame G', arm g^5, retracting-spring H, disk D, having notches *d*, disk B, having notch b^5, and hub *b'*, having groove b^2, dial F, having stem *f*, provided with lug *f'*, and screw G, substantially as and for the purpose specified.

412,978. **PRODUCTION OF YELLOW DYE-STUFFS.** JAMES ROSENBERG, Mülheim, near Frankfort-on-the-Main, assignor to Leopold Cassella & Co., Frankfort-on-the-Main, Germany. Filed Apr. 13, 1889. Serial No. 306,966. (Specimens.) Patented in France Oct. 16, 1888, No. 193,522.



Claim.—As a new article of manufacture, the coloring-matter obtained by introducing alcohol radicals into the primary thiosated bases from paratoluidine and xylidine, which as chlorhydrate is soluble in water, alcohol, and diluted acid, and dyes mordanted cotton a bright yellow.

412,979. **PRODUCTION OF YELLOW COLORING-MATTERS.** JAMES ROSENBERG, Mülheim, near Frankfort-on-the-Main, assignor to Leopold Cassella & Co., Frankfort-on-the-Main, Germany. Filed Apr. 13, 1889. Serial No. 306,968. (Specimens.) Patented in France Oct. 16, 1888, No. 193,523.

Claim.—As a new article of manufacture, the yellow coloring-matter obtained by sulphonating the alkylated thio bases from paratoluidine and xylidine, dyeing cotton a bright yellow in alkaline bath, being in the form of an alkaline salt easily soluble in water, scarcely soluble in alcohol, with green fluorescence.

412,980. **COTTON-CULTIVATING MACHINE.** EDWIN B. RENTON, Burns, Tex. Filed May 3, 1889. Serial No. 309,807. (No model.)

Claim.—1. In a cotton-cultivating machine, the combination, with a main supporting-frame, of a frame adjustably connected thereto, a chopper-wheel carried by the adjustably-mounted frame, driving-wheels, also carried by the adjustably-mounted frame, and connections between said driving-wheels and the chopper-wheel, substantially as described.

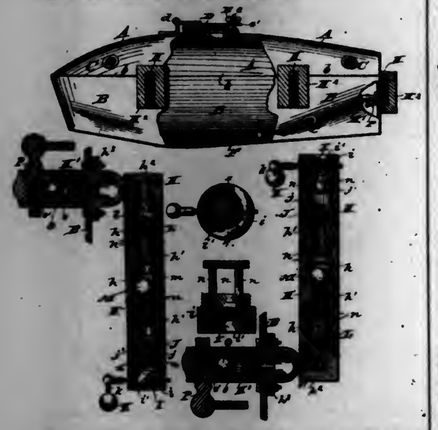
2. In a cotton-cultivating machine, the combination, with a main supplemental frame 10, of a frame 30, adjustably connected to the frame 10, a chopper-wheel 37, which is supported by the frame 30, driving-wheels 32 upon the supplemental frame, a gear 34, controlled by said driving-wheels, and a pinion 35, that is engaged by the gear and carried by the chopper-wheel shaft, substantially as described.

3. In a cotton-cultivating machine, the combination, with a main supporting-frame, of shafts 19 and 26, carried thereby, pulleys 20 and 27, supported by the shafts, chains or ropes 28, connected to the pulleys, a frame 30, connected to the chains or ropes 28, a shaft 36, carried by the frame 30, a chopper-wheel 37, mounted upon the shaft, a driving-shaft 31, driving-wheels carried thereby, a gear carried by the shaft 31, a pinion 35, carried by the shaft 36 and engaged by the gear 34, and a mechanism, substantially as described, for turning the shafts 19 and 26.

4. In a cotton-cultivating machine, the combination, with a main supporting-frame, of a frame 30, connected thereto, scraper-shovels carried by the frame 30, a chopper-wheel and the chopper-wheel-driving attachment, also carried by the frame 30, and cultivating-shovels, substantially as described.

5. In a cotton-cultivating machine, the combination, with a supporting-frame, of a frame 30, suspended therefrom, scraper-shovels carried by the frame 30, a chopper-wheel and means for driving it, also carried by the frame 30, cultivator-shovels adjustably connected to the frame 30, a means for raising the frame 30, and a lever 54, connected to the forward end of the frame 30 and fulcrumed in the main supporting-frame, substantially as described.

412,981. **SHOE-NAIL.** HOPKINS A. SANFORD, New Haven, Conn., assignor to the New Haven Nail Company, same place. Filed Sept. 24, 1888. Serial No. 286,171. (No model.)



Claim.—1. A nail for boot-heels, made from sheet metal, one end constructed in the form of a point *a*, the other end terminating in points *b c*, turned in opposite directions from the plane of the nail, the body of the nail between its two ends of irregular shape, substantially as described.

2. A flat nail for the heels of boots or shoes, made from a strip of sheet metal, pointed at its respective ends, the body of the nail between its two ends diagonally corrugated, substantially as described.

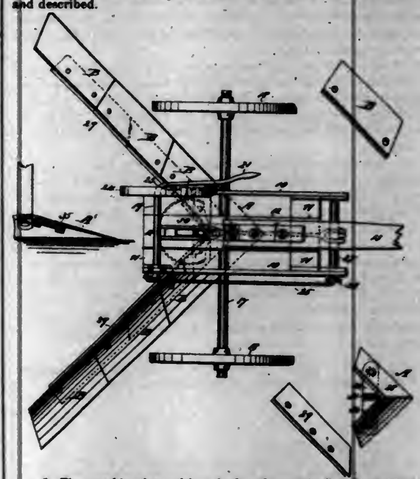
3. A nail for the heels of boots or shoes, made from a strip of sheet metal, one end terminating in a point *a*, the other end terminating in points *b c*, turned in opposite directions from the plane of the nail, the body of the nail between the two points diagonally corrugated, substantially as described.

412,982. LIFE-BOAT. PETER F. SCHENCK, Highland, N. J. Filed Feb. 9, 1889. Serial No. 299,243. (No model.)

Claim.—1. The combination, with a life-saving car, of one or more air-inlet tubes opening without and within the car, the outer parts of said air-tubes provided with valve-chambers having opposing perforate and imperforate seats, ball-valves placed in said chambers, and a self-acting sand-excluding valve fitted at the outer end of the tube, substantially as herein set forth.

2. The combination, with a life-saving car, of series of air-inlet tubes opening without and within the car, one or more of said tubes being set in reversed position relatively to the other tubes, and the outer parts of said air-tubes provided with valve-chambers having opposing perforate and imperforate seats, ball-valves placed in said chambers, and a self-acting sand-excluding valve fitted at the outer ends of the tubes, substantially as herein set forth.

3. The combination, with a life-saving car, of one or more air-inlet tubes comprising a main body portion H and a side spout H', provided with valve-chambers having opposing perforate and imperforate seats, and ball-valves J L O, placed in said chambers, said part H provided with a self-closing sand-excluding valve I, substantially as herein set forth.

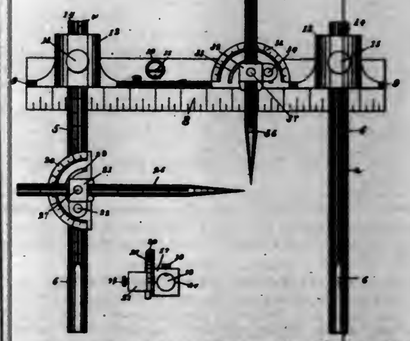


4. The combination, with a life-saving car, of one or more air-inlet tubes comprising a main body portion H and a side spout H', provided with valve-chambers having opposing perforate and imperforate seats, valves L O and J or M, placed in said chambers, a self-acting sand-excluding valve I at the outer end of part H, and a plug-valve P at the inner part of the spout H', all arranged for operation substantially as herein set forth.

5. In a life-saving car, the air-inlet tubes provided at their outer ends with a self-acting valve I, the box of which has a guard-plate i' outside the valve and provided with a beveled inner face, substantially as herein set forth.

412,983. WEED-CUTTER. ERNST SCHMIDT, Marysville, Cal. Filed May 18, 1889. Serial No. 311,315. (No model.)

Claim.—1. In a weed-cutter, the combination, with a body, a forward and a rear rock-shaft journaled upon the said body, a link connecting the said rock-shafts, and a vertical post connected with the rear rock-shaft, of an angular share secured to the said vertical post near its point and a pitman connecting the said post above the share with the forward rock-shaft, substantially as shown and described, whereby, when the rear rock-shaft is manipulated to raise or lower the share, the heel of the share will rise or fall in a line parallel with the point, as specified.

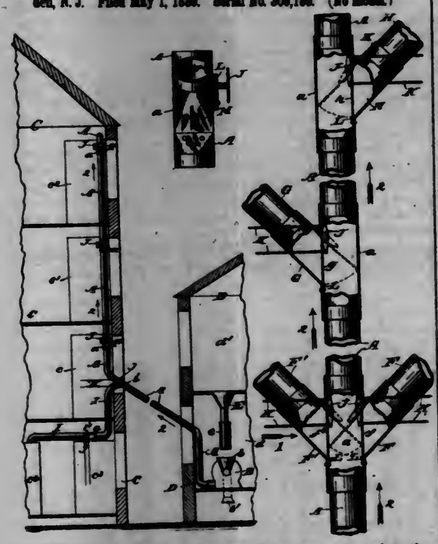


2. The combination, with a body, of a vertically-adjustable angled share carried thereby, said share comprising a series of cutting-blades and tie-plates or frogs secured to the under face of said blades and rigidly holding the opposed ends in contact, substantially as shown and described.

3. The combination, with a body, of a vertically-adjustable angled share carried thereby, said share comprising a series of cutting-blades and a series of tie-plates or frogs secured to the under side of said blades, holding the ends thereof in rigid contact, the said tie-plates being arranged to break joints with the blades, and means, substantially as shown and described, for raising and lowering the said share, as set forth.

4. A sectional share for weed-cutters, comprising an angled point, a series of side blades, and a series of tie-plates or frogs secured to the under side of the several blades, and the vertical post or standard provided with laterally-extending members adapted to be secured to the under side of the angle tie-bar or frog, substantially as shown and described.

412,984. INSTRUMENT FOR TAKING AND TRANSFERRING MEASUREMENTS. JOHN H. W. SCHMIDT, Davenport, Iowa. Filed June 5, 1889. Serial No. 313,252. (No model.)



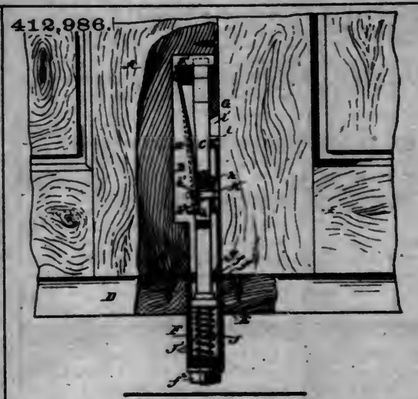
Claim.—1. In an instrument for measuring surfaces or objects and for transferring measurements from drawings to actual work, and vice versa, the combination of the graduated standards, movable holder on one of the standards, and indicator-point holder attached to said movable holder moving around a fixed center therein, a graduated indicator-point movably attached to such indicator-point holder, a graduated semicircle-plate attached to the holder on said standard, a head-block upon each standard, a graduated cross-bar carried by such head-block, a spirit-level in such cross-bar movable around a fixed center, a holder and graduated semicircle-plate movably carried on such cross-bar, an indicator-point holder attached to such holder and plate moving around a fixed center therein, a graduated indicator-point movably attached to each indicator-point holder, and a base index-finger on each standard in line of all center points, substantially as described.

2. In an instrument for measuring surfaces or objects and for transferring measurements from drawings to actual work, and vice versa, in combination with a graduated cross-bar, cross-heads and standards, the movable holders, one carried upon the standard and the other carried upon the cross-bar, each provided with a semicircle-plate indicating degrees, and an indicator-point holder moving around a fixed center, and each indicator-point holder provided with a movable graduated indicator-point, substantially as described.

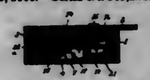
3. In an instrument for measuring surfaces or objects and for transferring measurements from drawings to actual work, and vice versa, in combination with a graduated cross-bar, cross-heads and standards, the movable holder and semicircle angle-plate provided with the pendent finger-index, and the indicator-point holder with the vertical index-finger carrying the movable graduated indicator-point, and attached to such movable holder to move around a fixed center of the diameter of said semicircle angle-plate, substantially as described.

4. In an instrument for measuring surfaces or objects and for transferring measurements from drawings to actual work, and vice versa, in combination with a graduated cross-bar, cross-heads and standards, the movable holder on the standard and semicircle angle-plate, and the indicator-point holder with index-finger carrying the movable graduated indicator-point, and attached to such standard movable holder to move around a fixed center of said semicircle angle-plate, substantially as described.

412,985. PNEUMATIC CONVEYER. CHARLES H. SCHNEIDER, Camden, N. J. Filed May 1, 1889. Serial No. 309,189. (No model.)



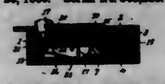
Claim.—1. A pneumatic conveyer for carpet, yarn, and woolen mills, consisting of a blower B, located in the picker-room and having a feanel *b* for the staple, a tube A, leading from the blower to the several stories of the mill and provided with branches F F', valves *f f'*, hinged at their upper ends and extending downwardly over the branch openings, cross-bars J, connected to said valves and provided with cords for operating them, and the receiving-boxes on the several floors into which the branch pipes discharge, substantially as set forth.



2. In pneumatic conveyers, the combination, with main-line and branch pipes and a flap-valve hinged at their junction and provided with a cross-bar J and pull-cords K, of a ratchet L on the valve-stem, a spring-pressed pawl M, adapted to the ratchet, and pull-cords N O, connected to the pawl, substantially as herein set forth.

412,986. BOLT. LOUIS SCHOEN and SIMON FRIEDMEYER, New York, N. Y. Filed Mar. 30, 1889. Serial No. 305,230. (No model.)

Claim.—The plate G, having bearings for the door-bolt C, in combination with said bolt, spring H, and push-button K, attached to the spring and held in a recess in the plate G, substantially as described.



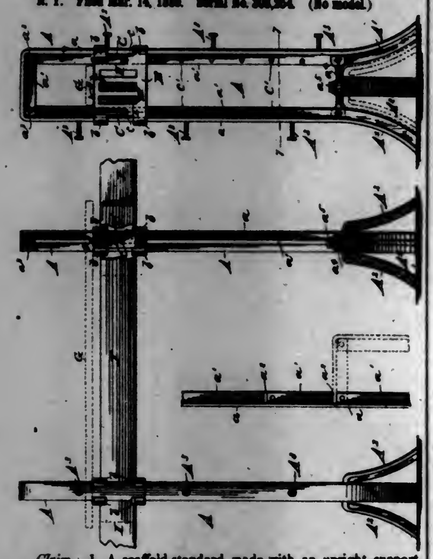
412,987. SASH-FASTENER. FERDINAND F. SCHUMANN, Brooklyn, N. Y. Filed Mar. 29, 1889. Serial No. 305,226. (No model.)

Claim.—1. In a sash-lock, the combination, with a bevel-nosed stump adapted for attachment to the casing, of pivoted locking-catches carried by the sash, springs acting to throw said catches to the locked position, and a sliding finger-piece having lugs engaging the locking-catches and acting when said finger-piece is moved to throw them outward to disengage the stamp.

2. The combination, with stump 4, beveled upon the sides and back, of pivoted locking-catches upon the sash having inclined shoulders 12 and cut-away portions 21, springs 10, acting to hold said catches in the locked position, a loosely-suspended spring locking-plate having upwardly-curved ends, and a finger-piece having lugs 13, engaging shoulders 12, and a lug 17, engaging the lower end of the locking-plate, whereby, when the parts are moved to the locked position, the lower end of the locking-plate is lifted between the spring-catches, retaining them in the locked position, and when the finger-piece is operated the locking-catches are thrown to the unlocked position and the lower end of the locking-plate pressed downward so that the locking-catches swing over it.

412,988. SASH-FASTENER. FERDINAND F. SCHUMANN, Brooklyn, N. Y. Filed Mar. 30, 1889. Serial No. 305,229. (No model.)

Claim.—1. In a sash-lock, the combination, with a bevel-nosed stump adapted for attachment to a window-sill, of pivoted locking-catches upon the sash, springs acting to throw said catches to the locked position, and a swinging finger-piece having lugs projecting inward and acting when said finger-piece is swung outward to disengage the locking-catches from the stump.



2. The combination, with a bevel-nosed stump adapted for attachment to the sill, of pivoted locking-catches carried by the sash, each of which is provided with an inclined shoulder, springs acting to throw said catches to the locked position, and a swinging finger-piece having inwardly-projecting lugs which engage said shoulders, and thereby disengage the catches from the stump.

3. The combination, with stump 4, having inclines 5 and 7, of pivoted locking-catches upon the sash having inclined shoulders, as shown, springs holding said catches in the locked position, a swinging finger-piece having inwardly-extending lugs adapted to engage said shoulders, a loosely-suspended spring locking-plate having upwardly-curved ends, which is tilted by the engagement therewith of incline 7 upon the stamp, and means, substantially as described and shown, for moving said plate out of operative position.

4. The combination, with stump 4, having inclines 5 and 7, of pivoted locking-catches upon the sash having inclined shoulders, as shown, springs to hold said catches in the locked position, a swinging finger-piece having inwardly-extending lugs adapted to engage said shoulders, a loosely-suspended spring locking-plate having upwardly-curved ends, which is tilted by the engagement of incline 7, and a push-pin projecting through the case and engaging the upper end of

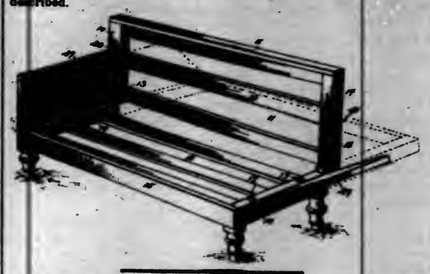
said locking-plate, whereby said plate is pressed beyond the plane of the locking-catches to permit the latter to be disengaged from the stump by the movement of the finger-piece.

412,989. SCAFFOLD-STANDARD. THOMAS SEXSMITH, New York, N. Y. Filed Mar. 14, 1889. Serial No. 303,254. (No model.)

Claim.—1. A scaffold-standard made with an upright support, and a block thereon provided in its body portion with one or more openings adapted to sustain ordinary scaffold-planks set edgewise, and having a supporting-face of sufficient width to safely sustain one of said planks flatwise, substantially as herein set forth.

2. A scaffold-standard made with an upright support, and a block thereon provided in its body portion with two or more independent vertically-ranging slots or openings, each adapted to sustain the end of an ordinary scaffold-plank set edgewise, said block having a supporting-face of sufficient width to safely sustain one of said planks flatwise, substantially as set forth.

3. A scaffold-standard made with an upright support, a block vertically adjustable thereon and provided in its body portion with an opening adapted to sustain ordinary scaffold-planks set edgewise, and having a supporting-face of sufficient width to sustain one of said planks flatwise, and a detent for the block on the support, substantially as herein set forth.



4. A scaffold-standard made with an upright support, a block vertically adjustable thereon and provided in its body portion with two or more independent vertically-ranging slots or openings, each adapted to receive an ordinary scaffold-plank set edgewise, said block having a supporting-face of sufficient width to sustain one of said planks flatwise, and a detent for the block on the support, substantially as herein set forth.

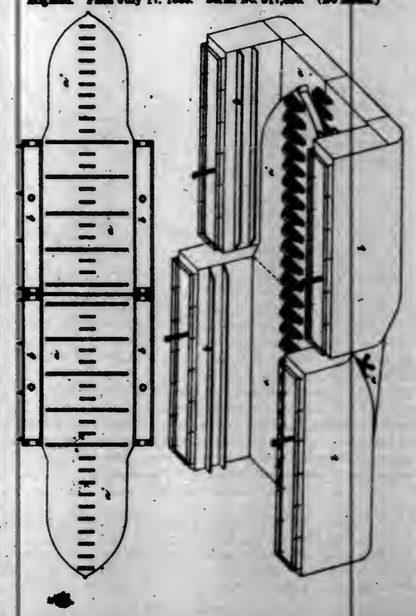
5. A scaffold-standard made with an upright support formed as an open frame, a block vertically adjustable on the frame and provided in its body portion with one or more openings adapted to sustain ordinary scaffold-plank set edgewise, and having a supporting-face between the opposite sides of the frame of sufficient width to sustain one of said planks flatwise, and a detent sustaining the block on the open-frame upright, substantially as herein set forth.

6. A scaffold-standard made with an upright support formed as an open frame provided at its lower end with two legs or feet in the plane of the frame, and provided also with another pair of legs or feet swiveled to a lower cross-piece of the frame and adapted to be swung around at right angles to the plane of the frame and to fold in like plane therewith, combined with a block held to the frame and adapted to sustain scaffold-planks, substantially as described, for the purposes set forth.

412,990. SOFA-BED. GEORGE H. BUNNELL, Guelph, Ontario, Canada. Filed Nov. 9, 1888. Serial No. 290,376. (No model.)

Claim.—The combination, with the base-frame 10, provided with apertures 17 18, of different inclinations, in their end pieces, and the back frame 11, hinged to the base-frame 10, as shown, of detachable end arms 27, provided with rods adapted to enter the apertures 17 18, said arms each provided with a straight edge 28 and an inclined edge 29, said inclined edges adapted to be adjusted for contact with the hinged back frame when used as a sofa-back and adjusted with said inclined edges outward when used as a sofa-bed, and means for holding said ends and hinged back in position, substantially as and for the purpose described.

412,991. RULING-PEN. JONAS S. SOUDER, New York, N. Y. Filed Feb. 21, 1889. Serial No. 300,663. (No model.)

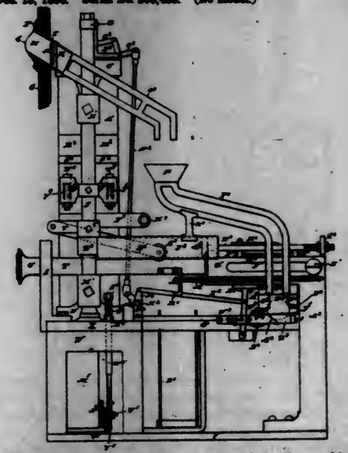


Claim.—1. A ruling-pen comprising a socket consisting of a split ring, resilient jaws extending from said socket, and bearing-points upon the inner sides of said jaws intermediate of said socket and the free ends of the jaws, substantially as specified.

2. A ruling-pen comprising a socket consisting of a split ring, resilient jaws extending from said socket, and bearing-points upon the inner sides of the jaws intermediate of said socket and the free ends of the jaws, the whole being formed from a single piece of metal, substantially as specified.

3. The combination, with a ruling-pen comprising a socket consisting of a split ring and resilient jaws extending from said socket, provided with bearing-points upon their inner sides, of a handle comprising a tapering spreader portion adapted, when inserted through the socket, to contact with said bearing-points to spread the jaws, substantially as specified.

412,992. FLOATING-DOCK. JOHN SPARKHALL, Westminster, England. Filed July 17, 1889. Serial No. 317,880. (No model.)



412,992.

Claim.—A floating-dock separable into two or more portions, such portions having along part of their length raised sides a sufficient distance apart to receive between them that portion of another section which is without raised sides, so that one portion can be docked upon the other.

412,993. AUTOMATIC VENDING-MACHINE. JOHN C. SEVERS, Mount Vernon, assignor to John F. Lovejoy, New York, N. Y. Filed Dec. 13, 1886. Serial No. 203,662. (No model.)

Claim.—1. In an automatic vending-machine, the combination, with a vertically-movable holder, of a hook secured to the upper end thereof, a swinging hook for engagement with the holder-hook, an operating slide-bar for operating the machine, and connection between such swinging hook and slide-bar, substantially as set forth.

2. In an automatic vending-machine, the combination, with a vertically-movable holder, of a hook secured to the upper end thereof, a swinging hook for engagement with the holder-hook, an operating slide-bar, and connections between the swinging hook and operating slide-bar, including links, a bell-crank lever, a rock-shaft carrying rock-arms, and a long connecting-rod, substantially as set forth.

3. The combination, with a trip having a nose and tail and adapted to be moved so as to depress its nose and elevate its tail, of an adjusting device—such as the screw H^2—operating-connections attached to the trip, a pawl engaging with the nose and tail of the trip, and a movable part carrying the pawl, whereby when such part is moved the pawl positively moves the trip, which frees itself from the pawl by its tail, substantially as set forth.

4. In an automatic vending-machine, the combination, with a vertically-movable holder, of an operating-lever and an adjustable cam carried by such operating slide-bar for lifting the holder, substantially as set forth.

5. In an automatic vending-machine, the combination, with a vertically-movable holder, of an operating slide-bar, a cam carried thereby, and a pivotal arm engaged by such cam and connected with the holder to lift the same, substantially as set forth.

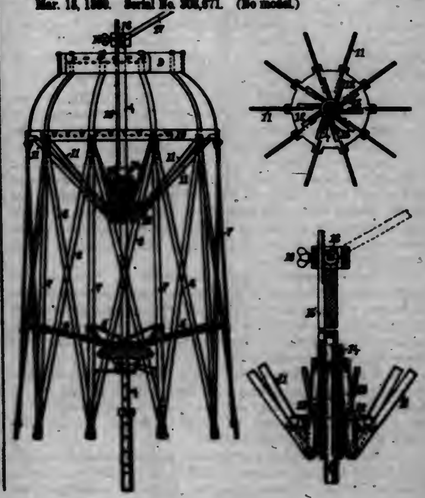
6. The combination, with a vertically-movable holder, of suspension mechanism, substantially as described, located at the upper end thereof and to which the holder is detachably connected, lifting mechanism, substantially as described, connected with the holder, an operating slide-bar connected with both the said mechanisms and adapted to detach and drop the holder and to restore it to its raised position, uprights located on opposite sides of the holder, and guides mounted on the said uprights and receiving guiding-extensions carried by the holder, substantially as described.

7. In an automatic vending-machine, the combination, with a vertically-movable tubular holder adapted to contain and deliver singly a series of articles to be vended, of uprights between which it is located, guides secured to such uprights for guiding the holder, buffers carried by the uprights, and buffer-heads secured to the holder on its opposite sides, substantially as set forth.

8. In an automatic vending-machine, the combination, with an operating slide-bar, of an unlocking-pawl, such operating slide-bar being adapted to positively move a coin edgewise, whereby the coin operates the pawl to unlock the operating slide-bar, substantially as set forth.

9. In an automatic vending-machine, the combination, with an operating slide-bar having a coin-recess, of a pawl normally locking the operating slide-bar and located below it, so as to partially close the lower end of its recess and support a coin therein until the coin is positively moved by the operating slide-bar to displace the pawl and unlock the operating slide-bar, substantially as set forth.

10. In an automatic vending-machine, the combination, with an operating slide-bar having a coin-recess, of a pawl normally locking the operating slide-bar and located below it, so as to partially close the lower end of its recess, and provided with a bevel, upon which the coin rests and against which it is pressed by the operating slide-bar to displace the pawl and so unlock the operating slide-bar, substantially as set forth.



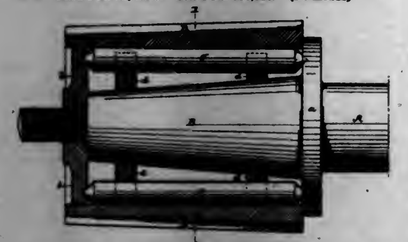
11. In an automatic vending device, the combination, with an operating slide-bar, of a gravity safety-pawl carried thereby, a rigid rack for engagement by such pawl, and a rail having an incline at one end to lift the pawl above the rack in the normal forward movement of the operating slide-bar, substantially as set forth.

12. In an automatic vending mechanism, the combination, with a sleeve, of two wheels, one of which is rigid and the other loose thereupon, a driven shaft passing through the sleeve, a snail-cam secured to the shaft, an oscillating lever actuated by such cam for operating the rigid wheel, and hence rotating the sleeve, a snail-cam carried by the sleeve and rotating therewith, and an oscillating lever actuated by the cam last mentioned and actuating the loose wheel in rotation, substantially as set forth.

13. In an automatic vending-machine, the combination, with a vertically-movable holder adapted to carry a number of blanks, of two type-wheels, an inking-ribbon, two spools, respectively located on opposite sides of the wheels, spool-frames removably secured in place, a ratchet-wheel carried by the spindle of one of the spools, a pawl normally disengaged from such ratchet-wheel, and an operating slide-bar for operating the holder and actuating such pawl, substantially as set forth.

14. In an automatic vending device, the combination, with a case having an indicator-opening and a coin-slot, of an indicating-slide adapted to be displayed through such opening, a slide to obstruct the coin-slot, a holder, a follower located therein, a weight located in the follower, having a projecting ear and normally supported by the contents of the holder, fingers adapted to be engaged by the ear when the weight drops after the removal of the last article from the holder, and connections between such fingers and slides for operating the latter, substantially as set forth.

412,994. DERRICK-CRANE. JOHN B. BROWN, Providence, R. I. Filed Mar. 18, 1889. Serial No. 303,671. (No model.)



Claim.—1. In a dress-form, the combination, with the standard, the spider 12, the vertical ribs, and the hinged radial braces, of the block 14, connected with the radial braces by strips, the rack-bar 15, the pinion 16, the crank 17, and clamp 18, constructed to adjust the dress-form by raising or lowering the block, as described.

2. The combination, with the central standard, the vertical ribs, the waistband, and hip-band of a dress-form, of radial braces pivotally secured to the vertical ribs at their outer ends, hinged on a spider secured to the central standard near their inner ends and connected by connecting-strips with a block sliding on the central standard, said sliding block provided with a rack operated by a pinion at or near the upper end of the dress-form to adjust the form, as described.

3. The combination, with the standard 4, the vertical ribs 7, the cross-ribs 8, the radial braces 5, and block 6, of the radial braces 11, pivoted at their outer ends to the vertical ribs hinged in the spider 12 and connected with the sliding block 14 by the strips 13, the block 14 being operated to adjust the form by the rack-bar 15, as described.

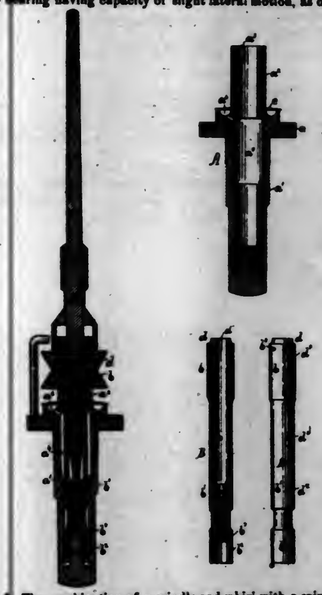
4. A dress-form consisting of the central standard 4, the vertical ribs 7, the cross-ribs 8, the block 6, the radial braces 5, connecting the vertical ribs with the block, the waistband 9, and hip-band 10, the spider 12, braces 11, the connecting-strips 13, the sliding block 14, rack-bar 15, pinion 16, the crank 17, and clamp-screw 18, as described.

412,995. JOURNAL FOR VEHICLES. THOMAS H. SUBERS, Philadelphia, Pa., assignor of three-fourths to Samuel B. Coughlin, Burlington, N. J. Filed Feb. 15, 1889. Serial No. 300,016. (No model.)

Claim.—1. The combination of the axle and its journal, the series of rings or collars mounted on said journal, and a series of rollers adapted to bearings in said rings or collars and forming the bearings for the journal-box of the wheel, but free from contact with the journal, substantially as specified.

2. The combination of the axle and its journal, the rings or collars mounted upon said journal, the rollers adapted to bearings in said rings or collars and serving as bearings for the journal-box of the wheel, and flanges or collars serving as bearings for the ends of said rollers and confining them in position longitudinally, substantially as specified.

3. The combination of the axle and its journal, the rings or collars mounted thereon and having in their outer peripheries segmental recesses each of greater extent than a half-circle, and rollers having their bearings in said segmental openings and serving as the bearings for the journal-box of the wheel, substantially as specified.



412,996. SUPPORT FOR SPINNING-FRAME SPINDLES. GUSTAVUS E. TAFT and HENRY F. WOODWARDT, Whitinsville, assignors, by mesne assignments, to the Sawyer Spindle Company, Boston, Mass. Filed Oct. 3, 1885. Serial No. 178,913. (No model.)

Claim.—1. A combined bolster and step having its upper part of a diameter to closely fit the bolster-case above and below the center of the whirl, and its lower end provided with a chamber and an elastic disk placed within said chamber, in combination with a bolster-case provided with an internal stem projecting upward from its bottom to support the bolster upon its elastic disk, substantially as and for the purpose described.

2. The combination of a spinning-spindle and its whirl, and a bolster-case provided with an internal stem projecting upward from its bottom, with a combined bolster and step having a chamber and elastic disk in its lower end, its upper part *b* forming a cylinder to fit closely into the bolster-case above and below the center of the whirl, as and for the purpose described.

3. A spindle-support consisting of a combined bolster and step, and the bolster-case supporting and inclosing it and forming a close-fitting bearing for the bolster above and below the center of the whirl, and a loose fit on the lower portion of the bolster, in combination with a spindle and whirl, as described.

4. The combination of a spindle and whirl with a spindle-support consisting of a bolster-case constructed to be secured to a spinning-machine and form an oil-reservoir from which oil is supplied to the spindle-bearings and bolster and step bearings contained in said case, the bolster-bearing being firmly held in the bolster-case against lateral motion above and below the center of the whirl, and the lower or step bearing having capacity of slight lateral motion, as described.

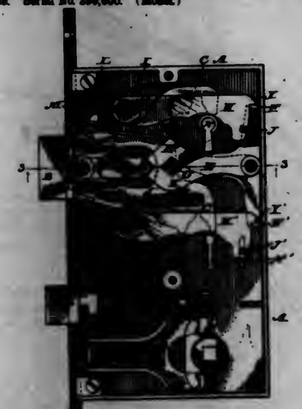
5. The combination of a spindle and whirl with a spindle-support consisting of a bolster-case forming an oil-reservoir, and a bolster-tube containing the bolster and step bearings held in the bolster-case firmly against lateral motion above the whirl and below the same, the step portion being of less diameter than the interior of the bolster-case, and an elastic or yielding cushion supporting said bolster and step bearing, as described.

6. The combination, with the bolster-case A and the bolster-tube B, rigidly secured in the bolster-case against axial or lateral motion near the upper end, of an elastic or yielding material supporting said bolster-tube to form a yielding vertical bearing for the spindle, as and for the purpose set forth.

7. The combination, with the bolster-case and the sleeve whirl-spindle, of the tube B, containing bolster and step bearings for the spindle, the said tube being fixed in the bolster-case at *b* opposite the bolster-bearing within the sleeve-whirl to resist the band-pull and supported within the chamber of the bolster-case, the said bolster-bearing extending both above and below the center of the whirl, substantially as described.

8. The combination, with the sleeve whirl-spindle, of a tube B, containing the bolster and step bearings of the spindle, and a support for the said tube supporting the latter within the whirl to resist the band-pull, the said tube extending below the point of its support, and the bolster-bearing extending both above and below the center of the whirl, substantially as described.

9. A sleeve whirl-spindle and a rigid bolster or support therefor below its junction with the whirl, combined with a step and means to support the same loosely and permit it to move laterally with the foot of the spindle.



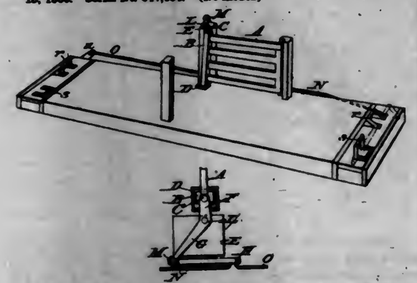
10. The combination, with a sleeve whirl-spindle, of a bolster case or support having a rigid bearing therein for the spindle, the sleeve-whirl surrounding the said bearing so that the band pulls the spindle against the said rigid bearing, and a step mounted loosely in the bolster case or support to move laterally therein with the foot of the spindle.

11. The combination, with a holder having a rigid bearing therein and a spindle, of a cushioned step-bearing having both vertical and lateral motion in or with relation to the said holder.

12. The combination of a bolster-case with bolster and step bearings placed therein, the said case having an oil-chamber and constructed to hold the bolster or upper bearing against axial or lateral motion, and the step or lower bearing having lateral motion.

13. The combination, with the bolster-case and the bearing-tube rigidly secured in the bolster-case against axial or lateral motion near the upper end, of an elastic or yielding support for the said bearing-tube to form a yielding vertical bearing for the spindle.

412,997. LOCK. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Feb. 12, 1889. Serial No. 299,600. (Model.)



Claim.—1. In a key-lock, the combination, with the bolt and two independent sets of tumblers, of two movable dogs and a fence upon each dog adapted to enter the gatings of the tumblers when set in alignment, and a separate key to operate each set of tumblers and the bolt, substantially as set forth.

2. In a lock, the combination of a bolt, a movable stamp, and two movable dogs, substantially as set forth.

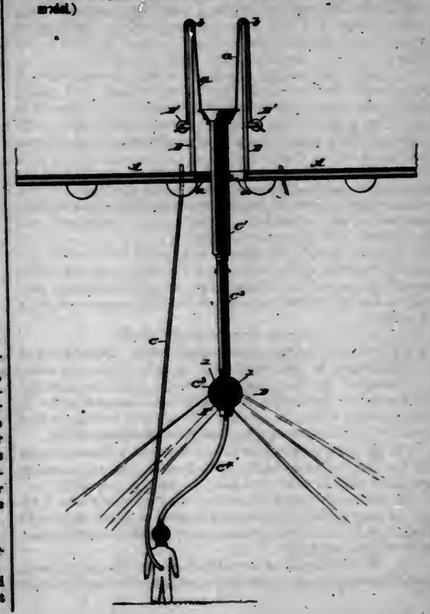
3. In a lock, the combination of a bolt provided with key-arms C C', two independent tumbler mechanisms, two independent keys, a movable stamp upon the bolt, and movable dogs engaging with the stamp at one end and with tumbler mechanism at the other end, so as to hold the bolt either in the locked or unlocked position, the whole so arranged that each key will operate one set of tumbler mechanism, one of the movable dogs, and the bolt, substantially as set forth.

4. In a lock, the combination of a bolt carrying a movable stamp, with a movable dog carrying a fence, and a tumbler mechanism, substantially as set forth.

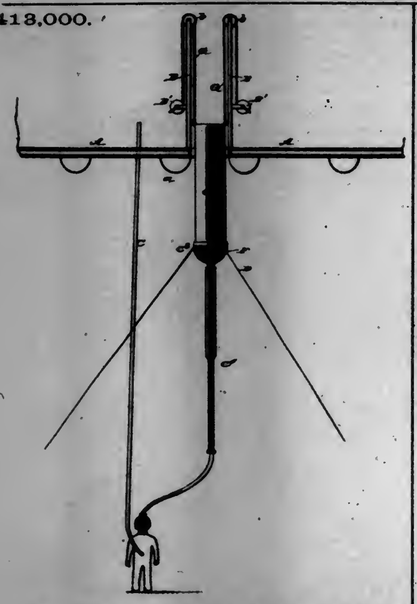
412,998. GATE. ISAAC M. THOMPSON, Franklin, Ind. Filed July 15, 1889. Serial No. 317,631. (No model.)

Claim.—The combination of the gate having an upper and a lower vertical pivot at one of its edges, the fixed bearing for the lower pivot, the gate-post, the bent lever pivoted to the post so as to swing horizontally across its top, and forming at one end a shifting bearing for the upper pivot of the gate, the lever pivoted to the outer edge of the post so as to swing in a vertical plane thereon, and having at its upper end the swivel-coupling M, and the pair of double-cranked shafts mounted in bearings on opposite sides of the gateway, and each having an arm which is connected with the lower end of the vertical lever by a connecting-rod, all being arranged to co-operate substantially as and for the purpose specified.

412,999. OBSTETRICAL APPLIANCE. JOHN P. TURNEY, Arlington, Oreg. Filed Feb. 4, 1889. Serial No. 299,067. (No model.)



Claim.—1. An obstetrical harness consisting of a back-pad B and an abdominal pad A, loosely connected, so as to have independent action, shoulder-loops connecting with the back-pad, and stirrups or foot-supports connecting with the abdominal pad to give a tightening action and downward progressive motion to the abdominal pad, as described.



2. An obstetrical harness consisting of a back-pad B and an abdominal pad A, loosely connected, shoulder-loops connected to the back-pad, and stirrups and hand-holds connected to the abdominal pad, the hand-holds being extended through a roller or loop of the stirrup-straps, as described.

3. The combination, with the stirrup-straps and the shoulder-straps, of the back-pad B, with plate A^3 connected to it by straps and buckles, the link-bars D D, and the abdominal pad A, having plate A^4 connected to it by straps and buckles and jointed to the links D D, and the underlying pad or shields X, substantially as shown and described.

413,000. SUBMARINE DIVING APPARATUS. FRANK VANSHAN, Elizabeth City, N. C. Filed Feb. 23, 1889. Serial No. 301,569. (No model.)

413,000.

Claim.—1. In an apparatus substantially as described, the combination of the diver's armor, casing, or inclosure, the air-supply tube leading thereto, the air-discharge tube leading therefrom, a transparent lamp-holder supported between lengths of said air-discharge tube at a point above the armor, casing, or inclosure and below the surface of the water, and a lamp supported in said holder, whereby to serve the double purpose of an illuminator and a draft-producer, substantially as set forth.

2. In an apparatus substantially as described, the diver's armor, casing, or inclosure and the tube supplying air thereto, combined with the air-discharge tube having a submerged transparent lamp-holder arranged at a point above the armor, casing, or inclosure, and a reflector or reflectors, whereby the light from the lamp in said holder may be cast downward, substantially as set forth.

3. In an apparatus substantially as described, the combination of the diver's armor, casing, or inclosure, the air-supply pipe leading thereto, the air-discharge tube leading therefrom and having at its upper end a cylinder-like section or sections, and provided at the lower end of the same with a glass globe-like lamp-holder, substantially as set forth.

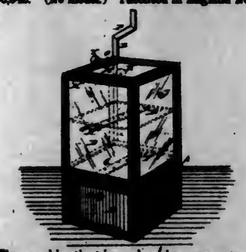
4. An apparatus substantially as described, consisting of the diver's armor, casing, or inclosure, the air-supply pipe leading thereto, the air-discharge pipe, the transparent lamp-holder arranged above the casing, armor, or inclosure, the lamp arranged in said holder, and the reflectors arranged above said lamp.

5. In an apparatus substantially as described, the combination of the diver's armor, casing, or inclosure, the boat or support having a well-like opening, the air-supply pipe, the air-discharge pipe movable through the well-like opening, and hoisting devices, substantially as set forth.

418,001. TOOTH-CLEANING IMPLEMENT. JOSEPH A. WALSH, Philadelphia, Pa. Filed July 8, 1889. Serial No. 316,823. (No model.)

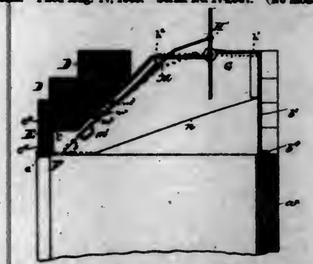
Claim.—1. The combination of the rubber band with the holder, comprising two arms having near their outer ends openings for the reception of the band, and provided with means for holding the band in position at the outer ends of the arms, substantially as specified.

2. The combination of the rubber band with a holder comprising two arms, means for supporting the band thereon, and a yoke for governing the expansion of the arms, substantially as specified.



3. The combination of the rubber band, the elastic arms carrying the same and having an inherent tendency to spread apart, and a confining-yoke movable on the arms and tending to contract the same, substantially as specified.

4. The combination of the rubber band with the carrying-arms therefor, having enlarged ends with openings for the reception of the band, and slots to permit the passage of the band into said openings, substantially as specified.

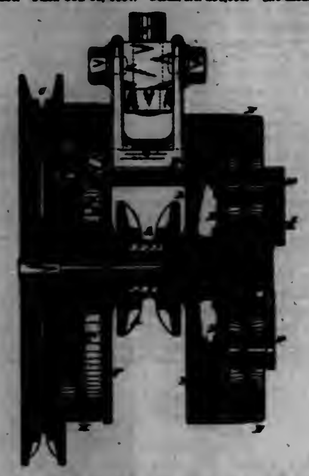


5. The combination of the rubber band with the holder, consisting of a recessed handle, and band-holding arms pivoted to said handle so as to be turned down into the same, said arms having near their outer ends openings for the reception of the band, and means for retaining said band, substantially as specified.

418,002. CHECK-RECEIVING APPARATUS. JOHN R. WARD, Kensington, County of Middlesex, England. Filed Nov. 30, 1887. Serial No. 256,542. (No model.) Patented in England Nov. 16, 1887, No. 15,732.

Claim.—The combination, in a checking apparatus, of the tubing L, fitted into the top of said checking apparatus, of a valve connected with said tubing, of the speaking-tube O, the breaks P, fitted with pieces of india-rubber or other compressible material Q, and means whereby said tubing may be run together, substantially as set forth.

418,003. FIRE-PLACE. CHARLES A. WELLINGTON, Lexington, Mass. Filed Aug. 17, 1888. Serial No. 174,567. (No model.)



Claim.—1. The fire-place top or hood B, having an inclined front wall or plate *b*, provided near its lower edge with the angular brick-support C, having a horizontal ledge above the bottom of the said hood for the bricks to rest on, and below said ledge a vertical wall to support or steady the tiles or the backing therefor, substantially as set forth.

2. The combination, with a fire-place provided with a flanged tile-supporting angle-plate *c*, of the fire-place top or hood B, having an inclined front wall provided near its lower edge with the angular brick-support C, having a horizontal ledge above the bottom of the said top or hood for the bricks to rest upon, and below said ledge a vertical wall to steady or support the tiles or tile-backing resting on the said angle-plate, substantially as set forth.

3. The combination, with the fire-place top or hood B, having the opening G, the front plate or wall of said hood being provided with the wedge-shaped ribs m^2 and the plate m^3, of the centrally-pivoted damper H, provided with the operating-rod M, extending downward beneath the said front plate or wall and adapted to be moved sidewise so as to be wedged between the said ribs and plate m^3 to retain the damper in any position to which it may be adjusted.

418,004. HOISTING MECHANISM. THOMAS A. WIESS, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Oct. 10, 1887. Serial No. 251,869. (No model.)

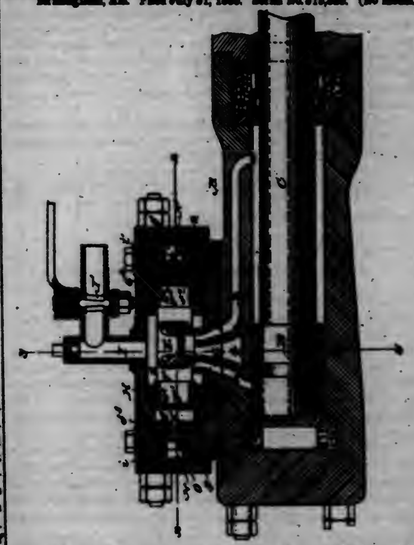
Claim.—1. The combination, with a hoist-frame, of a driving-sheave exterior to the frame on one side thereof, a train of sun-and-planet gearing exterior to the frame on the other side thereof and carried on the flanged extension of the hollow shaft, a driving-shaft upon which said sheave is fixed, and which gears with and gives motion to said train of gearing, a hollow shaft journaled in the two sides of the frame through which said driving-shaft passes, and the main lifting-sheave carried on said hollow shaft, substantially as set forth.

2. The combination, with a hoist-frame provided with a train of sun-and-planet gearing, of a main lifting-sheave secured to a hollow rotatory main shaft, the latter journaled at each end in the frame, and provided with a flange exterior to the hoist-frame and carrying the planet-pinions, and within the said rotatory hollow main shaft a driving-shaft, substantially as set forth.

3. The combination, with a hoist-frame, of a purchase-gearing consisting of a driving-sheave and its attached shaft, the latter journaled within a hollow main shaft, a driving-pinion made integral with the said driving-shaft, planet-pinions engaged with the driving-pinion, and also with a fixed annular wheel integral with the hoist-frame and external thereto, the said planet-pinions pivoted to and driving a flange or disk integral with the main hollow shaft, and the main hollow shaft journaled at each end in the frame and attached to a main lifting-sheave, substantially as set forth.

4. In a portable hoist, the combination of the hoist-frame in two parts D E, connected together by studs, as shown, said part D being provided with the annular flange D′, the lifting-sheave A between the two parts D E, the hollow shaft B, to which the sheave is fixed, provided with the flange B′, the pinions B^4 thereon, the driving-pinion C^3 and its shaft C, the brake-pulley I, check-wheel K and rollers, brake-strap H, and yoke G, substantially as set forth.

5. In a portable hoist, the combination of the hoist-frame in two parts D E, connected together by studs, as shown, said part D being provided with the annular flange D′, the lifting-sheave A between the two parts D E, the hollow shaft B, to which the sheave is fixed, provided with the flange B′, the pinions B^4 thereon, the driving-pinion C^3 and its shaft C, driving-pulley C, brake-pulley I, check-wheel K and rollers, brake-strap H, yoke G, and brake-releasing lever H^3, substantially as set forth.



6. In a portable hoist, the combination, with pulleys between which a check action is effected, of a separate cam check-wheel, which, with its rollers, occupies an annular groove in the body of one of the said pulleys and is loosely clutched to the other, substantially as set forth.

7. In a portable hoist, the combination of the pulley C with the brake-pulley I, and the check-wheel K, having lock K^4, located within the pulley I, and clutched to the pulley C by said lug K^4, substantially as set forth.

8. The combination, in a hoist embodied in a pulley-block frame, of a strap-brake, and a pivoted yoke, which is attached to the suspension-hook, whereby the brake is operated by the weight of the hoist and of any load thereon, substantially as set forth.

9. The combination, in a hoist embodied in a pulley-block frame, of a strap-brake and a pivoted yoke, which is attached to the suspension-hook, whereby the brake is operated by the weight of the hoist and of any load thereon, and an operating-lever for withdrawing the brake from action, substantially as set forth.

413,005. STEAM-ACTUATED VALVE. JAMES A. WIESS, Jr., Birmingham, Ala. Filed July 31, 1888. Serial No. 281,282. (No model.)

Claim.—1. In a steam-actuated valve, the combination, with a main valve and a main piston carrying the said main valve, of an auxiliary piston carrying an auxiliary valve, and two tappet reversing-valves controlled by the movement of the said pistons and valves, substantially as shown and described.

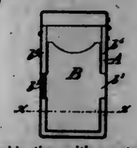
2. In a steam-actuated valve, the combination, with a steam-chest provided with two compartments in communication with each other, of a main piston held to slide in one of the said compartments and carrying a slide-valve controlling the egress of the motive agent from or its ingress to the cylinder, an auxiliary piston carrying an auxiliary valve and held to slide in the other compartment of the steam-chest, and tappet-valves controlled by the said main and auxiliary pistons, substantially as shown and described.

3. In a steam-actuated valve, the combination, with a steam-chest provided with two compartments in communication with each other, of a main piston held to slide in one of the said compartments and carrying a slide-valve controlling the egress of the motive agent from or its ingress to the cylinder, an auxiliary piston carrying an auxiliary valve and held to slide in the other compartment of the steam-chest, tappet-valves controlled by the said main and auxiliary pistons, and means, substantially as described, for regulating the communication between the two compartments of the said steam-chest, as set forth.

4. In a steam-actuated valve, the combination, with two pistons and two slide-valves arranged to move in alternation and adapted to control the necessary supply-ports and passages, of reversing tappet-valves adapted to produce said alternating movement independently of the movement of the main piston, substantially as shown and described.

5. The combination, with two tappet reversing-valves, of a valve-operating mechanism therefor, consisting of a pair of reciprocating pistons, one of which is connected to and moves the main valve of the engine, the other operating a similar valve for controlling the movements of the main-valve piston independently of the movements of the cylinder-piston, substantially as shown and described.

6. The combination, with the main valve, of a main piston actuated by a motive agent and carrying the said valve, two tappet reversing-valves for reciprocating the said main piston, and a second similar piston and valve for imparting an alternating reciprocating



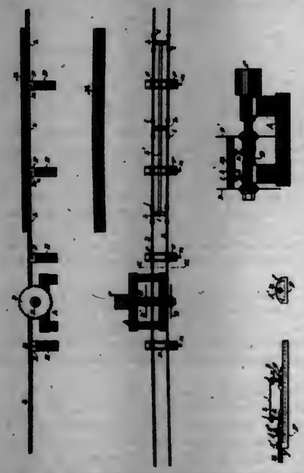
movement to the said main and auxiliary valve pistons independently of the movement of the cylinder-piston, substantially as shown and described.

7. The combination, with a main piston actuated by the motive agent, of two tappet reversing-valves arranged to open and close the main supply and exhaust ports independently of the movement of the cylinder-piston, and an auxiliary piston and valve controlling ports and passages for actuating the said main piston in conjunction with the said tappet reversing-valves, substantially as shown and described.

8. The combination, with the main piston actuated by the motive agent, of two tappet reversing-valves arranged to open and close the main supply and exhaust ports independently of the movement of the cylinder-piston, an auxiliary piston and valve controlling ports and passages for actuating the said main piston in conjunction with the said tappet reversing-valves, and means, substantially as shown and described, for regulating the admission of the motive agent from the main piston to the auxiliary piston, substantially as shown and described.

9. The combination, with two pistons and valves, of two tappet reversing-valves for producing alternating movement of the said piston and valves, substantially as shown and described.

418,006. COMBINED MATCH-SAFE AND TICKET-HOLDER. SOLOMON WOLHEIMER, New York, N. Y. Filed Dec. 4, 1888. Serial No. 292,641. (No model.)



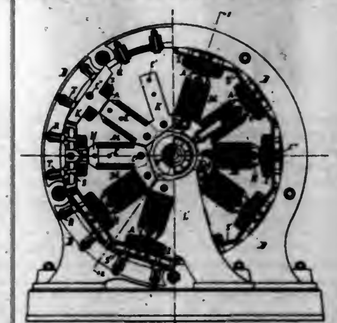
Claim.—1. The combination, with a match-safe, of a pocket for tickets upon the exterior thereof made separate from the match-safe, said pocket having side portions extending into the interior of the match-safe, and springs for forcing the pocket toward the match-safe, substantially as specified.

2. The combination, with a match-safe, of a pocket for tickets upon the exterior thereof made separate from the match-safe and having side portions extending into the interior of the match-safe, springs for forcing the pocket toward the match-safe, and a jacket within the match-safe, in which said springs are contained, substantially as specified.

3. The combination, with a match-safe, of the pocket B, having portions extending into the interior of the match-safe, springs b^3, and the jacket D, provided with lips d^3, substantially as specified.

418,007. JOINT-CROWNING MACHINE. CHARLES R. WOODRUFF, Duluth, Minn. Filed Dec. 28, 1888. Serial No. 294,850. (No model.)

Claim.—1. The combination, with a saw-frame provided with one or more saws, of a joist-carriage, a guide, sleepers for supporting said guide, ties mounted on said sleepers, and means for adjusting said ties, substantially as set forth.



2. The combination, with a saw-frame provided with one or more saws, of a joist-carriage guide constructed of material adapted to be sprung upon itself to the true arcs of different circles, and means for adjusting said guide to such arcs, substantially as and for the purpose specified.

3. The combination, with a fixed saw-frame provided with one or more saws, of a joist-carriage guide through the cutting-plane of the saws adjustable to the true arcs of different circles, consisting, essentially, of fixed sleepers, transversely-movable independent ties mounted on said sleepers, and one or more continuous guiding-rails rigidly secured to said ties, substantially as described.

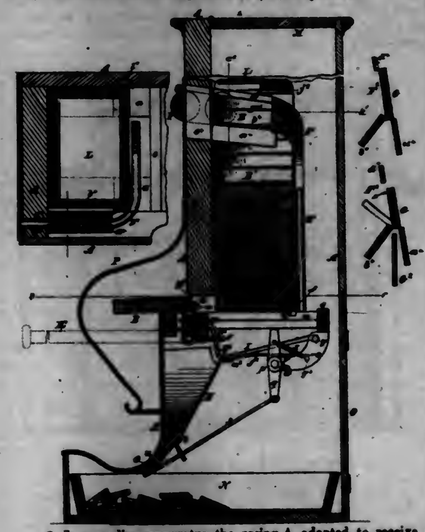
4. The combination, with a fixed saw-frame provided with the pair of saws, of the joist-carriage track herein described, consisting of fixed sleepers provided with tie-seats, the transversely-movable ties mounted in said seats, the adjusting-screws for controlling the movement of the ties independently of each other, and the continuous parallel rails rigidly secured to said ties, substantially as described.

5. The combination, with a saw-frame and saws, of track-rails adjustable by flexure to the true arcs of different circles transversely-adjustable ties in which the rails are seated, means for independently adjusting said ties, and a carriage movable upon said rails, substantially as set forth.

418,008. ALTERNATING-CURRENT MACHINE. CHARLES ZIPERNOWSKY, Buda-Pesth, Austria-Hungary. Filed Apr. 19, 1889. Serial No. 307,663. (No model.) Patented in England Dec. 27, 1887, No. 17,812; in France Jan. 17, 1888, No. 183,187; in Italy Mar. 22, 1888, No. 22,961; in Austria-Hungary June 7, 1888, No. 15,663 and No. 62,908; in Belgium July 13, 1888, No. 82,563, and in Spain July 26, 1888, No. 8,507.

Claim.—1. An alternating-current electric generator consisting of a fixed armature having inwardly-projecting armature-cores and bobbins, and a field-magnet wheel rotating inside the said armature, having outwardly-projecting field-magnet cores and bobbins, the said armature and field-magnet cores being composed of a number of segmental iron laminæ lying in the plane of rotation and pressed together with interposed layers of insulating material.

2. An armature-core for alternating-current electric generators, formed of T-shaped iron laminæ pressed together by strong press-plates and screw-bolts, the armature-bobbin being slipped over the perpendicular limb of this T-shaped core and fixed by clamps screwed to the press-plates.



3. An armature for alternating-current electric generators, composed of T-shaped cores with bobbins arranged in a circle with inwardly-projecting perpendicular limbs and fixed to but insulated from the frame-work of the machine.

4. A field-magnet wheel for alternating-current electric generators, consisting of many layers of V-shaped iron laminæ arranged in a circle with outwardly-projecting limbs, the interstices between the several laminæ of one layer being covered by the laminæ of the next, and of bobbins slipped over the outwardly-projecting limbs, the said laminæ being pressed together by strong press-plates and screw-bolts, and the said bobbins being held by suitable clamps and screw-bolts.

418,009. VENDING APPARATUS. BENJAMIN ADELMANN, Brooklyn, assignor to John H. Volkmann, New York, N. Y. Filed Jan. 26, 1888. Serial No. 261,940. (No model.)

Claim.—1. The movable coin support and conveyer D, combined with means, substantially as described, for moving the conveyer D, and with the coin-chute F and spring n^2, for holding the conveyer D in position to receive and move a coin and the package in front thereof immediately after the coin is inserted, as set forth.

2. The casing A, combined with the movable coin-support and conveyer D, which forms a rest for and embraces the lower end of the coin, as and for the purpose set forth, and with means, substantially as described, for moving said conveyer, as specified.

3. In a vending apparatus, the casing A, adapted to receive a number of packages, combined with a reciprocating coin support and conveyer D, having the movable coin-overlapping retainer J, and with the rod E, for reciprocating the support and conveyer, as specified.

4. In a vending apparatus, the combination, with the reciprocating coin support and conveyer D, having the recess r, and being adapted to receive a coin G, of the rocking lever q, adapted to be actuated by the coin when moving in one direction and to prevent the return of the support and conveyer holding a coin when moving in the reverse direction, substantially as described.

5. In a vending apparatus, the combination, with the reciprocating coin support and conveyer D, adapted to receive a coin and to hold it in the path of a package to expel the same, said support and conveyer having a recess r, of the rocking lever q, rod s, and chute H, said rod s being adapted to close the lower end of said chute to hold a coin therein and to uncloss said lower end, substantially as described.

6. In a vending apparatus, the combination, with a coin support and conveyer D, for holding a coin in the path of a package to expel the same, and the spring-pressed pawl J on said support and conveyer, of the lever I, for engaging the pawl J, and thereby preventing the return of the carrier before the package has been expelled, substantially as described.

7. In a vending apparatus, the combination of a coin support and conveyer adapted to receive a coin and hold it in the path of a package, said coin acting as the expelling medium, with the levers q I, spring-pressed pawl J, and stop w, for preventing the return of the support and conveyer before the package started by the coin is expelled from the machine, and for permitting said return after such package is expelled, substantially as described.

8. In a vending apparatus, the combination of the casing A, having the glass u, and the chute H, for receiving a coin from a support and conveyer, with a reciprocating support and conveyer D, adapted to hold a coin, a rocking lever q, and the movable rod s, connected to said lever, for supporting a coin under the glass u, substantially as described.

9. In a vending apparatus, a coin-chute provided with lower rails a^4 b^4, placed side by side and at such a distance apart that a proper coin will ride along the upper edges of said rails, but a thinner coin will fall between and pass below them, the chute being wider than the space between the rails, substantially as herein shown and described.

10. In a vending apparatus, a coin-chute provided with lower rails a^4 b^4, arranged side by side and at such a distance apart that a proper coin will ride along the upper edges of said rails, but a thinner coin will fall between and pass below them, and with the upper rail d^4 at such a distance above the lower rails that a proper-sized coin will rest against it, but a smaller coin will pass under it, the chute being wider than the space between the rails, substantially as herein shown and described.

11. In a vending apparatus, the weight L, adapted to rest on the package B, and having a foot j^3, combined with the coin support and conveyer D and rails a, having notch l^3, substantially as and for the purpose specified.

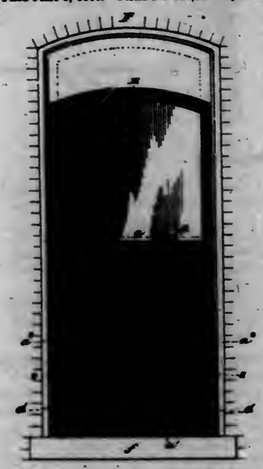
12. In a vending apparatus, the coin support and conveyer D, constructed with an opening in one side, incline i, and lug g, for preventing a coin passing downward through the support and conveyer, but permitting its passage from the side, substantially as described.

13. In a vending apparatus, the coin support and conveyer D, constructed with an opening in one side, incline i, and lugs h and g, for holding a coin in the support and conveyer and preventing its passage down and through the same, substantially as described.

14. In a vending apparatus, the combination of the coin support and conveyer D, having the incline i, with the catch j, having lug m, guide-rail a, and pin n, for engaging the lug m to turn the catch j, substantially as described.

15. In a vending apparatus, the combination of the coin support and conveyer D, having the incline i and lugs h and g, with the catch j, having lug m, guide-rail a, and pin n, all arranged for operation substantially as herein shown and described.

16. In a vending apparatus, the combination of the coin support and conveyer D, having recess r and coin G, with the rocking lever q and stops v and w, all arranged for operation substantially as described.



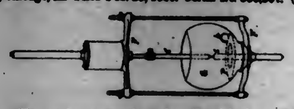
17. In a vending apparatus, the combination of the coin support and conveyer D and catch j, having lug m, with the guide-rail a, pin n, for engaging the lug m to turn the catch j to release a coin, and the stop c, for turning back the catch j by contact with the lug m, substantially as described.

18. In a vending apparatus, the lever I, having inclined part d^3, upon which a package operates to move the lever, combined with the coin support and conveyer D, having pawl J for engagement with said lever when held out of its normal position by a package, substantially as described.

19. In a vending apparatus, the spring-lever I, having upright part b^3, notch l^3 in said part b^3, and the inclined part d^3, combined with the coin support and conveyer D, having pawl J, all arranged for operation substantially as herein shown and described.

20. In a vending apparatus, the chute F, cut away at its lower end in front, combined with the coin support and conveyer D, constructed to receive a coin from the chute F, to hold it independently by itself, and to carry the coin away from the chute through said opening, substantially as described.

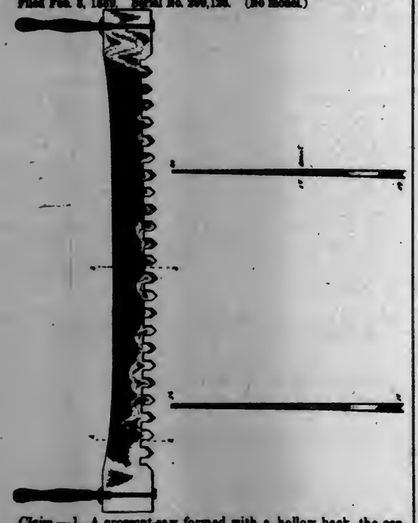
418,010. WINDOW-SCREEN. STEPHEN J. ANDERSON, St. Louis, Mo. Filed June 5, 1889. Serial No. 313,197. (No model.)



Claim.—1. The combination, with the screen-frame, of the strip H, rigidly secured to the inner surface of one side rail of the said frame and projecting laterally outward therefrom, and the strip H', projecting similarly outward from the opposite side rail of the frame and attached to said side rail by the hinges A, so that it can be turned inward on the rail, substantially as specified.

2. The combination, with the screen-frame, of the strips H H', attached to the inner surfaces of the opposite side rails of the frame and projecting laterally outward therefrom, the hinges A, connecting

the strip H' to the corresponding side rail of the frame, and the catch or detent K, pivoted to said rail, substantially as specified.



3. The combination, with the screen-frame, the strip H, rigidly secured to one side rail thereof, the strip H', attached to the opposite side rail of the frame, and the hinges A, connecting the strip H' to the said side rail, of the upper sash E, the lower rail of which forms a rest for the upper rail of the screen-frame, and the window-strips G G, against which the strips H H' bear, substantially as specified.

418,011. GLOBE-PROTECTOR FOR ARC LAMPS. GERRAY C. ARMEN, Chicago, Ill. Filed Feb. 23, 1889. Serial No. 300,967. (No model.)

Claim.—The globe-protecting plate P, with the metal binding-strips r r on the inside and outside rim r r, and handle A, for the purpose of strengthening the thin plate and facilitating the handling of the same during the cleaning process of the lamps, substantially as specified.

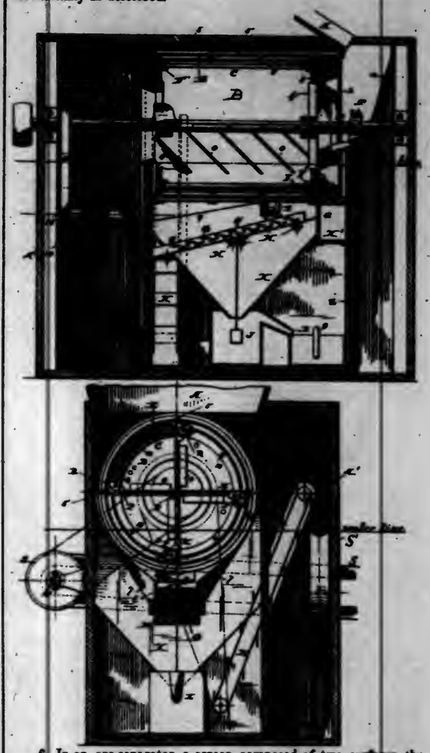
418,012. CROSSCUT-SAW. ELIAS C. ATKINS, Indianapolis, Ind. Filed Feb. 8, 1889. Serial No. 299,126. (No model.)

Claim.—1. A crosscut-saw formed with a hollow back, the central portion of which is ground thinner on the back than it is at the ends.

2. A crosscut-saw formed with its ends ground of a regularly-diminishing thickness from front to back and from a point near each end, on a line running to near the front edge at the center of the saw, ground thinner than said ends.

3. A crosscut-saw formed with a hollow back and ground from a point near each end, upon a curved line toward the center and front edge of the saw, thinner than the remaining portion.

418,013. ORE-SEPARATOR. WILLIAM RAINSBRIDGE, Omaha, Nebr. Filed Aug. 20, 1888. Serial No. 284,062. (No model.)



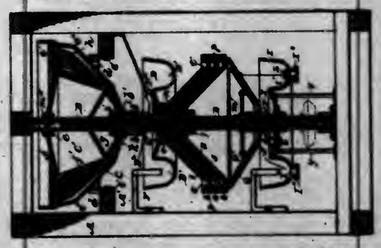
Claim.—1. In an ore-separator, a shoe composed of a frame, and Z-shaped plates mounted therein and arranged with spaces between them, forming horizontal shelves and settling-pockets for the gold, substantially as described.

2. An ore-separating screen divided longitudinally by partitions provided with flights or advancing plates carried by the partitions, substantially as described.

3. In an ore-separator, a cylinder having concentric screening-surfaces, the outer one being the finer, the pockets P, communicating with the space between the screening-surfaces, and the openings into the pockets through the outer surface closed by slides, substantially as described.

4. In combination with a rotary screen provided with an oblique cam, an inclined shoe mounted on rollers beneath the screen and having a projection to engage the oblique cam, substantially as described.

5. In an ore-separator, a screen composed of two cylindrical surfaces, the inner being made up of angular metallic bars placed edge to edge with spaces between, and the outer consisting of flat bars of very hard material overlapping each other with small spaces between, substantially as described.



6. In an ore-separator, a screen composed of two surfaces, the inner coarser than the outer and having a portion of its cylinder hinged to swing open into the central space, substantially as described.

7. In an ore-separator, a rotating screen divided longitudinally into compartments provided with two concentric screening-surfaces, the outer finer than the inner, and the inner provided with swinging traps opening into the interior, substantially as described.

8. In an ore-separator, a rotating screen composed of two screening-surfaces, the outer finer than the inner, longitudinal partitions, traps in the inner surface opening into the interior, and pockets between the surfaces and next the partitions, arranged substantially as described.

413,014. ORE-MILL. WILLIAM RAINSBRIDGE, Omaha, Nebr. Filed Dec. 17, 1888. Serial No. 293,783. (No model.)

Claim.—1. In an ore-pulverizing machine, the combination, with a hopper, of a grinding-disk composed of two sections, the upper section having a rotary and a free vertical movement and the lower a rotary movement only, and mechanism to operate the hopper and grinding-disks in opposite directions, substantially as described.

2. In an ore pulverizing and concentrating machine, the combination, with a hopper, a vertically-reciprocating grinding-disk, and mechanism to rotate these parts oppositely, of a washer-pan that is rotated by the same spindle that revolves the grinding-disk and a fixed scraper, substantially as set forth.

3. In an ore pulverizing and concentrating machine, the combination, with a washer-pan and a fixed scraper, of a series of conic disks provided with grooves and arranged so that adjacent disks will rotate in opposite directions, substantially as set forth.

4. In an ore-pulverizing device, the combination, with a hopper having tapering grinding-ribs and an external gear-rim, of a grinding-disk having free vertical play and mechanism to revolve the grinding-disk and hopper in opposite directions, substantially as described.

5. In an ore-pulverizing machine, the combination, with a rotating hopper having a series of tapering grinding-ribs, of an inverted conical grinding-disk that has tapering ribs on its surface and is composed of two sections, one of which has free vertical play, and mechanism to rotate the grinding-disk and hopper in opposite directions, in the manner and for the purpose described.

6. In an ore pulverizing and concentrating machine, the combination, with a hopper forming a portion of a pug-mill, a conical grinding-disk composed of two sections, one vertically movable and the other fixed, and means to rotate the cylinder and hopper oppositely, of a washing or concentrating chamber located immediately below the hopper, having a dished bottom and an integral annular outer chamber, and a scraper to remove the contents of the dished chamber, substantially as set forth.

7. In an ore pulverizing and concentrating machine, the combination of a primary reducing-mill, a concentrating-chamber, a series of oppositely-actuated scouring-disks, an amalgamating-chamber, all mounted on a common shaft, and a concentrating and settling chamber with an operating mechanism which is adapted to rotate the mill and scouring-disks, substantially as set forth.

8. In an ore pulverizing and concentrating machine, the combination, with a mill that first operates on the crude ore and is composed of a hopper and a grinding-disk provided with tapering ribs and rotated in opposite directions, of a washing-chamber, a series of scouring conic disks, and a lower receiving-chamber, all mounted on the same spindle, and a driving mechanism which is adapted to rotate the mill and disks to afford grinding action in each independent of the other, substantially as set forth.

9. In an ore pulverizing and concentrating machine, the combination, with a milling device that operates on the crude ore and reduces it to powder, a receptacle located immediately below it, a series of conic grinding-disks, and an inverted conic disk located below and containing a corresponding plain-faced disk mounted to rotate with the spindle, of a rigid amalgamating-receptacle located below the latter, a spindle that supports the milling and concentrating devices, and mechanism adapted to afford rotary motion to the milling devices, substantially as set forth.

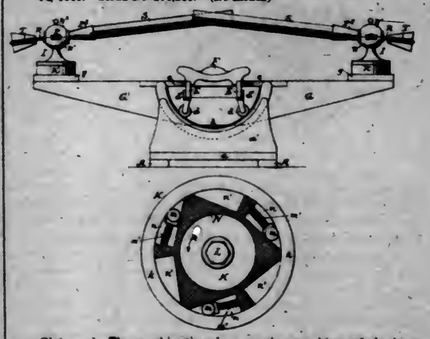
10. In an ore-pulverizing machine, the combination, with a cup-shaped hopper having a central boss perforated to receive a spindle and orifices near said boss for the passage of the ore, of a grinding-disk composed of two sections, the upper section capable of free vertical play and the lower having a rotary motion only, and mechanism to rotate the parts, substantially as described.

11. In an ore-grinding machine, a series of oppositely-actuated grinding-disks provided with a series of feed-orifices near the center, and grooves in the upper and lower surfaces of the disks, which grooves open into said feed-orifices and are deep near the center and become wide and shallow as they proceed from the center, ending before they reach the periphery, and mechanism for oppositely revolving said disks, substantially as described.

12. In an ore-grinding machine, a series of oppositely-actuated conical grinding-disks provided with a series of feed-orifices near the center which register with each other, the alternate disks extending beyond the intermediate disks and forming gutters for the reception of the ores, in combination with mechanism for actuating the same, substantially as described.

13. In an ore-grinding machine, a series of oppositely-actuated grinding-disks provided with a series of feed-orifices near the center, and grooves in the upper and lower surfaces of said disks opening from said feed-orifices and extending toward the periphery, and mechanism for oppositely revolving the disks, substantially as described.

14. In an ore-grinding machine, a series of oppositely-actuated conical grinding-disks provided with a series of feed-orifices near the center which register with each other, the alternate disks extending beyond the intermediate disks forming gutters and having teeth of the same pitch cut in their peripheries, thus forming a composite gear-wheel, and mechanism for oppositely revolving the disks, substantially as described.



15. In an ore-grinding machine, a series of oppositely-actuated grinding-disks provided with registering feed-orifices and grooves in the upper and lower surfaces, the alternate disks extending beyond the intermediate disks forming gutters and having teeth of the same pitch cut in their peripheries, and mechanism for revolving the same in opposite directions, in the manner and for the purpose substantially as described.

16. In an ore-grinding machine, a series of oppositely-actuated conical disks, alternate disks being keyed to a central spindle, and intermediate disks extending beyond the others forming gutters, in the bottom of which are registering discharge-openings, in combination with an inverted conical shell whose outer periphery fits the outer periphery of the lower cone-disk and is fastened to and revolved by it, and an inner inverted cone-disk keyed to the central spindle, and mechanism for oppositely revolving the spindle and intermediate disks, substantially as described.

17. In an ore-grinding machine, a series of grinding-disks alternately keyed to a central spindle, the intermediate disks being extended beyond the others, having teeth of the same pitch cut in their peripheries, and with central perforations which fit collars on the central spindle to admit of independent rotation, in combination with said central spindle and collar and mechanism for oppositely revolving the disks, in the manner and for the purpose set forth.

18. In an ore-grinding machine, a series of oppositely-revolving grinding-disks, in combination with an inverted conical shell fitting the lower grinding-disk, and an inner inverted conical disk having vertical play and revolved in a direction opposite to that of the conical shell, and mechanism for oppositely revolving the inverted conical shell and conical disk, substantially as described.

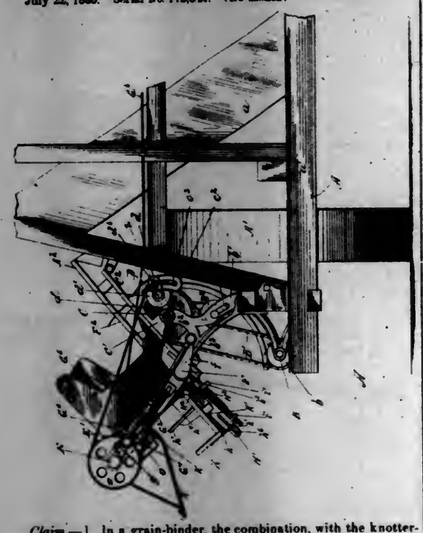
413,015. ROWING-MACHINE. THOMAS J. BIGGS, Philadelphia, Pa., assignor of one-half to Thomas A. Clough, same place. Filed Jan. 14, 1889. Serial No. 296,235. (No model.)

Claim.—1. The combination, in a rowing-machine, of the base-frame having transverse supporting-rails, with a boat-frame supported on said rails, a seat mounted on said boat-frame, with oar-pieces and supporting devices therefor secured to said boat-frame, substantially as described.

2. The combination, in a rowing-machine, of the oar-piece-supporting casing, the oar-piece adapted to said casing, with a feathering-indicator having projecting wings, substantially as and for the purpose described.

3. The combination of the base A, the supporting-brackets, and the concave rails *b*, with a boat-frame D, having rollers *d*, adapted to said rails and carrying both the seat and the oar-piece supporting mechanism, substantially as described.

4. The combination, in a rowing-machine, of the disk K, having a frictional surface on its under side, with a friction-disk J, secured to the frame of the machine, with a carrier N, oar-pieces connected thereto, with friction-balls between the edge of the carrier and a rim on the disk K, with an adjustable spindle L, by which the disks J and K can be drawn toward each other without binding upon the carrier, substantially as described.



5. The combination of the friction-disks J and K and intervening washer M with the carrier N and oar-pieces B, connected to said carrier, said carrier having tapered recesses in its periphery, in which fit rollers *m*, having springs *m'*, all substantially as described, whereby on the movement of the carrier in one direction the rollers will frictionally couple the carrier to the disk K, and when moved in the opposite direction the carrier will be released from the disk, substantially as set forth.

6. The combination of the disks J and K, the spindle L, the carrier N, and its rollers, said carrier having a socket and an elongated open-

ing *q* therein, with a ball P', adapted to said socket, and an oar-piece projecting from said ball and adapted to have a free vertical movement in said opening *q*, substantially as and for the purpose described.

7. The combination of the friction-disks J and K, the carrier N, its socket, with a ball P' adapted thereto, a longitudinal slot in the wall of the socket, and a weighted rod passing through the slot and secured to the ball, substantially as described.

413,016. GRAIN-BINDER. JOSEPH W. BLOOD, Plano, Ill., assignor of one-half to the Plano Manufacturing Company, same place. Filed July 22, 1885. Serial No. 172,347. (No model.)

Claim.—1. In a grain-binder, the combination, with the knotter-operating shaft and packer-shaft, of a counter-shaft driven by the packer-shaft, sprocket-wheels mounted on the said counter-shaft and the knotter-operating shaft, and a sprocket-chain passing over the sprocket-wheels, substantially as and for the purposes specified.

2. In a grain-binder, the combination, with the knotter-operating shaft E, having sprocket-wheel *e*, and the packer-shaft C, having pinion *c'*, of the counter-shaft D, mounted in a bearing supported on the packer-shaft and adjustable around the same, said counter-shaft being provided with a pinion d^2, to mesh with the pinion *c'*, and with a sprocket-wheel *d'*, and a sprocket-chain E', passing over the sprocket-wheels *d'* and *e*, substantially as and for the purposes specified.

3. The combination, with the packer-shaft C, having pinion *c'*, of the counter-shaft D, mounted in a bearing supported by arms *d*, loosely supported on the packer-shaft, curved slotted arm c^2, a bolt d^3, connecting one of the arms *d* to the arm c^2, a pinion d^2, mounted on the counter-shaft and meshing with the pinion *c'*, and a sprocket-wheel *d'*, connected by a sprocket-chain with the sprocket-wheel on the cam-shaft, substantially as and for the purposes specified.

4. The combination, with the cam-shaft and sprocket-wheel, of the arm G, attached to the cam-shaft and carrying the locking-pawl, and the sliding piece G^3, carrying the stop-arm and having inclined surface g^4, and recess g^5, with inclined wall g^7, substantially as and for the purposes specified.

5. The combination, with the sliding tripper H and stop-arm G^4, of the bell-crank levers H^2-H^3 and connecting-rods A^3 and A^4, substantially as and for the purposes specified.

6. The combination, with the sliding tripper H and stop-arm G^4, of the bell-crank levers H^2 H^3 and connecting-rods A^3 A^4, and a spring H^4, of adjustable tension, connected to one of the bell-crank levers, substantially as and for the purposes specified.

7. The combination, with the sliding tripper and stop-arm and the bell-crank levers and connecting-rods, of the spring H^4, coiled around the pivot of one of the bell-crank levers, and having one of its ends connected to the said lever and its other end retained by the notched segment H^5, substantially as and for the purposes specified.

8. The combination, with the sliding tripper H, provided with a series of holes h^3, of the bell-crank lever H^2, having one of its arms in engagement with one of the holes in the tripper and its other arm connected to the stop-arm G^4, substantially as and for the purposes specified.

9. The combination, with the needle-arm provided with a slotted segment f^2, of the sliding tripper H and the sliding spring-bar I, carried by the tripper and having a pin *i* to engage with the slotted segment, substantially as and for the purposes specified.

10. The combination, with the needle-arm F^2, having slotted segment f^2, of the sliding tripper H, having lugs i^2, the sliding bar I, having pin *i* to engage the slotted segment and mounted in the lugs i^2, and the spring I', coiled around the said bar and bearing against the upper lug *i* and the adjustable pin i^3, substantially as and for the purposes specified.

11. In a grain-binder, the combination, with the sheaf-sustaining bar, of the pivoted and spring-controlled supporting-arm arranged in the path of said bar and adapted to engage directly with and support the same when elevated, but not positively connected thereto, a spring-pawl mounted on said supporting-arm and free to move in one direction only, and the needle-arm provided with a single projection to engage the sustaining-bar to carry the same positively upward and to engage the spring-pawl to trip the supporting-arm, substantially as and for the purposes specified.

12. In a grain-binder, the combination, with the swinging sheaf-sustaining bar H', of the spring-controlled supporting-arm J and its pivot J^1, the spring-pawl J^3, provided with two arms, one of which is held normally against the pivot J^4, while the other is arranged in the path of the projection on the needle-arm, and the needle-arm F^2, provided with a projection J^5 to engage with the second arm of the spring-pawl and with the sustaining-bar, substantially as and for the purposes specified.

13. In a grain-binder, the combination, with the swinging sheaf-sustaining bar H', having elongated slot A^2, of the end-gate K, pivoted to the under side of the deck A^3 and constructed in two sections arranged one on each side of the sustaining-bar, and provided with arms *k'*, engaging the slot A^2, substantially as and for the purposes specified.

14. The combination, with the knotter-frame provided with slot *n* and the swinging cord-holder frame having slot o^2, of the sliding pawl O', which actuates the cord-holder, the said pawl being provided with a pin O^2, passing through the slots o^2 and *n*, substantially as and for the purposes specified.

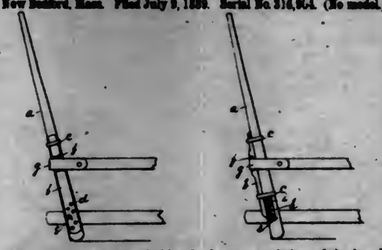
15. In a grain-binder, the combination, with the swinging cord-holder and its frame, of a pawl mounted thereon actuated by the cam-wheel and engaging both the cord-holder and its frame, whereby said pawl simultaneously rotates the cord-holder and swings the cord-holder frame, substantially as and for the purposes specified.

16. In a grain-binder, the combination, with the knotter-frame provided with a slot, of the cam-wheel M, having cam-groove M', the bell-crank lever P, pivoted on the knotter-frame and operated by said cam-groove, and the swinging cord-holder frame O, provided with a slot and having pawl O', operated by the bell-crank lever, and provided with a pin passing through said slots, whereby the said pawl operates to simultaneously rotate the cord-holder and swing the cord-holder frame, substantially as and for the purposes specified.

17. In a grain-binder, the combination, with the breast-plate R, having slot *r*, with bend *r'*, projection r^2, extending over the slot above the bend, and lower extension r^3, of the cord-stop R', having arm R^3, and slot R^2 and the swinging cord-holder frame connected to the said cord-stop to operate the same, substantially as and for the purposes specified.

18. The combination, with the swinging cord-holder frame, of the breast-plate R, slotted as described, and the cord-stop R', pivoted to the breast-plate at r^4 and having a pin R^4 to engage the slot r^4 in the swinging cord-holder frame, substantially as and for the purposes specified.

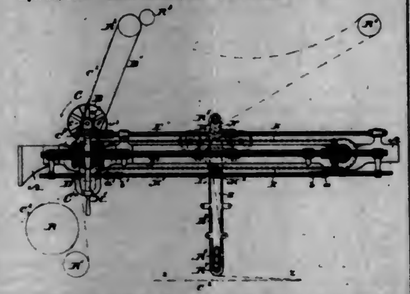
19. In a grain-binder, the main or cam shaft, the driving-wheel mounted loosely thereon, a spring-clutch for connecting said wheel to the shaft, a bracket secured on the shaft, and a stop-arm for disconnecting the spring-clutch, in combination with a spring locking-bolt adapted to engage the bracket to move the shaft slightly after the pawl is disconnected from the wheel, substantially as and for the purposes specified.



413,017. VEHICLE-BODY. CHARLES M. BLYDENBURGH, Riverhead, N. Y. Filed Aug. 5, 1889. Serial No. 319,733. (No model.)

Claim.—1. In a vehicle, the hollow front box or frame and a front seat hinged to the front wall thereof and adapted to be turned forward, in combination with a rear box or frame hinged to the rear of said front box, and having a seat supported thereon, said box or frame being adapted to fold forward into the rear open end of the front box, whereby the bottom of said rear box becomes the end-gate or rear panel of the front box or frame, substantially as described.

2. In a vehicle, the bottom thereof having a rearward extension, a front box or frame having a hinged seat thereon, and a hinged end-gate adapted to fold into and to close the rear open end of the front box, said end-gate forming a part of a rear box or frame and having a cushioned seat, substantially as described.



413,018. TUG-STRAP HOLDER FOR LOOMS. ANDREW R. BRAY, New Bedford, Mass. Filed July 9, 1889. Serial No. 316,904. (No model.)

Claim.—1. A tug-strap holder for looms, consisting of the bar *b*, having offset *f*, formed with a depression or recess adapted to receive and hold the tug-strap, and provided with a thimble *c*, adapted for inclosing the picker-staff, and having a series of holes for the reception of a device for holding it in place upon the picker-staff, as and for the purpose shown and described.

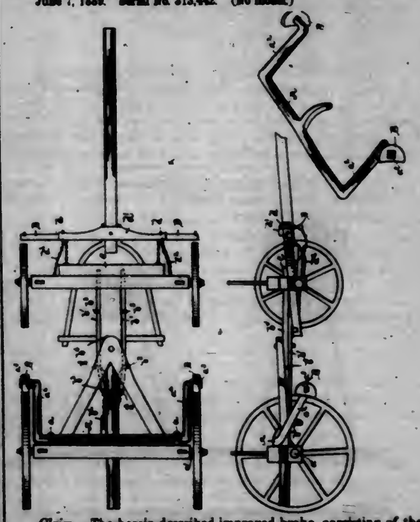
2. A tug-strap holder for looms, consisting of the bar *b*, having offset *f*, formed with a depression or recess to receive and hold the tug-strap, the thimbles *c e*, and the projection A, secured to the lower thimble *c*, and provided with a series of holes for the reception of a fastening-screw for securing the tug-strap holder in place upon the picker-staff, substantially as shown and described.

413,019. MACHINE FOR FOLDING CLOTH. WILLIAM P. BROOK, Philadelphia, Pa., assignor to Tetlow & Brookfield, same place. Filed Apr. 20, 1887. Serial No. 235,505. (No model.)

Claim.—1. A cloth-folding device having a carriage with feed-rollers thereon, feeding-rollers independent of said carriage feed-rollers, a driving-shaft, mechanism, substantially as described, connected to said driving-shaft, and consisting of shafts, a belt, and pinions, for operating the feed-rollers on said carriage, and mechanism, substantially as described, consisting of belts and pulleys connected to the driving-shaft for operating said independent rollers, substantially as and for the purpose set forth.

2. A cloth-folding machine having a driving-shaft, a shaft connected to said driving-shaft by intermediate gearing and having a bevel-wheel thereon, a counter-shaft with a clutch member splined thereon, and sleeves with bevel-wheels loosely mounted thereon, a tripping mechanism for said member, the shaft C having a bevel-wheel meshing with a fixed bevel-wheel on the counter-shaft, pulleys on the first-mentioned shaft and the shaft C, a chain on said pulleys, and a carriage connected to said chain and provided with feed-rolls, said parts being combined substantially as and for the purpose set forth.

3. In a cloth-folding machine, a carriage with feeding-rollers thereon, in combination with rollers independent of said carriage feeding-rollers, a driving-shaft, mechanism, substantially as described, connected to the said driving-shaft for operating said carriage feed-rollers and said independent rollers, a belt or chain for moving said carriage, shafting for imparting motion to said belt, and shifting devices for changing the direction of the movements of said belt or chain at the end of the folds, substantially as described.

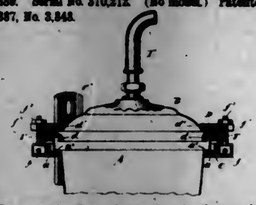


4. In a cloth-folding machine, a series of feed-rollers with a driving-shaft, gearing, and belt, for giving to the cloth a constant feed, a carriage with cloth guiding and feeding rollers and an extended bearing thereon, mechanism, substantially as described, connected with the shaft of one of said rollers for rotating the same, and a belt connecting said roller with one of the other rollers, a shaft parallel with the driving-shaft and connected therewith by gearing and carrying the bevel-wheel, D, a shaft having a chain-connection with the carriage and carrying a bevel-wheel, a shaft having on one end a bevel-wheel gearing with the last previously-mentioned bevel-wheel and on the other end two loose cog-wheels, a clutch member splined on said last-mentioned shaft between said loose wheels, a sliding rod with blocks thereon, and a pivoted handle having fixed bearings on said sliding rod and carrying the intermediate clutch member, said parts being combined substantially as described.

5. In a cloth-folding machine, the frame A, in combination with the shaft C, having driving-pulley B thereon, the cross-shaft C^2, having a pinion meshing with a pinion on the shaft C, and a bevel-wheel w^2 thereon, the shaft F', operated by the shaft C and having the bevel-wheel w^3 and the feathered bevel-wheel *w'*, the carriage N, having a bearing for said wheel *w'*, the roller R^2, having wheel *w*, gearing with bevel-gear *w'*, and arms S, having rollers R^3 R', and the belt B^2, substantially as and for the purpose set forth.

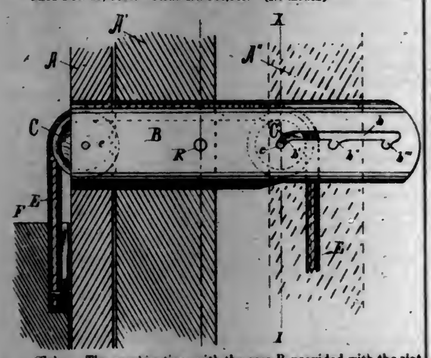
6. In a cloth-folding machine, the frame A, in combination with shaft C, with driving-pulley B thereon, the shafts C^2 and C^3, with connecting-gearing, the bevel-wheel D on shaft C^4, the shaft F, with loose bevel-gearing E E and clutch member D', and fast bevel-gear G, the shaft C', with bevel-wheel H, the pulleys I I' on shafts C^5 and C', respectively, the chain K, and the carriage N, secured to said chain, substantially as described.

7. In a cloth-folding machine, the frame A, in combination with the driving-shaft C, having pinion *c*, the shaft C^2, having pinion *c'*, and shaft C^3, operated by the shaft C, the bevel-wheel D on said shaft C^4, the shaft F, with bevel-wheels E E, loosely mounted thereon, and the fixed bevel-wheel G thereon, the shaft C', with bevel-wheel H, meshing with bevel-wheel G, pulleys I I' on shafts C^5 and C', respectively, the chain K, and carriage N, secured thereto, the bearing M^2, the rod M', having spring-buffers *b b'* and stops *a a'*, and the clutch member D', with handle, substantially as described.



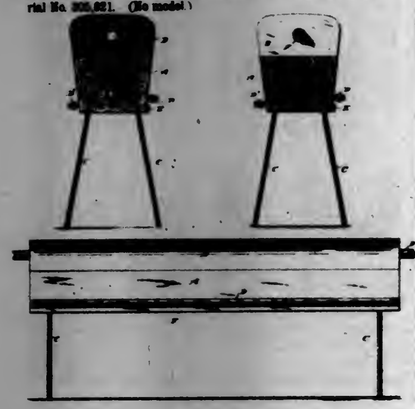
413,020. WAGON-BRAKE. JOSEPH S. BROWN, Bremen, Ky. Filed June 7, 1889. Serial No. 313,442. (No model.)

Claim.—The herein-described improved brake, consisting of the combination of the brake-rod having outer curved arms formed integral therewith and provided with shoes secured thereon, and a central projecting arm also formed integral with said rod, the sliding bar resting on said hounds, and the two chains or straps connected at their



forward ends to said bar and at their rear ends to said central arm, the whiffletree, the chains connected thereto and to said sliding bar, and the chains d^3, also connected to said whiffletree and to the front axle, substantially as set forth.

413,021. FILTER. CARL J. BORRING, Hamburg, Germany. Filed May 10, 1889. Serial No. 310,212. (No model.) Patented in England Mar. 14, 1887, No. 3,843.

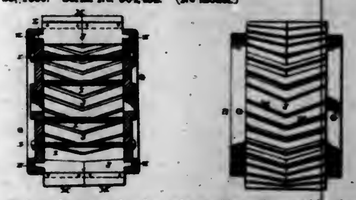


Claim.—The combination of a casing having a shoulder at its top edge, an interiorly-shouldered ring for supporting said casing, a vertical plate made integral with said supporting-ring, a cover fitting on the top of the casing, an elastic washer or gasket interposed between the top edge of the casing and the cover, a flanged top ring on the cover, screw-nuts pivoted to recessed lugs of the supporting-ring and engaging recessed lugs of the top ring, and screw-nuts applied to the upper ends of said screw-bolts, substantially as set forth.

413,022. SASH-CORD GUIDE. JOHN A. BURCHARD, Freeport, Ill. Filed Feb. 23, 1889. Serial No. 300,805. (No model.)

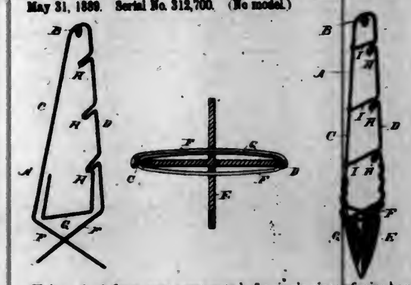
Claim.—The combination, with the case B, provided with the slot *b*, having notches *b' b''*, &c., in its lower margin, of a sash-pulley C, journaled at a fixed point in one end of said case, and a second pulley C', provided with gudgeons *c*, adapted to be shifted from one to the other of said notches, substantially as and for the purpose set forth.

413,023. APPARATUS FOR SHAPING AND DRYING BASKET-HANDLES. ANDREW BURNS, Westfield, N. Y. Filed Apr. 1, 1889. Serial No. 305,621. (No model.)



Claim.—1. In basket-handle-drying machines, the combination of the shaper and drier proper, mounted on suitable supports, and rods or rails extending along either side thereof for holding the handles in place while being dried, substantially as described.

2. In basket-handle-drying machines, the combination of the shaper and drier proper, mounted on suitable supports, rods or rails extending along either side thereof for holding the handles in place while being dried, and a gage for fixing the position of the handles to be dried, substantially as described.



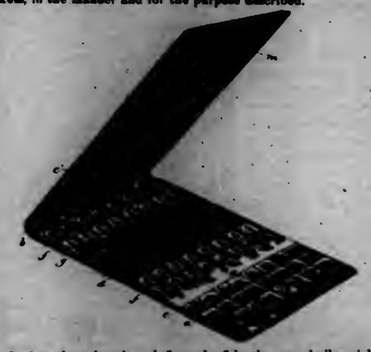
3. A basket-handle forming and drying machine, embracing the combination of a long hollow drum or dome part, a suitable base part upon which the dome is mounted, said base part corresponding in general contour with the dome, a gage or ledge extending along one side of the base part, and rods or rails supported adjacent to the opposite sides of said base part, substantially as described.

413,024. MACHINE FOR GRINDING WOOD. JOHN R. CARTER and JOHN W. PERTH, Kokomo, Ind., assignors of one-half to Monroe Seiberling, same place, and Emil S. Levi, New York, N. Y. Filed Mar. 23, 1889. Serial No. 304,462. (No model.)

Claim.—In a grinder for pulp-machines, the combination, with the circular end plates provided with grooves or recesses on their inner faces near their peripheries, and angular centrally-pointed castings having their ends placed in the recesses, and supported thereon radially to the axis of the grinder, of the two knives which are secured to the said castings, substantially as described.

413,025. FENCE-POST. ROLLIN S. CASE, Cleveland, Ohio. Filed May 31, 1889. Serial No. 312,700. (No model.)

Claim.—1. A fence-post constructed of a single piece of wire having its ends carried past each other and then wrapped around the adjacent portion of the wire, as set forth.



2. A fence-post consisting of a single piece of wire doubled on itself and having its ends carried past each other and wrapped around the adjacent portions of the wire, and the tie-wire also wrapped around the lower portion of the body of the post, as set forth.

3. The improved fence-post herein described and shown, consisting of a single wire doubled on itself and having its front portion provided with a series of loops or hangers, and having its ends carried past each other and then wrapped around the adjacent portions of the wire, the tie-wire having its ends wrapped around the main portion of the post, and the brace-wires connecting the front and rear sides of the post, as set forth.

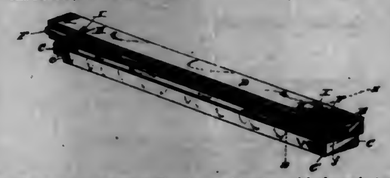
413,026. POCKET CHESS-BOARD. FRED GAYLER, Brooklyn, N. Y. Filed May 22, 1889. Serial No. 311,658. (No model.)

Claim.—1. A pocket chess-board provided with a folding flap and formed of leather, having pockets punched in its surface contiguous to the squares, in combination with men having a wedge-shaped portion adapted to enter said pockets, whereby the men are securely held in place, in the manner and for the purpose substantially as described.

2. In a pocket chess-board, a pair of folding leaves, one of which is provided with a board composed of leather, having pockets punched in its surface, and the other arranged to fold over the board when the latter is not in use, and to fold under it when in use, in combination with men having a wedge-shaped portion adapted to enter said pockets, in the manner and for the purpose described.

3. A pocket chess-board formed of leather or similar yielding material, having pockets punched in its surface contiguous to the squares, in combination with men having a wedge-shaped portion adapted to enter the pockets and to engage their edges, whereby they are securely held in place, in the manner and for the purpose described.

413,027. HAND-STAMP. EDMUND D. CHAMBERLAIN, Westfield, N. J. Filed July 11, 1888. Serial No. 279,610. (No model.)



Claim.—1. In a hand-stamp, the combination, with the casing, the pivoted arm D, the inking-ribbon, and the rolls upon which it is wound, of a plural number of double-acting pawls, one of said pawls being connected with and actuated by the pivoted arm of the stamp, and both pawls being adapted to be thrown from engagement with one roll to another, whereby the inking-ribbon is alternately and automatically wound upon the rolls, substantially as described.

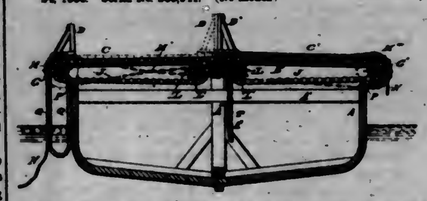
2. The combination, with a hand-stamp having a pivoted arm, an inking-ribbon, and rolls upon which the latter is wound, of a longitudinally-moving bar connected with and operated by said pivoted arm, a double-acting pawl carried by said arm, and a second double-acting retaining-pawl, said pawls being adapted for engagement with the inking-ribbon rolls, whereby the direction of travel of the inking-ribbon may be automatically changed and the said ribbon wound upon either roll, substantially as described.

3. The casing, the pivoted arm having a short-arm extension, the inking-ribbon, the rolls for the same, and a ratchet-wheel on the axis of each roll, in combination with the pivoted longitudinally-moving bar actuated by the pivoted arm, a double-acting pawl pivoted thereto and adapted to be thrown alternately into engagement with the ratchet-wheels, and a second double-acting retaining-pawl pivoted upon a stud projecting from the casing and adapted for engagement with both ratchets, whereby the inking-ribbon may be wound upon either roll by the movement of the pivoted arm and pawls, substantially as described.

413,028. DRAWER-GUIDE FOR BUREAUS, &c. DWIGHT C. CLAPP, Owosso, Mich., assignor of two-thirds to David M. Estey and the Estey Manufacturing Company, same place. Filed Feb. 15, 1889. Serial No. 300,044. (No model.)

Claim.—In a drawer-guide, the combination, with the strip having the recess in one side and the circular openings in the top wall of the said recess, of the spring guide-strips arranged in said recess and having pins arranged in the circular openings of the recess, whereby the guide-strip is capable of a universal movement in all directions and binding of the drawer is prevented, substantially as described.

413,029. ANGULAR PAPER BOX. DWIGHT S. CLARK, Cambridge, assignor to Emma L. Porter, Boston, Mass. Filed Aug. 6, 1889. Serial No. 319,862. (Model.)



Claim.—1. A blank for an angular paper box, scored or indented for folding, so as to form the sides A, B, C, and D, and the pasting-strip *p*, the full back flap *d*, the half front flap *b*, subdivided to form a trapezoidal figure, and two triangles 4 4 at the ends thereof, with two side flaps, each subdivided to form the triangular fields 1, 2, and 3, substantially as described.

2. A blank for an angular paper box, scored or indented for folding to form the sides A, B, C, and D, and the pasting-strip *p*, all connected together, and the four flaps *a*, *b*, *c*, and *d*, to form the end, all connected together and to the sides, of which one is a full flap, one a half-flap provided with two triangular fields at its sides, as shown, and two five-eighth flaps placed alternately and subdivided into three triangles, as set forth, substantially as described.

3. An angular paper box consisting of the sides A, B, C, and D, united to form a four-sided prism and closed by ends constructed each of the side flaps *a* and *c* folded in part upon themselves and in part against two equal folds of the front flap, of the remainder of said front flap, and of a large back flap covering the whole end of the box and all the flaps below it, substantially as described.

4. An angular paper box consisting of the sides A, B, C, and D, united to form a four-sided prism and closed by ends composed of, first, the adjacent triangular fields 2 and 3 of each of the side flaps in contact, respectively, with the triangular fields 1 1 of the same flaps and 4 4 of the front flap, with the remainder of the front flap laid flat upon the fields 4 4, and the folded side flaps, a full-sized back flap covering the whole and joined to fields 1 1 of said side flaps, substantially as described.

413,030. SHIFTING DECK FOR DUMPING-SCOWS. EDDY L. CLARK and LYMAN D. HOWARD, Brooklyn, N. Y., assignors to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed July 24, 1888. Serial No. 280,941. (No model.)

Claim.—1. A vessel provided with a laterally-shifting flexible deck composed of planks or bars Q Q, attached to laterally-moving chain drive-belts J J, and to carrying-belts K K, wheels H I L, to carry said belts, and shafts G L', to drive the wheels, all actuated by power applied to one of said shafts, substantially as described.

2. A vessel provided with a laterally-shifting flexible deck in two longitudinal separate halves, formed of planks or bars and adapted to move in opposite directions toward the sides of the vessel, each half being provided with belts J J K K, attached to the under side of the deck, substantially as described, wheels H I L, shafts G L', said shafts actuated by power applied to one of them under each half of the deck to drive its half in a direction opposite to that of the other half, whereby the deck-load is dumped equally and simultaneously on both sides, substantially as set forth.

3. A vessel provided with a laterally-shifting flexible deck composed of planks or bars Q Q, attached to laterally-moving belts J K, wheels H I L, to carry the belts, shafts G L', to one of which power is applied to drive the wheels, and tarpaulin or sheet N, to cover the joints of the deck, substantially as described.

4. A vessel provided with a laterally-shifting flexible deck composed of planks or bars Q Q, attached to laterally-moving belts J K, wheels H I L, to carry the belts, shafts G L', to one of which power is applied to drive the wheels, and side pocket O, to receive the flexible deck as it drops over the side, substantially as described.

5. A vessel provided with a laterally-shifting flexible deck com-

posed of planks or bars Q Q, attached to laterally-moving belts J K, wheels H I L, to carry the belts, shafts G L', to one of which power is applied to operate the mechanism, and back D, attached to one edge of the shifting deck, substantially as described.

6. The combination, with the shifting deck C, of chains J K, provided with blocks S and rollers S', adapted to engage with and upon the guide-track B, to facilitate the movement of the deck and to guide the chain, substantially as described.

7. The combination, with the shifting deck C, of chains J K, provided with blocks S, with side rollers S', attached thereto, and trough-shaped guide-track B, said blocks projecting downwardly between the sides of the trough to guide the chain in its traverse, and said rollers S' impinging upon said track to facilitate the movement of the superincumbent deck, substantially as described.

8. The combination, with the shifting deck C, of chains J K provided with blocks S and rollers S', and guide-track B, slanted downwardly toward the side over which the load is to be dumped, substantially as described.

9. A vessel having a rotary driving-shaft extending lengthwise of the hull thereof, with sprocket-wheels thereon, parallel shafts to said driving-shaft, having sprocket-wheels thereon, sprocket-chains connecting said driving-shaft to said side shafts, and shifting decks operated by the rotation of the driving and side shafts, said parts being combined substantially as described.

10. A vessel provided with a laterally-shifting flexible deck composed of planks or bars Q Q, attached by screws, bolts, or rivets to laterally-moving chains on sprocket-wheels, shafts G L', and actuating-shaft E, said parts being combined substantially as described.

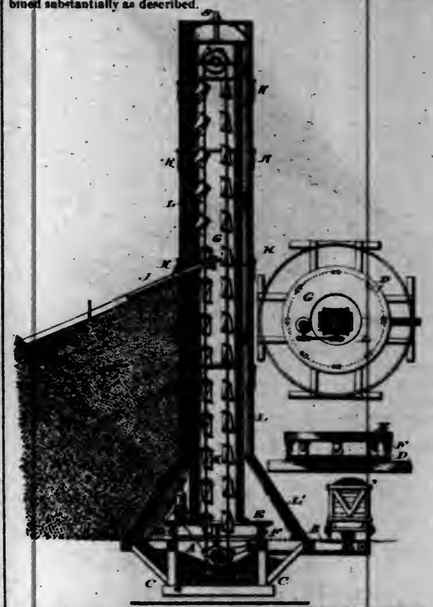
11. A vessel provided with a laterally-shifting flexible deck composed of planks or bars Q Q, attached by screws, bolts, or rivets to laterally-moving chains on sprocket-wheels, shafts G L', and actuating-shaft E, said deck being secured at its outer edge to the edge of the side of the vessel, whereby it will loop up as it falls over the side in dumping, substantially as described.

12. A vessel having a driving-shaft journaled in the hull thereof, shafts journaled in the sides of said hull, sprocket-wheels on said driving and side shafts, other shafts parallel to said shafts, having sprocket-wheels thereon, endless chains connecting last-mentioned shafts with the side shafts, and sprocket-chains connecting the driving-shaft with the side shaft, and flexible decks connected to said endless chains, said parts being combined substantially as described.

13. A vessel with a central shaft having bearings and provided with sprocket wheels, shafts at the sides of the vessel with sprocket-wheels thereon, shafts near the driving-shaft, also having sprocket-wheels, sprocket-chains connecting said driving-shaft and side shaft, and endless belts connecting said side shafts with the shafts near the driving-shaft, flexible decks hinged to the side of the vessel and connected to said endless belts, said parts being combined substantially as described.

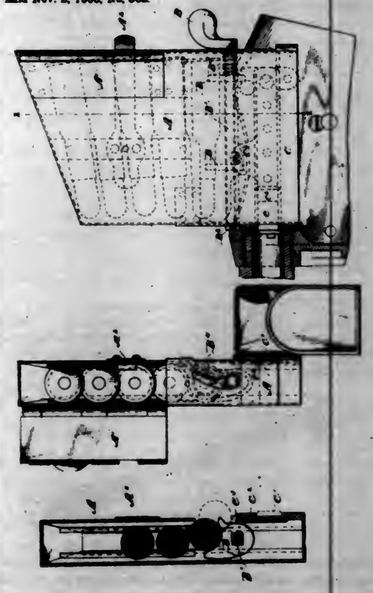
14. A vessel having flexible half-decks with backs at their inner ends, and endless belts with rotating shafts, the said decks being secured to said belts, the said parts being combined substantially as described.

413,031. TOWER FOR THE ELEVATION AND STORAGE OF COAL. EDDY L. CLARK, Brooklyn, N. Y., assignor to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed Mar. 15, 1889. Serial No. 303,367. (No model.)



Claim.—1. An apparatus for the purpose named having a pit with scaffolding therein, a circular track on said scaffolding, a truck with central opening on said track, a tower on said truck provided with side openings, an elevator, and a chute, said parts being combined substantially as described.

2. In an apparatus for the purpose named, a pit with scaffolding therein, a circular track on said scaffolding, a truck with central opening on said track, a tower on said truck and having side windows, an outer casing on said scaffolding, and provided with side openings, said casing having a widened lower part, said parts being combined substantially as described.

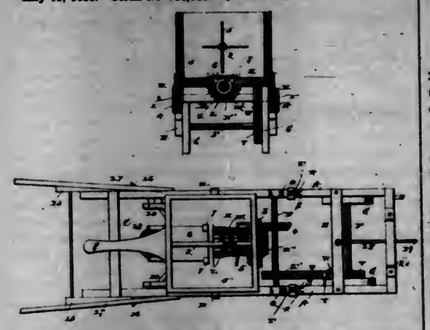


3. In an apparatus for the purpose named, a pit with scaffolding therein, a circular track on said scaffolding, a truck on said track, a tower on said truck provided with side openings, an outer casing on the scaffolding having side openings, and a shaft connected with the top of the tower and journaled in the top of the casing, said parts being combined substantially as described.

4. In an apparatus for the purpose named, a pit with scaffolding therein, a trimming device leading into said pit, a circular track on said scaffolding, a truck on said track, a tower having side windows on said truck, and an outer casing on said scaffolding, said parts being combined substantially as described.

5. In an apparatus for the purpose named, a pit with scaffolding therein, a circular track on said scaffolding, a truck on said track, a tower on said truck having side openings and provided with rollers journaled on the outer wall thereof, and a casing on said scaffolding having a circular track secured to its inner wall, said parts being combined substantially as described.

413,032. CARTRIDGE-MAGAZINE ATTACHMENT FOR RIFLES. ABRAHAM COLLEY, South Richmond, Victoria. Filed Apr. 24, 1888. Serial No. 271,748. (No model.) Patented in Victoria July 27, 1887, No. 5,205; in New South Wales Mar. 9, 1888, No. 538; in Tasmania Mar. 13, 1888, No. 550/10; in South Australia Mar. 13, 1888, No. 304; in New Zealand Mar. 19, 1888, No. 2,870; in England Apr. 12, 1888, No. 5,471; in Belgium Apr. 14, 1888; in India June 12, 1888, No. 230, and in Queensland Nov. 2, 1888, No. 502.



Claim.—1. The herein-described magazine, consisting of the case or box A, provided with the end-gate A', a lock for said gate, a discharge-slot E in its side wall, a dovetailed groove below said slot, and a spring-latch C, whose hook end C^3 projects into the groove, substantially as described, for the purposes specified.

2. In a magazine-gun in which the magazine is applied to one side of the receiver, the combination, with said receiver, of a magazine provided with a discharge-opening of less diameter at the forward than at the rear end, and an ejector consisting of a revolvable shaft and two saddles mounted thereon, having horns of unequal length, and operating to support the lowermost cartridge and eject the same into the receiver and hold the next succeeding cartridge against downward motion, substantially as described.

3. The herein-described magazine, consisting of the case or box A, provided with the end-gate A', a lock for said gate, a discharge-slot E in the side wall, a dovetailed groove below said slot, and a spring-latch C, whose locking-hook C^3 projects into said groove, and which is provided with the thumb-piece C^3, in combination with an injector consisting of a revolvable shaft, two saddles B, having horns of unequal length, mounted on said shaft, and a spring for returning the ejector into its normal position when moved out of it, substantially as and for the purposes specified.

413,033. COTTON-PLANTER. JOHN R. COOK, Rico, Tex. Filed May 15, 1889. Serial No. 310,861. (No model.)

Claim.—In a cotton-planter, the combination of a rectangular frame provided near its front end with an axle having the transporting-wheels, the hopper having a longitudinally-grooved bottom in which is mounted a spirally-threaded conveyer extending through the rear end of said hopper, a transverse shaft in front of the hopper, having a sprocket-wheel connected by a chain with a sprocket-wheel upon the axle, intermeshing pinions upon the transverse shaft and the conveyer-shaft, a regulating-slide, a shaft mounted longitudinally in the hopper and having a series of agitators and provided at its front end with a pinion meshing with a spur-wheel upon the conveyer-shaft, the arms 10, carrying the shank of the furrow-opener and having an inclined chute secured to their rear sides, the standards connected to the rear end of the frame and having the coverers, and the handles, all arranged and combined to form an organized machine, as herein set forth.

413,034. BUTTONER. THOMAS W. G. COOK, New York, N. Y. Filed Mar. 23, 1889. Serial No. 305,182. (No model.)

Claim.—1. A buttoner consisting of the handle A, having a pivot, and a wire loop having its free ends formed into a duplex eye for engaging the pivot, substantially as described.

2. A buttoner consisting of the handle A, having a pivot, and a wire loop having its free ends formed into a duplex eye for engaging the pivot, one portion of said duplex eye being made to surround or clasp the other portion, substantially as described.

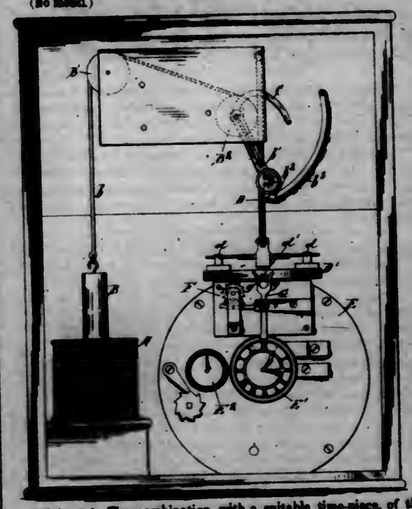
413,035. PROCESS OF MAKING SOAP. ALEXANDER L. CRAIG, Hot Springs, Ark. Filed Nov. 30, 1888. Serial No. 292,267. (No specimens.)

Claim.—The process of producing an alkaline borax soap, consisting of dissolving ordinary soap, rosin, and sal-soda in water, and in a separate vessel borax and salts of tartar, combining the two at boiling heat and then thoroughly mixing them, adding thereto beeswax, which solidifies the mixture, substantially as described.

413,036. ABSORBENT CARTRIDGE FOR PIPE-STEMS. WILLIAM DENUTH, New York, N. Y. Filed May 20, 1889. Serial No. 312,077. (No model.)

Claim.—A cylindrical cartridge for pipe-stems, made of a compressed absorbent material saturated with tar and having a smoke-passage extending centrally through it from end to end, substantially as shown and described.

413,037. AUGER-HANDLE. JAMES H. DEVOT, St. Louis, Mo. Filed Jan. 29, 1889. Serial No. 297,911. (No model.)

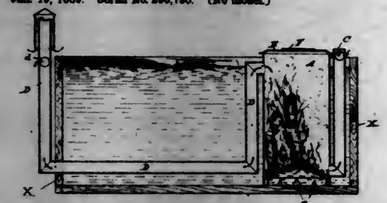


Claim.—1. An auger-handle having a removable grip 2, a ferrule 3, having a screw-threaded socket, a longitudinal rod 7, for securing the ferrule to the grip, a turning-barrel adapted to receive the shank of an auger, a head 6, containing said barrel, and a screw-stud 5, onto which the ferrule of the grip is screwed, substantially as set forth.

2. An auger-handle having a socket 19 for the auger-shank, with a dovetail seat or groove 20, and a wedge-formed dovetail key working in the seat, substantially as and for the purpose set forth.

3. The combination, in an auger-handle, of a grip 1, a removable grip 2, a turning-barrel 9, having the shank-socket extending from top to bottom, a ratchet device governing the rotation of the barrel, a screw-threaded projection 24, and a socket-piece 25, adapted to screw on the projection and to receive a feed-screw adapted to bear on the top of the auger-shank either above or below the top of the turning-barrel, substantially as and for the purpose set forth.

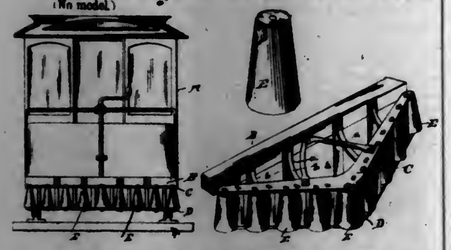
413,038. ELECTRIC METER. WILLIAM H. DOUGLAS, Stourbridge, County of Stafford, England. Filed May 5, 1888. Serial No. 273,073. (No model.)



Claim.—1. The combination, with a suitable time-piece, of the curb C, for regulating the movement thereof, the pulley B^3, to which said curb is attached, the cord *b*, attached to said pulley, the solenoid A, located in the circuit, and the core B, suspended within the same by means of the cord *b*, substantially as and for the purposes specified.

2. The combination, with a suitable time-piece, of the pulley B^3,

provided with curb C and counterpoise arm *b'*, the solenoid A, located in the circuit, the core B, and the cord *b*, connected to the pulley and supporting said core, substantially as and for the purposes specified.



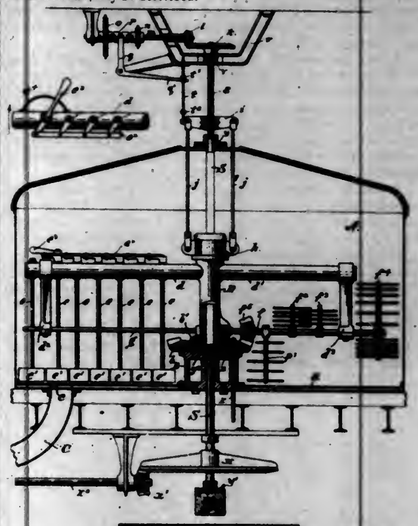
3. The combination, with the solenoid and core or ammeter, of a curb controlled thereby, a detached vibrating pendulum controlled by said curb, and a time-piece the escapement of which is provided with an additional lever to operate the said pendulum, substantially as and for the purposes specified.

413,039. **WATER-HEATER.** JULIUS C. EATON, Lyndon, Vt. Filed Jan. 19, 1889. Serial No. 296,795. (No model.)

Claim.—In a apparatus for heating water for stock, a heater composed of a single iron or metal shell having a slightly-elevated shallow conical bottom, and means whereby water may circulate below it, and provided with a suitable top having an opening for introducing fuel, and a hinged cover for same, a draft-tube connecting with the interior of said shell at a point just above said shallow conical bottom, and a suitable smoke-pipe and spark-arrester attached thereto, all constructed substantially in the manner and for the purpose set forth.

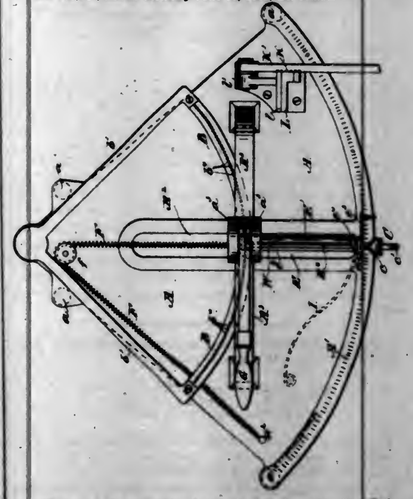
413,040. **FENDER-GUARD ATTACHED TO CARS.** ROBERT M. EDWARDS, San Francisco, Cal. Filed Apr. 13, 1889. Serial No. 307,196. (No model.)

Claim.—1. In a safety-guard or fender for cars and like vehicles, a series of vertical conical rolls arranged in double-inclined planes converging toward and intersecting each other in front of the car, substantially as described.



2. In a safety-guard or fender for cars and like vehicles, the combination, with the front of the car, of an upper and lower triangular-shaped platform and a series of vertical conical rolls arranged between said platforms with their enlarged ends downward, substantially as described.

413,041. **MASH-TUB MECHANISM.** JOHN H. BOCKENKOVT, Cincinnati, Ohio, assignor, by mesne assignments, to Matthew Gottfried, Chicago, Ill. Filed Nov. 21, 1887. Serial No. 255,725. (No model.)



Claim.—1. In a mash-tub, the combination of a central vertical driving-shaft, a horizontal arm centrally pivoted thereon and carried thereby, but free to be moved vertically on the driving-shaft, stirrers or beaters carried upon said horizontal arm and operated by the rotation of the driving-shaft, and means for automatically raising or lowering said horizontal arm while in rotation and automatically stopping said raising and lowering at predetermined limits, substantially as described.

2. In a mash-tub, the combination, with a central spindle D, having stirrers and scrapers suitably supported thereon, and means for raising and lowering said spindle, of the bevel-gear *b*, loosely supported by said spindle and meshing with the gearing *f*^3, for rotating shaft *f*, said bevel-gear and gearing so adapted as to be raised and lowered with the spindle D and remain in mesh, substantially as described.

3. In a mash-tub, the combination, with a central spindle D, having stirrers and scrapers suitably supported thereon and carrying the yoke A, and a shaft S, adapted to rotate said spindle, of a screw-shaft *s*, mounted upon shaft S, but rotatable independently thereof, and the screw-yoke *i*, engaging with said screw-shaft *s*, and connections between said screw-yoke *i* and yoke A, for raising and lowering the spindle D, substantially as described.

413,042. **MACHINE FOR MAKING TYPE-BARS.** ANTOINE J. ROELEN, Brussels, Belgium, assignor to Antoine Mullers, Rheinfeld, Cologne, and Gustave Maecks, Cologne, Germany. Filed Mar. 20, 1888. Serial No. 267,892. (No model.) Patented in Belgium July 11, 1884, No. 65,744; in England Aug. 2, 1884, No. 10,901; in France Jan. 9, 1885, No. 166,347, and in Germany June 16, 1885, No. 34,214.

Claim.—1. In a machine for producing characters in relief on a bar of compressible material, a matrix-plate having a plane face in which the characters are formed *in intaglio* and in which is formed a concave recess in front of each character, substantially as and for the purposes specified.

2. In a machine for producing characters in relief on a bar of compressible material, a matrix-plate having a plane face in which the characters are formed *in intaglio* and in which is formed a concave recess in front of each character extending from the character-space to the edge of the matrix-plate, said concave recess varying in length according to the width of the character-space, substantially as and for the purposes specified.

3. In a machine for producing characters in relief on a bar of compressible material, a matrix-plate having a plane face, in which the characters are formed *in intaglio* and in which is formed a concave recess in front of each character extending from the character-space to the edge of the matrix-plate, whereby when an impression is made a shoulder will be formed in front of each character by the depression of the latter below the face of the bar, in combination with a lever and connections to force the matrix-plate into the bar, feeding devices to automatically feed the bar forward, and a stop in the path of the bar adapted to engage the shoulder formed in front of each character to hold the bar against the action of the feeding devices, substantially as and for the purposes specified.

4. In a machine for producing characters in relief on a bar of impressible material, a matrix-plate having substantially the form of a right angle or L, having in the under face of its vertical portion a single row of characters *in intaglio*, a recess or depression in front of each character, and a cutting-edge on opposite sides of the character-space, one of said cutting-edges projecting beyond the face in which the characters are formed, for the purposes specified.

5. In a machine for producing type-bars, the combination of the following elements: a pivoted matrix-plate having the form of a segment of a circle, a vertical pivot therefor, elastic supporting-arms connecting the segment with its pivot, a lever for rotating the matrix-plate on its pivot, a power-lever, transmitting devices for transmitting the power exerted by the lever to the matrix-plate to depress the same against the stress of its supporting-arms, a stop to limit the downward movement of the matrix-plate, and a stop to lock the matrix-plate against movement on its pivot controlled by the power-lever through the transmitting devices, substantially as described, for the purposes specified.

6. In a machine for producing type-bars, the combination of the following elements: a pivoted matrix-plate having the form of a segment of a circle, a vertical pivot therefor, elastic supporting-arms connecting the segment with its pivot, a lever for rotating the matrix-plate on its pivot, a power-lever, transmitting devices for transmitting the power exerted by the lever to the matrix-plate to depress the same against the stress of its supporting-arms, a stop to limit the downward movement on its pivot, and feeding devices, the operation whereof is controlled by the matrix, to feed the type-bar blank a step forward at each impression, substantially as and for the purposes specified.

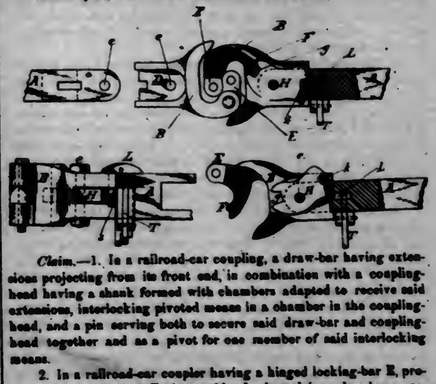
7. In a machine for producing type-bars, the combination of the sector-shaped matrix-plate B, connected by elastic arms to a pivot or stud *b*, the sector-shaped platform A, to which said matrix-plate is pivoted, the pointer-lever C, and a power-lever and plunger for forcing the matrix-plate down toward its support, said parts being arranged for operation for the purposes specified.

8. The combination, substantially as herein described, of the table A, having a guide-groove A^3 along its median line, the matrix-plate B, pivotally connected with the table, as described, and having a projecting edge b^3, and the spring-actuated carriage E, substantially as and for the purposes specified.

9. In a machine for producing type-bars, the combination, with the table A, provided with a guide-groove A^3 along its axial line, the matrix-plate B, having a horizontal and vertical movement on the table and being provided on opposite sides of its character-space with projecting cutting-edges b^3 b^3, respectively, and the spring-actuated carriage E, of the bridge D, said parts being arranged for operation for the purpose specified.

10. The combination, substantially as herein described, with the table A, the matrix-plate B, the carriage E, the spring F, and mechanism to depress the matrix-plate, of the bridge D and the guide-finger D', adjustable thereon, said parts being constructed and arranged for operation for the purposes specified.

11. The combination, with the table A, provided with the guide-groove A^3, the matrix-plate B, and the bridge D, of the carriage E, having vertical end walls and a like side wall, and the eccentric-roller E', journaled in said end walls, substantially as and for the purposes specified.



12. The combination, with the table A, having a guide-groove A^3, the matrix-plate B, and bridge D, of the carriage E, having vertical end walls and a like side wall, the eccentric-roller E', journaled in said end walls, and the laterally-movable clamping-plate E^3, interposed between the roller and the side wall of the carriage, substantially as and for the purposes specified.

413,043. **GAGE ATTACHMENT FOR SEWING-MACHINE PRESSER-FEET.** JOSEPH FARRIS, New York, N. Y. Filed Feb. 4, 1889. Serial No. 298,697. (No model.)

Claim.—The combination, with the sewing-machine presser-foot provided in one side with a recess D, of the piece E, placed and fitting in said recess and having its edges curved, the same as the front and rear edges of the presser-foot, a gage-arm F, projecting laterally from the bottom part of said piece E, the bottom surface of said gage-arm being inclined upward at its inner end and adjacent to the point where the needle passes through the presser-foot, and the remaining portion of the under side of said gage-arm being a short distance above the plane of the bottom of the presser-foot, whereby the material will be pressed down on the sewing-plate by the gage-arm from the edge of said material to the point where the needle enters, a sliding gage J, mounted on the arm F, through which gage the said gage-arm passes, the bottom of said gage J being in the same plane with the bottom of the presser-foot, screw K, for locking the gage J on the gage-arm F, and the screw H, for locking the piece E on the presser-foot, substantially as set forth.

413,044. **CAR-COUPLING.** FRANK A. FOX, San Francisco, Cal. Filed July 25, 1888. Serial No. 312,067. (No model.)

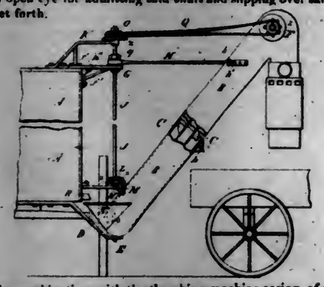
Claim.—1. In a railroad-car coupling, a draw-bar having extensions projecting from its front end, in combination with a coupling-head having a shank formed with chambers adapted to receive said extensions, interlocking pivoted means in a chamber in the coupling-head, and a pin serving both to secure said draw-bar and coupling-head together and as a pivot for one member of said interlocking means.

2. In a railroad-car coupler having a hinged locking-bar E, provided with a tail-piece F, the tumbler A, pivoted in a chamber or recess in the coupler-head and having a notch *g* in its front edge adapted to receive the end of the tail-piece F, and a notch *k* in its rear end to receive a key or pin L, substantially as specified.

3. In a car-coupling device, a separable coupling-head B, having a chamber in line with the tail-piece F of the locking-bar E, and a tumbler H, pivoted in said chamber or recess, the front end of which engages the rear end of the tail-piece when the locking-bar is closed, while its rear end is provided with means for locking it in position when closed, substantially as described.

4. In a car-coupling device, a locking-bar E, having a tail-piece F, a tumbler H, mounted on a center bolt in a recess or chamber in the bumper-head adapted to receive the end of the tail-piece and swing it into a locked position, a key or pin adapted to lock the tumbler in its locked position, and a lever adapted to raise the pin and release the tumbler and tail-piece, substantially as described.

5. In a car-coupling device, a tumbler H and locking-pin L, having the center bolt on which the tumbler moves, and the locking-pin in line with the center line of the draw-bar, substantially as described.



6. In a car-coupler, the combination, with a draw-bar provided with a chambered coupling-head having a pivoted extension formed with a tail-piece, of a tumbler in the chamber of said coupling-head having a notch in its rear end, and a key or pin adapted to engage said notch, the pivot of the tumbler and the key being located in line with the center of the draw-bar, substantially as shown, and for the purposes set forth.

7. In a car-coupling device having a locking-tumbler H, and a pin L, for engaging a notch *k* in the rear end of the tumbler, the tumbler H having one side beveled, substantially as and for the purposes described.

413,045. **GRAIN-ELEVATING ATTACHMENT FOR THRASHING-MACHINES.** ROBERT S. GARRET, Russville, Kans. Filed Dec. 14, 1888. Serial No. 293,962. (No model.)

Claim.—1. The combination, with the thrashing-machine casing, a conveyer pivoted at its lower end, the shaft J, means for driving said shaft, and connections between said shaft and the conveyer-belt, of

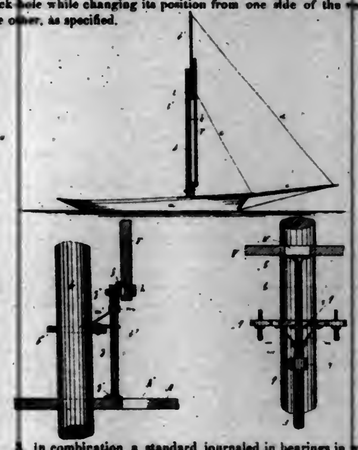
the hollow support G, through which said shaft passes, and the guy H, secured at one end to the casing of said conveyer and having at the other the open eye for admitting said shaft and slipping over said support, as set forth.

2. The combination, with the thrashing-machine casing, of a conveyer pivoted at its lower end, the shaft J, means for driving said shaft, connections between said shaft and the conveyer-belt, the hollow support G, through which said shaft passes, the guy H, having at one end an open eye for admitting said shaft and receiving said support, and the nut *g*, adapted to be turned onto said support and constituting a keeper, substantially as set forth.

3. The combination, with the thrashing-machine casing and the conveyer, of the bracket D, to which said conveyer is pivoted, the bracket F, having hollow support G, the guy H, secured at one end to the casing of said conveyer and at the other engaging said support, the bracket I, the shaft J, stepped onto said bracket and passing through the hollow support G, means for driving said shaft J, the wheel O, fixed to said shaft, and connections between said wheel O and the conveyer-belt, the axis of the shaft J being coincident with the axis of the pivot of the conveyer, substantially as set forth.

4. The combination, with the thrashing-machine casing and the wheel M, secured to one of the thrashing-machine shafts, of the pivoted conveyer, the wheel P, situated at the top thereof, the wheel O, the belt Q, embracing wheels O and P, the shaft J, to which wheel O is secured, the wheel L, also secured to said shaft, and the belt N, embracing wheels L and M, substantially as set forth.

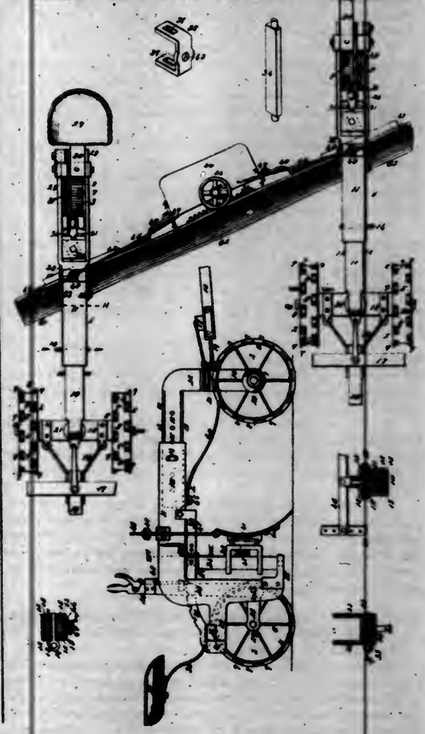
5. In an elevating attachment for thrashing-machines, the combination, with the thrashing-machine casing and the pivoted conveyer, of the sprocket-wheel P, situated at the top of the conveyer and having a flange projecting radially from the side next to the conveyer, the shaft J, means for connecting said shaft with one of the shafts of the thrashing-machine, the sprocket-wheel O, secured to said shaft and having a flange on the under side thereof, and twisted belt Q, embracing the wheels O and P, said wheels being situated in intersecting planes, substantially as set forth.



6. In a grain-elevating attachment, the combination, with the thrasher-casing and pivoted conveyer, of the vertical shaft J, situated with its axis coincident with the pivot of the conveyer, the sprocket-wheel L on the lower part of said shaft, the sprocket-wheel M on a shaft of the thrasher, said wheels being situated in intersecting planes and each with its traction side in the plane of the other, the half-crossed drive-chain N, embracing said wheels, the sprocket-wheel O, secured to the upper part of said shaft, the sprocket-wheel P, secured to the conveyer-shaft, said wheels being situated in intersecting planes, substantially as described, and the drive-chain embracing said wheels, as and for the purpose set forth.

7. The combination of the casing of the thrasher, the spout R, and the brackets D and F, situated in the vertical plane of said spout, the former below and the latter above it, the conveyer pivoted at its lower end to bracket D, and having the hopper S extending beyond the end of the spout R, the shaft J, journaled in bracket F, with its axis coincident with the pivot of the conveyer, the guy H, connected at one end to the conveyer and at the other having an eye through which said shaft J passes, the sprocket-wheel L on the lower part of said shaft, means for imparting to said wheel motion from one of the shafts of the thrasher, the sprocket-wheel O on the upper part of said shaft, the sprocket-wheel P on the conveyer-shaft, and the drive-chain Q, embracing said wheels, substantially as set forth.

413,046. SPINNAKER-BOOM STANDARD. FREDERIC J. GEVALT, Chelsea, Mass. Filed Feb. 4, 1889. Serial No. 298,556. (No model.)



Claim.—1. The standard *g*, having the lower step *g'*, middle bearing *b*, and upper bearing *m*, secured by means of braces *m' m'* to the mast-saddle and having pivoted to its upper end the ring *h*, combined with the spinnaker-boom F, sliding therein, and means for hoisting, lowering, and supporting the same, substantially as and for the purpose set forth.

2. The spinnaker-boom F, adapted to slide in the ring *h*, pivoted to the standard *g*, said standard being supported in bearings in which it can rotate, and said boom having means for lowering it through a deck-hole while changing its position from one side of the vessel to the other, as specified.

3. In combination, a standard journaled in bearings in which it is rotatable, a spinnaker-boom ring pivoted to said standard, a spinnaker-boom adapted to slide and to be supported in said ring, and a deck-perforation for receiving the spinnaker-boom while its position is being changed, substantially as and for the purpose set forth.

413,047. ROAD SCRAPER AND GRADER. JOHN C. GUNSON, Monmouth, Ill. Filed Jan. 23, 1889. Serial No. 297,377. (No model.)

Claim.—1. The two draft-carriages 1, having beams or arches composed each of two parts 10 and 11, telescoped together and sustaining a single scraper-blade, for the purpose set forth.

2. The beam or arch having a part 10 with flanges 12, and the part 11, having a socket adapted to receive the rear portion of part 10, and having grooves 13, in which the ribs 12 fit, substantially as and for the purpose set forth.

3. The combination of the two carriages 1 1, carrying the turn-bars 34, clevises 38, sliding on said bars, a bar or frame 40, pivoted to the clevises 38, and a scraper-blade adapted to slide endwise on the bar or frame 40, substantially as set forth.

4. The combination of the scraper-blade, the bar or frame 40, giving support to the blade, the clevises 38, and the turn-bars 34, working at the upper ends in adjustable bearings 36, substantially as and for the purpose set forth.

5. The combination of the carriages 1, the scraper-blade supported on levers 46, fulcrumed to the carriages, the ground-wheels 3, and the bell-crank levers 25, fulcrumed to the carriages and carrying the wheel-spindles 27, for the purpose set forth.

6. The two carriages 1, the bar or frame 40, connected to the carriages and carrying a hand-shaft 53, with cog-wheel 52, and the scraper-blade sliding on the bar or frame 40, and having a cog-rack engaged by the cog-wheel 52, substantially as and for the purpose set forth.

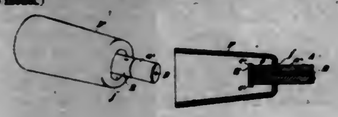
7. The combination, with the endwise-sliding scraper-bar having a cog-rack, of the dog 55, engaging the rack and connected to the treadle 57, substantially as and for the purpose set forth.

8. The combination of the two carriages 1, the bar or frame 40 connected to the carriages, the scraper-blade sliding endwise on the bar and carrying a cog-rack 51, a wheel 52, engaging the cog-rack, and a dog 55, engaging the cog-rack, with means for turning the cog-wheel and lifting the dog out of engagment with the cog-rack, substantially as and for the purpose set forth.

9. The combination of the two draft-carriages 1 1, supported at the front on the turn-axle 18 and wheels 2, and at the rear on wheel 3, carried by the adjusting-lever 25, and consisting of two parts 10 11, telescoped together, the turn-bars 34, clevises 38, sliding vertically on the turn-bars, bar or frame 40, pivoted to the clevises, a scraper-blade sliding on the bar or frame 40, the sustaining-levers 46, and the device for giving endwise movement to the scraper-blade and holding it in place, the same consisting of a rack on the scraper-blade, and a cog-wheel 52 and dog 55 on the bar or frame 40 engaging the cog-rack, substantially as and for the purpose set forth.

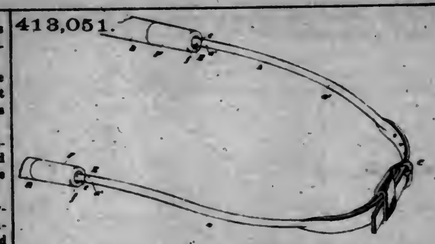
413,048. VIOLET COLORING-MATTER. ROBERT GNEHM and JAKOB SCHMID, Basle, Switzerland, assignors to the Society of Chemical Industry, same place. Filed Apr. 6, 1883. Serial No. 308,711. (Specimens.) Patented in France Apr. 18, 1888, No. 190,067.

Claim.—As a new product, the violet coloring-matter or dye-stuff monophenylmeta-amidophenolphthaleine, which forms a powder of a glistening copper-like appearance, insoluble in water and in benzine, soluble in alcohol with a violet-red color, and which dyes silk a beautiful violet with a strong copper-red fluorescence.



413,049. BLUE COLORING-MATTER. ROBERT GNEHM and JAKOB SCHMID, Basle, Switzerland, assignors to the Society of Chemical Industry, same place. Filed May 16, 1889. Serial No. 311,041. (Specimens.) Patented in France Apr. 18, 1888, No. 190,067.

Claim.—As a new product, the blue coloring-matter or dye-stuff diphenylmeta-amidophenoldichlorphthaleine, which forms a dark indigo-blue powder with a metallic luster, insoluble in water, difficultly soluble in hot benzine, soluble in alcohol with a blue color, and which dyes silk with a strongly fluorescent blue.



413,050. GRAY COLORING-MATTER. ROBERT GNEHM and JAKOB SCHMID, Basle, Switzerland, assignors to the Society of Chemical Industry, same place. Filed May 16, 1889. Serial No. 311,042. (Specimens.) Patented in France Apr. 18, 1888, No. 190,067.

Claim.—As a new product, the gray coloring-matter or dye-stuff, phenylmeta-amidophenoltetrachlorphthaleine, which forms a dark-green powder insoluble in water, difficultly soluble in hot alcohol, still more difficultly soluble in benzine, and which dyes silk with a gray color, showing a strong fluorescence.

413,051. SHAFT ATTACHMENT FOR CARRIAGES. CHARLES C. GRAHAM, Crawfordsville, Ind. Filed Aug. 14, 1889. Serial No. 320,662. (No model.)

413,051.

Claim.—A shaft attachment comprising the caps having the openings *f* in their ends, the strap consisting of sections and adapted to be buckled together, and the tips secured to the ends a^2 of the strap and provided with annular flanges, whereby the ends a^2 of the strap are swiveled to said caps, substantially as described.

413,052. BUCKLE. JACOB GOUP, Baltimore, Md. Filed June 4, 1889. Serial No. 313,042. (No model.)

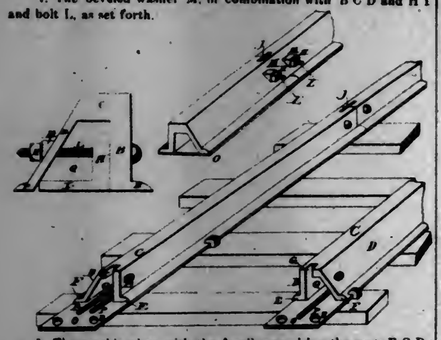
Claim.—1. In a buckle, the combination of a frame with a sliding tongue or tongues secured to the frame and adapted to move back and forth in a plane parallel to that of the frame and engaging with one end of the frame to form a buckle, the end of said frame with which the tongue or tongues engage being provided with a slot or rigid shield covering the point or points of the tongue, substantially as described.

2. In a buckle, the combination of a frame one end of which is slotted or provided with a rigid shield, and a spring-stop with a sliding tongue or tongues suitably mounted upon said frame to move back and forth in a plane parallel to that of the frame and in such position that the extremity of the tongue or tongues will enter the shield on one end of the frame and the spring-stop will lock the tongue or the device to which they may be attached in that position, substantially as described.

3. In a buckle, the combination of a frame-plate provided with a transverse slot at one end and a spring-stop consisting of a spring-hook with an upwardly-turned end secured to the frame-plate, with a sliding tongue-plate the edges of which surround the sides of the frame-plate, the spring-stop of the frame-plate being so located that when the tongue-plate is in its extreme former position it will be engaged and held by the spring-stop, substantially as described.

4. In a buckle, the combination of a frame-plate with a sliding tongue or tongues secured to a plate which is suitably mounted upon the frame so as to move back and forth in a plane parallel to that of the frame, the tongue or tongues engaging with the frame to form a buckle, and a spring-stop for locking the tongue-plate in a desired position, which consists of a spring-hook with an upwardly-turned end secured to the frame-plate and engaging the tongue-plate, substantially as described.

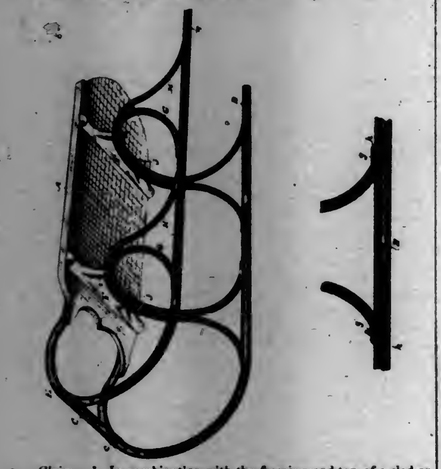
5. In a buckle, the combination of a frame-plate with a sliding tongue or tongues secured to a plate, which is suitably mounted upon the frame so as to move back and forth in a plane parallel to that of the frame, the tongue or tongues engaging with the frame to form a buckle, and a spring-stop for locking the tongue-plate in a desired position, which consists of a spring-hook with an upwardly-turned end secured to the frame-plate and engaging the tongue-plate, and a releasing device for the tongue-plate, which consists of a spring-hook with a downwardly-projecting point secured to the tongue-plate and located so as to stand immediately above the end of the upwardly-projecting spring-hook when the tongue is locked by the latter hook, substantially as described.



413,053. RAILROAD-RAIL. JOHN R. HALDEMAN, Bloomington, Ill. Filed Dec. 17, 1888. Serial No. 293,986. (No model.)

Claim.—1. The A railroad-rail with the upright standard B, top bed C, brace D, and feet E F, as set forth.

2. The combination, with the A-rail comprising the parts B C D, of the fish-plate or coupling having the standard H and the foot-rest I, as set forth.



3. The combination, with the A-rail comprising the parts B C D, the parts C being provided with the slots at the ends of the fish-plates H I, having the projections J J, as set forth.

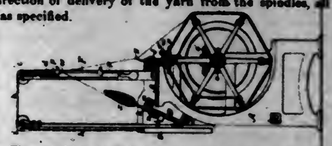
4. The beveled washer M, in combination with B C D and H I and bolt I, as set forth.

5. The combination, with the A-rail comprising the parts B C D, of the plate O, perforated as at R, the whole forming a tube or tunnel for the inclosure of electric wires, as set forth.

413,054. SLED. JOHN I. HANCOCK, Montrose, Pa. Filed Aug. 19, 1889. Serial No. 321,295. (No model.)

Claim.—1. In combination with the framing and top of a sled or sleigh, paired braces having spreading ends, substantially as and for the purpose set forth.

2. In combination with the gas-pipe framing and the top of a sled or sleigh, U-shaped braces of gas-pipe having downwardly and laterally curved ends, arranged in pairs, with the ends extending oppositely, substantially as and for the purpose set forth.



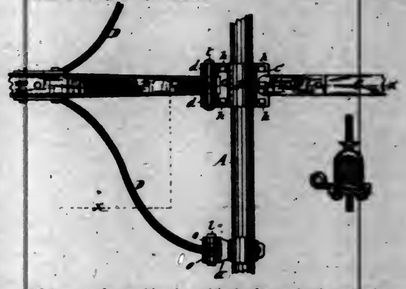
3. In a sled or sleigh, the combination of the top, cleats on the under side thereof, the gas-pipe framing, and paired U-shaped braces curving downwardly and laterally, the arms of each pair extending oppositely and having compressed ends concave on their under sides to fit the gas-pipe runners, means for connecting the ends to the runners, and means for connecting the braces to said cleats, said braces affording a broad bearing for the cleats, substantially as and for the purpose set forth.

4. A sled in which the runners are constructed of pipe, having the herein-described means for attaching the braces thereto, consisting of shouldered fastenings, the shoulders of which are adapted to engage the inner sides of the runners.

5. A sled in which the runners are constructed of pipe, having the herein-described means for attaching the braces thereto, consisting of rivets having enlarged lower ends passing through the runners and engaging the inner sides of the top thereof, and means for securing the braces to the rivets on the upper sides of the runners.

413,055. YARN-REELING MACHINE. HARRY HARDWICK, ADOLPH M. ULLMER, and FRANK FOWLER, Philadelphia, Pa. Filed Mar. 11, 1887. Serial No. 230,493. (No model.)

Claim.—1. The combination of the reel and its shaft, the spindles, bearings in which said spindles are free to turn, and a bar carrying guides for the yarn, said bar being movable vertically, so as to change the direction of delivery of the yarn from the spindles, all substantially as specified.

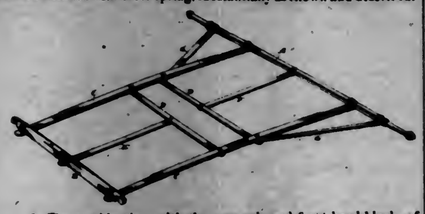


2. The combination of the reel and its shaft, the spindles, and bearings in which said spindles are free to turn, a movable bar having guides for the yarn, and weights connected to said bar and serving to counterbalance the same, all substantially as specified.

3. The combination of the reel and its shaft, the spindles, and bearings in which said spindles are free to turn, a bar having guides for the yarn and movable vertically, so as to change the direction of delivery of the yarn from the spindles, and a traverse-bar having guides for receiving the yarn after the same passes through the guides of the shifting-bar, all substantially as specified.

4. The combination of the reel and its shaft, the spindles, bearings in which said spindles are free to turn, a bar having guides for the yarn, and movable so as to change the direction of delivery of the yarn from the spindles, and hooked catches for retaining said bar in either of its extreme positions, all substantially as specified.

413,056. POLE-COUPLING. HANS M. HANSON, St. Paul, Minn., assignor of one-half to John H. Kennedy, same place. Filed Jan. 7, 1889. Serial No. 295,986. (No model.)



Claim.—1. In combination with the forward axle and pole-couplings *a a*, attached to the end portions of said axle, the saddle *b*, placed astride the central portion of the axle and formed with forwardly and rearwardly extending flanges *c* and *c'* and with perforated ears *d d* on the flange *c*, the clip-tie *e*, embracing the bottom portion of the axle and formed with flanges *f f*, tie-bolts *h h*, passing through the flanges of the saddle and clip-tie, the reach coupled to the rear flanges of the aforesaid parts, the pole P, formed with the extension P' terminating with the shackle-eye *i* between the ears *d d*, and a coupling-bolt passing through said ears and intervening eye, substantially as described and shown.

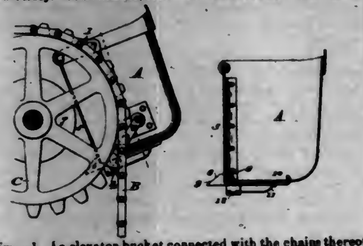
2. In combination with the axle A and reach C, the saddle *b*, placed astride the central portion of said axle and formed with the forwardly and rearwardly extending flanges *c c'* and with the perforated ears *d d*, the clip-tie *e*, embracing the bottom portion of the axle and formed with flanges *f f*, tie-bolts A A, passing through the flanges of the saddle and clip-tie, and the coupling-iron *g*, attached to the reach and having its forward end bifurcated and embracing the rearwardly-extending flanges of the aforesaid saddle and clip-tie and pivotally connected thereto, substantially as described and shown.

3. In combination with the forward axle and pole-couplings *a a*, attached to the end portions of said axle, and the pole P, formed with the extension P', terminating with the shackle-eye *i*, the clip *b*, placed astride the central portion of the axle and having the king-bolt integral with it, the clip-tie *e*, formed with the perforated ears *d d* for the reception of the shackle-eye *i*, and a coupling-bolt passing through said ears and intervening eye, substantially as described and shown.

413,057. SPRING-GEAR FOR VEHICLES. CHARLES C. HAVEN, Penn Yan, N. Y. Filed July 24, 1889. Serial No. 318,563. (No model.)

Claim.—1. The combination, with the rear axle and front head-block, of the side springs connecting the axle and head-block, the cross-springs connecting the side springs, the longitudinal spring connected at its front end with the king-bolt, and the rear longitudinal spring connecting the rear cross-spring with the rear axle, and the inclined springs extending from the axle to the side bars at their intersection with the rear cross-spring, substantially as shown and described.

2. The combination, with the rear axle and front head-block, of the side springs connecting the axle and head-block, the cross-springs connecting the side springs, the longitudinal spring connected at its forward end with the king-bolt and at its rear end to the front cross-spring, the rear longitudinal spring connecting the rear cross-spring with the rear axle, and the inclined springs connected with the rear axle and attached to the side bars at the point of intersection of the rear cross-spring, substantially as shown and described.

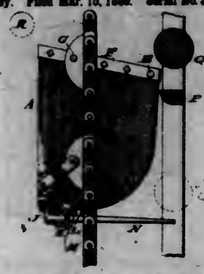


413,058. ELECTRICAL TOY. LUDWIG HIRSCH, New York, N. Y. Filed Mar. 8, 1889. Serial No. 302,594. (No model.)

Claim.—1. An electrical toy figure composed of a main part or body of tissue or other thin paper and a supporting-strip of stiff paper for said body, so that the latter can be attracted by a body charged with frictional electricity, substantially as set forth.

2. An electrical toy figure composed of a body of tissue or other thin paper, a supporting-strip of stiff paper, and a base made integral with strip, so that the latter and the body of the toy figure can be folded into one plane with the same, substantially as set forth.

413,059. ELEVATOR-BUCKET. LYMAN D. HOWARD, Philadelphia, Pa., assignor to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed Mar. 15, 1889. Serial No. 303,386. (No model.)



Claim.—1. An elevator-bucket connected with the chains thereof at top and bottom, respectively, inside and outside of the center-lines of strain, substantially as described.

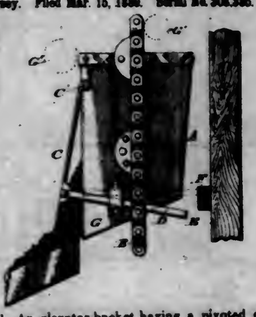
2. An elevator-bucket, in combination with a bucket-chain, links pivotally connected to said bucket and chain at the top and bottom thereof, the lower link being longer than the upper link and the points of connection of the said links with the bucket being on different sides of the line of strain, said parts being combined substantially as and for the purpose set forth.

3. The elevator-bucket A, with pivoted door 5, a catch pivotally connected with the bottom of the bucket and having noses adapted to engage the lower end of the door, a guard secured to the under side of the bucket, and a spring bearing against said catch, said parts being combined substantially as described.

4. The elevator-bucket A, with pivoted door 5, a catch pivotally connected with the bottom of the bucket and having noses adapted to engage the edge of the door, a guard secured to the under side of the bucket and embracing the catch, and a spring within the guard bearing against the catch, the nose of said catch being wider than said guard, said parts being combined substantially as and for the purpose set forth.

413,060. ELEVATOR-BUCKET. LYMAN D. HOWARD, Philadelphia, Pa., assignor to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed Mar. 15, 1889. Serial No. 303,384. (No model.)

Claim.—1. A bucket formed in sections and provided with a catch which has a nose engaging with one section and an arm engaging with a shoulder of the other section, substantially as described.

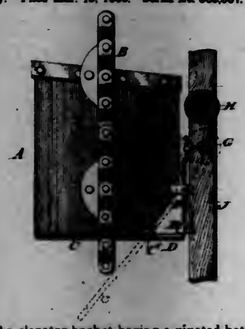


2. A bucket formed in sections and provided with a catch for locking the sections, in combination with abutments, one of which serves to tilt the bucket outward and the other to operate the catch for disconnecting the sections, substantially as described.

3. An elevator-bucket consisting of obliquely-connected sections, one of which is pivotally connected to a ring secured to the other, the band-section having a pivoted-link connection at its lower part with the bucket-chain, said parts being combined substantially as described.

4. An elevator-bucket consisting of two sections pivotally connected and a catch connected to one of said sections and having an arm adapted to engage a shoulder on the other section, and provided with a rearwardly-extending arm adapted to trip said catch, said parts being combined substantially as described.

5. An elevator-bucket consisting of two sections, one having a band to which the other section is pivoted and a bucket-chain to which the band-section is directly pivoted at its upper part and pivotally connected by a link near its lower part, and a catch connected to the band-section and having an arm engaging the pivot-section, and provided with a rearwardly-projecting arm adapted to trip said catch and release the sections, said parts being combined substantially as described.

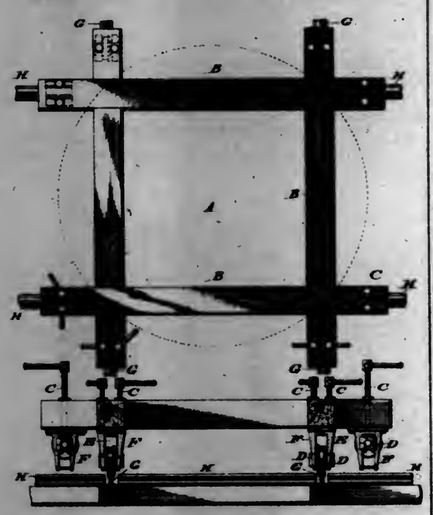


413,061. ELEVATOR-BUCKET. LYMAN D. HOWARD, Philadelphia, Pa., assignor to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed Mar. 15, 1889. Serial No. 303,385. (No model.)

Claim.—1. An elevator-bucket having a pivoted door, catches connected with said door and having noses adapted to engage the back of the bucket when the door is closed, keepers secured to the sides of the bucket and in which the catches play, and springs in said keepers bearing against said catches, said parts being combined substantially as and for the purpose set forth.

2. An elevator-bucket having a pivoted door, catches secured to said door, keepers in which said catches play, and springs bearing against said catches, the said catches having noses adapted to engage the back of said bucket, and a tripping device consisting of a beam with sides rounding upward, the outer ends of the noses being adapted to engage said beam, said parts being combined substantially as described.

413,062. ELEVATOR-BUCKET. LYMAN D. HOWARD, Philadelphia, Pa., assignor to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed Mar. 15, 1889. Serial No. 303,367. (No model.)

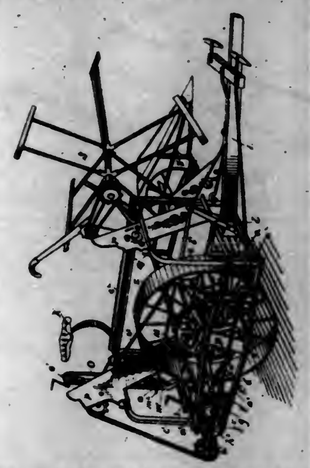


Claim.—1. An elevator-bucket having a pivoted bottom with an extension, a catch adapted to bear against the said extension, and means, substantially as described, for disengaging said catch from said extension, said parts being combined substantially as described.

2. An elevator-bucket having its dropping bottom provided with a rearward extension and a catch pivoted to said bucket engaging with said extension, said catch having also a deflector, whereby the catch may be moved from engagement with the bottom, substantially as described.

3. An elevator-bucket having a dropping bottom, a catch having a heel, and a deflector, said heel engaging with said bottom and formed with an inclined face, the deflector being adapted to engage with an abutment on the elevator-frame for clearing said heel from said bottom, substantially as described.

413,063. TRUCK-TRANSFERRING DEVICE. LYMAN D. HOWARD, Philadelphia, Pa., assignor to the Clark-Howard Excavator and Conveyor Company, of New Jersey. Filed Mar. 15, 1889. Serial No. 303,368. (No model.)



Claim.—1. An elevator-truck provided with two sets of wheels at an angle to each other and means for raising and lowering them, combined and operating substantially as described.

2. A truck provided with two sets of wheels at an angle to each other, boxes bearing said wheels, pedestals containing said boxes, and screws connected with the boxes for raising and lowering the same, the parts being combined substantially as described.

413,064. WITHDRAWN.

413,065. HARVESTER. GEORGE G. HUNT, Bristol, assignor to the Piano Manufacturing Company, Chicago, Ill. Filed Apr. 2, 1888. Serial No. 269,261. (No model.)

Claim.—1. In a harvester-frame, the inner cross-sills a^3 a^4, in combination with the front platform-sill b, connected at its inner end to the lower of said cross-sills, and a diagonal brace b^2, connected at its upper end to the upper cross-sill, and extending downward and outward toward the platform to the front sill b, to which it is connected at its lower end, substantially as and for the purposes specified.

2. In a harvester-frame, the inner cross-sills a^3 a^4, in combination with the front platform-sill b, connected at its inner end to the lower of said cross-sills, the post b^3, connecting the two cross-sills at the point where the platform-sill joins the lower, and the inclined brace b^2, connecting the said platform-sill with the upper cross-sill, substantially as and for the purposes specified.

3. In a harvester, a metal platform-frame B, composed of a front sill b, a pair of rear sills b^4 b^5, arranged one over the other, and an end sill b^7 and beam b^6, all rigidly connected together, substantially as and for the purposes specified.

4. In a harvester, the metal rear sills a a' of the gearing-frame, arranged one over the other, in combination with the metal rear sills b^4 b^5 of the platform-frame, arranged one over the other, and the metal post a^{10}, constructed as described, and connected to the inner ends of both said pairs of sills, substantially as and for the purposes specified.

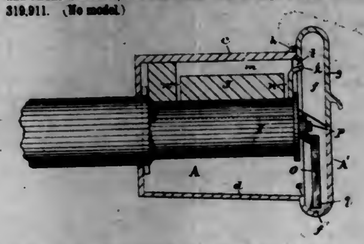
5. In a harvester, the metal sills a a', arranged one above the other and one pair at the front and the other at the rear of the gearing-frame, in combination with the metal cross-sills a^3 a^4, arranged one above the other and with one pair on each side of the main wheel, the single metal sill b at the front of the platform, the pair of metal sills b^4 b^5, arranged one above the other at the rear of the platform, the metal end sill b^7 and beam b^6 at the outer end of the platform, the upright metal sections e e', arranged one at the front and the other at the rear of the gearing-frame and rigidly connected thereto, and the metal cross-bars c^6, arranged upon the top of the upright sections and rigidly fastened to each, all substantially as and for the purposes specified.

6. In a harvester, the gearing-frame, in combination with a straight guide-rack set on said frame at an inclination, and the main-wheel axle provided with pinions engaging with said racks, substantially as and for the purposes specified.

7. In a harvester, the gearing-frame and the main-wheel axle, provided with pinions, in combination with the straight guide-racks set at an inclination on the gearing-frame, the counter-shaft, movable journal-boxes in which said shaft is mounted, and a chain-gearing connecting the axle and counter-shaft, substantially as and for the purposes specified.

8. In a harvester, the gearing-frame, in combination with the blocks F, set therein and provided with horizontal slots f, the journal-boxes f', sliding in said slots, the counter-shaft G, having its bearings in said boxes, and a chain-gearing connecting said shaft with the main axle, substantially as and for the purposes specified.

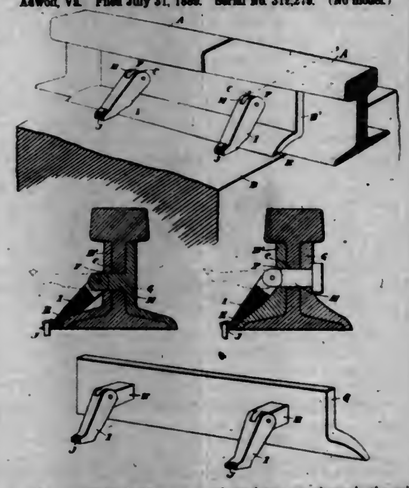
9. The counter-shaft G, in combination with the movable journal-boxes f', the bevel gear-wheel g on the end of said shaft, the cutter crank-shaft H, and the sliding bevel-pinion h^2, mounted thereon and connected to the sliding journal-boxes so as to move therewith, substantially as and for the purposes specified.



10. The counter-shaft G, in combination with the movable boxes in which it is mounted, the bevel gear-wheel g, crank-shaft H, bevel-pinion h^2, arranged to slide on said shaft, and the arm f^5, connected to the movable boxes and embracing said bevel-pinion, substantially as and for the purposes specified.

11. The hinged pole, in combination with the sliding rod M, connected to a post or frame on the pole, the chain-nut o, the chain O, and the chain-pinion o' on the crank-shaft o^2, substantially as and for the purposes specified.

12. The block F, provided with socket f^6 at its rear end, arranged transversely to the block, in combination with the crank-shaft H, parallel to said block, and the journal-box h' for the crank-shaft, seated in said socket, substantially as and for the purposes specified.



13. In a harvester, the gearing-frame, in combination with the guide-racks mounted thereon and inclined forward, the main wheel and its axle, adjusting devices for raising and lowering the gearing-frame on the axle, and a grain-binder mounted on the machine and adjustable toward the front or rear thereof, substantially as and for the purposes specified.

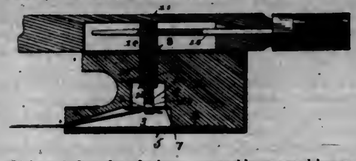
413,066. CAR-AXLE BOX AND LUBRICATOR. AMBROSE INDSER and PATRICK LYNCH, Baltimore, Md. Filed Aug. 6, 1889. Serial No. 319,911. (No model.)

Claim.—The combination of the box having a bottom which inclines toward the front, a circular head at the front of the box, the lowermost part of which projects below the box-bottom and forms a receptacle f', an axle or shaft, a bearing J, having a projecting oil-lip, a longitudinal groove m, extending therefrom across the top of the bearing, a duct passing down from said groove, and an arm secured to the axle and having at its extremity a dipper which projects to both sides of the arm.

413,067. RAIL-JOINT. EDGAR F. KILLINGER and JOSEPH U. WOLFE, Adwolf, Va. Filed July 31, 1889. Serial No. 319,270. (No model.)

Claim.—1. The locking-arms adapted to pass through the rail and having pawls pivoted to their ends adapted to be secured to the ties, as set forth.

2. The combination of the locking-arms adapted to pass transversely through the rails and one of the fish-plates, and the pawls pivoted to the ends of said arms and provided at their free ends with notches through which the securing-spikes are driven, as set forth.



3. The combination, with the rails, of the fish-plate D, having openings registering with the bolt-holes in the rails, the fish-plate G, having integral arms passing through the said bolt-holes and openings, and the pawls pivoted to the ends of said arms and adapted to be secured to the ties, as set forth.

413,068. COAL-BIN OR COAL-CABINET. JOSEPH J. KUYKENDALL, Cairo, Ill. Filed Apr. 2, 1889. Serial No. 305,955. (No model.)

Claim.—In a coal-cabinet, the combination of the rectangular body A, having the rearwardly-inclined bottoms B and E, the sliding door C, supported by cleats c, the lever b, so bent as to form two right angles, and at the same time leaving the ends parallel with each other, and provided on each side of the first bend with journals d, and joined by its inner end to the center of the sliding door C, all as shown, and for the purpose named.

413,069. VIOLIN-BOW. CLARENCE L. LANDAU, Titusville, Pa. Filed Apr. 25, 1889. Serial No. 308,508. (No model.)

Claim.—1. In a frog for bows, a movably-mounted key provided with a head having an opening, and a plate slotted for the reception of the head, in combination with means for operating the key, substantially as specified.

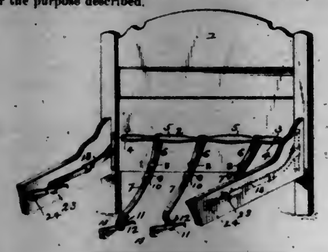
2. In a frog for bows, a bearing-plate having a slot, in combination with a key provided with a head having a slot and provided with a reduced spindle portion having screw-threads, and a binding-bolt mounted upon the key and internally bored and screw-threaded for the reception of the spindle, substantially as specified.

3. In a bow, a frog provided with a recess and a vertical perforation, in combination with a bearing-plate mounted in the recess and a key mounted in a perforation and provided with a slotted head adapted to be projected through an opening in the plate, and with a reduced screw-threaded spindle, and a binding-bolt provided with an internally-screw-threaded bore for the reception of the spindle, and with a transversely-apertured head for the reception of the adjustment-shaft, substantially as specified.

4. In a frog for bows, the key 10, longitudinally movable and having the slot 19, for the passage of the hairs, as set forth.

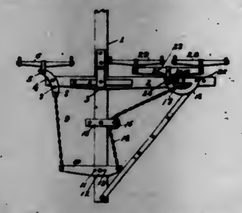
5. In a frog for bows, the key 10, longitudinally movable and having the hairs connected therewith, and the binding-bolt 14, having a threaded connection with the key, as set forth.

6. In a frog for bows, the key 10, longitudinally movable and having the hairs connected therewith, and the binding-bolt 14, having a threaded connection with the key, and the adjustment-shaft 16, connected with the binding-bolt, as set forth.



413,070. MANUFACTURE OF EXPLOSIVES. EDUARD LIEBERT, Berlin, Germany. Filed July 10, 1889. Serial No. 317,073. (No specimens.)

Claim.—The process of producing a new explosive compound, consisting in adding isoamyl nitrate to the nitro-glycerine, or nitrating a mixture containing glycerine with isoamyl nitrate or isoamyl alcohol.



413,071. DEVICE FOR SECURING THE COVERS OF BEDS. ROSA H. LOWE, Sumner, Wash. Filed Jan. 15, 1889. Serial No. 296,280. (No model.)

Claim.—In a device for securing bed-covers, the combination, with the rod or bar having swells, of the straps having rings at each end, the sliding snap-loops secured to the rings at one end of the straps, and clamps connected to and operated by the rings at the other ends

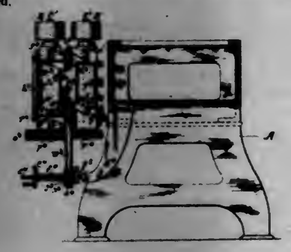
of said straps, said parts being arranged and operating substantially as and for the purpose described.

413,072. DRAFT-EQUALIZER. ISAAC R. LUCAS, Clartsville, Iowa. Filed Apr. 18, 1888. Serial No. 271,094. (No model.)

Claim.—1. A draft-equalizer comprising a pole, an unequal-armed spreader-bar pivoted to said pole to swing thereon, a strut, swinging connections between said strut and spreader-bar, an evener, and connections between said evener and spreader-bar, substantially as described.

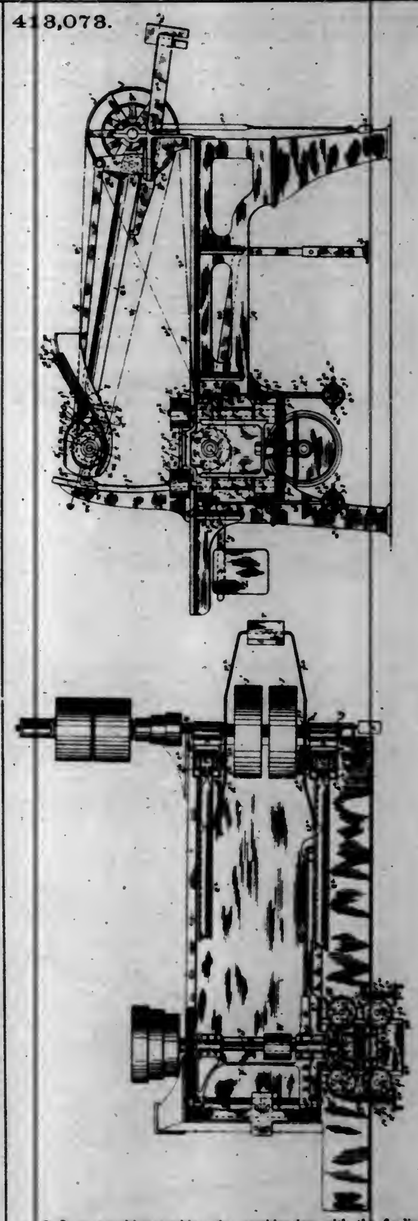
2. In a draft-equalizer, an unequal-armed spreader-bar, a plate or clevis pivotally connected thereto, a strut pivotally connected to said clevis, an evener, and chains connecting said evener and said spreader-bar, substantially as described.

3. In a draft-equalizer, an unequal-armed flexible spreader-bar having each end provided with pivoted clevis or plate, a pole or tongue, a strut connecting said pole or tongue and one of said clevis-plates, an evener, and connections between said evener and said spreader-bar, substantially as described.



4. In a draft-equalizer, a pole or tongue, an adjustable evener pivoted thereto, a flexible spreader-bar, adjustable clevis-plates pivoted to said spreader-bar, a strut connecting one of said plates with said pole, a pulley pivoted to said pole, and chain-connections between said evener, spreader-bar, and pulley, substantially as described.

5. In a draft-equalizer, a spreader-bar, an unequal-armed double-tree, a strut, and a plate or clevis pivotally connected to said spreader-bar, doubletree, and strut, substantially as described.



413,073. MATCHING-MACHINE. BENJAMIN G. LUTHER, Worcester, Mass. Filed May 3, 1889. Serial No. 309,477. (No model.)

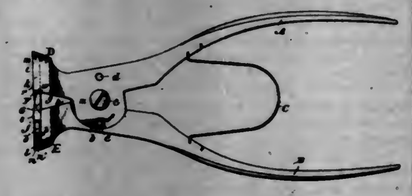
Claim.—1. In a matching-machine, the combination, with the cutter and the cutter-shaft, of a cutter-holding frame pivoted for movement in both a vertical and a horizontal plane, substantially as and for the purpose specified.

2. In a matching-machine, the combination, with the feeding-rollers, of the cutter-holding frame pivoted for movement in both a vertical and a horizontal plane, the cutter-shaft held in the pivoted frame, the cutter, and the vertically-adjustable gage for adjusting the depths of the cut to be made in the edge of the board, substantially as described.

413,073.

3. In a matching-machine, the combination, with the feeding-rollers, of the cutter-holding frame pivoted for vertical movement, the cutter-shaft held in the pivoted frame, the cutter, the gage for adjusting the depth of the cut to be made in the edge of the board, and the spring-operated side guides adapted for equal movement toward or from the plane of the cutter, substantially as described.

4. In a matching-machine, the combination, with the feeding-rollers, of the cutter-holding frame pivoted for movement in both a vertical and a horizontal plane, the spring-guide for limiting the horizontal movement of the frame, the cutter-shaft held in the pivoted frame, the gage for adjusting the depth of the cut to be made in the edge of the board, and the spring-operated side guides adapted for equal movement toward or from the plane of the cutter, substantially as described.



5. In a matching-machine, the combination, with the feeding-rollers, of the cutter-holding frame pivoted for movement in a vertical plane, the cutter-shaft held in the pivoted frame, the gage for adjusting the depth of the cut to be made in the edge of the board, and the spring-operated side guides provided with the shoes for resting upon the edge of the board and adapted for equal movement toward or from the plane of the cutter, substantially as described.

6. In a matching-machine, the combination, with the intervening cutter, of the opposite feeding-rollers, each held on a separate carrier, and the levers connected to the opposite carriers and adapted to cause the equal movement of the feeding-rollers toward or from the plane of the cutter, substantially as described.

7. In a matching-machine, the combination, with the intervening cutter, of the duplicate sets of opposite feeding-rollers, each roller being held on a separate carrier, the levers connected to the carriers of the opposite feeding-rollers and adapted to cause the equal movement of the feeding-rollers toward or from the plane of the cutter, and the opposite intermediate guides pivoted at each end to the corresponding carriers of each set of opposite feeding-rollers, substantially as described.

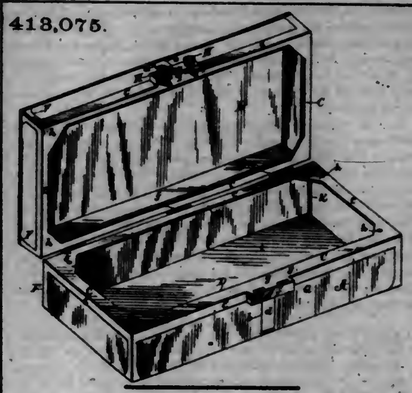
8. The combination, in a matching-machine provided with a cutter and duplicate sets of opposite feeding-rollers, each roller being held on a separate carrier, of an intermediate guide pivoted at each end to the corresponding carriers of each set of opposite feeding-rollers, substantially as described.

413,074. WIRE-TIGHTENER. EDWIN E. MACK, Marshalltown, Iowa. Filed June 27, 1889. Serial No. 315,732. (No model.)

Claim.—1. In a wire-tightener, a pair of levers provided with cams upon their short arms, said cams having their axes arranged at right angles to the fulcrum of the levers, in combination with gripping-surfaces against which the wires are held by the cams, in the manner and for the purpose substantially as described.

2. In a wire-tightener, a pair of levers provided with spring-actuated cams upon the outer extremities of the short arms thereof, said cams having their axes substantially at right angles to the fulcrum of the levers, and gripping-surfaces against which the wires are held by the cams, in the manner and for the purpose set forth.

3. In a wire-tightener, a pair of levers provided with spring-actuated cams, in combination with gripping-surfaces against which the cams bear and arms upon the cams arranged to engage the opposite arms of the levers, whereby the cams are held open for the reception of the wires and are released and thrown into action when receding from each other, in the manner and for the purpose described.



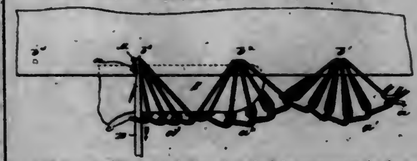
4. The combination, in a wire-tightener, of a pair of spring-actuated levers provided with spring-actuated cams upon their short arms, gripping-surfaces for the cams, and arms upon the cams arranged to engage oppositely-located recesses in the levers, all arranged and adapted to operate in the manner and for the purpose substantially as described.

5. In a wire-tightener, the combination of a pair of spring-actuated arms, enlarged heads on the ends of said arms having depressions formed therein, cams pivoted on said heads and arranged to be set by engaging said depressions, springs for actuating said cams, and grooved shoulders against which they bear, all arranged and adapted to operate as described.

413,075. TOILET-CASE. LOUIS B. MARSH, Fostoria, Ohio. Filed May 22, 1888. Serial No. 311,707. (No model.)

Claim.—The combination, in a toilet-case, of the bottom section, its false bottom, the metallic frame embracing the walls of the box and having inwardly-projecting corners A, and the bolts K, seated in said corners and bearing upon the false bottom, whereby it is held in position, substantially as set forth.

413,075.



413,076. PLANT CANE-SHAVER. ROBERT MAURER, Dunlapsville, Ia. Filed May 7, 1889. Serial No. 309,573. (No model.)

Claim.—In a cane-cutter, the triangular cutter A, concavo-convex transversely, as shown, in combination with the triangular shield B, having the three vertical sides or branches and secured to the upper convex side of the cutter at a distance from its marginal edges, the standard D', and the braces H and C, connecting the cutter and shield with the beam, and the whole secured to the cutter within the shield, substantially as specified.

413,077. METHOD OF FORMING A BORDER ON THE EDGES OF FABRICS. JOSEPH M. MERROW, Merrow, Ogn. Filed Apr. 20, 1889. Serial No. 307,989. (No specimens.)

Claim.—1. The hereinbefore-described improvement in the art of forming a finish upon fabrics, which consists in forming a cluster of loops extending beyond the edge of the fabric by passing the thread through the fabric, (a number of times at substantially the same place,) drawing a series of loops of the thread from opposite sides of the fabric beyond the edge thereof and around the finger, holding said loops under tension upon said finger and connecting the outer ends of said loops in a flexible chain, and then passing the thread through the fabric at another point and repeating the loop-forming operation one or more times, as set forth.

2. As an improvement in the art of forming a finish or border upon fabrics, the hereinbefore-described mode of forming and spreading clusters of loops, the same consisting in carrying the thread through the fabric and drawing loops therefrom above and below the fabric and on opposite sides of a finger located in proximity to the edge of the fabric, and connecting the loops together beyond the edge of said finger while held under tension thereon, repeating the operation a number of times by passing the thread through the fabric at substantially the same point, thereby forming a connected cluster around and upon the finger, and then feeding the fabric, passing the thread through the latter at another point, drawing loops therefrom and connecting said loops to the preceding cluster while supported upon the finger.

3. The hereinbefore-described improvement in the art of forming a finish upon fabrics, the same consisting in passing the thread through

the fabric and drawing loops therefrom on opposite sides of and beyond the edge of the fabric and connecting said loops, supporting the connected loops beyond the edge of the fabric, passing the thread again through the fabric at substantially the same point and forming and supporting the loops as before, and subsequently passing the thread through the fabric at another point and repeating the loop-forming operation.

4. The hereinbefore-described improvement in the art of forming a finish upon fabrics, the same consisting in forming a cluster of loops radiating from substantially the same point, projecting beyond the edge of the fabric, and connected together at their outer ends by carrying the thread through the fabric, drawing loops therefrom on opposite sides and beyond the edge of the fabric, connecting said loops, holding said connected loops under tension, carrying the thread again through the fabric at substantially the same point, and repeating the loop forming and connecting operations while the preceding loops are still under tension, and then, when a cluster has been completed, advancing the fabric and passing the thread again therethrough at another point, as set forth.

413,078. MAGAZINE FIRE-ARM.

KOSTA R. MILOVANOVITCH-KOKA, Vienna, Austria-Hungary. Filed Dec. 4, 1888. Serial No. 292,685. (No model.) Patented in Germany Oct. 30, 1888, No. 47,777; in France Oct. 30, 1888, No. 192,806; in Belgium Oct. 30, 1888, No. 83,779; in Switzerland Nov. 15, 1888, No. 46, and in Italy Dec. 31, 1888, Nos. 128 and 24,230.

Claim.—1. In a breech-loading gun, a receiver provided with a longitudinal slot in one of its sides and a guide composed of guide-ribs extending partly along the slot toward the receiver and at an angle to its longitudinal axis to guide the cartridge-bullet end foremost into the receiver and breech-chamber at a point in proximity to the latter, in combination with a magazine provided with suitable means to force the cartridge into said slot, substantially as and for the purposes specified.

2. In a breech-loading gun, the combination, with the receiver provided with a longitudinal slot in one side thereof, the forward portion of said slot being wider than the rear portion, said narrower rear portion being formed by guide-ribs arranged at an angle to the longitudinal axis of the receiver, of a magazine and a guide to guide the cartridges therefrom into the slot, substantially as and for the purposes specified.

3. In a breech-loading gun, the combination, with the receiver provided with a longitudinal slot in one of its sides, the forward portion of said slot being wider than the rear portion, said narrower rear portion being formed by guide-ribs arranged at an angle to the longitudinal axis of the receiver, and said ribs merging into guide-grooves, of a magazine and a guide to guide the cartridges therefrom into the slot, substantially as and for the purposes specified.

4. In a breech-loading gun, the combination, with the receiver provided with a longitudinal slot in one of its sides, the forward portion of said slot being wider than the rear portion, said narrower rear portion being formed by guide-ribs arranged at an angle to the longitudinal axis of the receiver, of a magazine and an elastic guide to guide the cartridges therefrom into the slot, said guide being provided with an opening leading into the magazine for the purpose of feeding the cartridges to the breech-chamber by hand, substantially as and for the purposes specified.

5. In a breech-loading gun, the combination, with the receiver provided with a longitudinal slot in one of its sides, of a magazine and a vertically-adjustable guide-cover therefor, consisting of an elastic plate having diverging arms extending over the open end of the magazine and arranged at an angle to the longitudinal axis of the receiver, substantially as and for the purposes specified.

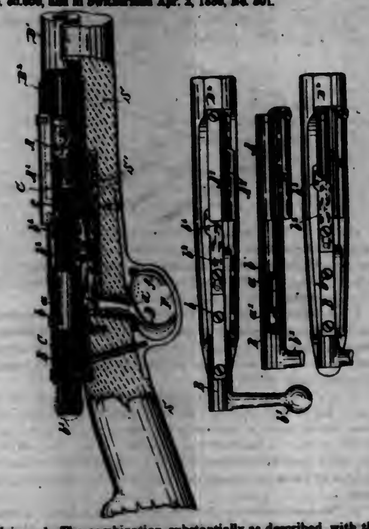
6. In a breech-loading gun, the combination, with the receiver provided in one of its sides with a longitudinal slot whose rear portion is narrower than its front portion, said narrower portion being formed by guide-ribs arranged at an angle to the longitudinal axis of the receiver and merging into guide-grooves, of a magazine provided with a vertically-adjustable elastic cover arranged at an angle to the horizontal and a spring lug or finger projecting into the magazine and adapted to impinge on the projectile end of the cartridges, substantially as and for the purposes specified.

7. In a breech-loading gun, the combination, with the receiver, of a magazine having its rear wall slotted vertically and provided with a graduated index, a feed-spring and follower, and a pointer connected with said follower and arranged to travel along the graduated index, substantially as and for the purposes specified.

8. In a breech-loading gun, the combination, with the receiver and a magazine and a laterally-movable cover shorter than said magazine and having a central opening or cut-away portion to form two diverging arms, of a cartridge-case open at top, bottom, and one side, and provided with spring-fingers at its lower edge to retain the cartridges therein, and with an ear projecting centrally across the open top, said case fitting into the magazine, substantially as and for the purposes specified.

9. In a breech-loading gun, the combination, with the receiver provided with a longitudinal slot in one of its sides, the forward portion of said slot being wider than the rear portion thereof, said narrower rear portion being formed by guide-ribs b, arranged at an angle to the longitudinal axis of the receiver and merging into grooves b', of a magazine provided with a vertically and laterally movable cover arranged at an angle to the horizontal, a spring-actuated follower, and the locking-lever a^{10}, substantially as and for the purposes specified.

10. A magazine for breech-loading guns, consisting of a rectangular receptacle or case and a spring-cover composed of the spring-shank a' and the inclined diverging arms a^{21}, provided with the lugs or ears a^4, said cover being secured to the box by a screw extending through a vertical slot in said box, in combination with a locking-lever a^{10}, for locking the cover against lateral movement, substantially as and for the purposes specified.



11. A magazine for breech-loading guns, consisting of a rectangular receptacle or case having vertical slots formed in both end walls and provided with an index graduated to the number of cartridges the magazine can hold, the graduations being numbered from top downward, and a horizontal slot a^{15} near the lower end of said merging into said vertical slots, and a spring-actuated follower arranged within the magazine and having extensions or lugs a^2 projecting through the vertical end slots of the magazine, substantially as and for the purposes specified.

12. A magazine for breech-loading guns, consisting of a rectangular receptacle and a cover therefor, composed of the diverging inclined arms a^{21}, provided with lugs or ears a^4, the re-enforced portion A^3, terminating in a slotted thumb-plate A^2, and an intermediate spring-shank a', said cover being secured to the front wall of the receptacle by a screw a^{11}, passing through the re-enforced portion of the cover-shank and through a slot in said receptacle, in combination with a spring-catch a^9, secured by said screw a^{11} to the cover-shank and extending through the slot of the thumb-plate, substantially as and for the purposes specified.

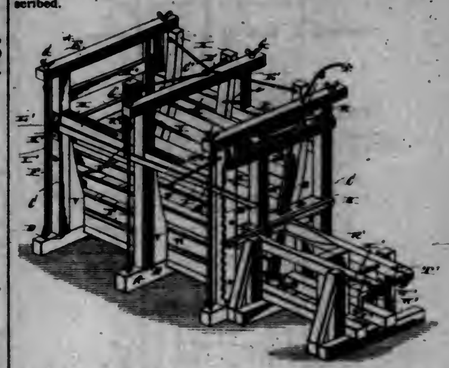
13. A magazine for breech-loading guns, consisting of a rectangular receptacle and a cover therefor, composed of diverging and laterally-movable spring-arms terminating in a hand-hold, the spread of said arms being less than the length of the box and constructed to form a notch or recess between them, in combination with a cartridge-case C, open at top, bottom, and front, and provided at its lower edge with spring-fingers c^3, with the outwardly-bent flange c^4 along the upper edge at one end, and with the central leg or ear c, provided with a strap c^4, said case being adapted for insertion into the magazine, substantially as and for the purposes specified.

413,079. FIRE-ARM.

KOSTA R. MILOVANOVITCH-KOKA, Vienna, Austria-Hungary. Filed Apr. 24, 1888. Serial No. 308,400. (No model.) Patented in France Apr. 2, 1888, No. 187,150; in Belgium Apr. 2, 1888, No. 85,050, and in Switzerland Apr. 2, 1888, No. 301.

Claim.—1. The combination, substantially as described, with the tubular breech-bolt A of a breech-loading gun, provided with a longitudinal slot having at its rear end an inwardly-projecting inclined face or shoulder, of a longitudinally-movable pull-bar carrying a pin or stud that projects into the slot of the bolt, a firing-pin and its actuating-spring contained within the breech-bolt, said firing-pin having its rear end connected with the pull-bar, an actuating-arm secured to and projecting from the forward end of the pull-bar and adapted to impart to the breech-bolt a partial revolution, a sear adapted to engage a full-cock notch on the pull-bar, and a trigger in engagement with the sear, for the purpose specified.

2. The combination, substantially as described, with the pull-bar B, provided with the full-cock notch, the sear adapted to engage said notch, and the trigger in engagement with the sear, of a locking-lever pivoted to the trigger-guard and adapted to engage a locking notch or shoulder on the trigger to lock the same into position and hold the sear out of the path of the full-cock notch on the pull-bar, substantially as and for the purpose specified.



3. In a breech-loading gun, the combination, with the receiver, of a breech-bolt provided with the locking-rib A' and with a longitudinal slot contracted at its rear end, said contracted portion of the slot having one of its lateral faces inclined, a firing-pin and its actuating-spring arranged within the bolt, a longitudinally-movable support for the bolt, to which support the rear end of the firing-pin is secured, and a stud or pin projecting from the support into the slot of the bolt, for the purposes specified.

4. In a breech-loading gun, the combination, with the receiver, of a breech-bolt provided with the locking-rib A' and with a longitudinal slot contracted at its rear end, said contracted portion of the slot having one of its lateral faces inclined, a firing-pin and its actuating-spring arranged within the bolt, a longitudinally-movable support for the bolt, to which support the rear end of the firing-pin is secured, a stud or pin projecting from the support into the slot of the bolt, and a locking-arm provided with a laterally-inclined face secured to and projecting from the forward end of the bolt, for the purposes specified.

413,080. PORTABLE STANCHION.

JOHN T. MORRIS and BENJAMIN S. COOK, Modern, Iowa. Filed Feb. 26, 1889. Serial No. 301,532. (No model.)

Claim.—1. In a cattle-stanchion, the frame having the rigid curved side, the hinged side arranged inside the frame and normally held away from the curved side by a spring and adapted to be swung toward or from the rigid curved side, the rigid post N at one end of the frame, the pivoted bar O, adapted to be swung toward and from the said post, and the latch to lock the said bar, substantially as described.

2. The stanchion-frame comprising the sills, the floor-board connecting them, the posts of the rigid side having their lower ends socketed in the sills and detachable therefrom, the cross-beams E mortised and tenoned on the upper ends of the posts, the side beams H, detachably secured to the posts, and the clamping-rods connecting the projecting ends of the sills and of the beams E, in combination with the pivoted side, an operating-lever pivoted at the opposite side of the frame, and the ropes connecting the pivoted side to the lever, substantially as described.

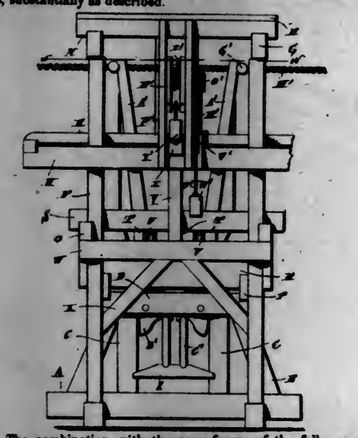
3. The combination, in a cattle-stanchion, of the rectangular frame having a rigid side and comprising the cleats V and connecting-strips W, the hinged side arranged opposite the rigid side and comprising the bars X and connecting-strips Y, the strips and cross-beams K at one end of the frame, the rigid post N, connecting said cross-bars, and the pivoted bar O, adapted to be moved toward and from the said post N, substantially as described.

413,081. JOURNAL-BEARING.

JOSEPH T. MURRAY, Newark, N. J. Filed Jan. 22, 1889. Serial No. 297,196. (No model.)

Claim.—1. A journal-bearing provided with a series of grooves or depressions whose outer edges diverge and converge throughout their entire length, and form contiguous circumferential channels consisting of a series of wedge-shaped communicating chambers adapted to hold a solid or semi-solid lubricant, the sides or walls of said chambers converging in the direction of rotation of the shaft, substantially as described.

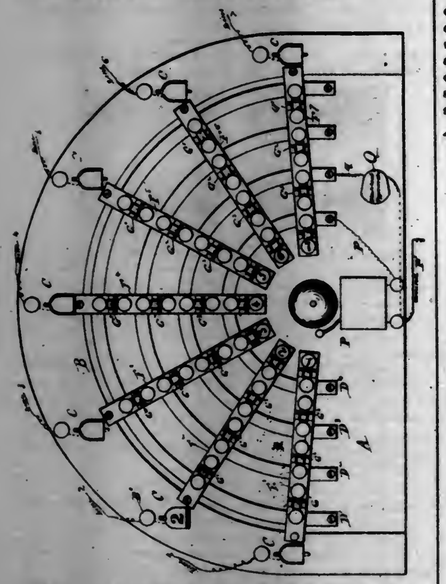
2. A journal-bearing provided with a series of wedge-shaped grooves and a series of angular pockets, said grooves and pockets overlapping each other at their ends, the grooves forming continuous circumferential channels consisting of a series of wedge-shaped communicating chambers adapted to hold solid or semi-solid lubricant, the sides or walls of the chambers converging in the direction of rotation of the shaft, substantially as described.



413,082. COTTON-PRESS.

WILLIAM W. MCALPINE, Beligne, Ala. Filed July 25, 1888. Serial No. 281,012. (No model.)

Claim.—1. The combination, with the press-frame, of the follower, the levers A', connected thereto, the rocking arms D', and levers E', the right and left hand screw-shaft journaled in and supported by the levers E' and engaging blocks mounted on the levers A', and gears to rotate the said screw-shaft, substantially as described.



2. The combination, with the press-frame, of the follower, the levers A', connected thereto, the rocking arms D' and counterbalanced levers E', the right and left hand screw-shaft journaled in the levers E' and engaging blocks mounted on the levers A', spur-wheel I' on said shaft, the shaft K', journaled in the levers E', having pinion L' and spur-wheel M', the shaft N', having gear P' and pulley O', the

counter-shaft having pulley V, and the endless belt connecting said pulleys, substantially as described.

3. The combination, with the press-frame, of the follower, the levers A', connected thereto, the rocking arms D' and levers E', the right and left hand screw-shaft journaled in levers E' and engaging blocks mounted on the levers A', the spur-wheel I' on said shaft, the shaft K', journaled in the levers E', having pinion L' and spur-wheel M', the shaft N', having gear P' and the pulley O', the counter-shaft having the pulley V, the endless belt connecting pulleys V and O', and the weighted slide bearing on said belt, for the purpose set forth, substantially as specified.

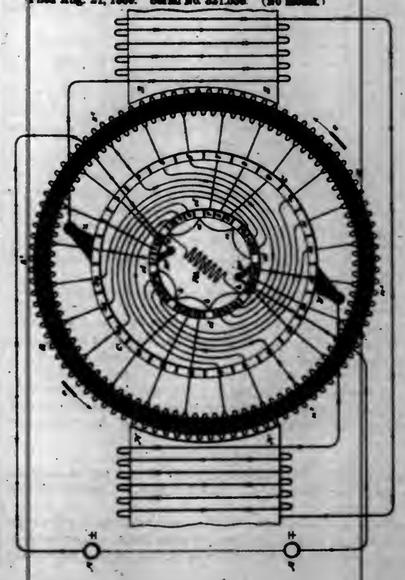
413,083. SWITCH-BOARD. JAMES F. MCLAUGHLIN, Philadelphia, Pa. Filed Dec. 27, 1887. Serial No. 259,149. (No model.)

Claim.—1. In a switch-board, the combination, with two sets of metallic strips, one above the other, of rocking switch-keys mounted between cars on the upper set of strips, and having lugs projecting through the said strips and into operative relation to the lower set of strips, substantially as described.

2. In a switch-board, the combination, with two sets of metallic strips, one set being provided with apertures, of pivoted switch-keys mounted upon and provided with contact-lugs extending through said apertured strips, each key having a thumb-piece on each side of its pivot, substantially as described.

3. In a switch-board, the combination, with two sets of metallic strips, one set being provided with contact-springs and the other set with apertures, of pivoted switch-keys mounted on the apertured strips, each key having a thumb-piece on each side of its pivot, and also having a contact-lug projecting through an aperture in the strip toward one of the springs on a strip of the other, substantially as described.

413,084. GRAIN-TOLLER. THOMAS M. HERBETT, Hemitt, S. C. Filed Mar. 13, 1889. Serial No. 303,125. (No model.)



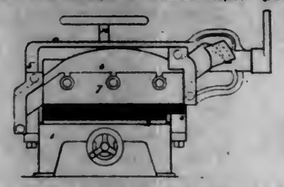
Claim.—1. An automatic toller for elevators, comprising a casing attached to the elevator-chute, a flap between said chute and casing, a bracket attached to the elevator-belt, and connections between said bracket and flap, whereby the latter will be opened by the passage of the former, substantially as described.

2. In a toller for elevators, a casing connected with the elevator-chute, a flap or door closing communication between said chute and casing, a pivoted lever connected with said flap or door, and a bracket connected to the elevator-belt to actuate said lever and its connected flap, substantially as described.

3. In a toller for elevators, a casing connected with the elevator-chute, a flap or door opening from said chute to said casing, a lever pivoted to said chute, a connection between one end of said lever and said flap or door, a pendent arm connected to the free end of said lever, and a bracket connected with the elevator-belt to contact with said lever and arm to actuate said flap or door, substantially as described.

4. The combination, with an elevator chute and belt, of a casing connected with said chute, a flap or door between said chute and casing, flexible strips connected to the opposite side edges of said flap or door to impinge against the sides of said chute, a pivoted lever connected with said flap or door, a bracket upon the elevator-belt to contact with said lever to raise said flap, and a spring connected with said flap to return the same to closed position, substantially as described.

413,085. ELECTRIC MOTOR. FRANCIS J. PATTEN, New York, N.Y. Filed Aug. 21, 1889. Serial No. 321,596. (No model.)



Claim.—1. An electric motor having an armature provided with a commutator or collector in which adjacent groups of bars are connected with the armature-winding at points respectively contiguous to and opposite to the said adjacent groups of segments in rotation around the ring.

2. An electric motor provided with two commutators or collectors, one having its bars or segments connected to successive points of the armature-winding in rotation, the other set having adjacent groups of bars connected alternately to segments of the first commutator, and through the latter to points of the ring-winding which lie respectively contiguous to and opposite to the said adjacent groups of bars in rotation around the ring.

3. An electric motor having an armature provided with two collectors or commutators and two pairs of brushes, one collector or commutator having its bars or segments connected in rotation to successive points of the ring-winding, and the brushes bearing on these connected to the field-circuit, the adjacent groups or bars of the other collector being connected in succession to points of the ring-winding respectively contiguous to and opposite to the said adjacent groups of segments in rotation around the ring, and the brushes bearing on this collector or commutator connected to a source of alternating current.

413,086. PAPER-CUTTING MACHINE. BENJAMIN J. PAYNE and THOMAS BURNS, St. Louis, Mo., assignors to the St. Louis Type Foundry, of Missouri. Filed Dec. 31, 1888. Serial No. 295,054. (No model.)

Claim.—1. The clamping-bar of a paper-cutter, with the piece 12 movable vertically in a recess 11 of the bar, substantially as and for the purpose set forth.

2. The combination, in a clamping-bar for paper-cutters, of the main part 8, having a recess 11 and a rabbet-groove 17, and the piece 12, movable vertically in each recess and having a rib 16 adapted to occupy the groove 17, substantially as and for the purpose set forth.

3. The combination, in the clamping-bar of a paper-cutter, of the main part or body 8, having a recess 11, and the piece 12, vertically movable in the recess, having guide-ribs 15 at the ends, and slotted lugs 18, and the screw-bolts 20, substantially as and for the purpose set forth.

4. The combination, in a clamping-bar of a paper-cutter, of the main part 8, with recess 11 and rabbet-groove 17, the piece 12, having a rib 16, slotted lugs 18, and spring-catches 21, and the bolts 20, all substantially as and for the purposes set forth.

413,087. MACHINE FOR MAKING TYPE. JAMES S. PAYNE, St. Louis, Mo. Filed Mar. 14, 1889. Serial No. 303,201. (No model.)

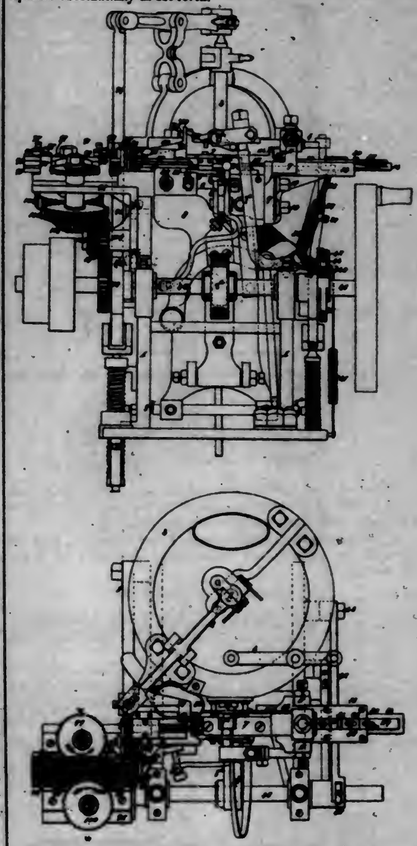
Claim.—1. The combination of a pusher 15, working through one side of the mold, and a pusher 16, engaging the projection 24', substantially as set forth.

2. The nipple-plate 25, having a recess, and the pusher 16, having a slot 23, adapted to engage an elongated projection 24' upon the type, for the purpose set forth.

3. The combination, with the vibrating plate 8, of the adjustable bracket 9, giving bearing to a slide 14, carrying the pusher 15, substantially as set forth.

4. The combination, with the slide 14, carrying the pusher 15, of the adjustable piece 29, having a hole 34 for the engagement of the actuating-lever 36, substantially as set forth.

5. The combination of slide 14 and lever 36, having bearing on the vibrating plate 8, lever 42, fulcrumed to the fixed frame, and cam 45 upon the main shaft 46, substantially as set forth.



6. The combination of slide 14 and lever 36, having bearing on the vibrating plate 8, lever 42, fulcrumed to the fixed frame and having an adjustable block 47, and the cam 45 upon the main shaft 46, substantially as and for the purpose set forth.

7. The combination of slide 14, lever 36, lever 42, cam 45, and spring 41, all adapted to operate substantially as set forth.

8. The combination of the slide 14, having a projection 115, and the vibrating mold-block 7, having a push-piece 116, substantially as and for the purpose set forth.

9. The combination of the pump-rod 79, having tappets, and the jet-breaker 78, constructed and operating substantially as set forth.

10. The combination, with the vibrating upper mold-block 7, of the dog 66, connected to the mold-block by link 68, and adapted to operate substantially as set forth.

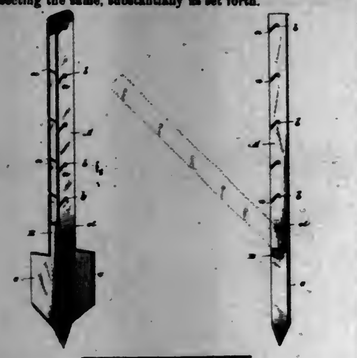
11. A dressing-plate, as 49, having inclined file-teeth adapted to press the base of the type against the cutter 58, substantially as set forth.

12. The combination of dressing-plates 49 57, carried by the vibrating plate 8, and dressing-plates 95 and 96, carried on a stationary bracket 92, substantially as and for the purpose set forth.

13. The combination of the transverse dressing-plates 91 and 91', carried, respectively, by the vibrating plate 8 and the stationary bracket 92, and adapted to operate substantially as set forth.

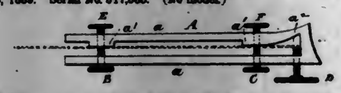
14. A type-dressing file, as 91, having teeth 113 and 114, presenting in opposite directions, substantially as and for the purpose set forth.

15. The combination, with the vibrating plate 8, of the two adjustable brackets 9 and 52, carrying, respectively, the slide 14, carrying a pusher, and dressing-plates 49 57, substantially as set forth.



16. The transverse oppositely-reciprocating dressing-files 91 91', and suitable supporting-brackets, said files being adjustably supported on the brackets by holding-block 86 and screws 86 87, substantially as set forth.

17. The vibratory breaker 78, in combination with the dressing-plates 49 57, the latter serving to hold the type firmly while the jet is broken off.



413,088. FENCE-POST. JAMES S. PAYNE, Virginia, Ill. Filed Apr. 13, 1889. Serial No. 307,031. (No model.)

Claim.—A fence-post having a base provided with central pointed portion wedge-shaped, as described, laterally-extending side wings, and upwardly-extending central portion having upper and lower perforations, an upper part formed of a strip of metal bent upon itself, its free ends being connected to the said perforated portion, the two

sides of said strip having registering openings and oppositely-arranged slots intersecting the same, substantially as set forth.

413,089. SAW-SET. HENRY PETER, Houston, Tex. Filed July 13, 1889. Serial No. 317,285. (No model.)

Claim.—1. A saw-set consisting of the frame A, having the arms *a a*, blade-bearings *a' a'*, setting-recess a^3, and the three screws B C D, all arranged substantially as shown and described.

2. The combination, with the frame A and screws D C D, of the screws E F, for regulating the degree of the set to be given to the teeth, as set forth.

413,090. HEEL-TRIMMING MACHINE. JOHN W. PLUMMER, Somerville, assignor to the Acme Heel Trimmer Company, Boston, Mass. Filed May 20, 1889. Serial No. 311,372. (No model.)

Claim.—1. In a heel-trimming machine, the combination, with the cutter-head and the counter-guard, of the carriage supporting the counter-guard, a screw journaled in a bearing on the carriage, a fixed bracket having guides in which said carriage is movable parallel with

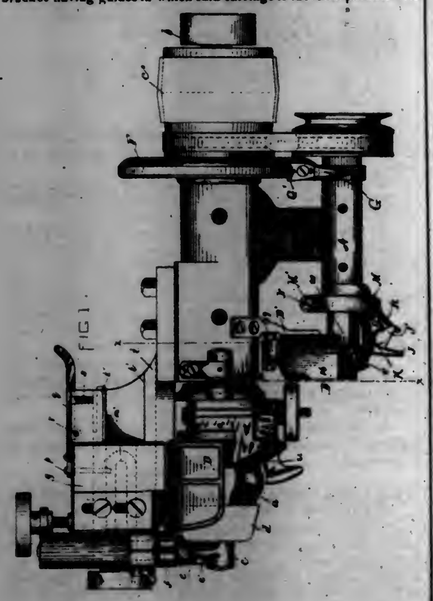


FIG 1.

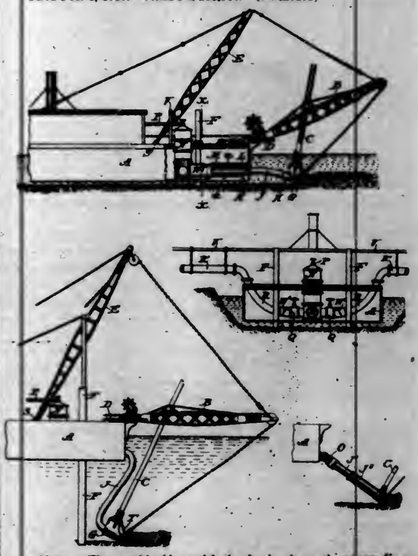
413,090.

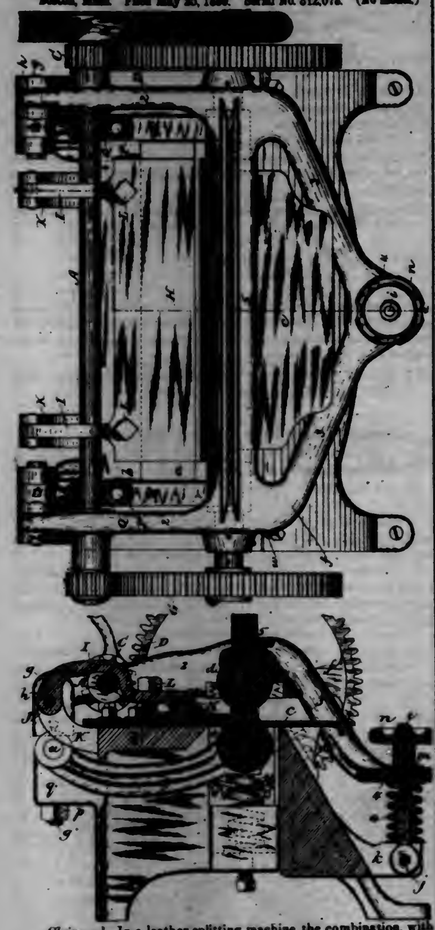


the axis of the cutter-head, a nut fitted to slide in a slot or guide in said bracket and engaged with said screw, and means for locking said nut to the bracket and for disengaging it therefrom, whereby when the nut is locked to the bracket the carriage and counter-guard can be adjusted only by the rotation of said screw, but when the nut is unlocked or released from the bracket said nut, screw, carriage, and counter-guard may be moved rapidly as one piece, as set forth.

2. In a heel-trimming machine, the combination, with the cutter-head and the counter-guard, of the carriage supporting the counter-guard, a fixed bracket having guides *i'*, in which said carriage is movable parallel with the axis of the cutter-head, a nut secured to said bracket and engaged with a screw on the carriage, a bolt *p* in said bracket, adapted to engage said nut, and a spring-pressed lever pivoted to the bracket and engaged with said bolt, as set forth.

3. The heel-rest J, having an arm J', combined with a rotary trimmer, a support to which said rest is pivoted, and a spring secured at one end to said support and bearing at the other end on said arm J', as set forth.

413,091. PNEUMATIC DREDGE. CARROLL L. RIKER, Bergen, N. Y. Filed Feb. 1, 1889. Serial No. 298,367. (No model.)



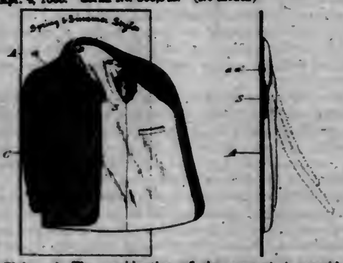
Claim.—The combination, with the dredge-boat, the scoop-dipper, the traveling handle supporting the same, and means, substantially as described, for supporting, guiding, and moving the handle, of a suction-pump, an adjustable suction-pipe extending from the pump to the bottom of the dipper, one or more discharge-pipes extending from the pump outwardly, and valves controlling said pipes, substantially in the manner and for the purpose herein set forth.

413,092. ELASTIC SOCKET FOR PEN-HOLDERS. MICHAEL I. RODRIGUE, San Francisco, Cal. Filed Mar. 29, 1888. Serial No. 268,763. (No model.)

Claim.—In a pen-holder, the combination, with the butt or handle portion C of the stock, of a split sleeve A, of metal, surrounding the portion C, to receive the pen between it and said portion, and a soft-rubber tube B, surrounding and clamping the sleeve C, substantially as and for the purpose set forth.

413,093. LEATHER-SPLITTING MACHINE. JOSEPH A. SAFFORD, Boston, Mass. Filed May 25, 1889. Serial No. 312,073. (No model.)

Claim.—1. In a leather-splitting machine, the combination, with a splitting-knife and a pressure-roll, of a gage-roll, the frame or yoke supporting the gage-roll and composed of the side arms 2 2, pivoted to the supporting-frame at their rear ends, and the cross-piece 3, connecting the outer portions of said arms with each other, the screw-threaded rod *i*, pivotally connected with the frame of the machine and passing through an opening in the central portion of the cross-piece 3, a nut on said rod constituting an adjustable stop or support for the gage-roll-supporting frame or yoke, and a spring whereby said frame or yoke is held against said nut, as set forth.



2. In a leather-splitting machine, the combination, with the pressure-roll, the knife, and the leather-supporting table, of the gage-roll, the supporting-frame made as one piece and composed of the side arms 2 2, in which the gage-roll is journaled, said arms being pivoted to the supporting-frame at one side of the gage-roll, and the connecting portion 3 3, curved downwardly and terminating in the end 4, which is below the table and located at the opposite side of the gage-roll from the pivoted ends of said arms, as set forth.

3. In a leather-splitting machine, the combination of the supporting-frame, the gage-roll, the adjustable gage-roll-supporting arms 2 2, pivoted to said frame, the pressure-roll, the arms *t t*, pivoted to the supporting-frame and carrying the pressure-roll, the gears D G, attached, respectively, to the gage-roll and the pressure-roll, the shaft A, journaled in the gage-roll-supporting arms between the gage-roll and the pivots of said arms and provided at one end with a pinion C, meshing with the gear D on the gage-roll, and at the other end with a pinion E, and the intermediate pinion F, mounted on a stud supported by one of the gage-roll-supporting arms and meshing with the pinion E and the gear G on the pressure-roll, said intermediate pinion being located between the pressure-roll and the pivots that connect the carrying-arms of said roll with the supporting-frame, the arrangement of said shaft A, pinion C E F, and gears D G being such that the operative engagement of said pinions and gears is not affected by the movements of the rolls, as set forth.

4. The combination of the bed *b*, the splitting-knife *a*, the clamping-plate having the arms I, hinged to fixed ears on the bed, and the screws engaged with the bed and having heads bearing on said arms I, whereby said plate is pressed upon the knife, as set forth.

5. In a leather-splitting machine, the combination, with the knife and the pressure-roll, of the gage-roll, the frame in which said roll is journaled, the vertically-movable supports *h h*, to which said frame is pivoted, said supports being located at one side of the gage-roll, means for vertically adjusting said supports, and an adjusting device for the forward end of said frame located at the opposite side of the gage-roll from the supports *h h*, as set forth.

413,094. SAMPLE-CARD. JACOB SAFFORD, Albany, N. Y. Filed Apr. 4, 1883. Serial No. 290,542. (No model.)

Claim.—1. The combination of the support A, provided with fastenings *a a'*, and a miniature garment fastened thereon and having within it an expanding or inflating device, substantially as described.

2. A miniature garment or its described equivalent provided with an expanding or inflating device for conforming it to represent the shape appropriate for use, with a suitable support having lists, marks, or headings thereon descriptive of the garment, substantially as described.

413,095. COMBINED MOP AND WRINGER. CHARLES SANDIFER and ALVA R. ORMSBY, Mansfield, assignors to said Ormsby, and Nellie M. Bradman, Boston, Mass. Filed July 9, 1888. Serial No. 316,970. (No model.)

Claim.—1. The combination of a mop-handle provided with a longitudinal groove, a cloth loop attached to said handle, a rod disposed in the groove in said handle, a cloth loop attached to said rod, and a sliding cap on said handle, the upper end of said rod being secured to said cap, substantially as described.

2. In a mop, the combination of a handle grooved longitudinally, a ferrule on one end thereof, a cloth-holder on said ferrule, a cap sliding on the opposite end of said handle, a rod sliding in said groove and secured to said cap, and a holder on said rod, substantially as described.

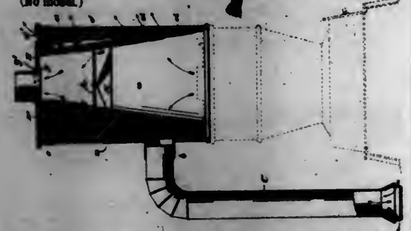
413,096. RUFFLING ATTACHMENT FOR SEWING-MACHINES. EDWARD SMITH, Peoria, Ill. Filed Oct. 11, 1888. Serial No. 287,890. (Model.)

Claim.—1. A ruffler comprising a base-plate, a reciprocating ruffler-blade, a plate secured to the base-plate and extending over and bearing upon the ruffler-blade and provided with a transverse guide-slot at one end extending through the edge of the plate, and a

spring-tongue yieldingly extending from the plate transversely across the open end of the slot to normally close the same, substantially as described.

2. In a ruffler, a swinging plate having a tube or socket extending laterally therefrom provided with a longitudinal opening and normally closed at its outer end, in combination with a reciprocating blade extending through said opening and having its upper end journaled in said tube or socket, substantially as described.

3. In a ruffler, the combination of a lever, a pivoted plate swung by the same, a tube extending laterally from the plate and having a longitudinal slot, a ruffling-blade extending loosely through said slot and having a head fitting loosely in said tube, and a screw-cap for the outer end of the tube, substantially as described.

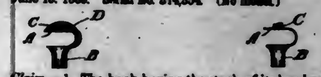


4. In a ruffler, a frame and a ruffling-blade, in combination with a separator-blade and a plate carrying the same and provided with a slot to receive a headed stud on the frame, having a contracted portion smaller than the head of the stud, said plate extending beneath the frame and provided in the rear of the separator-blade with a pair of parallel slots separated by a finger bent upwardly at its point of connection with the plate, for the purpose set forth.

5. A ruffler comprising the combination of a main frame, a ruffler-blade, a plate to reciprocate the blade, an operating-lever to swing said plate, a rotary circular cam carried by the lever, having a continuous contact periphery, a circular scale carried by the lever, each division of which corresponds to a certain portion of the periphery of the cam, and an indicator for the scale, the relative positions of the scale and indicator varying with the adjustment of the cam, for the purpose set forth.

6. In a ruffler, the combination of a frame, a ruffler-blade, a swinging plate reciprocating the blade, an operating-lever to swing the plate, a rotary spindle extending through the lever, a milled head on one end of the spindle, and a circular cam on the opposite end of the spindle, having a continuous-contact periphery forming a gradually-increasing curve around the axis of the cam, substantially as described.

7. In a ruffler, the combination of a frame, a reciprocating ruffler-blade, a swinging plate carrying the blade, provided with lateral lugs on opposite sides of its pivotal point, an operating-lever having a stationary point on one side of its fulcrum to engage one of said lugs, a rotary spindle extending through the lever on the opposite side of its fulcrum, a circular cam on one end of the spindle, having a continuous-contact periphery adapted to engage the opposite lug of said plate, a face-plate upon the opposite end of the spindle, having a scale, an indicator for the scale, and a milled head on the scale end of the spindle, substantially as described.



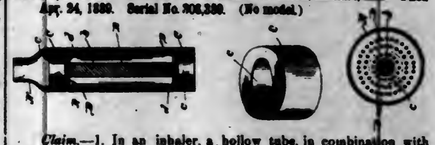
413,097. AIR HEATING AND CIRCULATING DEVICE. ABRAHAM SHIVELY, Hanoverton, Ohio. Filed Feb. 17, 1888. Serial No. 264,378. (No model.)

Claim.—1. The combination, in an air heating and circulating attachment for stoves, of an outer cylindrical drum B, provided near its lower edge with an air-inlet opening to which is attached a depending pipe, the opposite side of said drum having perforations *d d*, an inner conical casing the walls of which converge upwardly, said casing being of the same diameter at its base as the inner portion of the drum B, a top plate having a central exit-opening for the products of combustion, and depending flanges which engage with the upper portions of the inner and outer drums, said top having perforations *d'* located on a line with the perforations *d d*, the parts being organized substantially as shown, and for the purpose set forth.

2. The combination, in an air heating and circulating device which is adapted to be used in connection with a stove and supported thereon, of an outer cylindrical drum B, having a depending air-inlet pipe connected near the base thereof, the opposite side of said drum having exit-perforations *d d*, an inner conical drum D, secured at its base to the lower edge of the outer drum, a deflector of less diameter than the inner drum supported within the same, and a top plate E, with a central exit-opening and depending flanges which engage with the upper edges of the inner and outer drums, the parts being made up of sheet metal and organized substantially as shown, and for the purpose set forth.

413,098. SHOE-HOOK. WILLIAM H. SMITH, New York, N. Y. Filed June 15, 1889. Serial No. 314,354. (No model.)

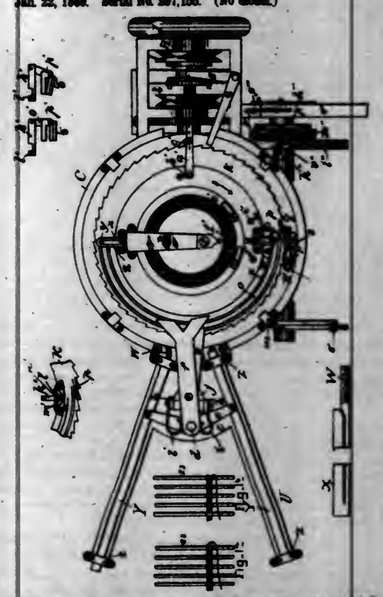
Claim.—1. The hook having the stock of its head perforated and the edges of said perforations thrown up, in combination with the external jacket of plastic material, as pyroxyline, surrounding said stock, substantially as set forth.



2. The hook having the eyelet thrown up from the top of its head and an exterior jacket of pyroxyline material compressed on said top and clinched thereto by said eyelet, substantially as shown and described.

413,099. SHOE-LACING HOOK. WILLIAM H. SMITH, New York, N. Y. Filed June 15, 1889. Serial No. 314,356. (No model.)

Claim.—A lacing-hook provided with a perforated head, and an external jacket of pyroxyline material applied to said head above and below and extending through the perforation, substantially as described.



413,100. INHALER. WILLIAM W. SMITH, Elkhart, Ind. Filed Apr. 24, 1889. Serial No. 308,289. (No model.)

Claim.—1. In an inhaler, a hollow tube, in combination with oppositely-located perforated disks, and an intermediate brace extending from disk to disk, substantially as specified.

2. In an inhaler, a hollow tube, in combination with oppositely located and bored corks, and an opposite intermediate brace provided with perforated disks at its ends bearing against the corks, substantially as specified.

413,101. CIRCULAR-KNITTING MACHINE. WALTER H. STEWART, Franklin, N. H., assignor to Morgan Wright, Norristown, Pa. Filed Jan. 22, 1889. Serial No. 297,155. (No model.)

Claim.—1. The combination, with the needle-bed and needles D E, of the cam-plate provided with needle-operating cams 2 3 4 5 6 7, ratchet-ring *h*, supported on the cam-plate and provided on its inner

edge with a notch, cam *n'*, block *h'*, provided with the stud *l*, adapted to rest against the inner edge of the ratchet-ring and be operated by said cam *n'*, connections, substantially as set forth, between block *h'* and cam 5, and means for operating the cam-plate and ratchet-ring, as set forth.

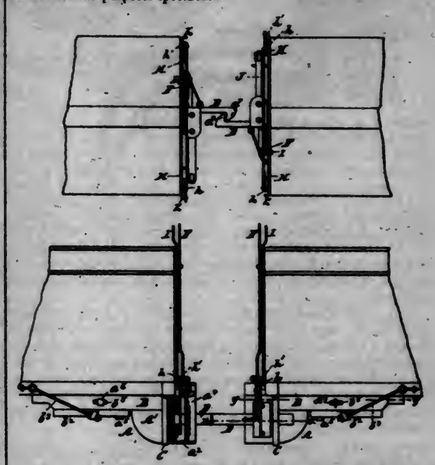
2. A rotary cam-plate, a needle-bed, two sets of needles D E, the former set provided with extensions or tails, movable chains supported by the bed and adapted to form a support for the tails of the needles, grooved or slotted slides attached to the said chains to engage the tails of said needles to lower or depress the same, brackets upon which said chains may be moved and guided from and to the bed, a pawl connected with each of said chains, rack-bars for engaging said pawls, lever *e*, connected with said rack-bars, lever *f*, connected at its outer end with lever *e* and extending over the cam-plate, lever *g*, fulcrumed upon said bracket, pivotally connected with lever *f* and also extending over the cam-plate, and pins which may be arranged in the cam-plate to engage said levers *f* and *g*, as set forth.

3. The combination, with the needle-bed, needles, and rotary cam-plate, of a rotary arbor H, a gear connecting said arbor with said cam-plate, pulleys I I, loose on said arbor, a clutch member splined on said arbor to be moved longitudinally thereon but to rotate therewith, arms or levers Q S and their arbor P, a ratchet-ring on the cam-plate, and means for moving it, a cam on said ratchet-ring, a lever *r*, fulcrumed on the cam-plate and provided on one end with a pin resting on said cam and connected at the other end with a vertically-arranged pin, and a spring for pressing said vertically-arranged pin upward, as set forth.

4. A rotary cam-plate, a needle-bed, two sets of needles D E, the former set provided with extensions or tails, movable chains supported by the bed and adapted to form a support for the tails of the needles, grooved or slotted slides attached to the said chains to engage the tails of said needles to lower or depress the same, brackets upon which said chains may be moved and guided from and to the bed, a pawl connected with each of said chains, rack-bars for engaging said pawls, lever *e*, connected with said rack-bars, lever *f*, connected at its outer end with lever *e*, and extending over the cam-plate, lever *g*, fulcrumed upon said bracket, pivotally connected with lever *f*, and also extending over the cam-plate, a ratchet-ring arranged on the cam-plate and provided with cams *n o*, means for moving said ratchet-ring, pins arranged to travel on said cams and on the face of the ratchet-ring, and springs for pressing said pins downward, as set forth.

5. The combination, with the needle-bed, needles, and cam-plate, of a ratchet-ring on said cam-plate, a lever pivoted upon the cam-plate and provided with a pawl to engage the ratchet-ring, a vertically-movable pin *m* to engage and move said lever, a rotary arbor, a cam on said arbor, a lever resting on said cam, a connecting-bar between said last-mentioned lever and pin, whereby the latter may be raised and lowered, a driving-shaft, and connections between the driving-shaft and cam-plate and between the driving-shaft and rotary arbor, whereby they may be operated, as set forth.

6. The combination, with the needle-bed, needles, and cam-plate, of a ratchet-ring on said cam-plate, a lever pivoted upon the cam-plate and provided with a pawl to engage the ratchet-ring, a vertically-movable pin *m* to engage and move said lever, a rotary arbor, a cam on said arbor, a lever resting on said cam, a connecting-bar between said last-mentioned lever and pin, ratchet-wheel *l''*, having one tooth cut away, secured to said arbor, ratchet-wheel *f''*, loose on said arbor, sprocket-wheel *l''*, secured to ratchet-wheel *f''*, chain *m''* on said sprocket-wheel, and provided with the pin *n''*, disk *o''*, provided with pin *p''*, fast on said arbor, a pawl engaging said ratchet-wheels, a driving-shaft, and connections between said driving-shaft and cam-plate and between the driving-shaft and pawl for operating the same, as set forth.



7. The combination, with needle-bed, needles, and cam-plate, of a rotary arbor H, a gear connecting said arbor with said cam-plate, pulleys I I, loose on said arbor, a clutch member splined on said arbor to be moved longitudinally thereon but to rotate therewith, arbor P, and its arms S T, gears *c''* and *b''*, the latter provided with cam *s''*, arbor *b''*, and means to rotate it from gear *b''*, disk *o''*, provided with cams *b''' c''*, lever *d''*, provided with pin *m''*, spring *l''*, slide *c''*, and lever *k''*, as set forth.

413,102. CAR-COUPLING. ARTHUR L. STOVER, Hamilton, Ohio. Filed Sept. 18, 1888. Serial No. 285,903. (No model.)

Claim.—1. The draw-bar A, having enlarged head A', provided with vertical groove a^3 and ridge a^4, and coupling-bar D, pivoted to the draw-head and provided with hook *d* and yoke d^1, and spring *d'*, substantially as and for the purposes specified.

2. The draw-bar A, having enlarged head A', provided with vertical groove a^3 and ridge a^4, and coupling-bar D, pivoted to the draw-head and provided with hook *d* and yoke d^1, and spring *d'*, and means for moving the bar D laterally, substantially as and for the purposes specified.

3. The combination of a car-body, box B, provided with shoulders *b b'*, draw-bar having shank A^2, provided with pins a^5 and a^6, projecting through the box B, and rod A^2, the latter having head a^6, collars *a a'* on rod A^2, and spring E' between collars *a a'*, substantially as and for the purposes specified.

4. The combination of a car-body, box B, provided with shoulders *b b'*, draw-bar having vertically-enlarged head A', provided with groove a^3 and ridge a^4, having shank A^2 and rod A^2, the latter having head a^6, collars *a a'* on rod A^2, and spring E' between collars *a a'*, and coupling-link D, pivoted to the draw-bar and having hook *d*, substantially as and for the purposes specified.

5. The combination of a car, draw-bar, coupling-bar, lever E, attached to the coupling-bar, and lever F, for operating lever E, substantially as and for the purposes specified.

6. The combination of a car, draw-bar, coupling-bar, lever E, attached to the coupling-bar, and rod J and levers J', for operating lever E, substantially as and for the purposes specified.

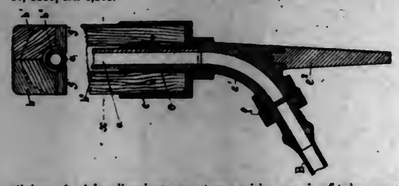
7. The combination of a car, draw-bar, coupling-bar, lever E, having tooth *e*, arc G, having shoulder *g*, and lever F, for operating lever E, substantially as and for the purposes specified.

8. The combination of a car, draw-bar, coupling-bar, and having tooth *e*, arc G, having shoulder *g*, lever E, attached to the coupling-bar, and rod J and levers J', for operating lever E, substantially as and for the purposes specified.

9. The combination of a car, draw-bar, coupling-bar, lever E, attached to the coupling-bar, and lever F, for operating lever E, and bar H, having inclined plane h^3 and handles *h'*, substantially as and for the purposes specified.

10. The combination of a car, draw-bar, coupling-bar, lever E, attached to the coupling-bar, and lever F, for operating lever E, bar H, having inclined plane h^3 and handles *h'*, and lever I, having hook *i*, catching behind the inclined plane h^3, substantially as and for the purposes specified.

11. The combination of a car, draw-bar, coupling-bar, yoke d^3, and spring *d'*, lever E, attached to the coupling-bar, and lever F, for operating lever E, and bar H, having inclined plane h^3 and handles *h'*, substantially as and for the purposes specified.



12. The combination of a car, draw-bar, coupling-bar D, yoke d^3, spring *d'*, lever E, attached to the coupling-bar, lever F, rod J, levers J', bar H, having inclined plane h^3 and handles *h'*, and lever I, having hook *i*, substantially as and for the purposes specified.

13. The combination of a car, draw-bar, coupling-bar, lever E, attached to the coupling-bar, and rod J and levers J', for operating lever E, and bar H, having inclined plane h^3 and handles *h'*, substantially as and for the purposes specified.

14. The combination of a car, draw-bar, coupling-bar, lever E, attached to the coupling-bar, and rod J and levers J', for operating lever E, bar H, having inclined plane h^3 and handles *h'*, and lever I and hook *i*, catching behind the inclined plane h^3, substantially as and for the purposes specified.

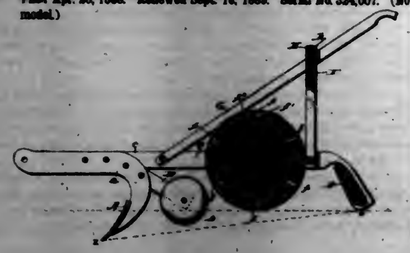
15. The combination of a car, draw-bar, coupling-bar, yoke d^3, and spring *d'*, lever E, attached to the coupling-bar, and rod J and levers J', for operating lever E, and bar H, having inclined plane h^3 and handles *h'*, substantially as and for the purposes specified.

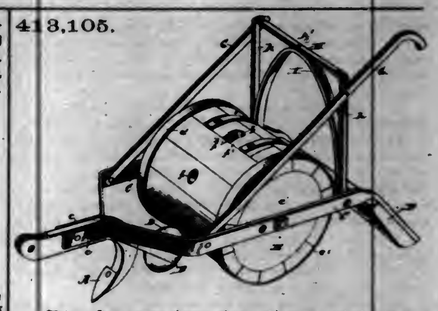
413,103. LEVELING-INSTRUMENT. CARL T. STRAUB, Riga, Russia. Filed May 3, 1889. Serial No. 309,464. (No model.) Patented in Belgium Apr. 16, 1889, No. 85,853; in England Apr. 16, 1889, No. 6,505; in France Apr. 16, 1889, No. 197,535; in Switzerland Apr. 16, 1889, No. 871; in Spain Apr. 16, 1889, No. 9,457, and in Portugal Apr. 17, 1889, No. 1,373.

Claim.—1. A leveling-instrument comprising a pair of tubes open at the top and bottom, a flexible tube connecting the lower ends of the tubes, and supports having grooves in their sides in which said tubes are secured, rings embracing the opposite ends of the supports, said supports being provided with vertical scales besides the tubes, and pins or bases on the lower ends of the supports, substantially as described.

2. In a leveling-instrument, the combination of a tube normally open at each end, a rod or support to which the tube is longitudinally secured, a cap on the lower end of the support surrounding the lower end of the tube, an arm or pointed base extending down from said cap to enter the ground, and a conduit forming a continuation of the lower end of said tube and extending downwardly and laterally through said arm, and provided with a nozzle to which the flexible pipe can be connected, substantially as described.

413,104. VELOCIPEDE. DANIEL W. SAXTON, Brewster, Nebr. Filed Feb. 20, 1889. Serial No. 300,545. (No model.)

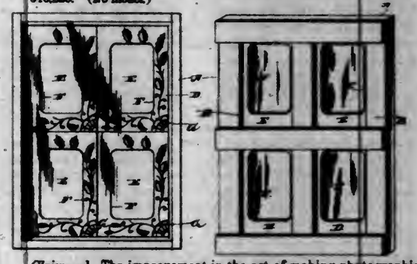




Claim.—1. The combination, in a velocipede, of the driving-wheel having the ratchets on opposite sides thereof, the levers, the vibrating arms V, the pawls connected to the said arms and adapted to engage the ratchets, and the rods connecting the said pawls to the levers, substantially as described.

2. The combination, in a velocipede, of the driving-wheel having the ratchets, the vibrating arms V, pivotally connected to the frame, the pawls pivotally connected to the vibrating arms, the levers, the rods connecting the same to the pawls, and the tappet-rods arranged in the paths of the pawls and adapted to move the latter into engagement with the ratchets, substantially as described.

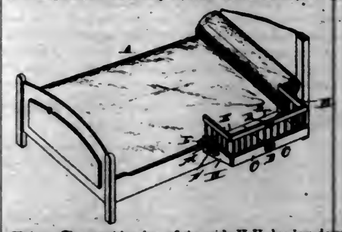
3. The combination, in a velocipede, of the frame, the steering-axle pivotally connected thereto, the driving-wheel journaled to the frame and having the ratchets, the vibrating arms pivotally connected to the frame, the pawls connected to the vibrating arms and adapted to engage the ratchets, the levers, the rods connecting the same to the pawls, and the yoke pivoted to the frame connected to the steering-axle, and having the tiller, substantially as described.



413,105. COTTON-SEED PLANTER. LOUIS R. SECRIST, Paris, Tex. Filed Apr. 20, 1888. Renewed Sept. 16, 1889. Serial No. 324,007. (No model.)

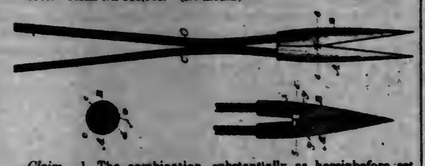
Claim.—In a cotton-planter, the combination, with the side bars C C of the main frame, the plow-standard *a*, connecting the front ends thereof, and the covering-board D, connecting the rear ends of the side bars, of the handles secured to the side bars near the front end of the machine, the rectangularly-bent brace-bar H, secured to the side bars and to the handles, and the centrally-bent brace-bar I, secured to the side bars and the brace-bar H, substantially as specified.

413,106. ART OF MAKING PHOTOGRAPHIC PICTURES. WILLIAM H. STAUFFER, Asbury Park, N. J. Filed May 10, 1889. Serial No. 310,225. (No model.)



Claim.—1. The improvement in the art of making photographic copies, which consists in arranging the pictures to be copied in a frame, each surrounded and partially covered by a separate frame design, making a negative from the said frame, printing from the said negative, and finally mounting and separating the individual pictures, substantially as and for the purpose herein set forth.

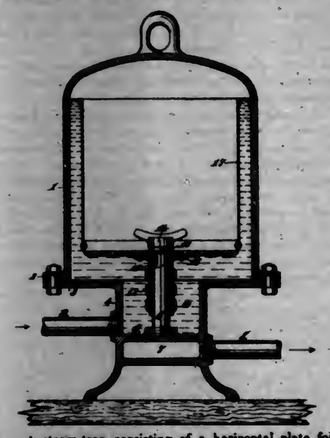
2. A duplicate frame for photographic copying, having a series of suitable openings, each surrounded by a separate frame design, the edges of said frame designs meeting each other so as to be readily separable, substantially as herein described, and for the purpose set forth.



3. The combination, with the copying-frame having a number of separate compartments, each provided with a spring-cleat and backing, of the duplicate frame suitably secured to the front of said copying-frame and having a series of openings registering with the compartments in said copying-frame, each of said openings being surrounded by a separate frame design, and the edges of said frame designs meeting each other so as to be readily separable, substantially as and for the purpose herein set forth.

413,107. CRIB ATTACHMENT FOR BEDSTEADS. JULIAN M. STOY, Augusta, Ga. Filed May 20, 1889. Serial No. 311,486. (No model.)

Claim.—The combination of the ends H H, having downwardly-extending portions adapted to bear against the side rail of a bedstead, the folding bottom secured to the ends, the folding front secured to the said bottom, the hooks L, adapted to engage over the edge of a bedstead-rail and provided with longitudinal slots, and the securing-screws passed through said slots into the downwardly-extended portions of the ends, as set forth.



413,108. POST-HOLE DIGGER. ELBERT C. TAYLOR and DAVID H. LIGHTFOOT, Hunnewville, Ind., assignors, by direct and mesne assignments, of one-half to John S. Lightfoot, Alfred W. Mitchell, John R. Akins, C. F. Kersey, and D. C. Kersey, all of same place. Filed May 16, 1889. Serial No. 310,970. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the solid conical working ends A and B, formed in two parts hinged together near their upper ends, but below the top, and provided with upwardly-inclined faces *y* above the hinge-connection, and each provided with a handle projecting upwardly and then inclined outwardly.

2. The combination, substantially as hereinbefore set forth, of the working end or head formed of two sections A and B, the section B being formed with a recess *d'* and a lug *c* on its inner face, and section A formed with a pair of lugs *c*, between which the lug *c* extends, and a bolt for securing the lugs together and forming a hinge-connection between the sections A and B.

413,109. STEAM-TRAP. BURCHARD TROBIS, New Orleans, La. Filed May 13, 1889. Serial No. 310,581. (No model.)

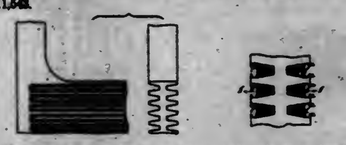
Claim.—A steam-trap consisting of a horizontal plate formed with a central pendent well having a bottom wall, a closed bell-shaped casing surmounting the horizontal plate, a float located in the bell-shaped casing and open at its top for the water to overflow thereinto, a vertical pipe secured to the bottom wall of the well, rising in the latter above its horizontal top plate and having its upper end provided with a fixed valve, and lateral orifices beneath the latter, a sleeve extending downward into the well from the bottom wall of the float, sliding up and down on the valved pipe and having its upper end opening through the said bottom wall of the float and there provided with a valve-seat, an inlet-pipe communicating with the well, and an outlet-pipe connected with the vertical pipe, substantially as shown and described.

413,110. ARTIFICIAL FUEL. DANIEL C. FISHER, Troy, N. Y., assignor to himself and MAX STADTMÜLLER, same place. Filed July 16, 1889. Serial No. 317,730. (Specimens.)

Claim.—1. An artificial fuel composed of vegetable refuse, coal-tar, charcoal, coal-dust, furnace-slag, and oyster or clam shells, substantially as set forth.

2. An artificial fuel composed of vegetable refuse, thirty-five parts; coal-tar, five parts; charcoal, ten parts; coal-dust, ten parts; furnace-slag, thirty parts, and oyster or clam shells, ten parts.

413,111. SHUTTLE-ACTUATING MECHANISM FOR SEWING-MACHINES. JAMES TRIPP, New York, N. Y. Filed Feb. 14, 1889. Serial No. 300,319. (No model.)



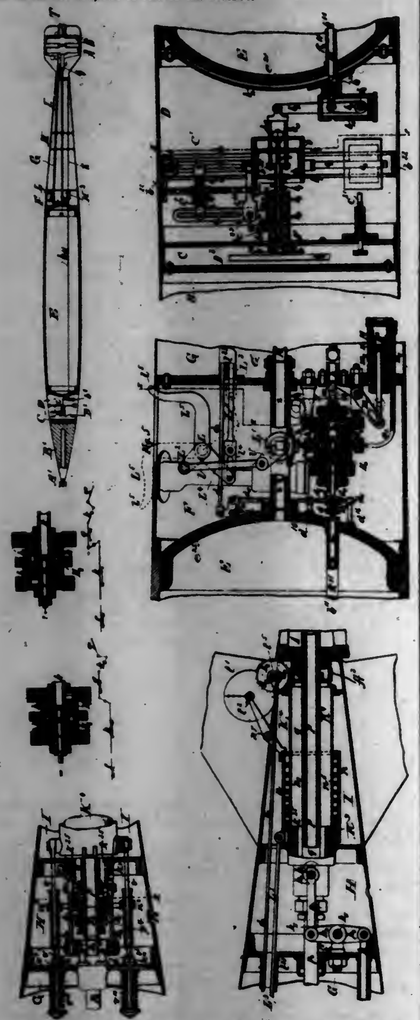
Claim.—1. The combination, in a sewing-machine, of a shuttle-shaft, three or more reciprocating plungers mounted upon said shaft, a shuttle provided with holes to receive the plungers, a cam for reciprocating the plungers to and from engagement with the shuttle, and a face-plate to hold the shuttle in its plane of revolution, the parts being arranged so that two of the plungers will at all times be in engagement with and carrying the shuttle, while the other plunger or plungers are being withdrawn to let the needle-loop pass and being again reinserted in the shuttle.

2. The combination, in a sewing-machine, of a shuttle-shaft, three or more reciprocating plungers mounted upon said shaft, a shuttle provided with holes to receive the plungers, a cam for reciprocating the plungers to and from engagement with the shuttle, a plate arranged to bear against the front face of the shuttle, and a yielding plate arranged to bear upon the rear face of the shuttle, for holding the shuttle in its plane of revolution, the plungers and cam being arranged so that two of the plungers will at all times be in engagement with and carrying the shuttle.

3. The combination, in a sewing-machine, of a shuttle-shaft, three or more reciprocating plungers mounted upon said shaft, a shuttle provided with holes to receive the plungers, a cam for reciprocating the plungers to and from engagement with the shuttle, and two plates arranged to bear against the peripheral edge of the shuttle upon its front and rear faces for holding the shuttle in its plane of revolution, the plungers and cam being arranged so that two of the plungers will at all times be in engagement with and carrying the shuttle.

413,112. ELECTRODE FOR SECONDARY BATTERIES. HENRY TUDOR, Rospert, Luxemburg, Germany. Filed May 31, 1889. Serial No. 311,564. (No model.) Patented in Belgium Oct. 30, 1888, No. 78,066; in France Nov. 2, 1888, No. 179,203, and in England Aug. 24, 1887, No. 11,542.

Claim.—1. A plate or element for secondary batteries having projections or ribs with sloping sides and enlarged or spread edges, substantially as set forth.



2. In a secondary battery, the combination of a support-plate having an oxidized surface and an additional coating or filling of an active material, as set forth.

3. In a secondary battery, an element consisting of a lead base or support-plate converted wholly or partially into a crystalline adherent bed of peroxide of lead and an additional coating or filling of peroxide of lead, substantially as and for the purpose set forth.

413,113. AUTO-MOBILE TORPEDO. ADOLF G. VON R. DE PRESSA, Vienna, Austria-Hungary. Filed Apr. 18, 1888. Serial No. 271,067. (No model.) Patented in Germany Feb. 24, 1888, No. 49,194; in France Feb. 24, 1888, No. 186,945; in Belgium Mar. 12, 1888, No. 81,008; in England Mar. 30, 1888, No. 4,397; in Italy Mar. 31, 1888, XXII, 23,126 and XLV, 431; in Portugal May 17, 1888, No. 1,344; in Norway May 28, 1888, No. 984; in Austria-Hungary June 30, 1888, No. 6,668 and No. 21,102, and in Spain June 30, 1888, No. 6,668.

Brief.—The torpedo has a diaphragm exposed to the hydrostatic pressure of the surrounding water. Suitable connections convey the movements of the diaphragm to a valve located in a cylinder, which valve controls the admission of the motive fluid to the cylinder. The piston in the cylinder is connected to a horizontal immersing-rudder, whereby the movements of the diaphragm cause the cylinder and its piston to operate the rudder. The diaphragm has adjustable springs by means of which it can be set to operate at any predetermined hydrostatic pressure and a pendulum which restores the diaphragm and the rudder to their normal position when disturbed. A spring-actuated mechanism is arranged to be connected at will to the piston-rod which is connected to the rudder, and is held in check by a detent. A timing mechanism connected to the propeller operates the detent

at any predetermined time, releasing the mechanism, thereby causing it to pull on the piston-rod and so operate the immersing-rudder as to cause the torpedo to rise to the surface.

Claim.—1. In a torpedo, the combination, with an immersing-rudder and a diaphragm exposed to the hydrostatic pressure of the ambient water, of a power-operated piston between said rudder and diaphragm, transmitting devices between the diaphragm and piston and controlling the power for said piston, and operating devices between the piston and the immersing-rudder, substantially as described.

2. In a torpedo, the combination, with an immersing-rudder and a diaphragm exposed to the hydrostatic pressure of the ambient water, of a cylinder connected to the supply of motive fluid, a valve for said cylinder controlling the admission and exhaust of said motive fluid and connected to be operated by the motion of said diaphragm, and a piston in said cylinder and connected to operate said rudder, substantially as described.

3. In a torpedo, the combination, with an immersing-rudder and a diaphragm exposed to the hydrostatic pressure of the ambient water, of a pneumatic cylinder, a compressed-air supply connected to said cylinder, a controlling-valve for the same having its rod connected to be actuated by said diaphragm, and a piston within said cylinder and having its rod connected to operate said rudder, substantially as described.

4. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a propeller, of an intermediate transmitting device having a power-supply, means connected to said diaphragm for controlling said power-supply, a locking device engaging said controlling means, a trip mechanism for said locking device and having its gearing engaged with and operated by said propeller, and operating means connected to said transmitting device and to said rudder, substantially as described.

5. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a propeller, of a cylinder connected with the supply of motive fluid, a valve for said cylinder controlling the admission and exhaust of said motive fluid and connected to be operated by the motion of said diaphragm, a locking device engaging the rod of said valve, a trip mechanism for said locking device and having its gearing engaged with and operated by said propeller, and a piston in said cylinder connected to operate said rudder, substantially as described.

6. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a propeller, of a pneumatic cylinder, a compressed-air supply for said cylinder, a controlling-valve for the same, having its rod connected to be actuated by said diaphragm, a locking device engaging the rod of said valve, a trip mechanism for said locking device and having its gearing engaged with and operated by said propeller, and a piston within said cylinder and having its rod connected to operate said rudder, substantially as described.

7. In a torpedo, the combination, with an immersing-rudder and automatic operating mechanism for the same, of a locking device which engages said operating mechanism, and a tripping mechanism for said locking device and operated and controlled by the propelling mechanism of the torpedo, substantially as described.

8. In a torpedo, the combination, with an immersing-rudder and an automatic operating mechanism for the same, which consists of a diaphragm exposed to the hydrostatic pressure of the ambient water, and devices for communicating the movement of said diaphragm to said rudder, of a locking device which engages said devices, and a trip mechanism for said locking device and operated from a time mechanism, substantially as described.

9. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a pneumatic transmitting device having its piston-rod connected to operate said rudder and having its valve-rod connected to said diaphragm and formed with a groove or recess, of a rod sliding in suitable guides and formed with a ring which engages said groove or recess from below, a bell-crank having one arm pivoted to said rod, a rod pivoted to the other arm of said bell-crank, and a disk connected to be revolved by the propelling mechanism of the torpedo and having a pin upon its face which engages the hooked end of said rod, substantially as described.

10. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, a pneumatic transmitting device having its piston-rod connected to operate said rudder and having its valve-rod connected to said diaphragm and formed with a groove or recess, and a screw-propeller formed with a worm upon its hub, of a rod sliding in guides and formed with a ring which engages said groove or recess with its lower end, a bell-crank having one arm pivoted to said rod, a connecting-rod having one end pivoted to the other arm of said bell-crank and formed with a hook at its other end, and a cogged disk engaging the worm upon the propeller and provided with a pin upon its face for engaging said hook, substantially as described.

11. In a torpedo, the combination, with an immersing-rudder and a diaphragm exposed to the pressure of the ambient water, of a pneumatic cylinder having an inlet-pipe and a central annular port, a piston in said cylinder having an axial bore, and channels extending from the middle of said bore to the end of the piston, a valve connected to said diaphragm and reciprocating within the central bore of said piston, and a rod secured to said piston and connected to said rudder, substantially as described.

12. In a torpedo, the combination, with an immersing-rudder and a diaphragm exposed to the pressure of the ambient water, of a pneumatic cylinder having an inlet-pipe at its middle and an annular port connected with said pipe, a piston having tubular extensions sliding through the head of said cylinder and formed with an axial bore and with channels opening at the middle of said bore and at the ends of the piston, a valve within said bore and connected to be operated by said diaphragm, and a rod secured to one of the extensions of said piston and connected to operate said rudder, substantially as described.

13. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a pneumatic transmitting apparatus for operating said rudder, of a casing secured to the middle of said diaphragm, a lever having one arm pivoted to said casing, and a valve-rod for said transmitting apparatus having its end pivoted to the other arm of said lever, substantially as described.

14. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a pneumatic transmitting apparatus for operating said rudder, of a casing secured to the middle of said diaphragm, a pendulum connected to said casing, a lever having one arm pivotally connected to the end of said casing, and a valve-rod for said transmitting apparatus having its end pivoted to the other arm of said lever, substantially as described.

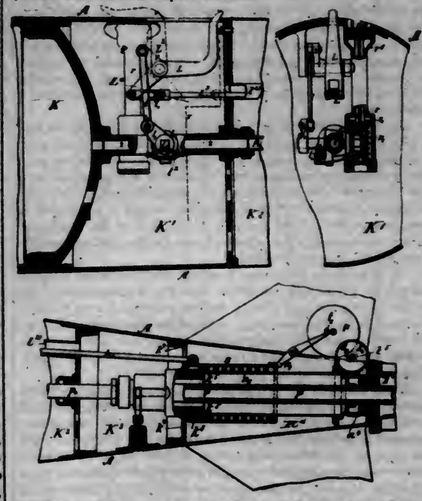
15. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a pneumatic transmitting apparatus for operating said rudder, of a casing secured to the middle of said diaphragm and formed with a tube through its axis, a hollow nut sliding in guides and having said tube projecting into it, guides for said nut, a spring coiled around said tube and bearing against said nut and the other closed end of said casing, a rod secured to said closed end of the casing and passed through said nut and adjustably secured to the guides for the same, rods secured to the end of said axial tube, a lever having one arm pivoted to the united ends of said rod, and a valve-rod for said transmitting apparatus and pivoted to the other arm of said lever, substantially as described.

16. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, a pneumatic transmitting apparatus for operating said rudder, and a valve-rod connected to control the operation of said apparatus, of a casing secured to the center of said diaphragm and provided with lugs upon its upper side, a lever having one arm adjustably connected to said casing and the other arm adjustably connected to said valve-rod, a lever having a slotted upper arm and having its lower short arm projecting between the lugs of said casing, a pendulum having a longitudinal slot, and a rod having its ends adjustably secured in the slots of said lever and pendulum, substantially as described.

17. In a torpedo, the combination, with an immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, a pneumatic transmitting apparatus for operating said rudder, and a valve-rod connected to control the operation of said apparatus, of a casing secured to the center of said diaphragm and provided with lugs upon its upper side, a lever having one arm adjustably connected to said casing and the other arm adjustably connected to said valve-rod, two set-screws in the lugs of said casing, a lever having a long slotted upper arm and a short lower arm projecting between the ends of said set-screws, a pendulum having a longitudinal slot, a set-screw projecting toward said pendulum to limit its play, screw-threaded rods having their ends sliding in the slots of said lever and pendulum, a screw-threaded sleeve connecting said rods, a revoluble screw, and a nut upon said screw and formed with a ring fitting around said sleeve, substantially as described.

18. In a torpedo, the combination, with a screw-propeller and the immersing-rudder, of endwise-movable propeller-shaft connected with and controlling the operation of the rudder by such movement, substantially as described.

19. In a torpedo, the combination, with a reaction screw-propeller and the immersing-rudder, of a tubular endwise-movable propeller-shaft connected with and controlling the operation of the rudder by its longitudinal movement, substantially as described.



20. In a torpedo, the combination, with a reaction screw-propeller and the immersing-rudder, of a pipe for supplying compressed air to the propeller and a tubular propeller-shaft mounted and movable endwise on said pipe, said shaft being connected with and controlling the operation of the rudder by its longitudinal movement, substantially as described.

21. In a torpedo, the combination, with a reaction screw-propeller, the immersing-rudder, a diaphragm exposed to the hydrostatic pressure of the ambient water, and a pipe for supplying compressed air to the propeller, of a tubular propeller-shaft mounted and movable endwise on said pipe, a connection between the shaft and rudder, and transmitting mechanism connecting the diaphragm with the propeller-shaft, substantially as and for the purposes specified.

22. The combination, with the diaphragm D', of the compressed-air main, the cut-off valve connected to and operated by said diaphragm, the piston-cylinder H^3, connected with said main, the piston H', having annular passage H^4, and the piston-rod *k*, provided with a radial pin m^4, of the piston-cylinder M, a pipe connecting one end of said cylinder with the cylinder H^3 and the piston-passage H^4, the spring-actuated piston *m*, and lever m^3, connected with said piston *m* and engaging the pin m^4 on piston-rod *k*, substantially as and for the purposes specified.

413,114. **SELF-PROPELLING TORPEDO.** ADOLF G. VON R. DE PRERAUA, Vienna, Austria-Hungary. Filed Nov. 13, 1888. Serial No. 290,903. (No model.) Patented in Germany June 19, 1887, No. 42,019; in Austria-Hungary Nov. 14, 1887, No. 34,063 and No. 49,331; in France Feb. 24, 1888, No. 183,945; in Belgium Mar. 12, 1888, No. 81,003; in England Mar. 20, 1888, No. 4,397; in Italy Mar. 31, 1888, XXII, 28,135, XLV, 431; in Portugal May 17, 1888, No. 1,944; in Norway May 30, 1888, No. 984, and in Spain June 30, 1888, No. 8,086.

Brief.—The torpedo is propelled by compressed air acting on reactionary screw-propellers. The supply of air is cut off from the propellers by means of a spring-operated mechanism which is tripped by a peg on a timing device which is attached or connected to the propellers, and can be set by the operator to come into action at any specified time after the torpedo is started.

Claim.—1. In a torpedo of the class described, the combination, with the reservoir for the motive power, the propelling mechanism, and the pipe connecting said mechanism with the reservoir, of a stop-cock interposed in said pipe, and a lever connected with said stop-cock, the end of which lever projects through the shell of the torpedo, substantially as and for the purposes specified.

2. In a torpedo of the class described, the combination, with the reservoir for the motive power, the propeller, and the supply-pipe for supplying such motive power to the propeller, of a cut-off valve interposed in said supply-pipe, an automatically-movable device connected therewith to close said cut-off valve, and a trip mechanism connected to said device and operated by the propeller to release said device, substantially as described.

3. In a torpedo of the class described, the combination, with the reservoir for the motive power, the propeller, and the supply-pipe for supplying such motive power to the propeller, of a cut-off valve in said supply-pipe, an automatically-movable device connected therewith to close said cut-off valve, a detent for engaging said device and keeping it set, and a trip for engaging said detent, operated by the revolutions of the propeller, substantially as described.

4. In a torpedo of the class described, the combination, with the reservoir for the motive power, the propeller, and the supply-pipe for supplying such motive power to the propeller, of a cut-off valve in said supply-pipe, a spring-actuated shifting device connected to close said valve, a detent for holding said device against the stress of its spring, and a disk revolved by the propeller and having a pin engaging said detent, substantially as described.

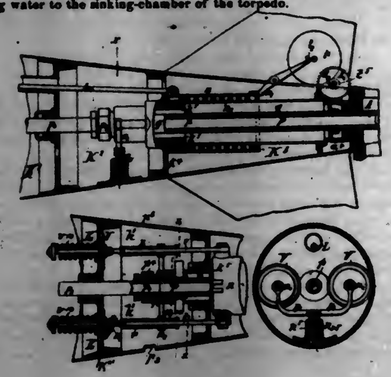
5. In a torpedo of the class described, the combination, with the reservoir for the motive power, the propeller, and the supply-pipe for supplying such motive power to the propeller, of a cut-off valve, a spring-actuated shifting device connected to close said valve, a detent for holding said device against the stress of its spring, and a timed tripping mechanism connected to the detent, operated by the propeller to trip the detent, substantially as described.

6. The combination, in a torpedo, with the supply-pipe *z*, the stop-cock L', its plug l^3, and radial arm *l'* on said plug, of the angular valve-lever L, projecting through the shell of the torpedo, the arm L^2 thereof, and the link *l*, connecting said arm with the arm *l'*, substantially as and for the purposes specified.

7. The combination, in a torpedo, with the supply-pipe for the motive power, of a stop-cock having a plug formed with a square end, means for turning said plug one-fourth of a revolution, and an elliptical spring bearing with its side against one face of the square end of said plug to hold said plug in an open or closed position, substantially as described.

8. The combination, in a torpedo, with the propeller, the supply-pipe for the motive power, a stop-cock and its plug in said pipe, of shifting mechanism consisting of a lever connected with the stop-cock, a spring-actuated shifting rod connected with the lever, a locking device to lock the rod against movement, and intermediate mechanism operated by the propeller and operating the locking device to release the shifting-rod, substantially as and for the purposes specified.

9. The combination, in a torpedo, with the propeller, the supply-pipe for the motive power, and a stop-cock and its plug in said pipe, of shifting mechanism consisting of a lever connected with the stop-cock, a shifting-rod connected with the lever, a spring-actuated cylinder connected with the shifting-rod, a locking device for locking the cylinder against motion, and a disk revolved from the propeller and provided with a pin for tripping said locking device, substantially as described.



10. The combination, in a torpedo, with the propeller, the supply-pipe for the motive power, a stop-cock and its plug in said pipe, of shifting mechanism consisting of a lever connected with the stop-cock, a shifting-rod connected with the lever, a spring-actuated cylinder connected with the shifting-rod, a detent for locking the cylinder against motion, a revolable disk provided with a pin projecting from the face thereof and traveling in the path of the detent, and gearing connected with the propeller to revolve the disk, substantially as and for the purposes specified.

11. In a torpedo of the class described, the combination, with the reservoir for the compressed motive fluid, the distributing-pipe, and the distributing-valve, of feeding devices comprising a valve-casing interposed in the distributing-pipe between the distributing-valve and fluid-reservoir, said valve-casing having its open outer end secured to the shell of the torpedo, and a check-valve arranged in said casing, substantially as and for the purposes specified.

12. In a torpedo of the class described, the combination, with the reservoir for the compressed motive fluid, the distributing-pipe, and the distributing-valve, of feeding devices comprising a valve-casing interposed in the distributing-pipe between the distributing-valve and fluid-reservoir, said valve-casing having its outer end enlarged and interiorly screw-threaded, said enlarged outer end being secured to the shell of the torpedo, a screw-plug r^4, for said enlarged outer end of the casing, and a spring-actuated check-valve r^2 arranged therein, substantially as and for the purposes specified.

418,115. AUTOMATIC SINKING-VALVE FOR SUBMARINE TORPEDOES. Adolf G. von B. de Pirquia, Vienna, Austria-Hungary. Filed Nov. 15, 1888. Serial No. 290,969. (No model.) Patented in Germany Feb. 24, 1888, No. 49,129; in France Feb. 24, 1888, No. 186,945; in Belgium Mar. 12, 1888, No. 81,053; in England Mar. 20, 1888, No. 4,397; in Italy Mar. 31, 1888, XXII, 23,135, XLV, 431; in Portugal May 17, 1888, No. 1,244; in Norway May 26, 1888, No. 994; in Austria-Hungary June 26, 1888, No. 3,068 and No. 21,102, and in Spain June 30, 1888, No. 3,095.

Brief.—A spring-actuated rod is attached to the sinking-valves, and this rod is held against the action of its spring by a detent. This detent is arranged so as to be tripped by a timing device in connection with and operated by the propeller. Upon the tripping of the detent the rod is pulled by its spring, thereby opening the valves and admitting water to the sinking-chamber of the torpedo.

Claim.—1. In a torpedo, the combination, with the motor and an immersing or sinking valve located in one of the heads or partitions of the sinking-chamber and communicating with the outside water, of an automatically-movable valve-operating device connected to said sinking-valve, a locking device or detent engaging said valve-operating device and holding it in position against the action of its operating power, and a trip mechanism, substantially such as described, operated from the motor and engaging said locking device or detent to trip the same, whereby to permit the automatically-movable valve-operating device to operate, substantially as described.

2. In a torpedo, the combination, with the motor for the same and a sinking-valve, of a timed valve-shifting mechanism comprising a spring-actuated valve-rod, a locking-lever to lock the rod against the stress of its spring and hold the valve to its seat, and a tripping mechanism operated by the motor to trip the locking-lever and release the spring, substantially as and for the purposes specified.

3. In a torpedo, the combination, with the motor for the same and a sinking or immersing valve located in one of the heads or partitions of the sinking-chamber and communicating with the outside water, of a rod provided with a hook at one end hooked to said valve, and an automatically-movable valve-operating device controlled from the motor for pulling said rod to operate said valve, substantially as described.

4. In a torpedo, the combination, with the motor for the same and a sinking or immersing valve, of a rod provided with a hook at one end hooked to said valve, an automatically-movable valve-operating device, and a screw inserted through the shell of the torpedo for raising the hooked end of said rod out of connection with said valve, substantially as described.

5. In a torpedo, the combination, with the sinking or immersed valves provided with eyes, of rods having hooked ends engaging said eyes, a fork which supports the hooked ends of said rods, and a screw inserted through a socket in the shell of the torpedo, the upper end of said screw being pivoted in said fork, substantially as described.

6. In a torpedo, the combination, with the motor for the same, a stop mechanism for said motor and controlled by the same, and a sinking-valve, of rods connected to said valve and to said stop mechanism, substantially such as described, and adapted to be pulled by said mechanism, substantially as described.

7. In a torpedo, the combination, with the motor for the same and a sinking-valve, of a spring-actuated device connected to open said valve, a detent for keeping said device set, and a trip mechanism operated by the motor to release said detent, substantially as and for the purposes described.

8. In a torpedo, the combination, with the motor for the same and a sinking-valve, of a spring-actuated sleeve, a rod which connects said valve and sleeve, a detent which holds said sleeve against the action of its spring, and a disk operated from said motor and provided with a pin for tripping said detent, substantially as described.

9. In a torpedo, the combination, with a motor for the same, a supply-pipe for said motor, and a cut-off valve for said supply-pipe, of a sinking-valve, a spring-actuated sleeve, a detent which holds said sleeve against the action of its spring, a trip mechanism operated by said motor for releasing said detent, a rod connecting said sleeve and cut-off valve, and a rod connecting said sleeve and sinking-valve, substantially as described.

10. In a torpedo, the combination, with the motor for the same, a supply-pipe for said motor, and a cut-off valve for said supply-pipe, of a sinking-valve, a spring-actuated device connected to close said cut-off valve, a detent for keeping said device set, a trip mechanism operated by said motor for releasing said detent, and a partly-extensible rod connected to said sinking-valve and to said spring-actuated device, substantially as described.

11. In a torpedo, the combination, with the motor for the same, a supply-pipe for said motor, and a cut-off valve for said supply-pipe, of a sinking-valve, a spring-actuated sleeve, a detent for holding said sleeve against the action of its spring, a trip mechanism operated by said motor for releasing said detent, a rod connected to said sleeve and to said cut-off valve, and a partly-extensible rod connected to said sleeve and to said sinking-valve, substantially as described.

12. In a torpedo, the combination, with the motor for the same, a supply-pipe for said motor, and a cut-off valve for said supply-pipe, of a sinking-valve, a spring-actuated sleeve, means operated by the motor for holding and releasing said sleeve, a rod connecting said sleeve and cut-off valve, a rod connected to said sinking-valve, and a rod connected to said sleeve and telescoping in the rod connected with the sinking-valve, substantially as described.

418,116. GUARD-FINGER. Randall W. Walker, Oxford, N. Y. Filed July 31, 1889. Serial No. 319,313. (No model.)

Claim.—1. The combination, with the guard-finger having vertical aperture, of the ledger-plate, the locking-plate B, and the wedge-shaped key C, substantially as described.

2. The combination, with the guard-finger having vertical aperture and recess *l*, of the locking-plate having horizontal lug B^3, fitting said recess, the ledger-plate, and the wedge-shaped key, as set forth.

3. The combination, with the guard-finger having vertical aperture, of the ledger-plate recessed and formed with inclined portion *c'*, the locking-plate having undercut lug B^3, and the wedge-shaped key, as set forth.

4. The combination, with the guard-finger having vertical aperture, a depression *g*, and ledges *i*, of the recessed ledger-plate having inclined portion *c'*, the wedge-shaped locking-plate having extended head and undercut lug, and the wedge-shaped key, substantially as described.

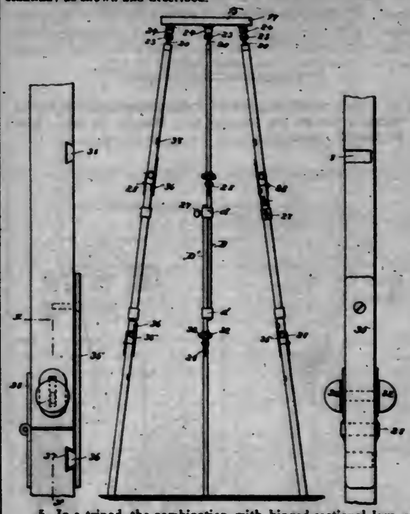
5. The combination, with the guard-finger having vertical aperture, depression *g*, shoulders *i*, and recess *l*, of the recessed ledger-plate having inclined portion *c'*, the locking-plate having wedge-shaped shank, horizontal lug B^3, extended head and undercut lug B^3, and the wedge-shaped key having a T-head, substantially as shown and described.

6. The combination, with the finger-guard having legs *b b c*, vertical aperture and spaces *d* between the legs, and the lug *c*, cut away upon its front face, of the recessed ledger-plate, the wedge-shaped locking-plate having lug B^3 upon its head, and the wedge-shaped key having T-head with reduced portion C^2, all arranged and operating substantially as and for the purpose specified.

418,117. BACK-BAND ATTACHMENT FOR HARNESS. Charles R. Ward, Rowey, Wis. Filed May 31, 1889. Serial No. 312,743. (No model.)

Claim.—1. The combination, with the back-band 1, terminating in opposite tag-loops 2 and having the central loop 4, of the ring 5, mounted loosely in the loop, and the back-strap 6, terminating in the loop 7, and the checkrein-hook 9, having the eye 11, engaging the loop 7, and the forwardly-projecting hook 10, substantially as specified.

2. In a harness, the back-band 1, having the ring 5, mounted loosely on the band, in combination with the back-strap attached to the ring 5 and carrying the checkrein-hook 9, as set forth.



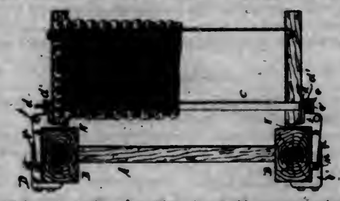
418,118. TRIPOD. Jonathan Warner, Bag Harbor, N. Y. Filed May 16, 1889. Serial No. 311,092. (No model.)

Claim.—1. In a tripod, the combination, with a head provided with a series of recesses and a clamp-plate having toothed legs covering each of the said recesses, of a leg provided with a threaded extension, a jam-nut traveling upon said extension, and a toothed clamp sliding upon the extension and manipulated by a jam-nut, substantially as shown and described.

2. In a tripod, the combination, with a head provided with a series of recesses, and a clamp-plate partially covering each recess provided with spaced toothed lugs, of legs having an upper threaded extension provided with a head, a jam-nut adapted to travel on the screw-extension, and a toothed clamp held to slide upon the said screw-extension above the jam-nut, all combined for operation substantially as shown and described.

3. The combination, with the head of a tripod and toothed legs or projections secured thereto, of a leg having an upper threaded extension, a jam-nut held to travel upon the said threaded extension, and a toothed clamp provided with a concave upper face held to slide upon the screw-extension above the jam-nut, substantially as shown and described.

4. The combination, with a tripod-head having a series of recesses produced in its under face, and a clamp-plate secured over each recess provided with a central slot and a toothed lug at each side of the said slot, of a leg having a screw-extension at the upper end provided with a head, a jam-nut held to travel upon the screw-extension, and a clamp held to slide above the jam-nut provided with a concave upper face and a tooth in said face, all combined for operation substantially as shown and described.



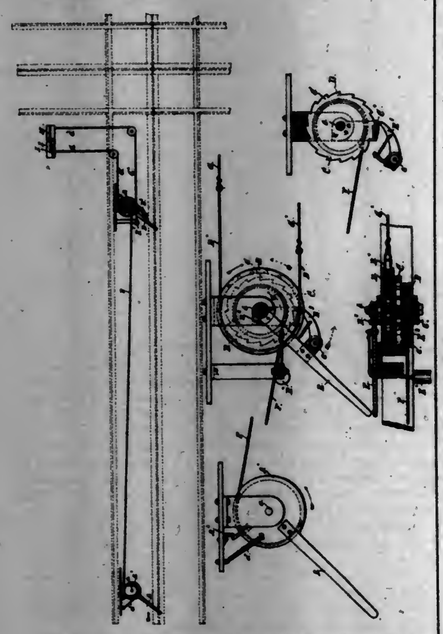
5. In a tripod, the combination, with hinged sectional legs, one leg-section being provided with a tongue and the opposed section with a groove to receive said tongue, of a locking-plate pivoted to one section adapted to cross the joint of the sections and unite with the opposed leg-section, substantially as shown and described.

6. In a tripod, the combination, with hinged leg-sections, one leg-section being provided with a tongue and the opposed section with a groove to receive said tongue, of a locking-plate pivoted to one of the leg-sections adapted to cross the joint of the sections, and a stud formed upon the free end of the said plate capable of engaging a slot in the leg-sections, substantially as and for the purpose specified.

7. The combination, with the hinged sectional leg of a tripod, one section being provided with a tongue having a recess therein and the opposed leg-section with a recess to receive the said tongue, of a spring-actuated thumb-bolt held to slide in the recessed section capable of entering the recess in the tongue when the sections are extended, substantially as shown and described.

8. The combination, with the hinged sectional leg of a tripod, one section being provided with a tongue having a recess therein and the opposed leg-section with a recess to receive the said tongue, of a spring-actuated thumb-bolt having longitudinal movement in the recessed leg-section capable of contact with the slot in the said tongue, and a locking-plate pivoted upon one section having a stud upon its free end capable of entering a depression in the face of one leg-section, substantially as shown and described.

418,119. PILLOW-SHAM HOLDER. Thomas R. Wetaft, New York, N. Y. Filed June 5, 1889. Serial No. 313,191. (No model.)



Claim.—1. A clamp for pillow-sham holders, composed of a front section provided with a bracket for supporting a pillow-sham holder, a rear section adapted to be secured to a bed-post, and a connecting screw-bolt engaging a threaded socket of the front section, substantially as set forth.

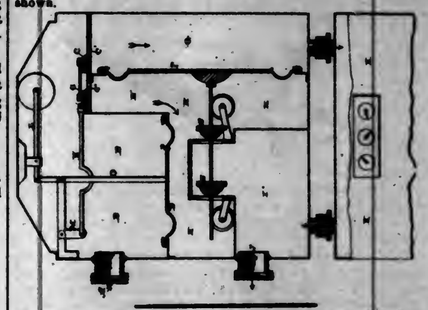
2. A clamp for pillow-sham holders, composed of a front section

provided with a bracket for a pillow-sham holder, a rear clamp adapted to be attached to a bed-post and provided with a beveled flange sliding on a beveled face of the front section, and a connecting screw-bolt engaging an interiorly-threaded socket of the front section, substantially as set forth.

3. A supporting-clamp adapted to be attached to a bed-post and composed of a front section, a rear section, a connecting screw-bolt engaging a threaded socket of the front section, said front section being provided with a socket-hole, and a bent arm fitting therein and adapted to support a mosquito-frame, substantially as set forth.

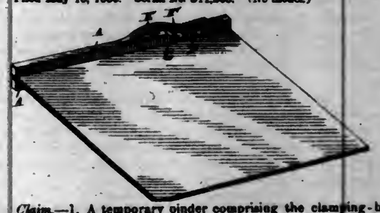
418,120. SIGNAL DEVICE FOR CABLE-RAILWAY CROSSINGS. George H. Wright, San Francisco, Cal. Filed Feb. 20, 1889. Serial No. 300,562. (No model.)

Claim.—1. The combination of the lever E, having the pawl E^3, with the ratchet C, and the sprocket-wheels B and H, and connection between the said sprocket-wheels to effect the lowering of the signal, as described.



2. The combination of the lever E, the pawl E^3, with the ratchet C, and the sheaves D and A^x, having the lever A and connections between the sheaves, substantially as and for the purpose set forth.

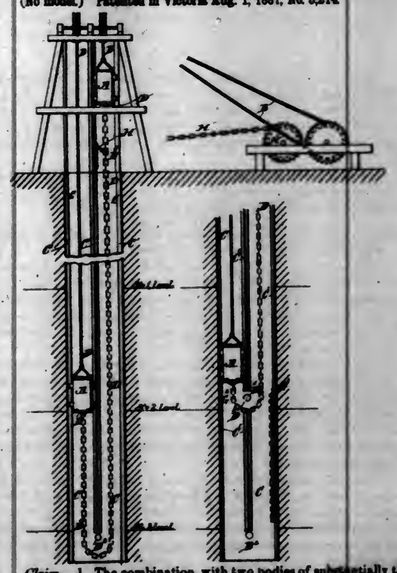
3. The combination of the lever E, the pawls E^3 and L, the ratchet-wheels C and K, the weight E^x, and stop E^3, substantially as and for the purpose set forth.



4. The combination of an apron C^x with the ratchet-wheels C and K, and the pawls E^3 and L on the lever E with the sheaves D and A^x, sprocket-wheels B and H, and connections between the sprocket-wheels and between the sheaves, substantially as and for the purpose set forth.

418,121. PROPORTIONAL METER. Fred E. Young, Pittsburg, Pa. Filed May 20, 1889. Serial No. 312,497. (No model.)

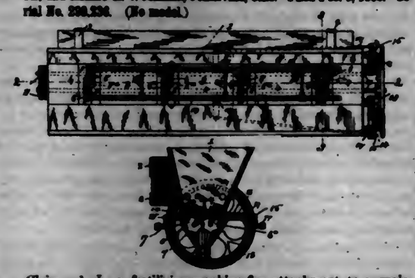
Claim.—The combination, in a proportional meter, of an inlet-chamber, a balance-chamber, a meter-feeding chamber, an outlet-chamber, a counterweighted diaphragm placed between the inlet-chamber and the balance-chamber, a proportional valve placed with the large opening leading to the balance-chamber, and the small opening leading to the meter-feeding chamber and operated by the counterweighted diaphragm, a balance-valve placed between the balance-chamber and the outlet-chamber, a diaphragm placed between the meter-feeding chamber and the balance-chamber and operating the balance-valve, and a tally-meter placed or connected between the meter-feeding chamber and the outlet-chamber, substantially as shown.



418,122. TEMPORARY BINDER. Joshua S. Akers, Millard, Dak. Filed May 16, 1889. Serial No. 311,265. (No model.)

Claim.—1. A temporary binder comprising the clamping-bars, the links having their ends journaled in the said bars, the bail pivoted to the lower clamping-bar and extending over the upper bar, and means for fastening the bail, as set forth.

2. The improved temporary binder comprising the clamping-bars A A, the links having their ends journaled in said bars, the bail pivoted to the lower clamping-bar, means for fastening the bail to the upper clamping-bar, and the stop on the lower clamping-bar adjacent to the pivot of the bail, as set forth



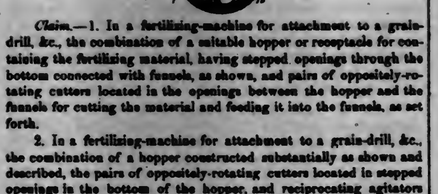
418,128. COUNTER-BALANCE FOR MINING-CAGES. Richard H. Arthur, Inglewood, Victoria. Filed Jan. 5, 1889. Serial No. 269,905. (No model.) Patented in Victoria Aug. 1, 1887, No. 5,214.

Claim.—1. The combination, with two bodies of substantially the same weight, haulage-ropes from which said bodies are suspended and adapted to move vertically in reverse directions, and a flexible counterpoise of substantially the same weight as the haulage-ropes, having its terminals connected with said bodies and depending therefrom, of the auxiliary chain H and auxiliary winding-drum H', arranged relatively to and adapted to co-operate with the counterpoise, substantially as and for the purposes specified.

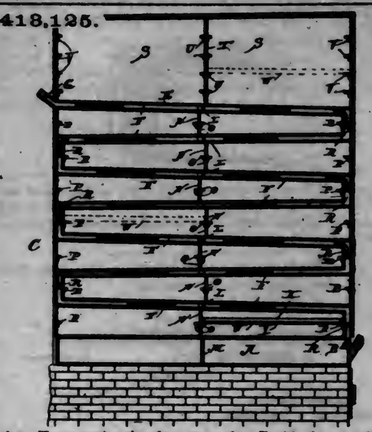
2. The combination, with two bodies of substantially the same weight, haulage-ropes from which said bodies are suspended and adapted to move vertically in reverse directions, and a flexible counterpoise of substantially the same weight as the haulage-ropes, and having its terminals connected with said bodies and depending therefrom, said counterpoise being made up of sections detachably connected together, of the auxiliary chain H and the auxiliary winding-drum H', arranged relatively to and adapted to co-operate with the counterpoise, substantially as and for the purposes specified.

418,124. FERTILIZING-MACHINE. Isaac S. Brandebura, Pearia, Ill., and Harry H. Workman, Johnsville, Ohio. Filed Feb. 9, 1889. Serial No. 299,236. (No model.)

Claim.—1. In a fertilizing-machine for attachment to a grain-drill, &c., the combination of a suitable hopper or receptacle for containing the fertilizing material, having stepped openings through the bottom connected with funnels, as shown, and pairs of oppositely-rotating cutters located in the openings between the hopper and the funnels for cutting the material and feeding it into the funnels, as set forth.



2. In a fertilizing-machine for attachment to a grain-drill, &c., the combination of a hopper constructed substantially as shown and described, the pairs of oppositely-rotating cutters located in stepped openings in the bottom of the hopper, and reciprocating agitators within the hopper for feeding the material to the cutters.



3. The combination of the hopper or receptacle provided with stepped openings in the bottom thereof, the funnels located beneath the openings, the pairs of oppositely-rotating cutters constructed substantially as shown and described, the reciprocating agitators, and the means for operating the agitators and the cutters, substantially as and for the purposes set forth.

4. In a fertilizing-machine, the combination of an oblong hopper provided with clamps or hooks for attachment to the grain-drill, stepped openings in the bottom of said hopper, funnels located beneath said openings, and mechanism for feeding the fertilizing material in the direction of the openings, and pairs of oppositely-rotating cutters for forcing the same into the funnels.

418,125. FRUIT-DRIER. James H. Baer, Oakland, Oreg. Filed Nov. 15, 1888. Serial No. 291,303. (No model.)

Claim.—The improved fruit-drier herein described and shown, consisting of the casing C, having an opening D in one side at its lower end, the boiler arranged within the casing out of contact with the sides of the same and provided with a feed-pipe B; the steam-conducting pipe E, communicating with and rising from the boiler and equal in width thereto, the said pipe having the inclined sections F and the straight sections R connecting the same, and having its upper end extended through the casing and provided with escape-pipes G, the plates H, connecting the alternate sections F with the opposite sides of the casing, the doors K in the front side of the casing, the braces L, arranged in the centers of the sections F, the brace M in the center of the boiler, the partition-plates N, having the brackets O, the brackets P, and the plate T, having the brackets U, all arranged substantially as specified.

418,126. VEHICLE-SPRING. Andrew J. Barney, Prairieville, Mich. Filed Jan. 3, 1889. Serial No. 295,970. (No model.)

Claim.—1. A vehicle-spring consisting of two inverted semi-elliptical end sections B, a semi-elliptical central section D, the ends of which are connected to the concaved faces of the end sections at or near the center, and links G, pivoted at their lower ends to the inner ends of the end sections and at their upper ends to the concaved face of the central section at or near its center, substantially as described.

2. The combination of the downcurved semi-elliptic spring D, of a given strength, pivoted links G, secured adjacent to the center of said spring, upcurved semi-elliptic springs B, of about half the strength of spring D, connected at their inner ends to the lower ends of said links, and provided at center with clips to secure the ends of the downcurved spring D, substantially as described.

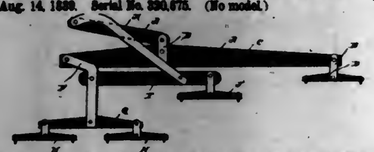
418,127. COMPOSITION FOR BASIC BRICK. Rudolf Bertrand, Kladno, Bohemia, Austria-Hungary, assignor to the Pottstown Iron Company, Pottstown, Pa. Filed July 19, 1888. Serial No. 280,698. (No specimens.)

Claim.—1. A refractory lining consisting of a mixture of calcareous phosphatic slag and lime.

2. The herein-described lining-brick for basic converters or furnaces, said brick consisting of a mixture of limestone or dolomite and calcareous phosphatic slag, burned, substantially as described.

3. The herein-described lining brick for basic converters or furnaces, said brick consisting of a mixture of limestone or dolomite with calcareous phosphatic slag and iron ore, burned, substantially as set forth.

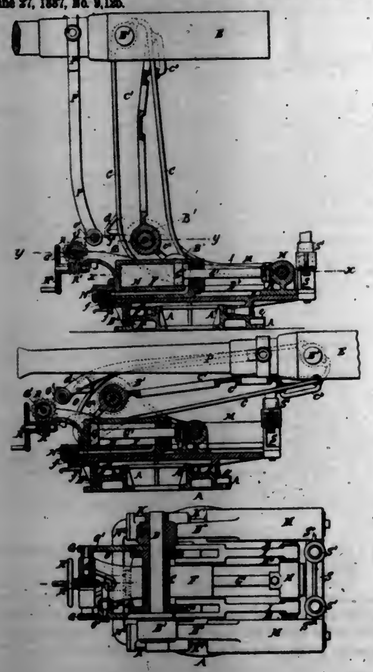
418,128. LOCK FOR DRAWERS. Frank Brabbs, Newark, N. J. Filed Oct. 15, 1888. Serial No. 288,486. (No model.)



Claim.—1. The combination, with a plate having in its body a series of graduated perforations K, a finger-piece F, formed at one end of said plate, and a perforated lip projecting beyond the finger-piece in the line of the body of the plate, of a stop adapted to engage the graduated perforations in the plate, the perforation in the

lip being made to receive the shackle of a lock, substantially as described.

2. The combination, with a plate having in its body a perforation K, a finger-piece F, and a perforated lip, of a stop having a head and a shank, said shank being adapted to rest and to be turned in said perforation K, and said head having bearing-faces placed at various distances from the shank, substantially as described.



413,129. DRAFT-EQUALIZER. JOHN BUTLER, Gaza, Iowa. Filed Aug. 14, 1889. Serial No. 320,675. (No model.)

Claim.—1. The combination of the main evener-bar A, the lever C, secured thereto and having a single whiffletree at one end and a pair of whiffletrees at the other end, the evener-bar I, carrying a single whiffletree and connected with the pair of whiffletrees, and connections between said evener-bars and the main evener-bar A, as set forth.

2. The improved draft-equalizer consisting of the main evener-bar A, the lever C, secured thereto, the angle-irons F at one end of the said lever, a pair of whiffletrees connected to the angle-irons and a single whiffletree connected to the end of the lever, the evener-bar I, secured to and extending from the angle-irons, and the braces extending between the evener-bars A and I, as set forth.

413,130. GUN-CARRIAGE. JEAN B. G. A. CANET, Paris, France, assignor of one-half to Sir Joseph Whitworth & Company, (Limited,) Manchester, England. Filed June 21, 1888. Serial No. 277,733. (No model.) Patented in France Mar. 1, 1887, No. 181,898, and in England June 27, 1887, No. 9,125.

Claim.—1. In a carriage or mounting for a disappearing gun, the combination of a rocking lever on which the gun is supported, arms or levers loosely mounted on the fulcrum-pin of the said rocking lever and provided with toothed segments, rods or links connecting the said arms or levers with the gun in such a manner that, together with the said arms or levers, the rocking lever, and the gun, they form a parallelogram, and pinions geared with said toothed segments and connected with elevating-gear, substantially such as above described, whereby the gun, after disappearing and before retraining to its firing position, can be adjusted to or nearly to the angle of elevation at which it is to be fired, but which will yield to abnormal or excessively severe stresses and thus prevent straining or breaking of the parts by the recoil, substantially as described.

2. In a carriage or mounting for a disappearing gun, the combination of a rocking lever on which the gun is supported, arms or levers loosely mounted on the fulcrum-pin of the said rocking lever and provided with toothed segments, rods or links connecting the said arms or levers with the gun in such manner that, together with the said arms or levers, the rocking lever, and the gun, they form a parallelogram, and pinions geared with the said toothed segments and connected with elevating-gear by means of friction cones or clutches, substantially as described.

3. In a carriage or mounting for a disappearing gun, the combination of a rocking lever on which the gun is supported, and which in the recoil turns through an angle of about ninety degrees, a hydraulic brake the piston of which is connected with the short arm of the said lever below its fulcrum, recuperative apparatus comprising hydraulic cylinders, communicating by a pipe or passage with the cylinder of the said brake and having rams or plungers connected with elastic resisting devices, substantially such as above described, a loaded valve in the said pipe or passage, and an adjustable valve in a by-pass around the said loaded valve, substantially as described.

4. In a carriage or mounting for a disappearing gun, the combination, with the rocking lever, the hydraulic brake, and the recuperative apparatus connected therewith, substantially as described, of a cross-head fixed on the piston-rod of the said brake and a buffer or cushion against which the said cross-head will impinge when the gun reaches its firing position, substantially as described.

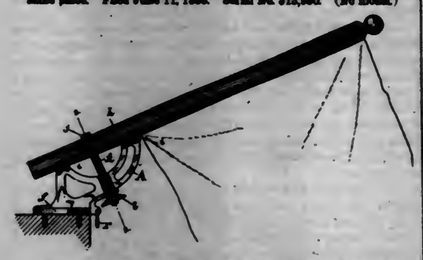
5. The combination, with the gun, of the rocking lever C, having the fulcrum-pin D, the arms or levers O, loosely mounted on the said fulcrum-pin and provided with toothed segments O', rods or links P, connecting the said arms or levers with the gun, pinions Q, geared with the said toothed segments and fixed upon shafts Q', friction cones or clutches Q^2, a worm-wheel R, connected thereby with the said shafts, and a worm R', geared with the said worm-wheel and provided with a hand-wheel R^2 for actuating it, substantially as described.

6. The combination, with the gun, of a rocking lever on which the said gun is supported, and which in the recoil turns through an angle of about ninety degrees, the pivot or fulcrum pin of the said lever being situated in rear of the point of connection of the gun therewith when the said lever is at the forward or upper extremity of its stroke or movement, arms or levers loosely mounted on said fulcrum-pin and provided with toothed segments, rods or links connecting the said arms or levers with the gun in such a manner that, together with the said arms or levers, the rocking lever, and the gun, they form a parallelogram, and pinions geared with the said toothed segments and connected with elevating-gear, substantially as described, so that the gun, after disappearing and before retraining to its firing position, can be adjusted to or nearly to the angle of elevation at which it is to be fired, substantially as and for the purpose set forth.

7. In a carriage or mounting for a disappearing gun, the combination, with a rocking lever supporting the gun, and a hydraulic brake connected with the short arm of the said lever below the fulcrum thereof, and the piston of which has orifices in or around the same, of two recuperators arranged one on each side of the said brake, and each comprising a ram or plunger working in a cylinder in communication with the brake-cylinder and elastic resisting devices connected with the said plunger, substantially as and for the purpose set forth.

8. The combination, with the gun and the rocking lever C, of the hydraulic brake F, the cross-head H, fixed on the piston-rod G' of the said brake and working in guides B^3, the rods or links I, connecting the said cross-head with the short arm of the said rocking lever, and recuperative apparatus comprising a ram or plunger working in a cylinder in communication with the brake-cylinder and elastic resisting devices connected with the said plunger, all substantially as and for the purpose set forth.

9. In a carriage or mounting for a disappearing gun, the combination, with a rocking lever supporting the gun and a hydraulic brake connected with the said lever, and the piston of which has orifices in or around the same, of a hydraulic cylinder K, communicating with the said brake by a pipe or passage provided with a loaded valve, a ram or plunger K', working in the said cylinder, and springs L, acting upon the said plunger, substantially as described.



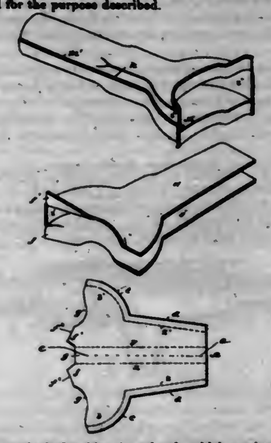
10. In a carriage or mounting for a disappearing gun, the combination, with a rocking lever for supporting the gun and a hydraulic brake connected with the said lever, of a recuperator-cylinder communicating by a pipe or passage with the brake-cylinder, a ram or plunger working in the said recuperator-cylinder, elastic resisting devices connected with the said plunger, a loaded valve in the said pipe or passage, a by-pass around the said loaded valve, and an adjustable valve for controlling the flow of liquid through the said by-pass, substantially as and for the purposes set forth.

11. In a carriage or mounting for a disappearing gun, the combination of the turn-table B, the brake F, the pipes or passages N N^3, the loaded valve N', the by-pass *f*, the valve *f'*, the cylinders K, provided with the plungers K', the boxes M, containing the springs L, the bearings B', the fulcrum-pin D carried thereby, and the rocking lever C, mounted upon the said fulcrum-pin and supporting the gun, substantially as described.

12. In a carriage or mounting for a disappearing gun, the combination of the turn-table B, the brake F, the pipes or passages N N^3, the loaded valve N', the by-pass *f*, the valve *f'*, the cylinders K, provided with the plungers K', the boxes M, containing the springs L, the bearings B', the fulcrum-pin D carried thereby, the rocking lever C, mounted upon the said fulcrum-pin and supporting the gun, the arms or levers O, and toothed segments O', the rods or links P, the pinions Q, the shafts Q', friction cones or clutches Q^2, and elevating-gear connected thereby with the said shafts, substantially as described.

13. In a carriage or mounting for a disappearing gun, the combination of a rocking lever, arms or levers loosely mounted on the fulcrum-pin of the said rocking lever and provided with toothed segments, rods or links connecting the said arms or levers with the gun in such a manner that, together with the said arms or levers, the rocking lever, and the gun, they form a parallelogram, pinions geared with the said toothed segments and connected with elevating-gear, a hydraulic brake the piston of which is connected with the short arm of the said rocking lever below its fulcrum, recuperative apparatus comprising hydraulic cylinders communicating by a pipe or passage with the cylinder of the said brake and having rams or plungers connected with springs, a loaded valve in the said pipe or passage, and an adjustable valve in a by-pass around the said loaded valve, substantially as described.

413,131. FLAG-STAFF HOLDER. FLORENCE J. D. CRAFFELL, Baltimore, Md., assignor of forty-nine one-hundredths to Wilbur H. Riddle, same place. Filed June 11, 1889. Serial No. 313,990. (No model.)



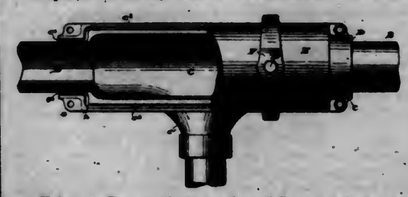
Claim.—1. In a flag-staff holder, the combination, with a shank having a supporting-base and concave seats for a flag-staff, of a screw-bolt passing through an aperture in said shank and having a hook at one end to embrace the staff, and a screw-nut at the other end whereby the staff is clamped to the concave seats, substantially as specified.

2. In a flag-staff holder, the combination, with the standards *d* and the supporting-base, of the shank A, pivoted between the standards and having a notched edge adapted to be held by a bolt *g*, the shank being provided with concave seats *i*, and a clamping-bolt passing through an aperture of the shank, whereby the flag-staff is held, substantially as described.

413,132. METHOD OF MANUFACTURING DRAW-HEADS. EVANDER H. CALWELL, Allegheny, Pa., assignor of one-half to Christian F. Kennweg, same place. Filed Mar. 28, 1889. Serial No. 304,982. (No model.)

Claim.—1. The method of making draw-heads, consisting, first, in cutting or forming a blank from a single piece of metal, then bending said blank longitudinally along two parallel lines to form one side, the top, and bottom of an embryo draw-head, then bending the edges of the top and bottom toward each other, and uniting the same together by welding, substantially as described, for the purpose set forth.

2. The method of making draw-heads, which consists, first, in cutting or forming a blank from a single piece of metal having the lateral wings *b b'* and the ears *f f'* and the recesses *g* at its front edge, then bending said blank longitudinally in two parallel lines to form the top, bottom, and one side of the embryo draw-head, then bending the free edges of the top and bottom and welding the bent portions together, and, finally, bending the front edge of the blank along the ears *f f'* and recessed edges *g* to form the vertical flanges, substantially as and for the purpose described.



3. The method of making draw-heads, which consists, first, in cutting a blank from a single piece of metal, then bending the blank longitudinally in two parallel lines to form the bottom, top, and one side of the embryo draw-head, then bending the edges of the top and bottom to form the meeting flanges and welding said flanges together to complete the remaining side of the draw-head, then uniting an end piece in the open rear end of the shank of the draw-head, and, finally, welding a hinge-piece to one side of the draw-head, substantially as described, for the purpose set forth.

4. The method of making draw-heads, which consists, first, in cutting a blank from a single piece of metal having the straight edge *g* at its front edge, the ears *f f'* on opposite sides of said straight edge, and the recesses, then bending the blank longitudinally in two parallel lines which extend from the terminals of the straight edge *g* at the front of the blank to the rear end thereof, to form the bottom, the top, and one side of the embryo draw-head, then bending the front edges of the top and bottom of the blank or embryo draw-head in opposite directions to form the vertical flanges at the front of the draw-head, then bending the side edges of the top and bottom to form the meeting flanges, and, finally, welding the side flanges together, substantially as described, for the purpose set forth.

5. A blank for use in making draw-heads, struck up from a single piece of metal and having the lateral wings *b b'* at its side edges near one end thereof, the recesses, the ears, and straight portion *g* at its front edge, and the inclined side edges, substantially as described.

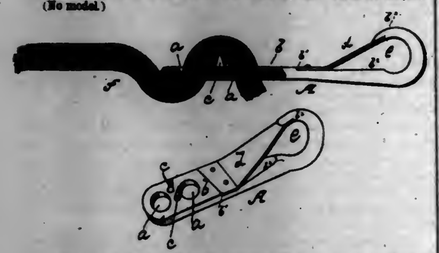
6. A blank for making draw-heads, struck up from a single piece of metal and having the lateral wings *b b'*, the longitudinal score-lines equidistant from a median line drawn through the blank, and the score-lines along and parallel with the side edges of said blank, substantially as described.

413,133. COUPLING-BOX FOR ELECTRICAL CONDUITS. SYLVESTER P. DARROW, Brooklyn, N. Y., assignor to George B. Thompson, Philadelphia, Pa. Filed July 27, 1889. Serial No. 318,916. (No model.)

Claim.—1. The combination, substantially as set forth, of the lower coupling-section, the half-collars bolted to the ends thereof, the cover fitting over the lower section and half-collars, and clamping devices for securing the cover.

2. The combination, substantially as set forth, with the cover and clamping devices for securing it in place, of the remaining portion of the coupling upon which the cover lies, comprising a lower section and rings or collars at the ends thereof for embracing the ends of the pipes, said coupling having a lateral passage, for the purpose described.

3. The combination, substantially as set forth, of the lower section having the lateral passage for house-connections, semicircular ends, and packing-grooves, the half-collars having the transverse packing-grooves, the cover, and clamping devices for securing the cover in place.



4. The combination, substantially as set forth, with the cover and clamping devices for securing it in place, of the remaining portion of the coupling upon which a cover lies, comprising a lower section and sectional rings or collars at the ends thereof for embracing the ends of the pipes, said coupling having a lateral passage, for the purpose described.

413,184. METHOD OF MAKING LATERAL CONNECTIONS IN UNDERGROUND CABLES. SYLVESTER P. DENISON, Brooklyn, N. Y., assignor to George R. Thompson, Philadelphia, Pa. Original application filed July 27, 1889, Serial No. 318,916. Divided and this application filed Sept. 21, 1889. Serial No. 324,613. (No model.)

Claim.—The herein-described method of making lateral or house connections with conductors inclosed in conduit-pipes, which method consists in cutting out a section of the conduit-pipe without injuring the inclosed conductors or cable, making the lateral connections with the conductors in the pipe, coupling the ends of the conduit-pipe by a closed sectional coupling, and leading out the house-connections through a lateral passage in said coupling.

413,185. SNAP-HOOK. ANDREW J. DENNE, Franklin, assignor to Adolf Dahlgren, Nashville, Tenn. Filed Feb. 12, 1889. Serial No. 299,618. (No model.)

Claim.—The within-described improved article of manufacture, consisting of a straight shank-hook having two tables in different planes, a shoulder *b'* at the junction of the two tables, the vertical apertures *a a* through the main portion of the flat shank, spurs *c c* between the two apertures, an obtuse angular spring *d*, secured to the shank and tapered, as described, and a shoulder b^2, formed on the inner side of the hook *e*, all constructed and adapted to operate in the manner and for the purposes described.

413,186. METHOD OF ELECTRIC REFRIGERATION. MARK W. DEWEY, Syracuse, N. Y., assignor to the Dewey Corporation, same place. Filed July 20, 1889. Serial No. 318,110. (No model.)

Claim.—1. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled and one or more parts adapted to be heated by the current therein, locating the cooled part or parts within or in contact with a receptacle to cool the interior thereof, and diffusing or conducting the heat from the heated part or parts of the circuit.

2. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled and one or more parts adapted to be heated by the current therein, locating the cooled part or parts within or in contact with a receptacle containing an uncongealable medium, insulating said receptacle from the influence of heat on the exterior thereof, and exposing the substance to be cooled to the cooling influence of said medium.

3. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled by the current therein, locating said part or parts within or in contact with a receptacle containing an uncongealable medium, insulating said receptacle from the influence of heat on the exterior thereof, and exposing the substance to be cooled to the cooling influence of said medium.

4. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled by the current therein, locating said part or parts within or in contact with a refrigerator or ice-chamber, and exposing the substance to be cooled within the said refrigerator.

5. The method of cooling or freezing a substance contained in a receptacle, consisting in removing the heat from the interior of said receptacle by or through the convection of heat produced by an electric current or currents.

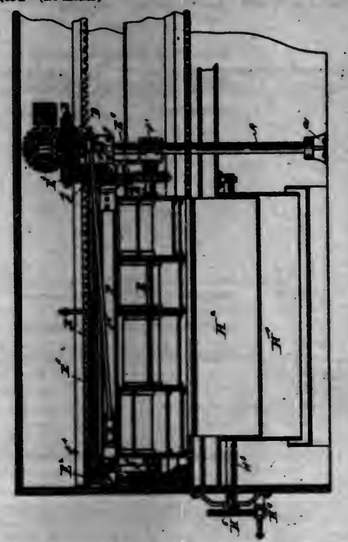
6. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled by the current therein, locating said part or parts within or in contact with a receptacle containing an uncongealable medium, electrically insulating the receptacle and medium from the circuit, insulating said receptacle from the influence of heat on the exterior thereof, and exposing the substance to be cooled to the cooling influence of said medium.

7. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled by the current therein, locating said part or parts within or in contact with a receptacle, electrically insulating the receptacle from the circuit, insulating the said receptacle from the influence of heat on the exterior thereof, and exposing the substance to be cooled within said receptacle.

8. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled and one or more parts adapted to be heated by the current therein, locating the cooled part or parts within or in contact with a receptacle, electrically insulating the same from the circuit, insulating the receptacle from the influence of heat on the exterior thereof, diffusing or conducting the heat from the heated part or parts of the circuit, and exposing the substance to be cooled within said receptacle.

9. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled and one or more parts adapted to be heated by the current therein, locating the cooled part or parts within or in contact with a receptacle, insulating the receptacle from the influence of heat on the exterior thereof, locating the heated part or parts of the circuit within or in contact with a conduit, passing a current of water or air through the conduit to dissipate the heat of said part or parts of the circuit, and exposing the substance to be cooled to the cooling effect of the said receptacle.

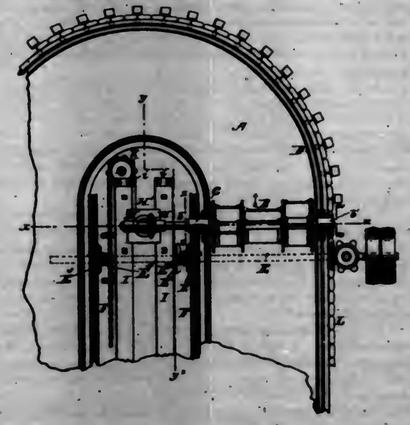
10. The method of electric cooling or freezing, consisting in establishing an electric circuit having one or more parts adapted to be cooled and one or more parts adapted to be heated by the current therein, locating the cooled part or parts within or in contact with a receptacle, insulating the receptacle from the influence of heat on the exterior thereof, diffusing or conducting the heat from the heated part or parts of the circuit, and exposing water to be frozen in a vessel within said receptacle containing an uncongealable medium.



11. The method of electric cooling or freezing, consisting in establishing an electric circuit, including a thermo-pile, locating the alternate junctions adapted to be cooled by the current within or in contact with a receptacle to be cooled, and dissipating or conducting the heat from the heated junctions.

12. The method of electric cooling or freezing, consisting in establishing an electric circuit, including a thermo-pile, locating the alternate junctions adapted to be cooled by the current within or in contact with a receptacle to be cooled, insulating said receptacle from the influence of heat on the exterior thereof, and dissipating or conducting the heat from the heated junctions.

13. In a system of electric cooling or freezing, consisting in connecting two or more thermo-piles or conductors having parts adapted to be cooled by a current flowing therein in multiple arc relations with leads from a suitable source of electricity, and regulating the current flowing through the thermo-piles or conductors independently of each other.

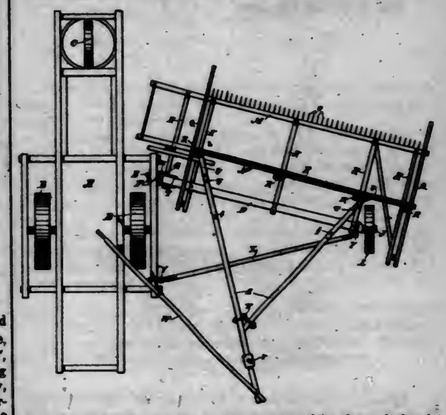


14. In a system of electric cooling or freezing, consisting in connecting two or more thermo-piles or conductors having parts adapted to be cooled by a current flowing therein in multiple-arc relation with leads from a suitable source of electricity, locating the cooled parts of each of said thermo-piles or conductors within or in contact with a suitable receptacle to be cooled, and regulating the current flowing through the said thermo-piles or conductors by any suitable and well-known method.

413,187. MALT-MACHINE. JOHN W. PREE, Boston, Mass., and MICHAEL A. BARBER, Norwich, Conn. Filed Feb. 4, 1889. Serial No. 298,634. (No model.)

Claim.—In combination with a frame F, adapted to be rotated horizontally around a central axis located at one end of said frame, a pair of shafts E' E^1, carried by said frame, one of said shafts, E', being higher than the other, stirrers on shaft *e*, a sprocket-gearing connecting the two shafts and causing the same to move harmoniously, a central driving-gear upon the central shaft A, a fixed rack F^3, arranged in arc about the axis of rotation of the frame above the shaft E', and an exterior gear E^2 on shaft E', engaging said rack, substantially as described.

413,188. MALT-STIRRING MACHINE. JOHN W. PREE, Boston, Mass., and MICHAEL A. BARBER, Norwich, Conn. Filed Feb. 4, 1889. Serial No. 298,633. (No model.)



Claim.—1. In a malting-machine, a malting-floor oblong in shape, having parallel sides and semicircular ends, the straight sides of said walls equal in length to each other, and the curved sides of the inner and outer walls being concentric with each other, in combination with the stirring-drum B, mounted on the two shaft-carriages *b'* and G, the inner endless chain F, and outer endless chain L, operating the shaft-carriages, and drum, and the reciprocating shaft-carriage H' and its ways I, carrying the inner end of the stirring-drum shaft, substantially as described.

2. In an oblong malt-machine, the combination of the shaft-carriage G, having hook *g*, with the endless chain F, engaging said hook, and means for operating said chain, substantially as described.

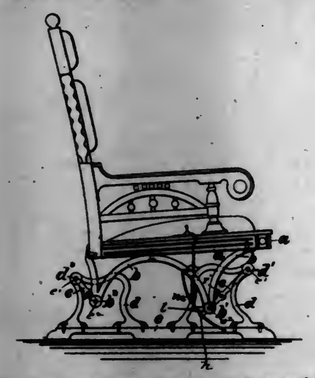
3. In a malt-machine, the combination of the carriage H', the yoke H, pivoted in said carriage, bevel-gear *h'* and sprocket h^2, having bearing in said carriage, shaft *b*, mounted in said yoke and carrying bevel-gear A, which engages the bevel-gear *h'*, and the operating-chain K, substantially as described.

4. The combination of the malting-floor having semicircular ends, with the stirring-drum B, the pivoted yoke H, and the exterior driving-chain L, substantially as described.

413,189. HEADER AND THRASHER. GEORGE W. HAINES, Stockton, Cal., assignor to the Stockton Combined Harvester and Agricultural Works, same place. Filed July 12, 1889. Serial No. 317,331. (No model.)

Claim.—1. The combination, in a combined header and thrashing-machine, of a sickle and carrying-belt frame, a single timber to which this frame is secured, a diagonally-disposed combined hinge and pivot by which the inner end of said timber is adjustably connected with the thrashing-machine frame in front of the axis of the main bearing-wheels, a single bearing-wheel journaled to the outer end of said timber, with its axis in a vertical plane with the axis of the main bearing-wheels of the thrashing-machine, and a counterbalance frame and weight attached to and extending rearwardly from the fulcrum-bearing timber, substantially as described.

2. In a combined header and thrashing-machine, a single fulcrum-bearing timber D, supporting the sickle and carrying-belt frame of a header, having its outer end supported upon a wheel journaled in line with the main bearing-wheels of the thrasher and its inner end connected with the thrasher-frame A in front of said wheels by means of a pivot-bolt extending through said frame, the beveled washers F upon each side of the frame A, the T-head upon the bolt, and the hinge connecting it with the fulcrum-timber of the header-frame, substantially as described.



3. In a combined header and thrashing-machine, the header having a single fulcrum-timber, the outer end of which is supported upon a bearing-wheel in line with the axis of the main bearing-wheels of the thrasher and the forward end connected by a pivot and hinged joint with the thrashing-machine frame in front of said axis, the sickle and carrying-belt frame secured to and standing in front of the fulcrum-timber, and the counterbalance frame and weight extending rearwardly therefrom, in combination with the brace-rod X, having its inner end connected with the rear of the thrashing-machine frame by a loose or swivel joint and its outer end connected with the movable timber of the header-frame by a similar joint, substantially as described.

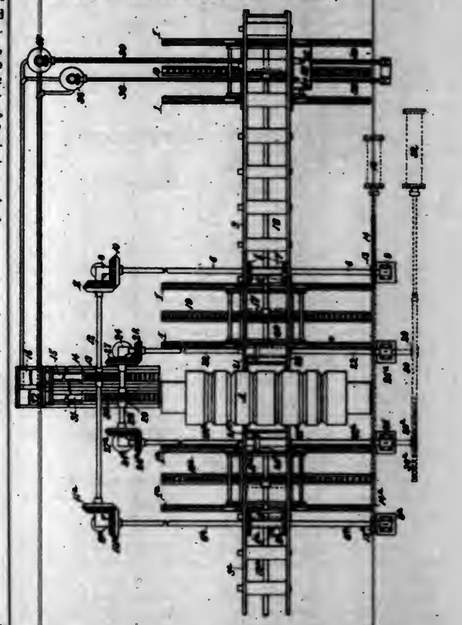
4. In a combined header and thrashing-machine, a header comprising a single timber standing diagonally outward from the thrashing-machine frame, having its outer end supported upon a bearing-wheel in line with the axis of the main bearing-wheels of the thrash-

ing-machine frame, and the inner end connected with the side timbers of the thrashing-machine by a pivot and hinged joint, a sickle and carrying-belt frame secured to this fulcrum-timber, and counterbalance-levers extending rearwardly therefrom, in combination with a board P, secured to the header-frame timbers behind the carrying-belt and standing upon edge upon said timbers, substantially as described.

5. In a combined header and thrashing-machine, the header composed of sickle and carrying-belt frame-timbers secured to a single fulcrum-timber, a bearing-wheel by which the outer end of said timber is supported, and a pivot and hinged joint by which the inner end of said timber is connected with the thrashing-machine frame, timbers U, secured to said fulcrum-beam and the header-frame timbers, in combination with the lever-arms S, bolted to the timbers U, the loose or hook connection T, by which these levers are united, the operating-lever W, fulcrumed upon the thrashing-machine frame, having its outer end connected with the rear end of one of the levers S, and the brace-bar X, with the eyebolt-connections Y and Z, whereby its inner and outer ends, respectively, are united to the thrashing-machine and the fulcrum-beam of the header-frame, substantially as described.

413,140. ROCKING-CHAIR. George F. Hall, Newark, N. J., assignor of one-half to Ellis R. Carhuff, same place. Filed May 25, 1889. Serial No. 312,144. (No model.)

Claim.—1. The combination, with a base and supporting-frame *d*, provided with the bearings d' and d^3, of a chair-seat provided with the bearings b' and b^3, suspended below the level of the bearings d' and d^3, the links *c*, connecting the bearings and provided with the studs c' and c^3, and one or more sleeves *f*, applied to one or more of the studs c^3 and provided with studs f^3, as and for the purpose set forth.



2. The combination, with a base and supporting-frame *d*, provided with the bearings d' and d^3, of a chair-seat provided with the bearings b' and b^3, suspended below the level of the bearings d' and d^3, the links *c*, connecting the bearings and provided with the studs c' and c^3, the rods *r*, connecting the links in pairs, and one or more sleeves *f*, applied to the studs c^3 and provided with studs f^3, as and for the purpose set forth.

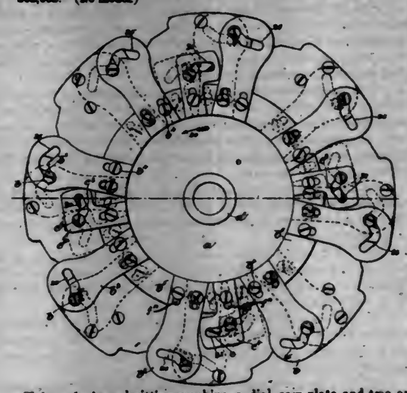
3. The combination, with a base-frame *c* and supporting-frame *d*, provided with the bearings d' and d^3, of a chair-seat provided with the bearings b' and b^3, suspended below the level of the bearings d' and d^3, the links *c*, connecting the bearings and provided with the studs c' and c^3, a sleeve *f*, applied to one of the studs c^3 and provided with perforated ear *h* and arm *l*, as described, a stationary curved rod *m*, secured at its ends to the frame *d* and base *c*, concentric with the bearing d^3, and passing through the aperture in the ear *h*, and means for turning the arm *l*, as and for the purpose set forth.

4. The combination, with a base-frame *c* and supporting-frame *d*, provided with the bearings d' and d^3, of a chair-seat provided with the bearings b' and b^3, suspended below the level of the bearings d' and d^3, the links *c*, connecting the bearings and provided with the studs c' and c^3, a sleeve *f*, applied to one of the studs c^3 and provided with perforated ear *h* and arm *l*, as described, a stationary curved rod *m*, secured at its ends to the frame *d* and base *c*, concentric with the bearing d^3 and passing through the aperture in the ear *h*, the lever *p*, pivoted to the chair-seat, and a link connecting the lever *p* with the arm *l*, the whole arranged and operated as and for the purpose set forth.

5. The combination, with the base-frame *c* and supporting-frame *d*, provided with the bearings d' and d^3, of a chair-seat provided with the bearings b' and b^3, suspended below the level of the bearings d' and d^3, the links *c*, connecting the bearings and provided with the studs c' and c^3, a sleeve *f*, mounted upon the stud c^3 and provided with perforated ear *h* and arm *l*, as described, a stationary curved rod *m*, secured at its ends to the frame *d* and base *c*, concentric with the path of the stud when the chair is in motion, and means for raising and depressing the arm *l*, as and for the purpose set forth.

413,141. ROLLING-MILL. Patrick F. Hamlet, Homestead, Pa. Filed Aug. 19, 1889. Serial No. 321,261. (No model.)

Claim.—1. In a rolling-plant, the combination of a laterally-moving carriage, a table provided with feed-rolls pivoted thereto, a shaft having a pinion keyed thereto, a fluid-pressure cylinder independent or outside of the carriage and adapted through interposed gearing to rotate said shafts, and stationary racks with which said pinion intermeshes, substantially as set forth.



2. In a rolling-mill plant, the combination of a carriage, a table provided with feed-rolls pivoted thereto, a curved rack attached to said table, a shaft having a pinion keyed thereto engaging the rack, and a fluid-pressure cylinder located outside of the carriage and adapted through interposed gearing to rotate the shaft, substantially as set forth.

3. In a rolling-plant, the combination of rolls, two carriages arranged on opposite sides of the rolls, tables pivoted to said carriages, racks arranged parallel with the axes of said rolls, shafts mounted on the carriages and provided with pinions engaging the racks, and a fluid-pressure cylinder independent of or outside of the carriages and adapted through interposed gearing to rotate said shafts, thereby effecting a simultaneous lateral movement of both carriages, substantially as set forth.

4. In a rolling-mill plant, the combination of rolls, two frames or carriages arranged on opposite sides of the rolls, tables pivoted to the carriages, curved racks secured to the tables, shafts having pinions keyed thereto engaging said racks, and a fluid-pressure cylinder located outside of the carriages and adapted through interposed gearing to rotate said shafts, thereby moving both tables simultaneously, substantially as set forth.

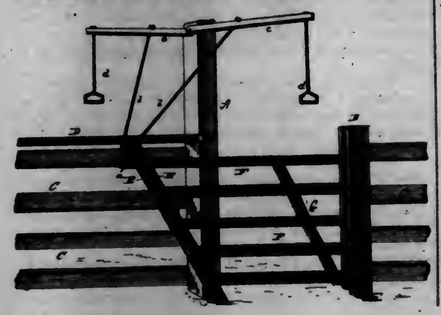
5. In a rolling-plant, the combination of rolls, two frames or carriages arranged on opposite sides of the rolls, tables pivoted to the carriages, fluid-pressure cylinders adapted by interposed gearing to shift the carriages and tables, a platform secured to one of the carriages, and levers connected to the valve mechanism of the cylinders and located in convenient proximity to the platform, substantially as set forth.

413,142. CIRCULAR-KNITTING MACHINE. Warren D. Hunt and Charles F. Carr, Laconia, N. H. Filed Aug. 13, 1888. Serial No. 282,603. (No model.)

Claim.—1. In a knitting-machine, a dial cam-plate and two or more sets of cams carried thereby and movable with relation to each other, as described, combined with arms provided with cam-slots and connected to the said cams, and with a movable ring carried by the cam-plate and to which the said arms may be connected, substantially as described.

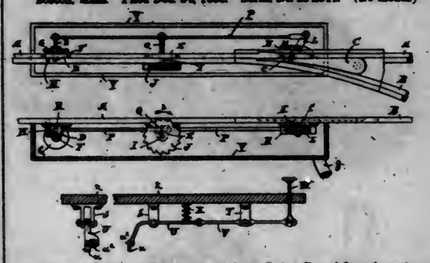
2. In a knitting-machine, a dial cam-plate and movable drawing-in and throwing-out cams, combined with arms provided with cam-slots and connected to the said cams, and with a movable ring carried by the cam-plate, and to which the said arms may be connected, substantially as described.

3. In a knitting-machine, a dial cam-plate and two or more sets of cams, each consisting of a throwing-out and a drawing-in cam, one or more of the said throwing-out cams being made movable, combined with arms provided with cam-slots to engage the studs on the movable cams, and with a movable ring carried by the cam-plate, and to which the said arms are connected, substantially as and for the purpose specified.



413,143. HOLDBACK FOR VEHICLES. Henry A. Koogler and Charles H. Slonecker, near De Graff, Ohio. Filed July 27, 1889. Serial No. 318,958. (No model.)

Claim.—1. The combination, with the shaft-bearer L and strap O of the adjustable piece B, having shoulder C, and attachded to the plate I on the shaft by thumb-screw F, playing in a slot and secured by the nut G, as and for the purpose set forth.

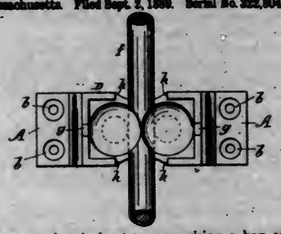


2. The combination of the buggy-shaft and plate I, with the adjustable shoulder-piece B, the bevel groove and slot K, the thumb-screw F, and bevel-nuts G, as and for the purpose set forth.

413,144. GATE. Charles P. Lancaster, Fairmount, Ind. Filed Feb. 13, 1889. Serial No. 299,755. (No model.)

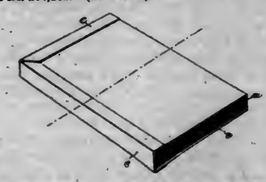
Claim.—In a folding gate, the combination of the posts A B, a horizontal rail D, attached to the said post A, the stationary battens E E, attached to the post A and rail D and inclined away from the former, the horizontal gate-rails F, pivoted between the said battens and pivotally connected together near their ends by means of an inclined bar, the upper one of said rails being provided with an extension *a*, extending beyond its pivotal point, operating-rods pivotally connected to the said extension *a*, and pivoted levers and handles for operating these rods, as and for the purpose set forth.

413,145. SWITCH FOR STREET-RAILROADS. Hosea W. Libbey, Boston, Mass. Filed Dec. 24, 1888. Serial No. 294,511. (No model.)



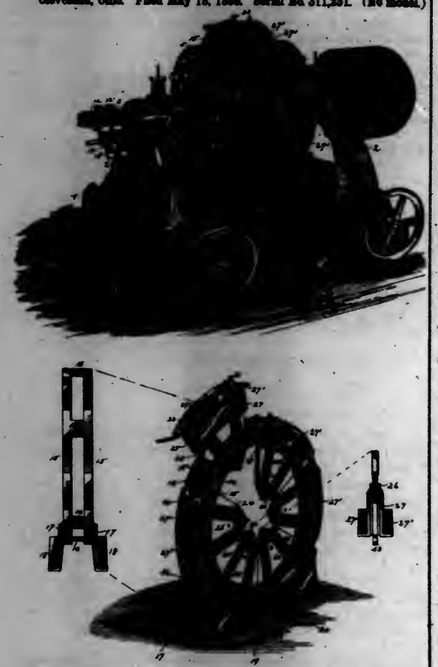
Claim.—1. The switch-tongue C, lever L, bar P, rod Q, and ratchet-wheel J, in combination with a lever U, secured to a car, substantially as and for the purpose set forth.

2. The combination of the tongue C, lever L, bar P, disk G, presser-bar H, and ratchet-wheel J, and their intermediate connections, whereby the tongue will be thrown in one direction by the depression of the lever H, and in the opposite direction by a partial revolution of the ratchet-wheel J, substantially as shown and described.



3. The treadle-rod W, lever V, bent lever U, and spring X, supported by brackets S T on the under side of a car, in combination with the ratchet-wheel J, bar P, lever L, switch-tongue C, and their intermediate connections, substantially as shown and described.

413,146. INSULATOR. Louis McCarthy, Boston, Mass., assignor to Charles Tennant Lee, same place, and the Gould & Watson Company, of Massachusetts. Filed Sept. 2, 1889. Serial No. 322,804. (No model.)



Claim.—An electric insulator comprising a box or case with a suitable base for securing it in position, the sides of said case being open for the passage of the wire, and two rolls composed of insulating material and placed loosely within said case, said rolls being grooved circumferentially to receive the wire, substantially as shown and described.

413,147. BLACK TABLET. Charles S. Perry, Boston, assignor of one-half to Robert M. Cable, Hyde Park, Mass. Filed Jan. 23, 1889. Serial No. 297,192. (No model.)

Claim.—As an improved article of manufacture, the herein-described black tablet, composed of superimposed sheets of heavy black paper with a hard-finished surface adapted to be marked on by a pencil and the marks erased without injury thereto, said sheets being secured together and united to a back, substantially as described.

413,148. DYNAMO-ELECTRIC MACHINE. GUSTAV PFANHEUSER, Cleveland, Ohio. Filed May 18, 1889. Serial No. 311,231. (No model.)

Claim.—1. In a dynamo-electric generator, the combination of rotating field-magnets and a stationary armature made of non-magnetic material, substantially as described.

2. A dynamo-electric generator consisting, essentially, of rotating field-magnets and a stationary armature, the generating portions of which are exposed to the inductive action of the magnets, and the inactive and structural portions of which are beyond the inductive sphere of the same, substantially as set forth.

3. A dynamo-electric generator consisting, essentially, of annular series of rotating field-magnets and an annular series of stationary armature-coils arranged with their active portions within the field or fields of force and with their inactive portions outside of said field or fields, substantially as described.

4. In a dynamo-electric generator, the combination of annular series of rotating field-magnets with an annular series of stationary armature-coils mounted upon a non-magnetic support and wound upon insulating-coils, said coils being arranged with their active portions within the field or fields of force and with their inactive portions outside of said field or fields, substantially as described.

5. In a dynamo-electric generator, the combination of two annular series of rotating field-magnets forming an annular magnetic field of force or an annular series of magnetic fields of force between the opposed pole-faces of the magnets, with an annular series of stationary segmental armature-coils wound upon non-magnetic cores, and occupying, with their radial branches, the magnetic field, while their inactive portions are outside of said field, substantially as described.

6. In a dynamo-electric generator, the combination of two annular series of rotating field-magnets forming an annular magnetic field of force or an annular series of magnetic fields of force between the opposed pole-faces of the magnets, with a stationary annular armature-support of non-magnetic metal composed of detachable segments and located in the plane of the magnetic field, but beyond the inductive influence of the same, substantially as described.

7. In a dynamo-electric generator, the combination of two annular series of rotating field-magnets forming an annular magnetic field of force or an annular series of magnetic fields of force between the opposed pole-faces of the magnets, with a stationary annular armature-support of non-magnetic metal composed of detachable segments and located in the plane of the magnetic field, but beyond the inductive influence of the same, and a series of segmental armature-coils removably mounted in the annular support, with their radial branches exposed to the action of the field and with their peripheral portions beyond the inductive sphere of the magnets, substantially as described.

8. In a dynamo-electric machine, the combination of a series of rotating field-magnets with a series of stationary armature-coils mounted on a non-magnetic support, the conductor of the armature-coils being disposed in a plane parallel to the plane of rotation of the field-magnets, substantially as described.

9. In a dynamo-electric machine, the combination of a series of rotating field-magnets with a series of stationary armature-coils mounted on a non-magnetic support, the conductor of the armature-coils being disposed in a plane parallel to the plane of rotation of the field-magnets, and the outer portion of the coils being faced with insulating material, substantially as set forth.

10. In a dynamo-electric machine, the combination of a series of rotating field-magnets with a series of stationary armature-coils mounted on a support located outside of the field of force, substantially as set forth.

11. In a dynamo-electric machine, the combination of a series of rotating field-magnets with a series of stationary armature-coils mounted on a non-magnetic support located outside of the field of force, substantially as set forth.

12. In a dynamo-electric machine, the combination of a series of rotating field-magnets with a stationary supporting-frame encircling the field of force, and armature-coils removably secured thereto, substantially as set forth.

13. In a dynamo-electric machine, the combination, with a series of rotating field-magnets, of a series of stationary armature-coils mounted on a non-magnetic support, the inner ends of said coils arranged to encircle but out of contact with the shaft of the field-magnets, substantially as set forth.

14. In a dynamo-electric machine, an armature consisting in the combination, with a supporting-frame, of a series of radially-detachable coils secured at their outer ends to said frame, substantially as set forth.

15. In a dynamo-electric machine, an armature comprising a supporting-frame, and a series of armature-coils connected together by interlocking plates and secured at their outer ends to said supporting-frame, substantially as set forth.

16. In a dynamo-electric machine, an armature comprising a supporting-frame, a series of armature-coils provided with tongue-and-groove plates for connecting together the adjacent coils, said coils being secured at their outer ends to the supporting-frame, substantially as set forth.

17. In a dynamo-electric machine, the combination, with a support, of a series of radially-disposed armature-coils connected with said support, said armature-coils mounted on interlocking supports, substantially as set forth.

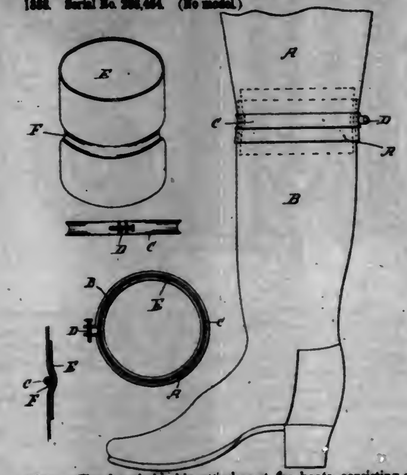
18. In a dynamo-electric machine, an armature composed of a series of armature-coils, each having a plate of insulating material secured to its side, which plates are furnished with interlocking tongues and grooves, substantially as set forth.

19. In a dynamo-electric machine, the combination of rotating field-magnets with a stationary annular armature-support of non-magnetic metal surrounding the field of force and provided with equally-spaced slots, and armature-coils removably seated in said slots and extending into the fields of force, substantially as described.

20. In a dynamo-electric generator, the combination of rotating field-magnets with a stationary annular armature-support of non-magnetic metal surrounding the field of force and provided with equally-spaced slots, armature-coils clamped at their inactive ends between non-magnetic plates seated in said slots, and interlocking spacing-plates of insulating material between the coils, substantially as set forth.

21. In a dynamo-electric generator, the combination of field-magnets carried by a rotating shaft with an annular armature-support of non-magnetic metal concentric to but not in contact with the shaft and composed of two semicircular sections detachably secured together upon the line of a diameter, whereby the armature may be removed from the machine without disturbing the shaft, substantially as described.

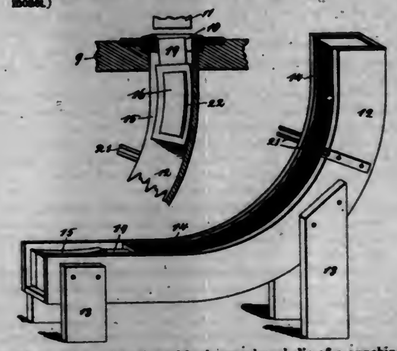
22. In a dynamo-electric generator, the combination of field-magnets carried by a rotating shaft, and a series of armature-coils mounted upon the two semicircular detachable sections of an annular support of non-magnetic material, each semicircular section being movable upon guides at right angles to said shaft, substantially as described.



23. In a dynamo-electric machine, a stationary armature composed of a series of segmental coils removably seated in an annular skeleton support of non-magnetic metal composed of flanged plates parallel to each other, with bridge-pieces extending between them, whereby the support is divided into a number of equally-spaced seats for the coils, substantially as described.

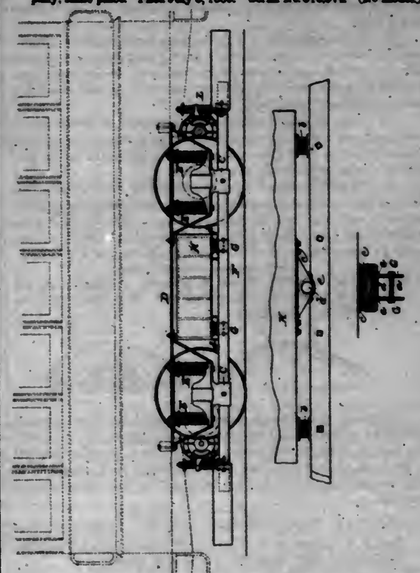
24. In a dynamo-electric machine, the combination of parallel annular series of rotating field-magnets with an armature composed of a series of segmental coils removably seated in a stationary annular skeleton support of non-magnetic metal in the plane of but beyond the inductive influence of the magnetic field of force, said support consisting of flanged plates arranged parallel to each other, with bridge-pieces extending between them, whereby the support is divided into a number of equally-spaced seats for the coils, substantially as described.

25. In a dynamo-electric machine, an armature provided with coils wound upon cores composed of silicious or other equivalent material, substantially as set forth.



26. In a dynamo-electric machine, an armature provided with coils wound upon cores of insulating material, said coils being provided with interlocking plates composed of silicious or equivalent material, substantially as set forth.

413,149. HIP ATTACHMENT FOR BOOTS. CHARLES G. REXER and ALEXANDER W. SIDENBERG, Bellefontaine, Ohio. Filed Sept. 26, 1888. Serial No. 286,494. (No model.)



Claim.—The detachable hip attachment for boots, consisting of the detachable top, the tubular piece provided with the circumferential groove, and the attaching-band, as and for the purpose set forth.

413,150. RECEIVING-BOX FOR PUNCHING-MACHINES. WILLIS W. RUSSELL, Norwood, assignor to the Russell & Morgan Printing Company, Cincinnati, Ohio. Filed Mar. 26, 1889. Serial No. 304,883. (No model.)

Claim.—In combination with the punch and die of a punching-press or similar machine, the blank-receiving box being curved and having its front side and lower end fully open to permit the removal of the blanks or cards at any point therefrom, further having a sliding support 15, being curved and shaped to correspond to the box, and having two of its sides yielding and pressed outwardly against the two opposite sides of the box by a spring, two forks 21, connected opposite each other to the sides of the box, and a stop 20, held in position by said forks, as and for the purposes fully explained.

413,151. ELECTRIC-RAILWAY CAR. FRANK J. SPRAGUE, New York, N. Y., assignor to the Sprague Electric Railway and Motor Company, same place. Filed July 5, 1889. Serial No. 316,574. (No model.)

Claim.—1. The combination, with a railway-car, of secondary batteries supported independently of the body of the car, substantially as set forth.

2. The combination of a railway-car truck, a car-body supported thereby, and secondary batteries supported by the truck beneath the car-body and independent thereof, substantially as set forth.

3. The combination of a railway-car truck, a car-body carried thereby, and secondary batteries carried by the axles of the truck independently of the car-body, substantially as set forth.

4. The combination of a railway-car truck, a car-body carried thereby, a frame joining the axles of the truck, and secondary batteries carried by said frame, substantially as set forth.

5. The combination of a railway-car truck having vertically-movable axle-boxes and secondary batteries supported by said axle-boxes independently of the car-body, substantially as set forth.

6. The combination of a railway-car truck having vertically-movable axle-boxes and equalizing-bars joining the axle-boxes on each side, and secondary batteries supported by said equalizing-bars, substantially as set forth.

7. The combination, with a railway-car truck having rails or bars extending across it beneath the car-body, of secondary batteries supported upon said rails or bars, substantially as set forth.

8. The combination of a railway-car truck, a car-body carried thereby, and secondary batteries flexibly supported on said truck beneath the car-body, substantially as set forth.

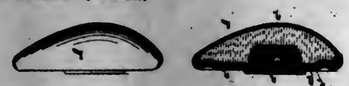
9. The combination of a railway-car truck, a car-body carried thereby, a frame joining the axles of the truck, and secondary batteries and an electric motor carried by said frame, substantially as set forth.

10. The combination of a railway-car truck, a car-body carried thereby, and secondary batteries and an electric motor independently flexibly supported by said truck, substantially as set forth.

11. The combination of a railway-car truck having vertically-movable axle-boxes, a frame joining the axle-boxes, and secondary batteries and an electric motor independently flexibly supported by said frame, substantially as set forth.

12. The combination of a railway-car truck having vertically-movable axle-boxes, equalizing-bars joining the axle-boxes on each side of the truck, cross bars or rails connecting said equalizing-bars at or near the middle of the truck, and secondary batteries supported on said cross bars or rails, substantially as set forth.

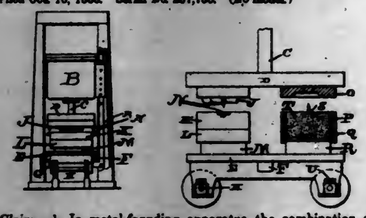
13. The combination of a railway-car truck having vertically-movable axle-boxes, equalizing-bars joining the axle-boxes on each side of the truck, cross bars or rails connecting said equalizing-bars at or near the middle of the truck, and secondary batteries flexibly supported on said cross bars or rails, substantially as set forth.



14. The combination of a railway-car truck having vertically-movable axle-boxes, equalizing-bars joining said axle-boxes on each side of the truck, and secondary batteries and an electric motor supported by separate cross-pieces from said equalizing-bars, substantially as set forth.

15. The combination of a railway-car truck having vertically-movable axle-boxes, equalizing-bars joining said axle-boxes on each side of the truck, and secondary batteries and an electric motor independently flexibly supported upon cross-pieces from said equalizing-bars, substantially as set forth.

16. The combination, with a railway-car truck, of electric motors and secondary batteries located beneath the car-body, the batteries counterbalancing the weight of the motors to effect an even distribution of weight, substantially as set forth.

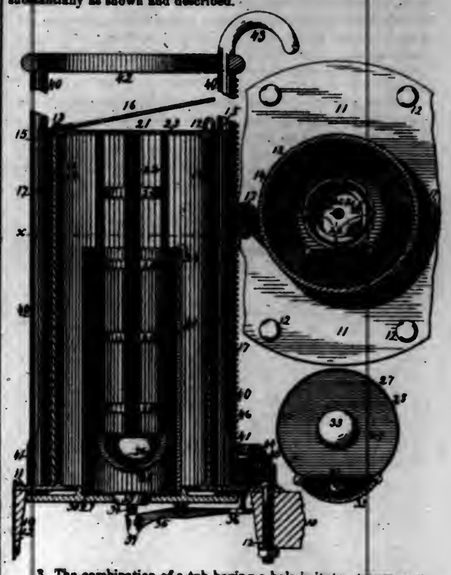


17. The combination of a railway-car truck, a frame joining the axles of said truck, and secondary batteries and electric motors supported by said frame and distributed thereon, so that a portion of the weight of said batteries and motors is at the middle part of the frame and a portion at each end of the frame, substantially as set forth.

418,152. TRUSS. GEORGE M. STERETER, Philadelphia, Pa., and AUGUSTUS D. SHELLENBERGER, College Point, N. Y. Filed Apr. 26, 1889. Serial No. 308,765. (No model.)

Claim.—A pad having a metal back provided with a thickened portion for a screw-socket extending partially through it, a soft-rubber front, a sheet of soft rubber covering the back and vulcanized to the front, and the rigid back being provided with a groove in its edge for the reception of the edge of the soft rubber, substantially as specified.

418,153. METAL-FOUNDING MACHINE. HARRIS TABOR, New York, N. Y., assignor to the Tabor Manufacturing Company, same place. Filed Oct. 10, 1888. Serial No. 287,780. (No model.)



Claim.—1. In metal-founding apparatus, the combination, substantially as set forth, with a press arranged to force two horizontal opposing press-surfaces toward each other, of a face pattern part upon one of said press-surfaces and provided with dowels, a back pattern part alongside of but away from said face pattern part and upon the same press-surface of the press and provided with dowel elements of intermembering correspondence with the dowel elements of said face pattern portion, and a horizontal axis of oscillation for the support of one of said press-surfaces arranged in the vertical plane of the space between the said two pattern parts.

2. In a metal-founding machine, the combination, substantially as set forth, with a press arranged to force two opposing pressing-surfaces toward each other, of one such pressing-surface arranged at right angles to the path of pressing motion, an opposite pressing-surface disposed normally parallel to said first-mentioned pressing-surface, a central horizontal pivot of oscillation centrally supporting said second surface, and springs supporting said surface at each side of said pivot.

418,154. WHISKY-TESTER. KNEBEL TAYLOR, Frankfort, Ky., assignor of one-half to John Meagher, same place. Filed July 31, 1888. Serial No. 319,234. (No model.)

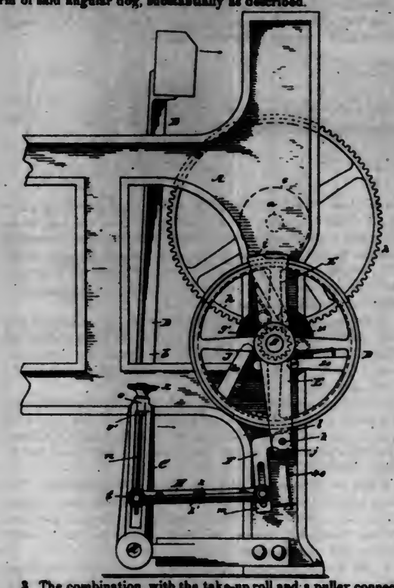
Claim.—1. The combination of a covered liquor-tub, a chamber thereon having one or more transparent sides, a crib for loosely supporting a hydrometer hung within the chamber, a thermometer-cup adapted to rise within the chamber and around the crib, there being an opening from the chamber into the tub through which the said cup may pass, and a rod or rods attached to the cup, whereby it may be dipped in the tub and brought into the said chamber, substantially as shown and described.

2. The combination of a tub having a hole in its top, a transparent cover for the hole, a crib or equivalent hydrometer-holder beneath the said cover, and a cup adapted to be raised around the said crib, substantially as shown and described.

3. The combination of a tub having a hole in its top, transparent cover for the hole, a cup adapted to be raised through the hole beneath the cover, a thermometer secured to one side of the cup, and a transparent cover to the thermometer, convex on its outer face, substantially as shown and described.

4. The combination of a covered liquor-tub having a hole in the cover, a transparent chamber secured over the said hole, a crib for holding a hydrometer removably suspended within the chamber, and a cover hinged to the chamber and adapted to be locked, substantially as shown and described.

5. The combination of a liquor-tub having a hole in its top, a transparent chamber secured over the hole, a thermometer-cup adapted to pass up through the hole, guide-rods attached to the cup, whereby it may be sunk into and drawn up out of the contents of the tub, and guides for the said rods fixed relatively to the said chamber, whereby the raising of the rods will draw and direct the cup into the chamber.



6. The combination of a thermometer-cup, guide-rods therefor, one of which is provided with a toothed rack, a support provided with guides through which the rods may slide, a toothed barrel-wheel journaled on the said support to engage the said rack, and a balance-spring within the barrel, substantially as shown and described.

7. The combination of a thermometer-cup, a puppet-valve in its bottom having a depending stem, a lever hung to the bottom of the cup and provided with a weight beneath the said stem, rods supporting the cup, fixed guideways for the rods, a trip-rod located in the guide-frame over the free end of the said lever, and a spring for supporting the said trip-rod, substantially as shown and described.

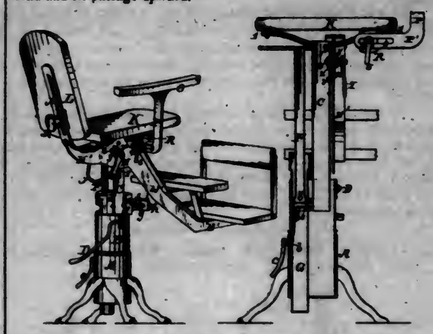
418,155. TAKE-UP MECHANISM FOR LOOMS. AMARIAH S. WARNER and ALLEN I. STEBBER, Springfield, Mass., assignors of one-fourth to George C. Wilson, same place. Filed Mar. 18, 1889. Serial No. 303,794. (No model.)

Claim.—1. In a take-up mechanism for looms, the combination, with the lay-frame and the radial arm C, fixed on the pivotal shaft of said lay-frame, provided with the longitudinal slot, and the driver-lever, of the block *p*, movable in said slot, having at one end a head and at the other a spindle projection, a sleeve fitted on the said spindle and bearing on the side of the arm, the link by one end suitably connected to the driver-lever and at its other provided with a bored hub fitting over said sleeve, and the nut *i*, substantially as described.

2. The combination, with the take-up roll and a pulley connected thereto, the lay-frame and the radial arm C, fixed on the pivotal shaft thereof, of a driver-lever having a hub-bore elongated in the direction of the length of said driver and provided at the end of one arm with the angular projection *i*, and having an angular dog F, pivoted to the end of its other arm, and a connection between said arm C and one arm of said angular dog, substantially as described.

3. The combination, with the take-up roll and a pulley connected thereto, the lay-frame, and the radial arm C, fixed on the pivotal shaft thereof, of a driver-lever having a hub-bore elongated in the direction of the length of said driver and provided at the end of one arm with the angular projection *i*, and having an angular dog F, pivoted to the end of its other arm, a spring applied between said dog and said driver, and a connection between said arm C and one arm of said angular dog, substantially as described.

4. In a take-up mechanism for looms, the combination, with the lay-frame and the radial arm C, fixed on the pivotal shaft of said lay-frame, provided with a longitudinal slot, and the driver-lever and the angular dog F, having an aperture or slot in the arm *m* thereof, of the blocks *p p*, fitting in said slots, each having at one end a head with a circular portion *y*, and at the other a spindle projection, a sleeve fitted on each of said spindles and bearing on the adjacent side of the arm, a link H, provided at each end with bored hubs fitting over said sleeves, and a duplicate link fitting by its bored hubs over the circular headed portions of said blocks, and a bolt-and-nut connection intermediately of said links, substantially as described.



5. In a take-up mechanism for looms, the combination, with the take-up roll and the pulley connected thereto, of a spring-actuated pawl-arm pivotally attached to the frame of the loom and provided with an aperture 30, and a spring-arm 24, by one end fixed to the frame of the loom and having its other end formed with an angular projection, substantially as and for the purpose described.

6. In a take-up mechanism for looms, the combination, with the take-up roll and the pulley connected thereto, of a spring-actuated pawl-arm pivotally attached to the frame of the loom and provided with the channel 29 and the aperture 30, and a spring-arm 24, by one end fixed to the frame of the loom and having its other end formed with an angular projection, substantially as and for the purpose described.

7. In combination, the take-up roll and a pulley connected thereto, the lay-frame and the radial arm C, fixed on the pivotal shaft thereof, the driver-lever having angular projection *i* and provided with the elongated hub-bore fitting over the pulley-carrying shaft, and the angular dog F, pivoted thereto, the spring 40, applied between said dog and driver, a block longitudinally movable in said arm C, and means for securing it against movement, a link between and secured to said block and one arm of said dog, and a clutch mechanism affixed to the frame of the loom and engaging said pulley, substantially as and for the purpose described.

418,156. DENTAL CHAIR. BASIL M. WILKERSON, Baltimore, Md., assignor, by mesne assignments, to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Mar. 14, 1878. (No model.)

Claim.—1. The combination, substantially as set forth, of a liquid-carrying cylinder, a plunger movable up and down in the liquid in the cylinder, the plunger-head by which the liquid above and below it communicates at all times, and the chair-frame connected with the plunger and partaking of its movements, whereby the descent of the chair-frame, when the plunger is free to move downward, may automatically be retarded by gradual displacement of the liquid beneath the plunger-head and its passage upward.

2. The combination, substantially as set forth, of a liquid-carrying cylinder, a hollow plunger movable up and down in the cylinder, the plunger-head, an automatically-acting valve seated in the plunger-head and by which communication is at all times maintained between liquid above and below said head, and the chair-frame connected with and partaking of the movements of the plunger, whereby descent of the chair-frame, when the plunger is free to move downward, may automatically be retarded by gradual displacement of the liquid beneath the plunger-head and its passage upward.

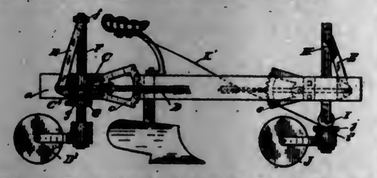
3. The combination, substantially as set forth, of a liquid-carrying cylinder, a hollow plunger movable up and down in the liquid in the cylinder, the plunger-head by which the liquid above and below it is the cylinder communicates at all times, an automatically-acting valve seated in the plunger-head and by which communication is at all times maintained between liquid in the plunger and in the cylinder, and the chair-frame connected with and partaking of the movements of the plunger, whereby the descent of the chair-frame, when the plunger is allowed downward movement, may automatically be retarded by gradual displacement of the liquid beneath the plunger-head and its passage upward around and into the plunger.

4. The combination of the liquid-carrying cylinder, a hollow plunger movable up and down in the cylinder, the chair-frame connected with and partaking of the movements of the plunger, the plunger-head, an automatically-acting main valve seated in the plunger-head, and by which communication is at all times maintained between liquid above and below said head, and the automatically-acting supplemental valve for varying the area of the communicating way or passage afforded by the main valve, substantially as and for the purpose set forth.

5. The combination of a liquid-carrying cylinder, a chair-frame support or plunger movable up and down in the cylinder, having bearings at the upper end thereof and fitting loosely at its lower end or head therein below said bearings to allow of constant communication between the liquid above and below said head, the lifting devices, and the locking or upholding devices, substantially as and for the purpose set forth.

6. The combination of the pedestal or base, the chair-frame support or plunger carried thereby, the lifting devices, the automatic clamping devices sustained by connection with the pedestal or base, consisting of the clamp-block and the self-adjusting knee-jointed support therefor, said clamping devices yielding to allow the chair-frame support or plunger to ascend but preventing its descent, and the lever for tripping the clamping devices to release said plunger, substantially as set forth.

7. The combination, substantially as set forth, of the chair-frame support or plunger, the clamp-bar provided with the end flange for engaging the plunger at one side, the slide-block for engaging the plunger at the opposite side, the lever, and the cam by which the lever is connected with the clamp-bar and slide-block, whereby the clamp-bar flange and slide-block may be caused to grip the plunger for elevating it.



8. The combination, substantially as set forth, of the pedestal or base, the vertically-adjustable support or plunger carried thereby, the clamp-block acting on said plunger, and the adjustable thrusting jointed support of said block, said support yielding to allow upward movement of the plunger.

9. The combination, substantially as set forth, of the pedestal or base, the vertically-adjustable plunger carried thereby, the clamp-block acting on said plunger, the self-adjusting thrusting-support for the clamp-block, said support yielding to allow upward movement of the plunger and acting on said block to automatically lock the plunger against descent, and the lever acting on the clamp-block to release the plunger.

10. The combination of the seat, the arm, the supporting standard or stem of the arm, and the pivot extending parallel, or nearly so, with said arm, and passing through said stem to connect it with the seat, whereby the arm may be swung in a plane transverse to the seat and adjusted toward and from it, substantially as and for the purpose set forth.

11. The combination of the vertically and centrally slotted chair-frame-back standard, the vertically-adjustable and laterally-tilting chair-back, and the screw-clamp secured to and carrying or moving up and down with the chair-back, and engaging with and movable in the slot of said standard, whereby the chair-back may be moved up and down by and swung about said clamp, substantially as and for the purpose set forth.

413,157. SULKY-PLOW. ROBERD C. WESTERVELT, South Bend, Ind. Filed June 20, 1889. Serial No. 315,019. (No model.)

Claim.—1. The combination of the casting formed with a sleeve and segment, the lever pivoted thereon and vertical rod playing through said sleeve having a bent lower end, and the lever connecting said rod, with a sleeve on the lower end of said rod, the latch carried thereby, and the caster-wheel, all substantially as specified.

2. The combination of the casting, the vertically-movable rod, and the levers and link for operating said rod, with the adjustable sleeve on the lower end of the rod having a depending stud, and a caster-wheel attached to said stud, substantially as set forth.

3. The combination of the plow, its side wheel, and adjustable rear caster-wheel, with the casting secured to the front end of the beam, having a segment and sleeve formed integral therewith, a vertical rod playing through said sleeve, having a bent lower end, the lever pivoted to said casting, the link connecting said lever and rod, the sleeve on the bent lower end of said rod having a depending stud, the caster-wheel suspended on said stud having a flanged and notched arm, and the spring-controlled latch on said sleeve engaging said arm, all constructed and arranged to operate as and for the purpose set forth.

REISSUES.

11,084. PHOTOGRAPHIC DEVELOPING-BATH. CHARLES SPIRO, New York, N. Y. Filed Sept. 9, 1889. Serial No. 323,457. Original No. 402,612, dated Apr. 30, 1889.

Claim.—1. The combination, with a photographic developer, of a non-actinic coloring-matter, so as to produce a transparent and non-actinic developing mixture, as and for the purpose set forth.

2. The combination, with a photographic developer, of a solution of non-actinic aniline coloring-matter, substantially as and for the purpose set forth.

3. The combination, with a photographic developer, of orange aniline, substantially as and for the purpose set forth.

11,085. TOOL FOR PACKING STUFFING-BOXES. FRANK J. SMITH, Philadelphia, Pa., assignor to himself and Joseph R. C. Smith, same place, and William R. Smith, Washington, D. C. Filed Feb. 27, 1889. Serial No. 301,868. Original No. 367,456, dated Aug. 7, 1888.

Claim.—1. The herein-described packing-tool, consisting, essentially, of a tubular packer-rod adapted to fit upon the part to be packed and provided with a longitudinal guide-slot extending along the tubular portion of the rod for the reception and guidance of the packing-strand, whereby when said rod is placed upon the part to be packed and revolved said strand will be wound around such part, substantially as and for the purposes specified.

2. The herein-described packing-tool, consisting, essentially, of a tubular packer-rod adapted to fit upon the part to be packed and provided with a longitudinal guide-slot, and a guide-eye arranged in proximity to the closed end of said slot, substantially as and for the purposes specified.

3. The herein-described packing-tool, consisting of a tubular and longitudinally-slotted packer-rod adapted to fit onto the part to be packed, and in combination therewith of a friction-brake to maintain the packing-strand at the proper tension, substantially as and for the purposes specified.

4. The herein-described packing-tool, consisting, essentially, of a tubular longitudinally-slotted packer-rod adapted to fit upon the part to be packed, a friction-brake for the packing-strand, and a guide for said strand interposed between the friction-brake and slot, substantially as and for the purposes specified.

5. The herein-described packing-tool, consisting of a tubular packer-rod adapted to fit upon the part to be packed and provided with a longitudinal slot extending along the tubular portion of the rod for the reception and guidance of the packing-strand, in combination with a revolvable carrier for the packing, substantially as and for the purposes specified.

6. The herein-described packing-tool, consisting of a tubular packer-rod adapted to fit upon the part to be packed and provided with a longitudinal slot formed in the tubular portion thereof, said slot curving from right to left at the open end of said tubular portion of the rod, and a guide-eye a^3, arranged in proximity to the closed end of said slot, substantially as and for the purposes specified.

7. The herein-described packing-tool, consisting of a tubular packer-rod adapted to fit upon the part to be packed and provided with a longitudinal slot formed in the tubular portion thereof, one of the walls of said slot having its outer end formed into or provided with a cutting-lip, whereby the rod is made to perform the function of an auger when revolved in a given direction, substantially as and for the purposes specified.

8. The herein-described packing-tool, consisting of a tubular packer-rod provided with a guide-slot for the packing-strand, in combination with a revolvable packing-carrier, and a friction-brake for said carrier, substantially as and for the purposes specified.

9. A tool of the class described, comprising a tubular packer-rod adapted to fit upon the part to be packed and provided with a guide groove or slot for the reception and guidance of the packing, a handle for said rod, and a revolvable carrier for the packing, said parts being detachably connected together, substantially as and for the purposes specified.

10. The herein-described packing-tool, consisting of a tubular packer-rod A, provided with a slot a and a cutting-lip a^2, in combination with the spool B and the spring-plate b^3, provided with the cone-pin b', that constitutes one of the journals for the spool and operates as a friction-brake, substantially as and for the purposes specified.

PHOTO LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Eastern District of Missouri, Eastern Division.

CARSON *v.* URY *et al.*

Decided September 2, 1889.

1. LABEL WHICH IS NOT A VALID TRADE-MARK.

A label which does not indicate with any degree of certainty by what particular person or firm the articles to which it may be affixed were manufactured, or serve to distinguish the goods of one manufacturer from the goods of another, and in which complainant appears to have no vendible interest, but merely a right to use it on articles of his own make, so long and only so long as he remains a member of a certain union, is not a valid Trade-Mark.

2. SAME—BILL TO RESTRAIN THE MAKING AND SELLING COUNTERFEITS THEREOF—PRESUMPTION ARISING FROM SUCH MANUFACTURE AND SALE.

A bill to restrain defendants from making and selling counterfeits of Labels that are not Trade-Marks may be maintained, even though it does not show that defendants have affixed any of the spurious Labels to articles of their own manufacture, or that they have sold any articles bearing the counterfeit Labels, where it appears that complainant has a right to use the Label and the right to use it is a valuable one, and the adoption of the Label is not unlawful or opposed to public policy, and that he has sustained such special pecuniary damage as gives him a right to complain of the fraud. From the fact that defendants have made and sold spurious Labels and advertised them for sale, it will be presumed that they intended that they should be used by the persons who buy them on articles similar to those on which complainant uses them, and that they manufacture and sell them for that purpose.

3. SAME.

Such case is not a Trade-Mark case, and the court cannot interfere as in ordinary Trade-Mark cases.

4. SAME.

Cases of *Cigar Makers' Protective Union, No. 98, v. Conhaim et al.* (41 N. W. Rep., 943) and *Schneider v. Williams* (14 Atlantic Rep., 812) distinguished from the case at bar.

ON demurrer to the amended bill.

STATEMENT OF THE CASE.

The case made by the bill and admitted by the demurrer may be summarized as follows:

The "Cigar Makers' International Union of America" is a voluntary unincorporated association of practical cigar-makers, having many members, and was formed to promote the mental, moral, and physical welfare of its members, to assist them in obtaining remunerative wages, to extend pecuniary aid to members and their families in case of sickness or death, and generally to maintain a high standard of workmanship.

In September, 1880, at a convention held by members of the union, a Label was adopted to be placed on cigar-boxes for the purpose of designating cigars made by members of the union. The Label is nothing more than a certificate printed on blue paper, and purporting to have been issued by authority of the union, to the effect that the cigars contained in the box to which it is affixed have been made by first-class workmen, members of the union, and not by "inferior rat-shop, coolie, prison, or tenement-house workmanship." All members of the "Cigar Makers' International Union of America" (and the membership is said to exceed 25,000) are allowed to affix the Label to cigars made and sold by themselves, provided they do not employ others to make cigars. It is also the practice of the union to furnish the Label gratuitously to all cigar-manufacturers throughout the United States who employ exclusively members of the union at an agreed schedule of wages.

Complainant in this case is a member of the union, and for two years past has been making and selling cigars of his own manufacture in the city of New York; and in the course of his business has used (as he is entitled to) the union Label aforesaid and built up a profitable trade.

The wages received by members of the union are about three dollars higher per 1,000 cigars than the wages received by other cigar-makers, and cigars bearing the union Label are worth in the market $3 per 1,000 more than they would be worth without it, because in public estimation the Label is a guaranty that the cigars bearing it have been made by competent workmen in clean and healthy shops.

By the use of the genuine Label in question on cigars of his own manufacture the complainant has made great profits, and the public has also been protected from purchasing inferior cigars.

Since the adoption of the union Label and since complainant began to use the same the defendants have conspired to cheat and defraud complainant and other members of the union as well as the public by making and selling and offering for sale counterfeit Labels for cigar-boxes. The Label made and sold by defendants is a fac-simile of the union Label, and cannot fail to deceive. In furtherance of the scheme to defraud defendants have adopted a fictitious name under which they manufacture and sell the counterfeit Label in question, and they also have their correspondence concerning the same sent to a false address in the city of St. Louis, whence it is forwarded to defendants' real place of business. By making and selling such spurious and counterfeit Labels to cigar-manufacturers throughout the country the public is deceived and a great pecuniary loss is occasioned, which is borne by the complainant and other members of the union, who, like him, manufacture and sell cigars and make use of the genuine union Label in the course of their business to enhance the value of their product and increase the demand therefor.

Such in brief is the case made by the bill.

Messrs. Briesen, Steele & Knauth, and *Messrs. Hough, Overall & Judson* for the complainant.

Mr. Chester H. Krum for the defendants.

THAYER, *D. J.*, (after stating the facts as above:)

On the facts stated I think that complainant is entitled to equitable relief. It is no doubt true that the union label does not answer to the definition ordinarily given of a technical Trade-Mark, because it does

not indicate with any degree of certainty by what particular person or firm the cigars to which it may be affixed were manufactured, or serve to distinguish the goods of one cigar-manufacturer from the goods of another manufacturer, and because the complainant appears to have no vendible interest in the Label, but merely a right to use it on cigars of his own make so long, and only so long, as he remains a member of the union. In each of these respects the Label lacks the characteristics of a valid Trade-Mark. The court cannot interfere in this instance, as in ordinary Trade-Mark cases, on the ground that one person is intentionally or unintentionally appropriating a mark, symbol, design, or word which has become the exclusive property of another when used by him to distinguish goods of a certain class. In short, this is not a Trade-Mark case. As I view it, it is a bill filed to restrain the defendants from perpetrating a fraud which injures the complainant's business and occasions him a pecuniary loss. Even where no Trade-Mark was infringed or involved, courts of equity have granted injunctions on more than one occasion against the use upon goods of certain marks, labels, wrappers, &c., when the evident design of such use was to deceive the public by concealing the true origin of the goods and making it appear that they were the product of some other manufacturer of established reputation, thereby depriving the latter of a portion of the patronage that would otherwise come to him or injuring the reputation of his goods. (*Croft* v. *Day*, 7 Beavan, 84; *McLean* v. *Fleming*, 96 U. S., 245; *Wotherspoon* v. *Currie*, 5th H. L. Cases, 508; *Seixo* v. *Provezende*, L. R. 1st Chan., 195; *Thompson* v. *Winchester*, 19 Pick., 214; *Perry* v. *Truefitt*, 6 Beavan, 66; *Newman* v. *Alvord*, 51 N. Y., 189; *Avery & Sons* v. *Meikle*, 81 Ky., 73; *Burton* v. *Stratton*, 12 Fed. Rep., 696; *Brown Chemical Co.* v. *Meyer*, 31 Fed. Rep., 453; Browne on Trade-Marks, sections 43 and 44.)

No valid reason can be assigned why the principle which underlies these decisions does not entitle the complainant to relief. The right of the court to grant relief in the cases cited was predicated on the ground that the conduct of the parties proceeded against in intentionally marking, labeling, wrapping, or advertising their wares so that they would be mistaken for the goods of some other manufacturer was fraudulent. That, and the fact that the fraud complained of had a natural tendency to injure the business of the person whose marks, labels, &c., had been simulated, by lessening his sales or injuring the reputation of his goods, was held sufficient to give the person who had thus sustained or was liable to sustain special damage a right to equitable relief.

In the case at bar complainant shows that he has a clear right to use the union Label and that the right to use it is a valuable privilege, inasmuch as it enhances the value of the cigars which he manufactures and sells and increases the demand therefor.

It does not appear from the averments of the bill that the action of the Cigar Makers' Union in adopting a Label to distinguish cigars made by its members was or is in any respect unlawful or opposed to public policy. On the other hand, the action of the defendants is confessedly fraudulent.

The demurrer admits that they are engaged in making and selling counterfeit Labels purporting to have been issued by the "Cigar Makers' International Union of America." The bill avers that the sale of such counterfeit Labels injures the complainant's trade and business, and such would seem to be the necessary and immediate result of such fraudulent acts. In other words, complainant shows that he has sustained such special pecuniary damage as gives him the right to complain of the fraud. It is true that the bill does not show that the defendants have affixed any of the spurious Labels to cigars of their own manufacture, or that they have sold any cigars bearing the counterfeit certificates or Labels; but this is not important. From the fact that they have made and sold spurious Labels and advertised them for sale the court must presume that defendants intend that they shall be used on cigar-boxes by the persons who buy them, and that they manufacture and sell them for that purpose.

The conduct of the defendants is equally as culpable as that of the manufacturers of cigars who buy and use the spurious Labels, and the loss which complainant sustains by the use of the same on cigar-boxes is as directly attributable to the persons who make and sell the counterfeit Labels as to the dealers in cigars who buy and use them.

In conclusion, I will add that my attention was called on the hearing of the demurrer to a recent decision of the Supreme Court of Minnesota affecting the union Label in the case of the *Cigar Makers' Protective Union, No. 98*, v. *David E. Conhain et al.*, (41 N. W. Rep., 943.) Also, to a decision of the Court of Chancery of New Jersey in the case of *Schneider* v. *Williams*, (14 Atlantic Rep., 812.) In both of those cases the bill seems to have been framed upon the theory that the union Label was a technical Trade-Mark, and that as such it was the property of the members of the union in the aggregate, and that any one or more members of the union, whether they were or were not engaged on their own account in the manufacture and sale of cigars and in the use of the Label might maintain a suit to restrain an unauthorized party from using the Label. The decision in each case was adverse to such contention. The bills appear to have been filed by persons and by an association who were not engaged in the manufacture and sale of cigars on their own account. Hence they were not injuriously affected by the fraudulent acts complained of, or, if they were liable to suffer a pecuniary loss to any extent or at any time in consequence of such acts, the loss to be apprehended was indirect and speculative.

It may well be conceded that the plaintiffs in those cases had no such property rights involved as would enable them to maintain an action, even on the theory on which this decision proceeds. The case at bar differs from those cases, however, in the respect before mentioned, that complainant is himself a manufacturer of cigars, and according to the averments of the bill has built up a profitable trade by the use of the union Label, which trade has been damaged and is liable to be further damaged by the fraudulent acts of the defendants. I think that he is entitled to relief on the facts stated in the amended bill, and accordingly overrule the demurrer.

U. S. Circuit Court—District of Oregon.

ASBESTINE TILING AND MANUFACTURING COMPANY *v.* HEPP *et al.*

Decided June 28, 1889.

1. INFRINGEMENT—ACCOUNTING.
Under section 4921 of the Revised Statutes, where a decree is given in a suit in equity restraining the infringement of a right secured by patent, the court may also decree a recovery of the profits arising from such infringement and the damages the plaintiff has sustained thereby.

2. MUNICIPAL CORPORATION—INFRINGEMENT OF PATENT.
Where the council of Portland authorizes a contractor to lay a sewer in one of its streets in pursuance of a power contained in its act of incorporation, and in so doing the contractor infringes upon the patent of another for making sewer-pipe, the act being a corporate one for the benefit of the corporation, it is liable for such infringement the same as a private corporation or person.

SUIT IN equity for the infringement of a patent.

Mr. Albert H. Tanner for the plaintiff.

Mr. William H. Adams for the defendants.

DEADY, *J.*:

This suit is brought by the Asbestine Tiling and Manufacturing Company, a corporation formed under the laws of Washington, against V. Hepp and F. D. Ball, citizens of the State of Oregon, and the city of Portland, a municipal corporation of said State. It is brought to restrain the defendants from using or vending certain molds for making mortar-pipes for which Ezra Hamilton, the inventor, on October 28, 1877, obtained a patent from the United States for the term of 14 years, for an account of the profits arising from the making, using, and vending of said molds, and damages for the same. The defendants Hepp and Ball answer the amended bill and the city of Portland demurs thereto.

It appears from the bill that the plaintiff is the assignee of this patent for this county, and that the city of Portland is authorized by its act of incorporation to lay down sewers within the corporate limits, designate the material to be used in the construction of the same, exercise exclusive control in all matters relating thereto, and to assess the cost thereof on the property benefited thereby; that the defendant, by its common council, has employed and contracted with the defendants Hepp and Ball to put down numerous sewers constructed of pipe made with said molds, and in pursuance thereof has used a large number of said molds and a large quantity of pipe made by means thereof, and is about to contract with them for the construction of other sewers therewith.

On the argument of the demurrer the points made in support of it were these:

(1.) The city of Portland, in constructing sewers, exercises a police power for the benefit of the public health, which "in no way inures to the profit or advantage of the city in its corporate capacity," and therefore it "is not liable for the infringement of a patent in prosecuting such work."

(2.) The city of Portland is not liable for profits on account of the alleged infringement, "none being realized" or "claimed by the bill." Hence equity has no jurisdiction.

(3.) The city, if liable at all, is only liable for damages, and these can only be recovered in an action at law.

By section 4921 of the Revised Statutes (section 55, act of July 8, 1870, 16 St., 206) it is provided that in cases arising under the patent laws this court shall have power to grant injunctions—

to prevent the violation of any right secured by patent, and upon a decree being rendered in any such case for an infringement the complainant shall be entitled to recover, in addition to the profits to be accounted for by the defendant, the damages the plaintiff has sustained thereby.

Presumably the city has made no profits out of the alleged infringement; but, whether it has or not or will not, the complainant is presumably damaged thereby to the extent of the royalty or license-fee usually charged for the use of the patent.

Prior to the act of 1870 damages could not have been recovered in a suit in equity for the infringement of a patent, but resort must have been had to an action at law for this purpose.

The city, like any natural person, may be enjoined from violating any right secured to the patentee in this patent or his assigns, and the statute expressly provides that in case of a decree for an injunction to restrain the infringement of a patent the plaintiff shall be entitled to recover the damages sustained thereby.

In *Root* v. *Railway Co.* (105 U. S., 189) the whole subject of redress in equity for the violation of a right secured by a patent is exhaustively examined by the late Mr. Justice Matthews. The bill was filed after the expiration of Letters Patent for the profits derived by the defendant from the use of an improvement in railway-car brakes, and, as there could be no further infringement after the expiration of the patent, it was not a case for an injunction, and consequently not of equitable cognizance.

In stating the conclusion of the Court, Mr. Justice Matthews said, (page 215:)

That a bill in equity for a naked account of profits and damages against an infringer of a patent cannot be sustained; that such relief ordinarily is incidental to some other equity, the right to enforce which secures to the patentee his standing in court; that the most general ground for equitable interposition is to insure to the patentee the enjoyment of his specific right by injunction against a continuance of the infringement.

In the case under consideration, on the demurrer to the bill, the plaintiff is entitled to an injunction against the continuance of the infringement by the city, and this gives this court, sitting as a court of equity, jurisdiction. Incidental to this, according to the rules of procedure in equity and the express language of the statute, (section 4921, Rev. St.,) the court may give the plaintiff further relief by way of the recovery of the profits made by the infringer or the damages sustained by the plaintiff.

By the act of October 24, 1882, incorporating the city of Portland, the common council thereof is authorized to open, lay out, widen, grade, and improve the streets of the city, and by section 121 of such act "to lay down all necessary sewers and drains, and cause the same to be assessed on the property directly benefited by such drain or sewer," and by subdivision 30 of section 37 of said act the council is given the power "to regulate * * * the building and repairing of sewers."

In Dillon on Municipal Corporations (3d Ed., section 966) it is said that such corporations "are liable for acts of misfeasance positively injurious to individuals done by their authorized agents or officers in the course of the performance of corporate powers constitutionally conferred, or in the execution of corporate duties." But, the writer adds, there is "not a little diversity of opinion as to what duties are corporate duties." However this may be, it is certain that the State may authorize the officers of a municipal corporation to perform a duty which is not corporate in its character or purpose, and for the omission or wrong-doing of which the corporation is not, and

ought not to be, liable to any one. My attention has not been attracted to any specific instance of this kind, but many suggest themselves. For instance, if the State were to authorize and require the mayor of the city to keep a rain-gage or weather-record in Portland, or an account of the immigrants arriving at the port, in the performance of such duties he would be serving the public at large, and not the agent of the corporation. But where the act is a corporate one, to be performed primarily for the benefit of the corporation—the inhabitants of the municipality—it is none the less a private, corporate act, because the public at large may be incidentally benefited thereby.

What few cases there are on this subject refer to and follow the ruling in *Bailey* v. *Mayor, &c.*, (3 Hill, 531.) In this case it appeared that certain "water commissioners," appointed by the State under an act of the legislature to provide the city of New York with pure and wholesome water, employed persons to build a dam across the Croton river. The action was brought against the corporation to recover damages for injuries caused by the insufficient construction of the dam. The court held that the work was a corporate one; that the commissioners were the agents of the corporation, and that the latter was therefore liable for the injury.

In delivering the opinion of the court, Mr. Chief Justice Nelson, in speaking of the grants of power to municipal corporations for exclusive public purposes and those for private purposes and the difficulty sometimes of distinguishing them, said:

> But the distinction is quite clear and well settled and the process of separation practicable. To this end regard should be had not so much to the nature and character of the various powers conferred as to the object and purpose of the legislature in conferring them. If granted for public purposes exclusively, they belong to the corporate body in its public, political, or municipal character. But if the grant was for purposes of private advantage and emolument, though the public may derive a common benefit therefrom, the corporation, *quoad hoc*, is to be regarded as a private company. It stands on the same footing as would any individual or body of persons upon whom the like special franchises had been conferred.

Certainly the purpose of the power to drain the streets of the corporation for the health and convenience of the inhabitants thereof is quite as much a private one as that of the power to furnish them with water. Like the power to maintain fire-engines and lights, the power to drain the streets by constructing sewers therein to carry off the waste water and refuse matter is granted and intended for the benefit and emolument of the corporation—the dwellers in the city—and not the general public, although the latter may be and is incidentally benefited thereby.

When the municipal corporation of Portland was created by the legislature, it was not contemplated that the inhabitants thereof should be left to perish in their own filth and the place become a nuisance, and therefore the corporation is authorized, for its own benefit, to provide for the removal of its waste water and refuse matter by laying down sewers or constructing drains in its streets.

In *Ransom* v. *New York* (1 Fish. Pat. Cas., 254) and *Bliss* v. *Brooklyn* (4 Fish. Pat. Cas., 596) it was held that the municipal corporation was liable as an infringer for acts done in the course of the execution of its corporate powers and duties, the patents infringed being in the one case for fire-engines and the other for an improvement in hose-couplings.

In *Elizabeth* v. *Pavement Co.* (97 U. S., 126) it was not questioned that the corporation, having contracted with third persons to lay down a pavement on its streets, which was in fact an infringement of the pavement company's patent, was liable therefor as an infringer for profits, if any were made, and for damages, if any were sustained. But the suit having been commenced before the passage of the act of 1870 "damages" could not be recovered therein, and it not appearing that any profits had been made by the corporation, there were none to recover.

Nor is it material whether the council contracted for or required that the pipe to be used by the contractor should be made on the machine of the plaintiff. It is enough that it has accepted the same, or allowed the contractor to use it, without the license of the patentee or his assignee.

The demurrer is overruled.

U. S. Circuit Court—District of New Jersey.

ZINSSER *et al. v.* KREMER.

Decided August 27, 1889.

1. INFRINGEMENT—APPLICATION FOR REHEARING.

In a suit for infringement of a patent an application for rehearing after settlement of the case must be denied.

2. SAME—PETITION FOR LEAVE TO INTERVENE.

After litigation is closed in suit for infringement of a patent, a petition in behalf of a party for leave to intervene as a defendant, alleging that he had actually defended respondent's case and was most interested in the defense against complainants' patent, must be dismissed.

STATEMENT OF THE CASE.

The decision on final hearing in this case was published in the OFFICIAL GAZETTE of July 2, 1889, p. 114. Since then the defendant's counsel made an application for a rehearing, and also a petition in behalf of one Charles Zoller for leave to intervene as a defendant, Zoller alleging that he had actually defended Mr. Kremer's case, and that he, being the manufacturer of the infringing lumps of bicarbonate of soda, was most interested in the defense against complainants' patent. The question came up on Zoller's motion for leave to intervene.

Mr. Arthur v. Briesen for the complainants.

Mr. Joseph M. Deuel for the defendant and for petitioner Zoller.

BUTLER, *J.*:

The respondent's application for rehearing fell with his settlement of the case.

The only matter now before me is the petition of Charles Zoller for leave to intervene. Whether such leave should have been granted if applied for earlier in the litigation need not be decided. It certainly should not be now, when the litigation has closed. The petitioner waited until the judgment of the court had been pronounced and the case settled in pursuance of it.

The fact that the petitioner assisted in the defense by arrangement with respondent does not entitle him to favorable consideration on this motion. If it was proper that he should take part in the litigation, he should have come into the case as a party, and have made himself answerable to the complainant for any just demand which the latter might have against him, as well as for costs; otherwise the complainant was liable to be harassed, delayed, and subjected to liability for costs by the petitioner without any remedy against him.

The petition is therefore dismissed.

THE OFFICIAL GAZETTE OF THE United States Patent Office.

Changes in Classification.

(ORDER No. 567.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., October 18, 1889.

The following sub-classes are hereby established in Division IV:

In Class 108, Roofing:
- Car.
- Portable.
- Thatch.

In class 104, Railways:
- Track-cleaners—
  - Flangers—Rotary.
  - Vibrating.
- Hot plows.

In Class 37, Excavating:
- Snow road machines.

C. E. MITCHELL,
Commissioner.

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1862, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1861, with an appendix, July 1, 1861, to June 30, 1862. One volume, 280 pages. In paper covers, $3; bound, $4.

Vol. 2. Appendix No. 2, July 1, 1862, to June 30, 1863. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1863, to June 30, 1864. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1864, to June 30, 1865. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1865, to June 30, 1866. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1866, to June 30, 1867. One volume, 52 pages. In paper covers, $1.50.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of October 22, 1889.

DESIGNS.

19,362.—FONT OF PRINTING-TYPE.—*Charles H. Beeler, Jr.*, Philadelphia, Pa. Application filed August 29, 1889. Serial No. 322,366. Term of patent 7 years.

19,364.—FONT OF PRINTING-TYPE.—*Henry W. De Witt* and *Charles E. Tiede*, Chicago, Ill., assignors to *Barnhart Brothers & Spindler*, same place. Application filed September 26, 1889. Serial No. 325,217. Term of patent 14 years.

19,365.—COMB.—*Joseph P. Noyes*, Binghamton, N. Y., assignor to *Joseph P. Noyes & Co.*, same place. Application filed July 9, 1889. Serial No. 316,998. Term of patent 7 years.

19,366.—STAIR-CARPET BUTTON.—*David Walker*, Newark, N. J. Application filed September 25, 1889. Serial No. 325,061. Term of patent 14 years.

19,367.—CULTIVATOR-FRAME.—*Samuel L. Allen*, Cinnaminson, N. J. Application filed July 27, 1889. Serial No. 318,972. Term of patent 14 years.

19,368.—LABEL.—*Abigail A. Draper*, Blue Island, Ill. Application filed August 29, 1889. Serial No. 322,375. Term of patent 3½ years.

19,369.—EXTERIOR OF A STABLE.—*Antoine Lacroix, Jr.*, Brooklyn, assignor to *The Co-operative Building Plan Association*, New York, N. Y. Application filed September 28, 1889. Serial No. 325,452. Term of patent 3½ years.

19,370 to 19,373, inclusive.—EXTERIOR OF A COUNTRY HOUSE.—*Antoine Lacroix, Jr.*, Brooklyn, assignor to *The Co-operative Building Plan Association*, New York, N. Y. Applications filed September 28, 1889. Serial Nos. 325,453 to 325,456, inclusive. Term of patents 3½ years.

19,374.—EXTERIOR OF A COUNTRY HOUSE.—*Antoine Lacroix, Jr.*, Brooklyn, N. Y. Application filed September 28, 1889. Serial No. 325,457. Term of patent 3½ years.

19,375.—JEWEL-HOLDER.—*John L. Remlinger*, Providence, R. I. Application filed August 17, 1889. Serial No. 321,150. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

17,120.—WATER-TUBE VERTICAL BOILERS.—*The Hazelton Boiler Company*, New York, N. Y. Application filed September 7, 1889. Used since July, 1860.

"The word 'PORCUPINE.'"

17,121.—WATER-TUBE VERTICAL BOILERS.—*The Hazelton Boiler Company*, New York, N. Y. Application filed September 7, 1889. Used since July, 1860.

"The word 'HAZELTON.'"

17,122.—WATER-TUBE VERTICAL BOILERS.—*The Hazleton Boiler Company*, New York, N. Y. Application filed September 7, 1889. Used since January, 1869.

"The representation of a porcupine."

17,123.—CERTAIN NAMED WOOL DRESS-GOODS.—*Hilton, Hughes & Denning*, New York, N. Y., and Paris, France. Application filed September 21, 1889. Used since 1872.

"The word 'HORTENSE.'"

17,124.—CORSETS.—*William S. Thomson*, London, England. Application filed September 14, 1889. Used since January, 1867.

"The words 'THOMSON'S GLOVE FITTING CORSET.'"

17,125.—CUTLERY AND EDGE-TOOLS.—*B. Worth & Sons*, Sheffield, England. Application filed September 23, 1889. Used since 1873.

"The word 'WORTH.'"

17,126.—LAGER-BEER.—*Conrad Geise & Co.*, Chattanooga, Tenn. Application filed May 7, 1889. Used since May 1, 1888.

"The word 'FAULTLESS' associated with a pair of spread wings and diverging rays of light."

17,127.—BEER, ALE, AND LAGER.—*Crystal Spring Brewing Company*, Syracuse, N. Y. Application filed August 19, 1889. Used since October 1, 1888.

"The representation of a spring with a background of rocks and female figures clinging to the rocks and holding a vessel catching water."

17,128.—FOODS AND RELISHES, SUCH AS FRUITS AND VEGETABLES.—*Henry Ferdinand Ihlee*, Battersea, county of Surrey, England. Application filed August 28, 1889. Used since June 20, 1888.

"The words 'FRAME FOOD.'"

17,129.—MEDICATED FOODS AND MEDICINAL TONICS.—*Henry Ferdinand Ihlee*, Battersea, county of Surrey, England. Application filed August 28, 1889. Used since June 20, 1888.

"The words 'FRAME FOOD.'"

17,130.—MALT LIQUORS, COFFEE, TEA, AND COCOA.—*Henry Ferdinand Ihlee*, Battersea, county of Surrey, England. Application filed August 28, 1889. Used since June 20, 1888.

"The words 'FRAME FOOD.'"

17,131.—CONFECTIONERY, CANDIES, AND PREPARED SUGAR.—*Henry Ferdinand Ihlee*, Battersea, county of Surrey, England. Application filed August 28, 1889. Used since June 20, 1888.

"The words 'FRAME FOOD.'"

17,132.—LEATHER MADE FROM SHEEP AND GOAT SKINS.—*James F. Ingraham*, West Peabody, Mass. Application filed August 19, 1889. Used since January 15, 1886.

"The representation of the head of a bear and the word 'BEAR.'"

17,133.—KEROSENE-OIL.—*Mourilyan, Heimann & Co.*, Yokohama and Hiogo, Japan, and New York, N. Y. Application filed August 21, 1889. Used since July 1, 1869.

"The representation of the national flags of the United States and Japan on crossed poles tied by a rope which ends in tassels."

17,134.—MEDICINES FOR THE PREVENTION AND CURE OF MICROBE DISEASES.—*Chas. Alf Chemical Company*, St. Louis, Mo. Application filed September 2, 1889. Used since August 20, 1889.

"The representation of a man seated before a table, upon which are supported a jar and a tumbler, a mortar, and a bunch of herbs in a suitable stand, the left hand of the man, resting upon the table, holding the mortar, and in his right hand holding a magnifying-glass, through which he is examining the herbs."

17,135.—MINERAL WATER.—*Brooklyn Purified Mineral Water Co.*, Brooklyn, N. Y. Application filed August 24, 1889. Used since March 1, 1887.

"The representation of a mortar and pestle."

17,136.—SALT.—*Genesee Salt Company*, New York, N. Y. Application filed June 27, 1889. Used since January, 1886.

"The conventional representation of a cube impressed on a dark ground."

17,137.—HERB TEA.—*Gunton & Curtis*, Philadelphia, Pa. Application filed September 10, 1889. Used since April 8, 1889.

"A group of fern leaves and blossoms with the words 'VEGETABLE TEA' interwined in it in a fanciful manner."

17,138.—IN-DOOR BASE-BALL GAMES.—*Ida Parmly*, Bridgeport, Conn. Application filed September 26, 1889. Used since September 16, 1889.

"The word 'WINTER' and the representation of a game of base-ball."

17,139.—STICKY FLY-PAPER.—*Ryan Drug Company*, St. Paul, Minn. Application filed August 27, 1889. Used since May 1, 1889.

"The word 'EAGLE.'"

17,140.—VARNISHES, JAPANS, AND HARD OIL FINISH.—*James P. Sloane*, Brooklyn, N. Y. Application filed August 2, 1889. Used since July 22, 1889.

"The words 'KINGS COUNTY VARNISHES' and the representation of a crown."

17,141.—WHISKY.—*E. H. Taylor, Jr., & Sons*, Frankfort, Ky. Application filed August 13, 1889. Used since January 1, 1887.

"The script fac-simile 'E. H. TAYLOR, JR.'"

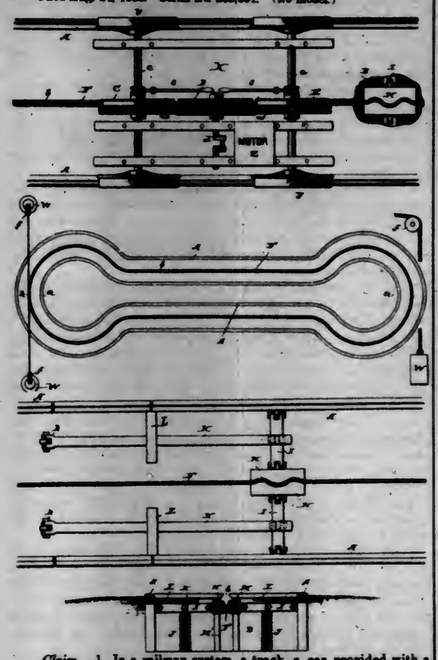
17,142.—PRESERVED MEAT, FISH, AND FRUIT.—*Carl Warhanek*, Vienna, Austria-Hungary. Application filed August 6, 1889. Used since May, 1868.

"A representation of the mythological figure known as a 'SPHINX' or the word 'SPHINX.'"

LABELS.

6,041.—Title: "HOLLOWAYS CELEBRATED STOMACH BITTERS."—*George W. Holloway*, Syracuse, N. Y. Application filed September 28, 1889.

6,042.—Title: "SHERMAN'S HEADACHE CAPSULES."—*Charles A. Sherman*, Rochester, N. Y. Application filed September 24, 1889.



6,043.—Title: "CHAS. ALFF'S GERM EXTERMINATOR."—*Chas. Alf Chemical Company*, St. Louis, Mo. Application filed September 2, 1889. (Trade-Mark Registered.)

6,044.—Title: "TAFT'S BOTTOM POLISH."—*George H. Taft*, Worcester, Mass. Application filed August 15, 1889.

PATENTS

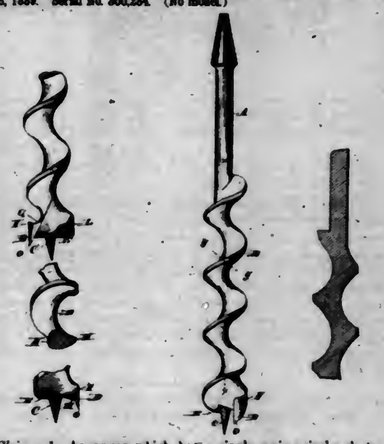
GRANTED OCTOBER 22, 1889.

418,158. RAILWAY SYSTEM. CHARLES B. ADSIT, Chicago, Ill. Filed Aug. 24, 1888. Serial No. 283,061. (No model.)

Claim.—1. In a railway system, a track, a car provided with a driven winding-wheel, and a stationary cable mounted adjacent to the track and arranged to pass over the said winding-wheel on the car, the end of the cable being free and weighted, substantially as described.

2. In a railway system having a continuous looped track, a single stationary cable mounted adjacent to the track, having its end portions crossed, and a car provided with a winding-wheel, substantially as and for the purpose set forth.

3. In a railway system having a continuous looped track, a stationary cable mounted in a channel adjacent to the track, and having its end portions crossing each other and free and weighted, and a car provided with a winding-wheel for the cable, substantially as described.



4. In a railway system, the combination of a stationary cable lying adjacent to the track and stationary gripping devices for engaging with the cable between its ends, substantially as described.

5. In a railway system, a track, a car traveling thereon provided with a winding-wheel, a stationary cable arranged adjacent to the track, and a stationary gripping device having blocks or jaws which clamp the cable and connected to be separated by the passing of a car, substantially as described.

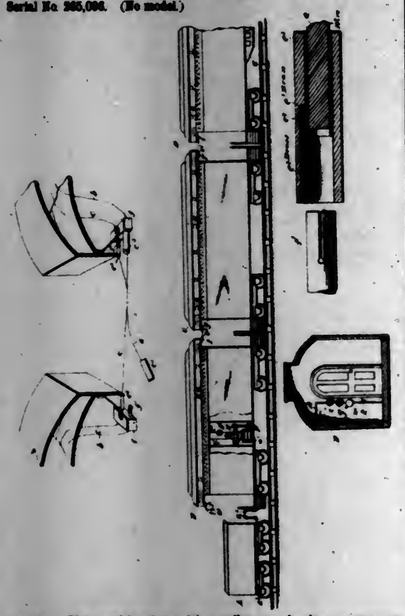
6. In a railway system, a track, a car traveling thereon provided with a driven winding-wheel, a stationary cable arranged adjacent to the track, the stationary cable-clamping blocks or jaws, the springs which hold the jaws clamping the cable, and levers connected with the blocks or jaws and operated by a passing car to separate the blocks or jaws against the action of the springs, substantially as described.

7. In a railway-car, the combination of the traction-wheels, a driven wheel *w*, mounted loosely on the axle of the wheels, a clutch whereby the wheel *w* may be connected with the axle to drive the traction-wheels, and a cable-winding pulley connected with the wheel *w*, to be driven thereby, substantially as described.

418,159. AUGER. JOHAN BAILEY, Wilmington, Ohio. Filed Feb. 18, 1889. Serial No. 300,284. (No model.)

Claim.—1. An auger which has a single main spiral web, together with a pointed cutter backed by a spiral web which has a pitch greater than the pitch of the main spiral web of the auger, and which decreases gradually in radius as it ascends and runs into and coincides with the said main spiral web at a short distance from the cutter, substantially as described.

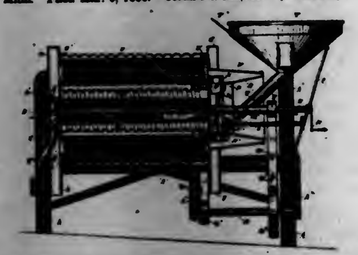
2. An auger which has a single spiral main web which increases in thickness gradually and uniformly from the outer to the inner edge, together with a pointed cutter placed to one side of and at some distance from the axis of said auger, and a support for said cutter projecting from said axis, substantially as described.



3. An auger which has a single main spiral web which terminates in a suitable edge for removing the chips, together with a pointed cutter backed by a spiral supporting-web which has a pitch greater than the pitch of the main spiral web, and which decreases gradually in radius as it ascends and runs into and coincides with the said main spiral web, substantially as described.

4. An auger which has a single main spiral web which increases in thickness gradually and uniformly from the outer to the inner edge, together with a pointed cutter which is backed by a short spiral web which has a pitch greater than that of the main spiral web, and which decreases gradually in diameter as it ascends and runs into and coincides with the main spiral web, substantially as described.

5. In an auger, the single pointed cutter supported upon and projecting downward from a suitable web, which terminates in a straight



cutting-edge, a portion of the cutting-edge of the pointed cutter being above said web, substantially as described.

413,160. ELECTRIC CAR-LIGHTING. SIDNEY H. BARRETT, Springfield, Mass., assignor to Dwight Holland, same place. Filed Feb. 24, 1888. Serial No. 265,096. (No model.)

Claim.—The combination, with a railway-train the cars composing which are provided with the main wires *b c*, of wires *d e*, connecting said main wires of the several cars in a continuous circuit, wires *h* within each car, connected by switch with said main wire *c*, lamps *a*, connected to wires *b h*, dynamo E, located in one of the cars and connected with the main wires thereof, engine F, operatively connected with said dynamo, pipes $a' a^2$ and coupling a^3, connecting said engine with the locomotive-boiler, storage-battery G, and wires *k l*, connecting said battery with the main wires of one of the cars through switch *m*, arranged and operating substantially as and for the purpose set forth.

413,161. GRAIN-SEPARATOR. GEORGE C. BEEMAN, Minneapolis, Minn. Filed Mar. 9, 1889. Serial No. 302,703. (No model.)

Claim.—1. The combination, with a revoluble shaft, of a separating-cylinder mounted thereon, multiple small-diameter separating-cylinders grouped about the central cylinder outside thereof and outside each other, imperforate partitions between the separating-surfaces of the different cylinders, and a conveyer-case inclosing the whole group of cylinders and in communication with the central cylinder, adapted to receive the screenings from the outside cylinders and force them into the central screen, substantially as described.

2. The combination, with a revoluble shaft, of a central separating-cylinder mounted thereon, a central imperforate conveyer or shell with spiral corrugations surrounding said central cylinder, multiple small-diameter separating-cylinders grouped about said central conveyer outside thereof and outside each other, imperforate partitions between the separating-surfaces of the outside cylinders, and an exterior conveyer case or shell with spiral corrugations inclosing the whole group of cylinders and in communication with the central cylinder, substantially as described.

3. The combination, with a revoluble shaft, of a central cylindrical screen mounted thereon, a central imperforate conveyer-shell inclosing said central screen, multiple small-diameter cylindrical screens grouped about said central conveyer outside thereof and outside each other, an exterior conveyer-shell inclosing the whole group of screens, chutes connecting the upper end of the exterior conveyer with the upper end of the central screen, and radial partitions between the outside screens, extending outward from the periphery of the central conveyer near to, but stopping short of, the exterior conveyer, substantially as described.

4. The combination, with a revoluble shaft, of separating-cylinders, mounted thereon, a mouth-piece in communication with said separating-cylinders, and a sectional receiving-screen removably mounted in said mouth-piece, substantially as described.

5. The combination, with a revoluble shaft, of separating-cylinders mounted thereon, a mouth-piece in communication with said cylinders, screen-section seats in said mouth-piece, and a sectional receiving-screen having its separate sections removably mounted in said seats, substantially as described.

6. The combination, with a revoluble shaft, of separating-cylinders mounted thereon, a mouth-piece in communication with said cylinders a receiving-screen in said mouth-piece, and a blast-fan between said receiving-screen and separating-cylinders, adapted to blow the chaff and light material out at the head of the machine, substantially as described.

7. The combination, with a revoluble shaft, of separating-cylinders mounted thereon, a mouth-piece in communication with said cylinders, a receiving-screen in said mouth-piece, an adjustable fan-case in said mouth-piece, and a blast-fan in said case, substantially as described, whereby the blast may be made to pass under, over, or clear of said receiving-screen at will.

8. The combination, with a revoluble shaft, of separating-cylinders mounted thereon, a mouth-piece in communication with said cylinders, a receiving-screen in said mouth-piece, a cylindrical fan-case in said mouth-piece between the receiving-screen and the separating-cylinders, having a blast-outlet near its periphery approximately in line with its axis, a blast-fan therein having straight radial blades, and spiral peripheral blades connecting the inner and outer corners of adjacent radial blades, substantially as described.

9. The combination, with a revoluble shaft, of separating-cylinders mounted thereon, a mouth-piece in communication with said cylinders, a receiving-screen in said mouth-piece, a partially-revoluble fan-case in said mouth-piece b*y* *k* of the receiving-screen, having a blast-outlet near its periphery approximately in line with its axis, and a blast-fan in said case having straight radial blades and spiral peripheral blades connecting the inner and outer corners of adjacent radial blades, substantially as described.

10. The combination, with a revoluble shaft, of separating-cylinders mounted thereon, a mouth-piece in communication with said cylinders, a receiving-screen in said mouth-piece, a partially-revoluble fan-case with blast-fan in said mouth-piece, having a toothed section attached thereto, and a hand-shaft mounted on main frame, having a pinion at one end adapted to engage with said ratchet for adjusting said case, substantially as described.

11. The combination, with a revoluble shaft, of multiple separating-cylinders rigidly mounted thereon, a mouth-piece surrounding the upper end of said shaft in communication with said cylinders, a blast-fan loosely mounted on said shaft within said mouth-piece and provided with a driving-pulley, a counter-shaft on the main frame provided with a large and a small pulley, an inclosing shell or case surrounding said multiple cylinders, a belt from said case to said small pulley, and a belt from said large pulley to said fan-driving pulley, substantially as described.

12. The combination, with a revoluble shaft, of a central separating-cylinder mounted thereon, multiple separating-cylinders grouped about said central cylinder, but entirely outside thereof and outside of each other, a conveyer for conducting the screenings from the interior cylinder to the head of the central cylinder, and a separate outlet for the discharge from said central cylinder, substantially as described.

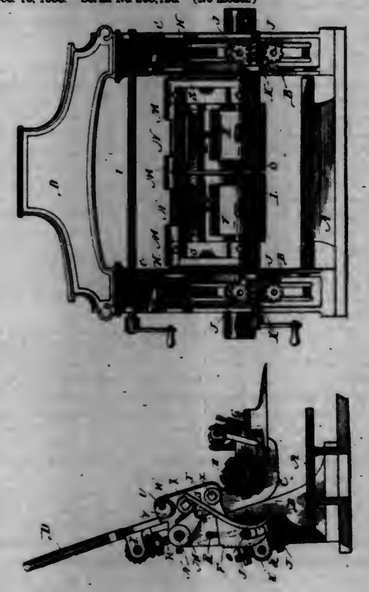
13. The combination, with the revoluble shaft, of the central screen, the multiple screens grouped about the central screen, each outside of every other, the lower end drum-head adapted to fit over the group of screens, the inwardly-projecting flange thereon and separate outlet-chute therefrom, and the outwardly-projecting flange on the end of the central screen, adapted to telescope therewith, substantially as described.

14. The combination, with the revoluble shaft, of the central screen, the exterior multiple screens, each outside of every other, the exterior conveyer-case, the radial inlet-chutes therefrom to the head of the central screen, and the deflector on the inside of said central screen for preventing the discharge from said radial chutes interfering with each other, substantially as described.

15. The combination, with the revoluble shaft, of the central screen having an imperforate upper section, the outside multiple screens, each outside of every other, the exterior conveyer-case, and the inlet-chutes from the head of said conveyer-case to the head of the imperforate section of the central screen for avoiding impact and securing better distribution of the central screen, substantially as described.

16. The combination, with a revoluble shaft, of a series of separating-cylinders supported thereby and a conveyer-case provided with spiral corrugations surrounding said series of cylinders, substantially as set forth.

17. The combination, with a revoluble shaft, of a separating-cylinder mounted thereon, multiple small-diameter separating-cylinders grouped about the central cylinder outside thereof and outside each other, and a conveyer-case inclosing the whole group of cylinders and in communication with the central cylinder, substantially as and for the purpose described.



413,162. FLUID CAN AND PUMP. FRANK S. BELCHER, Charlotte, Mich. Filed May 15, 1889. Serial No. 310,806. (Model.)

Claim.—1. In a liquid-pump, the combination, with the can or tank having a central filling and vent opening, of the plunger having its handled or outer end provided with a plug entering or closing said opening, substantially as set forth.

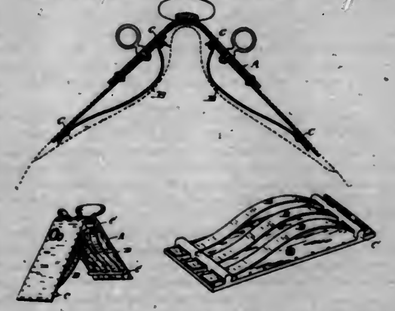
2. The liquid-pump having the discharge-pipe adapted to enter at its discharge or outlet end, a pocket or well in the can cover or top, and the plunger having its outer or handled end provided with a plug entering or filling an opening in the can or tank, substantially as set forth.

413,163. PLANING-MACHINE. EDWIN BENJAMIN, South Evanston, Ill., assignor to the Benjamin Machine Company, of Illinois. Filed Dec. 10, 1888. Serial No. 293,128. (No model.)

Claim.—1. The combination, with the cylinder of a planing-machine, of a pivoted link downwardly inclined toward the cylinder, a chip-breaker suspended from the end of said link nearest the cylinder and having a slot in its lower portion, as described, and a guide-rod through said slot, whereby the lower edge of the chip-breaker will move in a circular path concentric with the cylinder, substantially as described.

2. The combination, with the cylinder of a planing-machine, of a pivoted link downwardly inclined toward the cylinder, a chip-breaker suspended from the end of said link nearest the cylinder and having a slot in its lower portion, as described, a guide-rod through said slot, and a set-screw passing through the chip-breaker and abutting against said guide-rod, substantially as described.

3. The combination, with the housing and cylinder of a planing-machine, of side pieces horizontally adjustable thereon for supporting the chip-breaker or the pressure-bar, a shaft, and eccentrics on said shaft by which the side pieces may be simultaneously adjusted, as and for the purpose set forth.

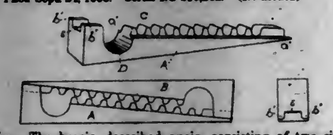


413,164. END-GATE. WILLIAM C. BLEE, Manilla, Iowa. Filed Aug. 10, 1889. Serial No. 320,280. (No model.)

Claim.—1. The combination, with the end-gate and the body, of the hinged bars pivoted to the end-gate and the wagon, the locking-lever, and the rod swiveled to the locking-lever and adapted to engage the body, substantially as described.

2. The combination, with the end-gate and the body, of the hinged bars pivoted to the end-gate and the wagon, the nut having an eye, the locking-lever pivoted to the end-gate, and the rod swiveled to said lever and having its free end hooked and adapted to engage the eye of the nut, substantially as described.

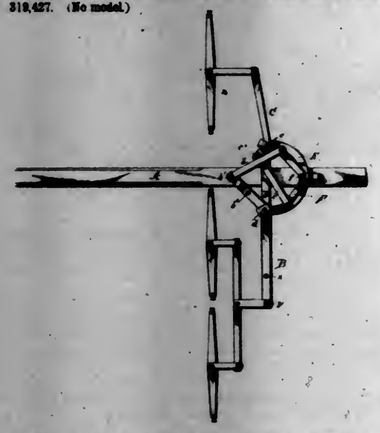
413,165. HARNESS-SADDLE. JOHN D. BRAHM, Detroit, Mich. Filed Apr. 25, 1888. Serial No. 308,542. (No model.)



Claim.—1. The combination, with a saddle, of a plurality of springs arranged side by side, each spring having one of its ends pointing toward the center of the saddle and fixedly connected with said saddle, and the other loosely engaged with a loop connected with the saddle so as to be free to expand toward the end of said saddle, substantially as described.

2. In a pad for harness-saddles, the combination, with a foundation-plate, of a plurality of curved metal leaf-springs B, secured thereto with their ends extending in opposite directions, free to expand each independent of the other in the longitudinal direction of the pad by means of loops C, into which the springs are engaged loosely at one end and rigidly secured at the other end, substantially as described.

3. As an improved article of manufacture, a skeleton harness-saddle pad, consisting of a metallic saddle-tree section provided at its under side with two rows of loops C at the ends of the pad, and of a plurality of metallic leaf-springs curved in the form of the pad and



secured to these loops, with their ends extending in opposite directions, free to expand at one end, each independent of the other, substantially as described.

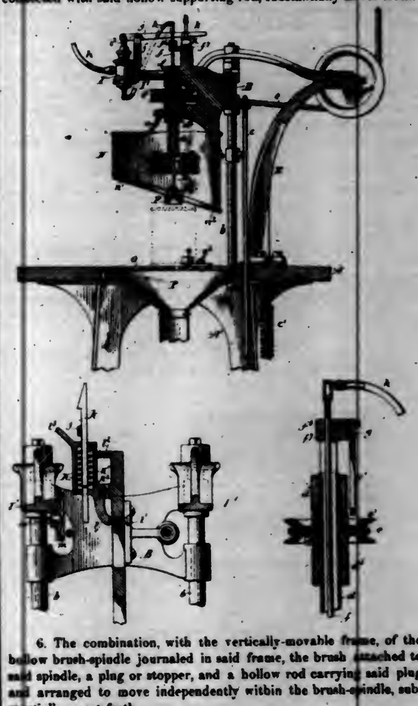
413,166. PRINTER'S QUOIN. ABRAHAM T. H. BROWER, Chicago, Ill. Filed Sept. 24, 1888. Serial No. 286,202. (No model.)

Claim.—The herein-described quoin, consisting of two similar reversible wedges A and B, each having a single rack-bar C centrally along its inner face, with continuous marginal bearings *a a'* on either side of the same, projecting guide-bearings *b b'* at its thick end, upon which said marginal bearings slide, and notch D at said thick end, forming a socket for the key, substantially as shown and described.

413,167. DRAFT-EQUALIZER. ALFRED G. BROWN, La Crosse, Wis., assignor of one-half to Erwin G. Boynton. Filed Aug. 1, 1889. Serial No. 319,427. (No model.)

Claim.—In a draft-equalizer, independent draft-levers pivoted at equal distances from the center line of the vehicle-pole, in combination with a cross-arm pivoted on said pole, the inner ends of the draft-levers being attached to the opposite ends of the cross-arm by means of suitable connecting-bars, substantially as and for the purpose described.

413,168. MACHINE FOR WIPING CANS. CHARLES A. BURT, Rochester, N. Y. Filed Oct. 16, 1888. Serial No. 288,262. (No model.)



Claim.—1. The combination, with a stationary support upon which the cans are placed, of a vertically-movable frame arranged above said support, and a revolving brush and a plug mounted in said frame and moving therewith toward and from the can-support, substantially as set forth.

2. The combination, with a stationary support upon which the cans are placed, of a vertically-movable frame arranged above said support, a revolving brush and plug mounted in said frame and moving therewith toward and from the can-support, a water-supply pipe and valve, and a trip mechanism mounted on said movable frame, whereby said valve is opened and closed, substantially as set forth.

3. The combination, with the stationary can-support and the vertically-movable frame, of the hollow brush-spindle journaled in said frame, the brush attached to said spindle, a plug or stopper, and a rod carrying said plug or stopper and arranged within the bore of the brush-spindle, substantially as set forth.

4. The combination, with the hollow brush or wiper spindle and the brush attached thereto, of a plug or stopper closing the opening in the can, a hollow supporting-rod arranged within the hollow brush-spindle, carrying said plug and provided with water-escape openings, and a water-pipe connected with said hollow supporting-rod, substantially as set forth.

5. The combination, with the hollow brush-spindle and the brush attached thereto, of a plug or stopper closing the opening in the cans, a hollow plug-supporting rod arranged within the hollow brush-spindle, and provided with water-escape openings above said plug, a deflector arranged above said escape-openings, and a water-supply pipe connected with said hollow supporting-rod, substantially as set forth.

6. The combination, with the vertically-movable frame, of the hollow brush-spindle journaled in said frame, the brush attached to said spindle, a plug or stopper, and a hollow rod carrying said plug and arranged to move independently within the brush-spindle, substantially as set forth.

7. The combination, with the vertically-movable frame and the hollow brush-spindle journaled in said frame, of a plug or stopper, a hollow rod carrying said plug and arranged within the brush-spindle, a water-supply pipe connected with said hollow rod, and a cut-off valve arranged in said supply-pipe and operated by the vertically-movable frame, substantially as set forth.

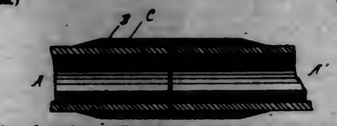
8. The combination, with the vertically-movable frame and the hollow brush-spindle journaled in said frame, of a plug or stopper, a hollow rod carrying said plug and arranged within the brush-spindle, a water-supply pipe connected with said hollow rod, a cut-off valve arranged in said supply-pipe and provided with an actuating-lever, and a trip mechanism attached to said movable frame, whereby said actuating-lever is operated and released, substantially as set forth.

9. The combination, with the vertically-movable frame and the hollow brush-spindle journaled in said frame, of a plug or stopper, a hollow rod carrying said plug and arranged within the brush-spindle, a water-supply pipe connected with said hollow rod, a cut-off valve arranged in said supply-pipe and provided with an actuating-lever, and a movable pawl-frame attached to said vertically-movable frame and provided with a pawl engaging with said actuating-lever and with a trip-cam which engages against a stationary part of the machine, substantially as set forth.

10. The combination, with the supply-pipe A and the cut-off valve I, provided with an actuating-lever, of the movable brush-frame B, the yielding pawl-frame K, pivoted to said movable frame and provided with a pawl *k* and a tripping-cam *P*, and an adjustable stop against which said tripping-cam engages, substantially as set forth.

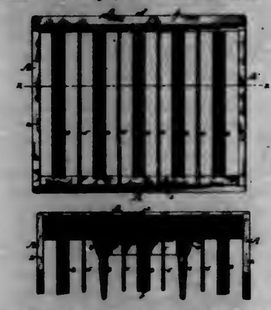
11. The combination, with the fixed stop and the vertically-movable brush-frame, the water-supply valve, and its lever, of the movable pawl-frame attached to the movable brush-frame, a pawl made vertically movable in the pawl-frame, and a spring interposed between the pawl and its frame, substantially as set forth.

12. The combination, with the vertically-movable brush-frame, the revolving brush and the plug mounted in said frame, and a water-supply pipe, of a table provided with an opening underneath the brush-frame, a grate arranged in said opening for supporting the cans, and a sink arranged below said grate, substantially as set forth.



413,169. HYDROCARBON GENERATOR AND BURNER. LEWIS R. CALDER, Terre Haute, Ind. Filed Mar. 6, 1889. Serial No. 302,064. (No model.)

Claim.—1. In a hydrocarbon-burner, the vertically-extended mixing-chamber B, provided at its lower end with air-ports *c*, the combination, with the superheating-chamber C, provided with the vertical extension E, located wholly within the mixing-chamber and having a jet *e* located within the field of the air-ports *c*, of the mixing-chamber, whereby the commingled vapor and air are caused to ascend through a heated space before ignition, substantially as and for the purpose hereinbefore set forth.

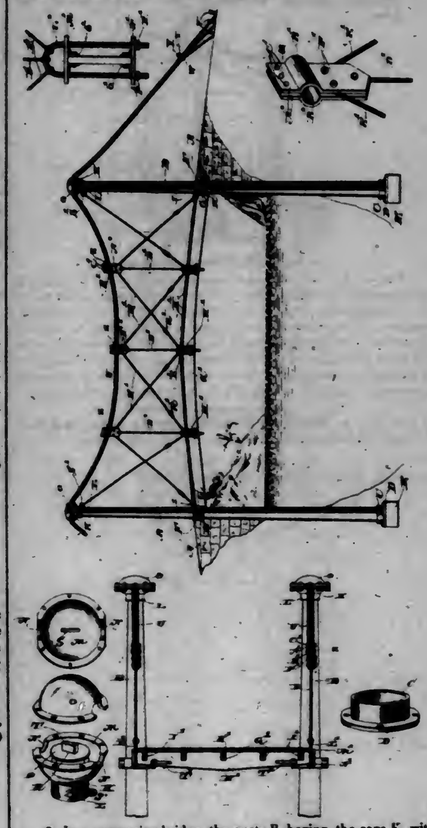


2. In a hydrocarbon generator and burner, the combination, with the vertically-extended mixing-chamber provided at its lower end with air-ports, of valves for controlling the admission of air to said chamber, the superheating-chamber provided with the hollow extension located wholly within and being entirely inclosed by the mixing-chamber and having a jet at its lower end, and the supply-pipe entering the side of the superheating-chamber and brought around adjacent to the flame-orifices of the mixing-chamber, substantially as described.

413,170. COUPLING FOR STONEWARE PIPES. HORACE B. CAMP, Cuyahoga Falls, Ohio. Filed May 27, 1889. Serial No. 312,351. (No model.)

Claim.—In a pipe-coupling, the combination of a strip of fabric saturated with asphaltum and wrapped about the adjacent ends of the pipe-sections with a strip of like material saturated with a solution of water-lime cement wrapped about the inner strip and extending beyond it and uniting with the pipe in each direction, substantially as shown and described, and for the purpose specified.

413,171. RIBBON OR NOTION TRAY. WILLIAM H. CARRIGO, Manistee, Mich. Filed July 6, 1889. Serial No. 316,663. (No model.)



Claim.—1. The ribbon-tray herein described, composed of the frame A, having concave bottom pieces arranged at intervals across the bottom and narrow top partition-strips arranged parallel with and between the bottom pieces, legs hinged to one side of the frame, and a spring-catch to hold the legs when in upright position, substantially as described.

2. The ribbon-tray herein described, composed of the frame A, having bottom pieces arranged at intervals across the bottom, and partition-pieces arranged parallel with and between the bottom pieces, and supporting-legs on one side of the frame, substantially as described.

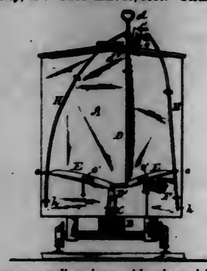
413,172. SUSPENSION-BRIDGE. GEORGE H. GLUYER, Bloomingsburg, Ind. Filed Mar. 22, 1889. Serial No. 304,245. (No model.)

Claim.—1. In a suspension-bridge, the posts having the caps with concavities M, in combination with the cables strung through the caps, the cam-blocks around which the cables are wound, and the removable keys inserted in openings in said blocks and in said caps, for the purpose set forth, substantially as described.

2. In a suspension-bridge, the posts B, having the caps K, with flanges having openings N, and the caps O, bolted on the caps K and having the flanges provided with the openings registering with openings N, whereby the cables are adapted to pass through the said openings, substantially as described.

3. The supporting-saddles for the girder of a bridge, these saddles comprising the inverted-U-shaped bars L', having opposite arms, through which the girders are passed, and the upper and lower plates notched to receive the arms, adapted to embrace the girders, and nuts threaded on the ends of the arms, and the vertically-opposite pairs of lugs O', bolted to the inner surface of the plates and to the girders at opposite sides, substantially as specified.

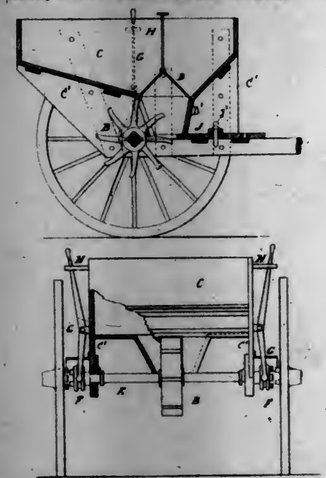
4. The combination, in a suspension-bridge, of the cables, the clamps Z, attached thereto, the stringers, the girders connecting the same, the saddles at the ends of the girders, the supporting-rods D', having their upper ends attached to the clamps and their lower ends attached to the saddles, and the truss-rods E', crossed midway between the supporting-rods, and also having their upper and lower ends attached to the clamps and saddles, substantially as described.



5. In a suspension-bridge, the cables strung over the posts and having their ends untwisted, the separate strands of the cables being attached to independent anchor posts or devices, substantially as described.

6. In a suspension-bridge, a post provided with a cable-receiving rotatable drum, in combination with a key for locking the drum against rotation, substantially as specified.

7. In a suspension-bridge, opposite pairs of posts, each provided with rotatable cams locked in position thereon, in combination with cables wound intermediate their ends around the blocks, and anchors

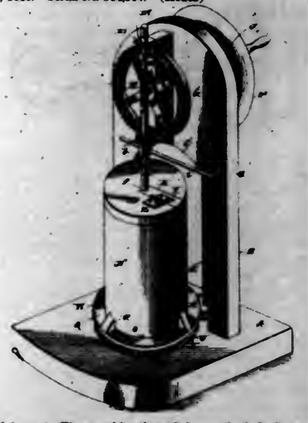


arranged in rear of the posts and connected with the ends of the cables, substantially as specified.

413,173. CAR-COUPLING. ANTHONY COBLE and JAMES H. MOORE, Montgomery City, Mo. Filed Mar. 13, 1889. Serial No. 303,113. (No model.)

Claim.—In a car-coupling, in combination with the vertical rod D, supporting the coupling-pin C, and having the handle *d* and shoulder *d'* and laterally-extending hand-levers E *e* E *e*, pivotally connected to said rod D, the slotted bolt G, hinged at the top of the car, rods H H, secured upon opposite sides of the bolt G and extending down to the lower outer edge of the car, as shown, and hinged or folding stop F, adapted to close against the car when not in use, or be extended outward to engage above or below the hand-levers E, as described.

413,174. MANURE-DISTRIBUTER. RUFUS A. CORNELL, Whigham, Ga. Filed May 17, 1889. Serial No. 311,180. (No model.)



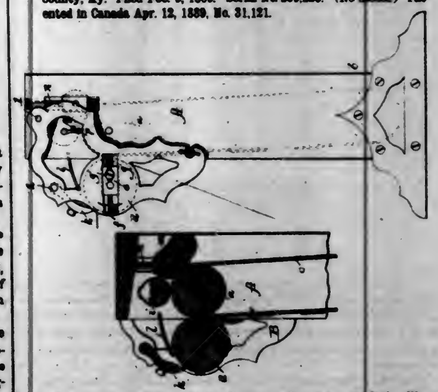
Claim.—1. The combination, substantially as hereinbefore set forth, of the hopper having an opening at the bottom, the axle below the opening in the hopper, the supporting-wheels, the toothed distributing-wheel below the hopper, but extending into the opening in the hopper, and the vertically-removable cover D.

2. The combination, substantially as hereinbefore set forth, of the hopper having an opening in the bottom with the vertically-removable cover D, having inclined sides, for the purpose specified, the wheel B, having flat forwardly-projecting teeth extending into the opening of the hopper, and the axle on which the wheel is carried, and on each end of which is a supporting-wheel.

3. The combination, substantially as hereinbefore set forth, of the hopper having oppositely-inclined bottom pieces, the vertically-removable cover having inclined sides, the toothed wheel below the opening in the hopper, the axle to which it is secured, the supporting-wheels loosely mounted on the ends of the axle, and clutch mechanism for rigidly securing the supporting-wheels to the axle.

4. The combination, substantially as hereinbefore set forth, of the hopper having oppositely-inclined bottom pieces, the vertically-removable cover for the opening in the bottom of the hopper, the front piece D', the horizontally-moving slide J below the front piece, the supporting wheels, the axle, and the toothed wheel secured to the axle and projecting into the opening in the hopper in rear of the front piece D'.

413,175. CHURN. WILLIAM H. CRAWFORD, Paris, Tex. Filed Mar. 23, 1889. Serial No. 304,397. (Model.)

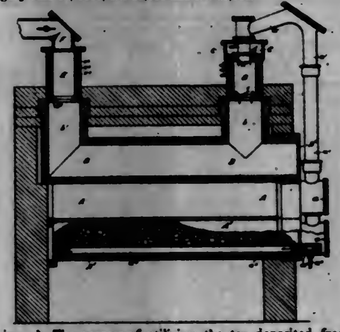


Claim.—1. The combination of the vertical shaft, mechanism for rotating said shaft, the rotary base provided on its edge with gear-teeth, and a rib or flange above said gear-teeth, having a portion cut away, and the pinion mounted on the lower end of the vertical shaft engaging the gear-teeth on the rotary base and adapted to pass through the space in the rib or flange, as set forth.

2. The combination, with the standard, of the bracket L, having key-hole slots in its ends, the dasher-rod having recesses in its sides, and cylindrical above said recesses, whereby the recesses are adapted to enter the key-hole slots, and the dasher-rod depressed until the cylindrical portions bear against the key-hole slots, and suitable mechanism supported by the standard for rotating the dasher, as and for the purpose set forth.

3. The combination of the standard, the rotary base having gear-teeth on its edge, the churn-body removably secured on said base, the driving-shaft mounted in the upper end of the standard, the dasher-rod, gearing between the driving-shaft and the dasher-rod, the vertical shaft provided at its lower end with a pinion engaging the gear-teeth on the edge of the rotary base, and gearing between said shaft and the driving-shaft, as set forth.

413,176. PRINTING APPARATUS. CHARLES H. DRAKE, Woodford County, Ky. Filed Feb. 9, 1889. Serial No. 299,229. (No model.) Patented in Canada Apr. 12, 1889, No. 31,121.



Claim.—1. A printing device for wrapping-paper and the like, consisting of an endless band having upon its surface the characters, suitable supporting-rollers, a pivoted frame, an impression-roller carried by said frame, and a retaining device for holding said frame in its operative position, substantially as described.

2. In a printing apparatus, an inking device consisting of a feed-roller and an inking-cylinder having a perforated swell portion on one side and a handle connected to said cylinder for turning the same until the perforated swell portion comes in contact with the distributing-roller, substantially as described.

3. In a printing apparatus, the rollers *a d*, between which the paper is passed to be printed, a pivoted knife supported above the roller *d*, and an arm or arms supported so as to extend between the roller *d* and the knife, thus preventing upward movement of the paper when the knife is lifted, substantially as described.

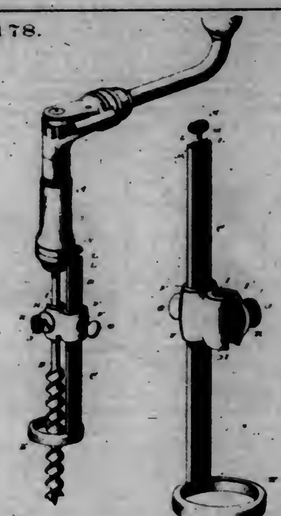
4. A printing apparatus consisting of a suitable frame, rollers *a b*, carrying an endless printing-belt, inking devices for said belt, a pivoted frame, an impression-roller carried by said frame, and a pivoted knife above said impression-roller, also carried by the pivoted frame, substantially as described.

413,177. PROCESS OF MANUFACTURING GAS. JOHN H. R. DICKSON, Liverpool, County of Lancaster, England. Filed July 18, 1888. Serial No. 280,208. (No model.) Patented in France July 17, 1888, No. 191,851; in Belgium July 18, 1888, No. 82,605; in Spain Oct. 2, 1888, No. 8,519; in Canada Nov. 16, 1888, No. 30,201, and in Austria-Hungary Jan. 13, 1889, No. 29,633 and No. 49,962.

Claim.—1. The process of utilizing the tar deposited from the gases produced from coal or analogous substances, consisting in artificially cooling said gas and thereby condensing both the lighter and heavier liquids carried therewith, collecting the liquids thus condensed, separating the tar from the lighter liquids of condensation, reheating and fixing said gas, and revaporizing said tar in the presence of said gas while it is being fixed, and subsequently cooling said combined gases.

2. The process of utilizing the tar deposited from the gases produced from coal or analogous substances, consisting in mixing said gas with water-gas or other diluent gas, artificially cooling said combined gases and thereby condensing both the lighter and heavier liquids carried therewith, collecting the liquids thus condensed, separating the tar from the lighter liquids of condensation, reheating and fixing said combined gases, and revaporizing said tar in the presence of said gases while being fixed, and subsequently cooling said combined gases.

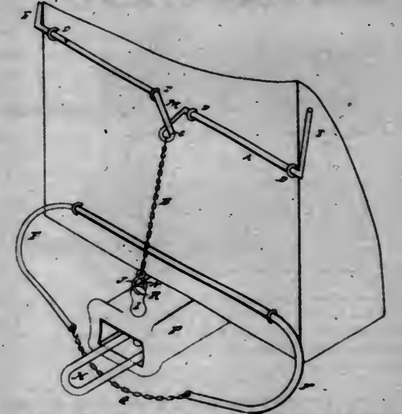
3. The process of utilizing the tar deposited from the gases produced from coal or analogous substances, consisting in cooling said gas, collecting the tar thus condensed, reheating and fixing the said gases, and revaporizing said tar in the presence of said gas while being fixed by subjecting it while chilled suddenly to the action of a cherry-red heat without its coming in contact with surfaces below said heat.



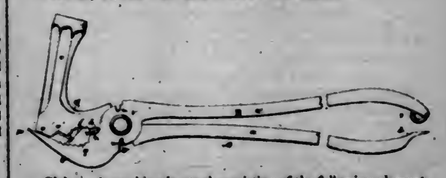
4. The process of utilizing the tar deposited from the gases produced from coal or analogous substances, consisting in condensing and separating from said gas the tar carried thereby, reheating and fixing said gas, revaporizing said tar in the presence of the gas while being fixed by subjecting it while chilled to the action of a cherry-red heat without its coming in contact with surfaces below said heat, and subsequently passing said tar-gas through a heated retort to fix it.

413,178. COMBINED SCRATCH AND BIT GAGE. ELMER E. DOE, Mount Tom, Mass. Filed Mar. 9, 1889. Serial No. 302,649. (No model.)

Claim.—The combination, with the bit and the strip C, formed with recess L at one end, ring E at the other end, and provided with the scale, as shown, of the casting F, adjustable on said strip and adapted to hold said strip to the bit and the piece L' at one end of said strip and formed with sharpened edges, and the set-screw N, passed



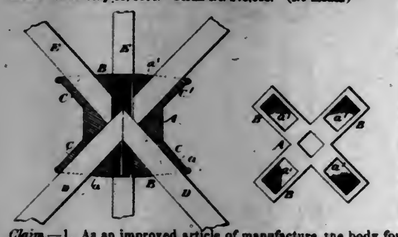
413,178.



through said piece L' into the strip C, substantially as and for the purpose specified.

413,179. CAR-COUPLING. JOHN H. RAKER, Detroit, Mich. Filed Oct. 29, 1888. Serial No. 289,664. (No model.)

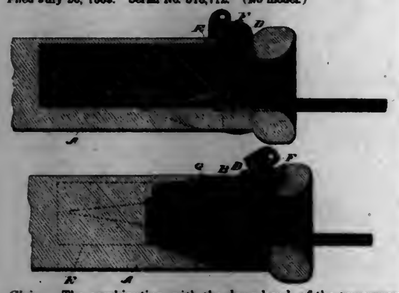
Claim.—The rod A, provided with handles E E at its ends supported in bearings horizontally across the end of a car, said rod being bent to form at its center the loop M, and the loop C at the part of the loop M which is farthest from said rod, substantially as shown and described.



413,180. COMBINATION-TOOL. ELISHA D. ELY, Canton, Ohio. Filed May 13, 1889. Serial No. 310,547. (No model.)

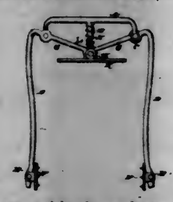
Claim.—A combination-tool consisting of the following elements, namely: the members A and B, pivoted together, the member A, provided with a handle *a*, terminating at one end in a screw-driver *b*, and provided at its opposite end with recesses of different diameters, the

walls of each provided with teeth, a hammer portion *e*, and a hammer-pole *c*, the other member provided with a curved recess provided with teeth and with a tack-claw, the two members provided with opposite notches to produce wire-cutters *m m* and *n*, substantially as set forth.



413,181. SUPPORT FOR WASH-TUBS. ORRIN GERSLEY, Owatonna, Minn. Filed May 11, 1888. Serial No. 273,605. (No model.)

Claim.—1. As an improved article of manufacture, the body for a tub-support herein shown and described, consisting of a metal casting formed with the upper and lower ribs extending diametrically oppositely from the center and formed with the inclined openings extending through from the upper to the opposite lower rib and through the same, substantially as shown and described.

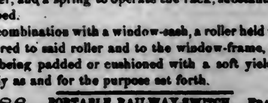


2. The combination of the casting A, formed with the upper and lower ribs extending diametrically in opposite directions from the center, and said ribs formed with the inclined openings extending through the casting from one upper rib to the opposite lower rib, the inclined legs in the openings in the lower ribs, with their ends abutting within the casting, and the tub-supports E, with their lower ends in the openings in the upper ribs, with their ends abutting against the upper ends of the legs, substantially as shown and described.

413,182. CAR-COUPLING. CLERMONT C. HODGES, Gonzales, Tex. Filed July 26, 1889. Serial No. 318,712. (No model.)

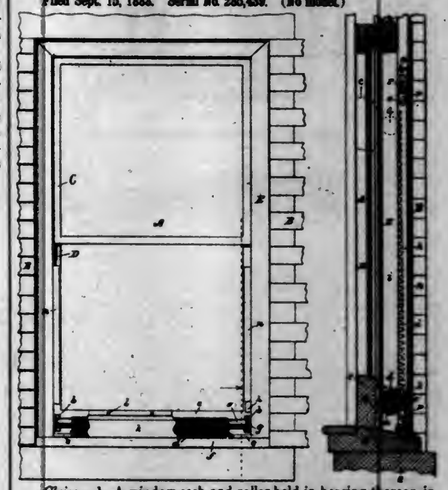
Claim.—The combination, with the draw-head, of the transverse pivot-pin in the top of the draw-head, the coupling-pin provided with a longitudinal slot engaging said pivot-pin, and the weights mounted on said pivot-pin and adapted to bear on the end of the link, as set forth.

413,183. FIRE-TONGS. CHARLES E. HOUSE, Canton, Ohio. Filed Mar. 18, 1889. Serial No. 303,751. (No model.)



Claim.—1. As a new article of manufacture, a fire-tong consisting, essentially, of the frame A, legs, as D, pivotally secured thereto, arms G, projecting inwardly from said legs and loosely secured together at their end portions, and a spring interjacent said arms and frame, substantially as described, and for the purpose set forth.

2. The combination, in fire-tongs, of the U-shaped frame-piece A, having a tubular portion B, a spring N about said portion, legs D, pivotally secured to said frame, having inwardly-projected arms G, a hand-piece J, having a horizontal portion K, and stem portion L, adapted to enter said tubular portions, pivotally secured to the end portion of said arms, substantially as described, and for the purpose set forth.



3. The combination, in fire-tongs, of the frame A, legs D, arms G, hand-piece J, spring N, and plates F, pivotally secured to the foot portion of said legs, substantially as described, and for the purpose set forth.

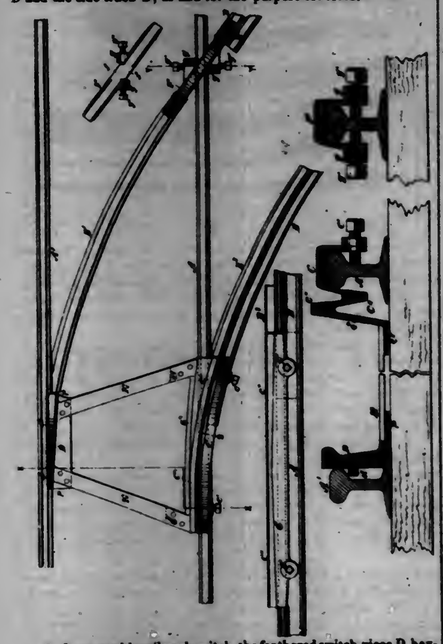
413,184. HOLDBACK FOR VEHICLES. GEORGE L. HYDORN, Lacona, N. Y. Filed June 6, 1888. Serial No. 313,273. (No model.)

Claim.—A holdback constructed from a single piece of wire bent to form a point 1, thence curved outwardly, thence bent to form a shoulder 3, thence extending back, and a cross-bar across the arms adjacent to the shoulder secured by a screw, and a screw through the eye upon the rear end of the arms, in combination, as set forth.

413,185. WINDOW-SCREEN. GABRIEL A. JACOBS, Red Creek, N. Y. Filed Sept. 15, 1888. Serial No. 285,439. (No model.)

Claim.—1. A window-sash and roller held in bearing thereon, in combination with a screen secured to said roller and to the window-frame, a pinion on the roller and a rack to engage the pinion secured to the frame, a housing for the roller secured to the sash, and angular side strips *n*, secured to the frame parallel with the sash, substantially as shown and described.

2. In combination with a window-sash, a roller held in bearings thereon, a screen for the window attached to said roller and secured to the window-frame, and a rack and pinion for turning the roller as the sash is moved, said rack being provided with means whereby it may move endwise upon its bearings, substantially as and for the purpose set forth.

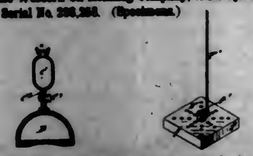


3. A window-sash, in combination with a roller held thereby, a screen having one edge attached to said roller, and the opposite edge secured to the window-frame, a yielding rack and a pinion for turning the roller, and a spring to operate the rack, substantially as shown and described.

4. In combination with a window-sash, a roller held thereon, and a screen secured to said roller and to the window-frame, the surface of said roller being padded or cushioned with a soft yielding material, substantially as and for the purpose set forth.

413,186. PORTABLE RAILWAY-SWITCH. FRANK G. JOHNSON, New York, N. Y. Filed Dec. 19, 1888. Serial No. 294,057. (No model.)

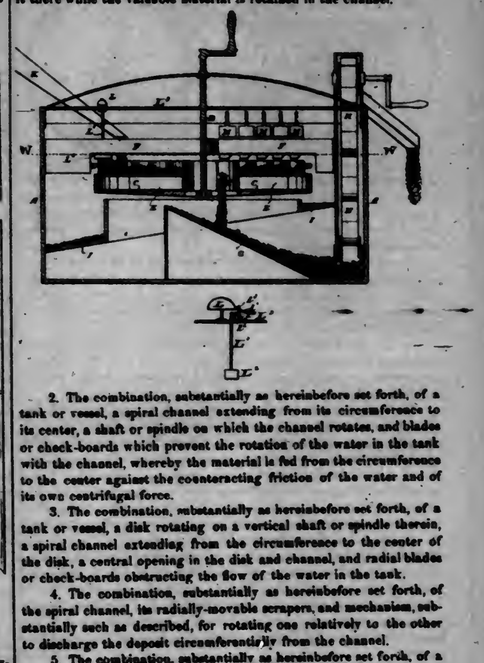
Claim.—1. In a portable railroad-switch, the gutter-shaped bridge-rail F, having the legs *g g*, set-bolts *g' g'*, and vertical sides diagonally cut away at *f f* to straddle the main track, in combination with the ends of the broken side-track rail B' B', main-track rail A, bridge switch-piece C, guard-rail *c' c'*, guard-rail B', and feathered switch-piece D, the top of the said bridge-rail resting on the head of the said main rail, and being laterally, vertically, and longitudinally held in place, substantially as described.



2. In a portable railroad-switch, the peculiarly-formed curved gutter-like bridge switch-piece C, having the guard-rail *c' c'* in line with the guard-rail B', in combination with the main-track rail A and side-track rail B, whereby the said piece C, besides furnishing a bridge from the main-track rail A to the side-track rail B, also furnishes a guard-rail *c' c'* to keep the car-wheels free from and from jumping the curve of the opposite rail formed by the feathered switch-piece D and the side-track B', as and for the purpose set forth.

3. In a portable railroad-switch, the feathered switch-piece D, having the projection *d* to extend under the head of the main-track rail A, in combination with the switch bridge-piece C, having the guard-rail *c' c'*, connecting-bars E E, main-track rail A' and side-track rail B', whereby, when the the portable switch is laid for use, the said feathered switch-piece cannot be lifted or otherwise misplaced until the said bridge-piece C is raised from the rails A and B, as and for the purposes described.

4. In a portable railroad-switch, the peculiarly-formed curved gutter-like switch-piece C, having the guard-rail *c' c'* in line with the guard-rail B', the lugs and set-bolts *c' c'*, in combination with the feathered switch-piece D, having the projection *d*, connecting-bars E E, main-track rail A and side-track rail B, whereby both of the said switch-pieces C, with the guard-rail *c' c'* and the said feathered switch-piece, are securely fastened to the main-track rail A' on the one side and to the main-track rail A and side-track rail B on the other by the two set-screws *c' c'*, as and for the purpose set forth.



413,187. PROCESS OF FREEING MALODOROUS HYDROCARBONS FROM OFFENSIVE ODOR. EDWARD D. KENDALL, Brooklyn, N. Y., assignor to the Western Oil Refining Company, of New York. Filed Dec. 11, 1888. Serial No. 293,293. (Specimens.)

Claim.—The process of freeing malodorous hydrocarbons from offensive odor, which consists in subjecting the same to the action of chlorids of sulphur, substantially as described.

413,188. APPARATUS FOR SORTING MINERALS. GEORGE ELLIOTT, Westminster, England. Filed Feb. 7, 1889. Serial No. 299,092. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a tank or vessel, a spiral channel extending from its circumference to its center, blades or check-boards overlying the channel, and mechanism, substantially such as described, for traversing the blades and water in the tank relatively to each other, to feed the refuse material from the circumference to the center of the channel and discharge it there while the valuable material is retained in the channel.

2. The combination, substantially as hereinbefore set forth, of a tank or vessel, a spiral channel extending from its circumference to its center, a shaft or spindle on which the channel rotates, and blades or check-boards which prevent the rotation of the water in the tank with the channel, whereby the material is fed from the circumference to the center against the counteracting friction of the water and of its own centrifugal force.

3. The combination, substantially as hereinbefore set forth, of a tank or vessel, a disk rotating on a vertical shaft or spindle therein, a spiral channel extending from the circumference to the center of the disk, a central opening in the disk and channel, and radial blades or check-boards obstructing the flow of the water in the tank.

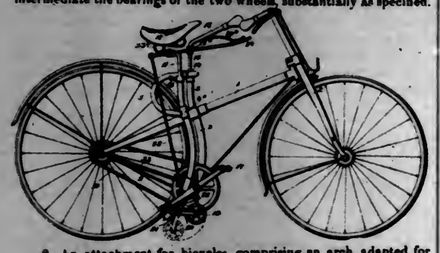
4. The combination, substantially as hereinbefore set forth, of the spiral channel, its radially-movable scrapers, and mechanism, substantially such as described, for rotating one relatively to the other to discharge the deposit circumferentially from the channel.

5. The combination, substantially as hereinbefore set forth, of a tank or vessel, a disk rotating on a vertical shaft or spindle therein, a spiral channel above the disk, and an air-chamber counterbalancing the weight of the disk and channel.

6. The combination, substantially as hereinbefore set forth, of a tank or vessel, a disk rotating therein, a spiral channel on the disk, an air-chamber or float counterbalancing the weight of the disk and channel, and blades or check-boards opposing the tendency of the water to rotate relatively to the disk.

7. The combination, substantially as hereinbefore set forth, of a rotating disk, its channel, and an alarm provided with a vertically-moving spindle having a plate or knob on its lower end, against which the material in the channel strikes when the channel is full and causes the alarm to be sounded.

8. The combination, substantially as hereinbefore set forth, of a tank or vessel, a spiral rotary channel therein, a circumferential feed-chute, a central tailings-discharge opening, and a circumferential discharge-chute through which the material escapes from the channel.



9. The combination, substantially as hereinbefore set forth, of a tank or vessel, a disk revolving on an axis therein, a spiral channel extending from the circumference to the center thereof, radially-movable scrapers, and a circumferential discharge-chute into which the material is discharged from the channel by the scrapers.

10. The hereinbefore-described sorting apparatus, consisting of the combination, substantially as hereinbefore set forth, of a tank or vessel, a disk revolving on a vertical axis therein, a spiral channel on the disk, having a central discharge-opening, a counterbalancing air-chamber, radial blades, radially-movable scrapers thereon, a circumferential feed-chute, a central tailings-discharge chute, and a circumferential discharge-chute for the material scraped from the channel.

413,189. ATTACHMENT FOR BICYCLES. JOHN A. KIRK, Washington, D. C., assignor of one-half to Josiah J. Bumbaugh, Chicago, Ill. Filed May 20, 1889. Serial No. 311,267. (No model.)

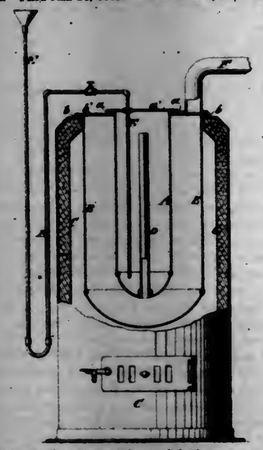
Claim.—1. An attachment for a two-wheeled machine, adapted to carry cranks and treadles, and means, substantially as described,

for connecting the attachment to a fixed part of the machine-frame intermediate the bearings of the two wheels, substantially as specified.

2. An attachment for bicycles, comprising an arch adapted for connection with the standard of a machine occurring between the bearings of the two wheels, and saddle-supporting standards, each of which is provided at one end with a box for a crank-shaft and treadle and at the other end with means for connection therewith of a saddle, substantially as specified.

3. An attachment for bicycles, consisting of an arch bent to embrace the saddle-standard of a machine, and having at the bent portion a clamp and saddle-screw, and carrying standards each of which is adapted to receive at one end a crank-shaft and treadles and at the other end a saddle, substantially as specified.

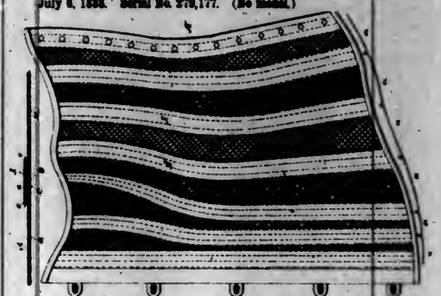
4. An attachment for bicycles, consisting of an arch having a clamp and terminating in standards having shaft and saddle receiving devices at opposite ends, and safety-wheels and means for raising and lowering the wheels, substantially as specified.



5. A saddle-standard provided with a clamp terminating in a flat plate, in combination with a saddle mounted on a plate adapted to fit the plate of the clamp, and bolts for adjustably securing the plates together, the whole combined and operating substantially as specified.

6. An attachment for bicycles, comprising a U-shaped frame adapted to be attached to the frame-work of a bicycle, and carrying crank-shafts and treadles, one crank of each pair being adapted for connection with the treadles of the machine, substantially as specified.

7. In an attachment for bicycles, the combination of treadle and saddle-standards 4, and connecting and supporting arch 5, adapted at its center 5× for connection with the seat-standard of a machine and provided with a clamp, substantially as specified.

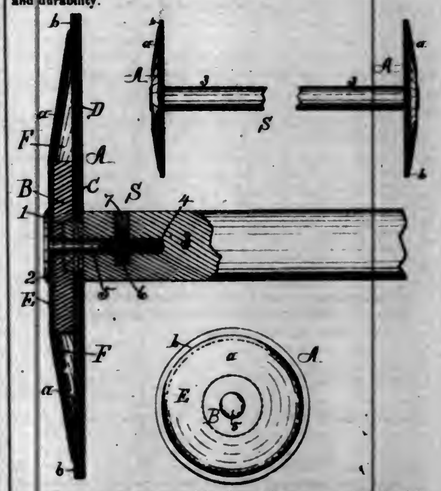


8. The combination of the standards 4, having the boxes 15, and adapted to support the rock-shaft 21, the machine-standard 3, the arch 5, the wheels 19, arms 20 22 23, and lever 24, substantially as specified.

413,190. APPARATUS FOR THE MANUFACTURE OF GAS. DAVID H. KRAFF, Norwich, N. Y., assignor of one-half to Reed Campbell, same place. Filed Jan. 21, 1889. Serial No. 297,097. (No model.)

Claim.—The combination of the upright inner vaporizing-retort, the outer upright decomposing-retort, and the furnace outside of the latter, the oil-pipe entering the inner retort, and an upright pipe connected with the inner retort at its lower end and opening into the outer retort and having its open upper end extending into the inner retort, and an outlet-pipe for gas communicating with the outer retort, substantially as specified.

413,191. CORSET. LEOPOLD KRAUS, Birmingham, Conn. Filed July 6, 1888. Serial No. 279,177. (No model.)



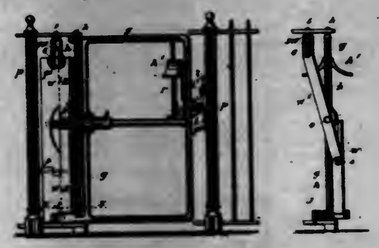
Claim.—1. The combination, in a corset, of the inner sections joined at their edges and an outer section upon each of the inner sections, the turned-down portions of the inner sections lying upon the same side of said sections as that on which the outer sections are placed, and lying between the adjacent edges of said outer sections, substantially as described.

2. The combination, in a corset, of the inner sections joined at their edges with the turned-down portion of each seam upon the outside, an outer section of facing material upon each inner section, the downturned portion of the inner sections lying between the adjacent edges of the outer sections, and overlying strips secured to the body of the corset upon the outside, substantially as described.

3. The combination, in a corset, of the inner sections *a*, joined at their edges with the turned-down portion *c* upon the outside, narrower sections of ornamental facing material *d* upon the outside of the inner sections, the edges of which are adjacent to the turned-down portions of the seams, and overlying boned strips I, overlapping the downturned portions of the seams and the edges of the outer sections and secured thereto and to the inner sections, substantially as described.

413,192. HEAD FOR JACK-SPOOLS. FREDERICK LATTLE, Syracuse, N. Y., assignor to Armstrong Maltbie, same place. Filed Feb. 6, 1889. Serial No. 298,837. (No model.)

Brief.—The object of the invention is to produce an improved head for jack-spools, &c., which shall combine lightness with strength and durability.



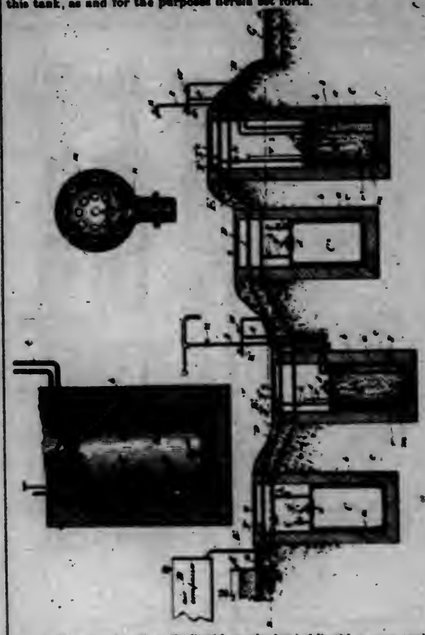
Claim.—1. As a new article of manufacture, a rawhide head for jack-spools, formed of two disks of rawhide held apart centrally by an interposed retaining-block, and secured together at their circumferential meeting edges, substantially as described.

2. As a new article of manufacture, an attachable head for jack-spools, consisting of two rawhide disks of desired contour, formed of one or more integral thicknesses of rawhide held out of central contact with each other by an axially-disposed retaining-block interposed between them, to whose opposite faces they are respectively secured, and secured together at their circumferential meeting edges, which extend some distance beyond the periphery of the retaining-block, substantially as described.

3. As a new article of manufacture, an attachable head for jack-spools, comprising two rawhide disks formed of one or more thicknesses of rawhide cemented together, a retaining-block interposed centrally of their circumference and to a face of which they are respectively cemented, and extending radially a sufficient distance beyond the periphery of the retaining-block to create an annular chamber between said block and their circumferential edges when they come in meeting contact and are cemented together, and creating a flanged portion, and means for connecting the head to an end of the body or spindle portion of the jack-spool, substantially as described, and for the purposes set forth.

4. As a new article of manufacture, a rawhide head for jack-spools, formed of two disks of rawhide provided with an interposed retaining-block, to which their contacting portions are secured, and secured one to the other at their circumferential meeting edges, substantially as described.

413,193. SELF-CLOSING GATE. WILLIAM LEDO, Tipton, Ind. Filed July 24, 1889. Serial No. 318,582. (No model.)



Claim.—1. A self-closing gate hinged to a rod passing through extensions of the upper and lower cross-bars, a jaw connected to the extension of the lower cross-bar, an automatic closing device comprising a weight, its lower end normally resting in said jaw and suspended at its upper end from a swivel or its equivalent connected to an upper plate supported upon the fence-post, the central part of the upper section of the closing device grooved to admit a headed pin connected to an extension of the central cross-bar of the gate, said upper section pivoted to the lower weighted section, and a frame-work for supporting the gate and its closing mechanism, substantially as shown and described.

2. A self-closing gate comprising a frame-work hinged to a rod having bearings in upper and lower supports, an automatic closing device connected to the rear of such gate, comprising a weighted section pivoted to an upper section, the latter in turn pivoted to a swivel, and the whole suspended upon a pivotal pin passing through the upper plate of the frame-work of the fence, the central part of the upper section grooved to admit a headed pin connected to an extension of the central cross-bar of the gate, a latch passing through a mortise in the front bar of the gate-frame, which is mounted on a vertical rod secured therein, and a pair of gravity-catches pivoted to a front plate connected to the gate-post and adapted to engage with the latch of the gate, all combined substantially as shown and described.

3. In a self closing and locking gate, a pair of gravity-catches pivoted to a plate secured to the inner face of the post, such plate provided with stops *b* to limit the upward and downward movement of the gravity-catches, a latch passing through a mortise in the gate-frame and adapted to engage with such gravity-catches and connected to a lifting-handle mounted on a rod supported in the gate-frame, in combination with a gate and automatic weight-closing device connected at the rear thereof, substantially as shown and described.

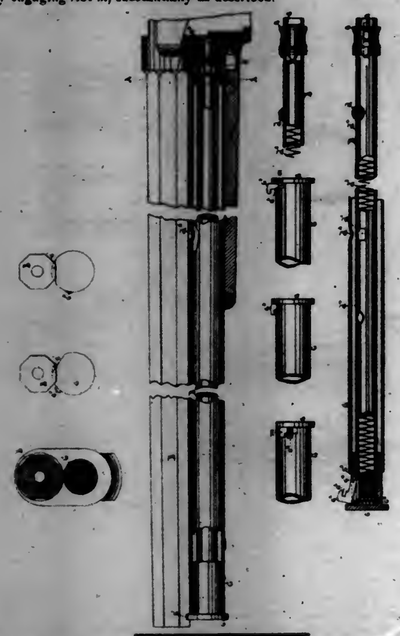
413,194. HYDRAULIC AND COMPRESSED-AIR SYSTEM FOR CONVEYING LIQUIDS. JOHN K. LEEDY, Tom's Brook, Va. Filed Jan. 30, 1889. Serial No. 298,069. (No model.)

Claim.—1. The combination of a liquid-supply, a liquid-conveying pipe connected to this liquid-supply, buried liquid-storage tanks connected to the said conveyor by means of valved pipes, valved supply-pipes leading from these buried storage-tanks to the surface of the ground, and a discharge-tank C, located below the level of the said liquid-supply, the discharge end of the conveyor being submerged in this tank, as and for the purposes herein set forth.

2. The combination of a liquid-supply, buried liquid-storage tanks connected to the said liquid-supply by means of valved pipes, valved discharge-pipes leading from the buried liquid-tanks, compressed-air-storage tanks buried beneath the surface of the ground, and a main compressed-air conveyer connected to these tanks and the liquid-tanks by means of valved pipes, substantially as and for the purpose herein set forth.

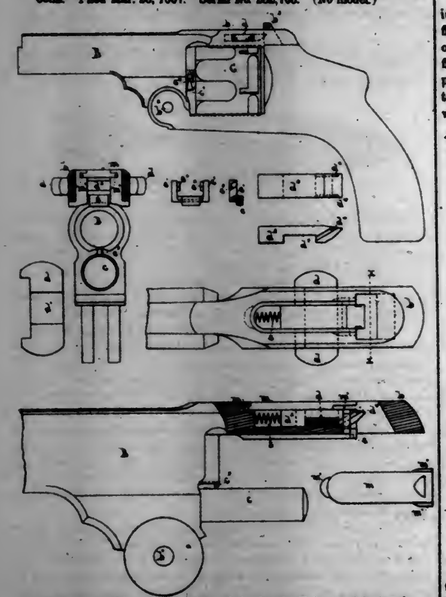
413,195. TENSION-REGULATING DEVICE FOR LOOM-SHUTTLES. HENRY C. LYNDEBORG, Lawrence, Mass. Filed Mar. 8, 1889. Serial No. 302,576. (No model.)

Claim.—The combination, with the shuttle-body having a slot X, a chamber I, with groove D around the same, and the educt E, of the plug B, having the holes C F, the post P, the disk K, and the pin L, substantially as shown and described.



413,196. MAGAZINE FIRE-ARM. JOHN M. MARLIN, New Haven, Conn. Filed Nov. 23, 1884. Serial No. 148,902. (No model.)

Claim.—1. The combination of the removable magazine D, the sleeve *e*, having stop d^3 attached thereto, and the shoulder e^2, located in the magazine-case C in the path of sleeve *e* when the magazine is introduced into the case, and adapted to be brought into contact with and move the sleeve and stop when the magazine is inserted in its case, substantially as described.



2. The combination of the removable magazine D, provided with the latch c^2, attached thereto, and the head *e*, projecting laterally therefrom, with the magazine-case provided with the slot *m*, and the barrel of the arm, provided with the slot *c'*, said slots *m* and *c'* being respectively located and adapted to engage with said latch and head of the magazine, substantially as described.

3. The combination of the magazine-case C, provided with the slot *m* and stop d^3, projecting inwardly, the removable magazine D, fitting within the case and provided with the slot d^4 and stop-notch *d'*, the spring d^5 and the sliding bolt *d* within the magazine, provided with a head adapted to engage with notch *d'* to lock the same and with stop d^6 to unlock the same, and the latch c^2, adapted to lock said magazine and its case together, substantially as described.

4. The combination of the magazine-case C, provided with the shoulder c^2 and slot *m*, with the removable magazine D, provided with the sliding sleeve *e*, adapted to engage with said shoulder and the stop e', and the latch e^3, adapted to lock said magazine and case together by engaging slot *m*, substantially as described.

413,197. REVOLVING FIRE-ARM. JOHN M. MARLIN, New Haven, Conn. Filed Mar. 28, 1887. Serial No. 232,763. (No model.)

Claim.—1. The combination of the latch d^3, located in its chamber in the barrel-extension *b* and provided with one or more grooves d^5, and the cylinder C, with the stop *e*, mounted in a vertical guideway in said extension, and provided with one or more tongues e^3, engaging with said groove or grooves and adapted to raise and lower said stop by the movement of the bolt, substantially as described.

2. The combination of the latch or bolt d^3, having the transverse slot d^4, embracing the cross-bar *d* and the inclined slot or slots d^5 and adapted to lock the extension *b* to the frame of the arm, the cross-bar *d*, having the slot d', embracing the bolt, the catch *e*, having the tongue or tongues e^3, engaging with said inclined slot or slots, and the revolving cylinder C, substantially as described.

413,198. BUTTON. LOUIS C. H. MEISSNER, Chelmsford, County of Essex, England. Filed Feb. 9, 1888. Serial No. 263,467. (No model.)

Claim.—1. In a stud or button, the combination of the back, the supports carried thereby, the retaining-wings pivoted to such supports, a cap or face having a rotary movement only on the back and carrying a screw, a longitudinally-movable nut, and arms connected to the nut and to the wings, substantially as set forth.

2. The combination of the back, the supports *c* carried thereby, the retaining-wings pivoted in the supports, a cap or face connected with the said back so as to have a rotary movement only thereon, a screw carried by the cap or face, a block *f*, engaging with the said screw, and the arms *b*, connecting the block and the wings, substantially as described.

413,199. COTTON-PLANTER. MAURICE M. MILLER, Law's Hill, Miss. Filed June 13, 1889. Serial No. 314,109. (No model.)

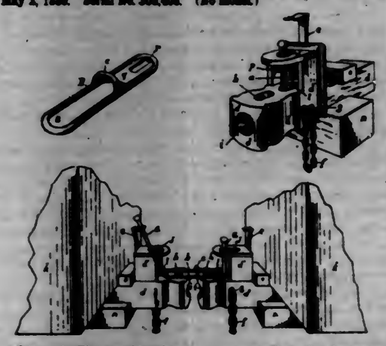
Claim.—The planter and distributer having the agitator consisting of a spiral or twisted shaft provided with a series of stirrers or fingers, one series comprising two inwardly-curved projecting fingers, one arranged near each end of the shaft, others of said stirrers or fingers being formed in pairs, each pair being in a single piece and passing through and projecting beyond the opposite side of the shaft, the projecting portions of the latter-referred-to fingers or stirrers converging at their free or distant ends, substantially as set forth.

413,200. HANGING WASH-STAND. JOHN C. MILLIGAN, Brooklyn, assignor to the Lalance & Grosjean Manufacturing Company, New York, N. Y. Filed Dec. 14, 1888. Serial No. 293,565. (No model.)

Claim.—1. The combination of a hanger comprising side portions, cross-bars at the lower end of said side portions and extending back beyond the line of the side portions and holding the hanger in a vertical position, cushions on said extended portions, outstanding hooks supporting the hanger, and a shelf pivotally connected to the cross-bars by knuckle-joints, substantially as specified.

2. The combination, with a metal hanger consisting of a horizontal portion and side portions extending downwardly from the horizontal portion, of a water-tank secured to the inner surfaces of the side portions of the hanger and a shelf pivoted below the water-tank, substantially as specified.

3. The combination, with a hanger and a shelf pivotally connected thereto, of a water tank or reservoir arranged within the hanger and a receptacle for brushes and combs forming a cover for said tank, substantially as specified.



4. The combination, with a hanger and a shelf pivotally connected thereto, of a water tank or reservoir arranged within the hanger and detachably connected thereto and a brush or comb receptacle supported in the top of the reservoir, substantially as specified.

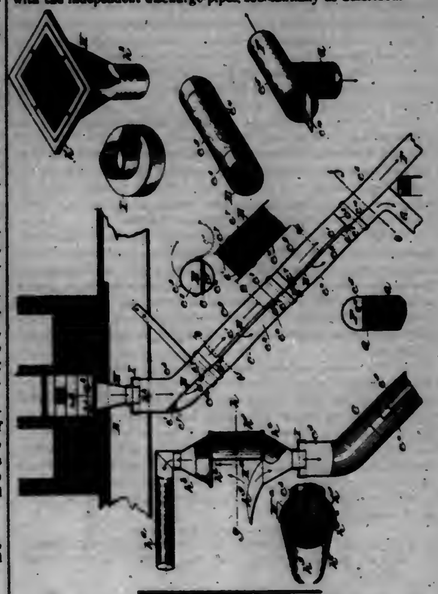
5. As a new article of manufacture, a shelf and a hanger to which the shelf is pivotally connected, the hanger being provided with a horizontal portion constructed to engage with hooks supported from a wall, and a water-tank removably connected within the hanger, substantially as specified.

6. The combination, with a hanger and a reservoir removably secured to the hanger, of a receptacle arranged within the reservoir and forming a cover therefor, a shelf pivotally connected to the hanger, and a basin fitted in said shelf, the parts being so disposed that the shelf may be swung up in front of the hanger without necessitating a disturbance of the said parts arranged within the hanger and shelf, substantially as specified.

7. In a portable wash-stand, the combination of a hanger, a water-tank removably secured thereto, a receptacle secured in the top of the tank and serving as a cover, a shelf pivotally connected to the hanger, a basin, and a cup and soap-dish secured to the shelf, the parts being so disposed that the shelf may be swung up and in front of the hanger without necessitating a disturbance of the said parts arranged within the hanger and shelf, substantially as specified.

413,201. CAR-COUPLING. RICHARD P. MCBRIDE, Canandaigua, N. Y., assignor of one-half to Elbridge G. Lapham, same place. Filed May 2, 1889. Serial No. 309,403. (No model.)

Claim.—1. The combination, in a car-coupler, of a bumper *d*, having on its top side a draw-head d', to which may be attached a pin-rest *e*, all as substantially set forth.



2. In a car-coupling, the combination, with the bumper having the draw-head in its upper portion, of the link weighted at one end and provided with a handle, substantially as described.

3. The herein-described link provided with openings for the reception of a pin at each end, having one end weighted, and a handle attached to the link at about its center, substantially as described.

413,202. SCREEN. WILLIAM MCCORMACK, Philadelphia, Pa., assignor of one-half to Daniel J. Birmingham, same place. Filed Sept. 26, 1888. Serial No. 286,707. (No model.)

Claim.—1. The combination, with a range, &c., of the hopper opening into the ash-pit thereof, the inclined chute connected with said hopper and composed of attachable and detachable pipe-sections, each of which is provided with an opening and door on one side thereof, the longitudinal screen or partition contained within said chute and composed of a series of separable sections successively supported within said pipe-sections, together with the independent discharge-pipes communicating with the upper and lower divisions, respectively, formed by said screen, substantially as described.

2. The combination of the hopper provided with the external supporting-flange at its upper end, the elbow-pipe section c^6, the collar I, connecting the same with the hopper, the inclined-chute sections c^5, the cross-bars therein, the screen-sections supported upon said bars and provided with the stop-hooks c', and the lower section c^3, provided with the independent discharge-pipes, substantially as described.

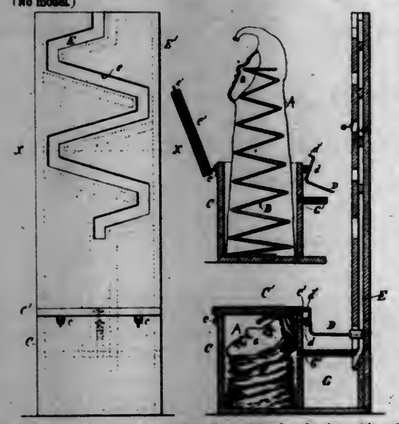
413,203. BIT-STOCK. LEONARDO MCMANUS, Spaulding, Neb. Filed Jan. 14, 1889. Serial No. 296,260. (No model.)

Claim.—1. The stationary box provided with apertures at right angles to each other, and the chuck having a shank adapted to enter either of said apertures, in combination with the rotary handle swiveled to said box and engaging and turning said chuck in either position, substantially as described.

2. The stationary box having an elongated bearing at its rear and provided with two apertures at right angles to each other, one in its face opposite said bearing and the other in its side, and the rotary handle turning on said bearing, in combination with a chuck having a shank adapted to enter either of said apertures and to engage with and be rotated by said handle in either position, substantially as described.

3. The stationary box B, having a hollow elongated bearing *b* at its rear end and provided with two apertures Q, one in its face opposite said bearing and the other in its side at right angles thereto, and the handle A, bevel-gear G thereon having hollow hub *g*, and a wrench having an enlarged head W, provided with a squared recess, the shank *w* of said wrench fitting within said hollow bearing *b* and hub *g* and both being secured to said handle, in combination with the chuck C, having a reduced shank C, fitting loosely in either of said apertures Q, and squared at its end to fit said squared recess in the wrench, and a bevel-gear G' on said clutch, adapted to mesh with said gear G when the shank is inserted in the side aperture of the box, substantially as described.

4. The stationary box B, having a hollow elongated bearing *b* at its rear end, and provided with two apertures Q, one in its face opposite said bearing and the other in its side at right angles thereto, and the handle A, bevel-gear G thereon, having hollow hub *g*, and a wrench



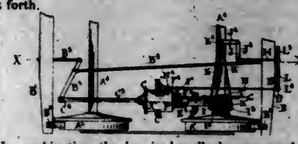
having an enlarged head W, provided with a squared recess, the shank *w* of said wrench fitting within said hollow bearing *b* and hub *g* and both being secured to said handle, in combination with the chuck C, having a reduced shank C', fitting loosely in either of said apertures Q, and squared at its end to fit said squared recess in the wrench, and a bevel-gear G' on said chuck adapted to mesh with said gear G when the shank is inserted in the side aperture of the box, and with a thumb-screw T in one side of said box provided with a rounded point *t*, engaging an annular groove *t'* in said shank C', substantially as described.

5. The box B, having an elongated bearing *b*, the handle A, journaled upon said bearing, and the cap S, swiveled in one side of said box and having a squared recess in its inner face, said box having two recesses Q, one opposite said bearing, the other opposite said cap, in combination with the chuck C, having a reduced shank C', fitting either of said apertures Q, and squared at its end to fit said recess in the cap S, as and for the purpose described.

6. The handle A, having a cavity in its face, the bevel-gear G, having a hollow hub *g* fitting said cavity, and a wrench having an elongated shank *w* fitting within said hollow hub, said wrench also having an enlarged head W, in combination with the pin *p*, passing through said handle, hub, and shank, and with the box B, having a hollow bearing fitting within said hollow gear and swiveled upon said elongated shank *w* and over said head W, as and for the purpose described.

7. The handle A, carrying bevel-gear G, wrench W, secured thereto and having a squared recess in its face, the box B, journaled upon said wrench, and the cap S, swiveled in the side of said box and having a squared recess in its inner face, in combination with the chuck C, having a reduced shank C' with squared end adapted to enter an aperture in the face of said box and engage with said recess in the wrench, and a bevel-gear G' on said chuck adapted to engage said bevel-gear G when the shank C' is passed into an aperture in the side of said box and its squared end seated in the recess in the cap, as and for the purpose described.

413,204. COIN-OPERATED TOY. MOSES NEWMAN and GEORGE H. BENNETT, New York, N. Y. Filed Aug. 5, 1889. Serial No. 319,843. (No model.)



Claim.—1. In a toy, the combination, with a box having a hinged lid, of a movable figure in said box having a flexible body, a motor for actuating the figure, a detent for engaging with the lid of the box, and a sinuous chute, into which one end of the detent extends to be operated upon by the weight of a coin, substantially as specified.

2. The combination, with a movable figure having a motor controlled by a detent, of a sinuous chute for coin, having a sinuous slot or opening in its front, so that a coin may be seen as it passes to the detent, substantially as specified.

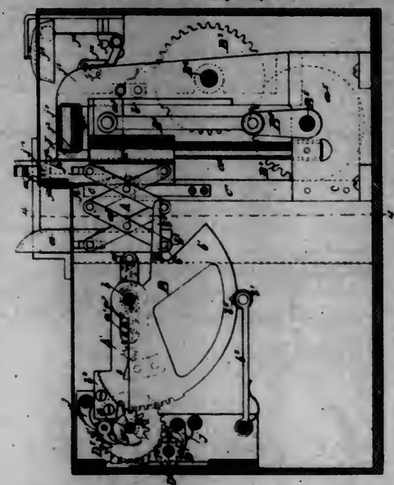
413,205. AIR-BRAKE. THOMAS V. MORRIS, Rockford, Ill. Filed Nov. 16, 1888. Serial No. 291,070. (No model.)

Claim.—1. In combination, an air-pump, an eccentric mounted upon and taking power from the axle of a railway-truck, an eccentric-strap constructed and arranged in such a manner as to readily admit of being engaged with and disengaged from said eccentric while revolving, an eccentric-lever connecting said eccentric-strap with the piston-rod of said air-pump, a brake-rod L, the arm L', rigidly secured thereto, the rod M, hinge-jointed to said arm L', the bell-crank hinge-jointed to said rod M, and the rods K, hinge-jointed to said bell-crank and eccentric-strap, substantially as described, and for the purpose set forth.

2. In combination, the herein-described compressed-air cylinder and air-pump having the operative parts and connections, as shown, an eccentric I, mounted upon and taking power from an axle A^4, the eccentric-strap I^3, mounted upon and depending from the eccentric-lever C^3, the brake-rod L, the arms L' L^3, secured thereto, the connecting-rod M, hinge-jointed to said arm L', the bell-crank J, hinge-jointed to said rod M, the rods K, hinge-jointed to said bell-crank and eccentric-strap, the valve-crank F^4, and the rod N, connecting the latter with said arm, substantially as set forth.

413,206. REGISTERING-RECEPTACLE FOR COINS. ISAAC PFORZHEIMER, New York, N. Y., assignor of one-half to Carl Zallud, same place. Filed Oct. 4, 1888. Serial No. 287,174. (No model.)

Claim.—1. In a receptacle for coins or other articles, the combination, with an indicator, of a movable carriage, jaws upon said carriage for gripping the coin or other article, a lever or levers for operating the indicator, and a notched piece with which the coin or other article will contact when the carriage is moved in one direction to cause a movement of said notched piece, so as to permit the rocking of the lever or levers to operate the indicator, substantially as specified.



2. In a receptacle for coins or other articles, the combination, with an indicator, of a movable carriage, a rocking arm pivoted near one end and provided with notches at its other end, levers for operating the indicator provided with projections bearing upon said rocking arm, said arm being adapted to be struck by the coin or other article during the movement of the carriage in one direction and rocked to permit a projection on the lever to pass into a notch on the arm and rock the lever to cause the operation of the indicator, substantially as specified.

3. In a receptacle for coins or other articles, the combination, with an indicator, of a movable carriage, a lever or levers for operating the indicator, a pawl for maintaining said levers in a normal position, a notched piece adapted to be struck by the coin or other article during the movement of the carriage in one direction and moved a distance depending upon the diameter of the coin or other article, said carriage operating to release said pawl after the notched piece has been struck by the coin or other article, substantially as specified.

413,207. TICKET-REGISTERING MACHINE. ISAAC PFORZHEIMER, New York, N. Y., assignor of one-half to Carl Zallud, same place. Filed Jan. 8, 1889. Serial No. 295,732. (No model.)

Claim.—1. In a ticket-registering machine, the combination, with a longitudinally-movable carriage having a movable jaw and adapted to receive tickets of different widths and different thicknesses, of a movable device in the path of said carriage and adapted to be moved by said carriage, a register-train operated from said movable device, a second movable device arranged in the path of a ticket when the latter is inserted in the carriage and moved by the ticket independently of the carriage, a second register-train, and mechanism, substantially such as described, between the second-named movable device and the second-named register-train operated by said second-named movable device, substantially as specified.

2. In a ticket-recording machine, the combination of a register-train, a carriage having jaws adapted to receive tickets of different thicknesses, a movable device extending into the path of a ticket when the latter is inserted between the jaws and adapted to be moved outwardly by said ticket, and mechanism, substantially such as described, between the movable device and the register-train operated by the said movable device, substantially as specified.

3. In a ticket-registering machine, the combination, with a box or case, of a carriage into which a ticket to be recorded is passed, said carriage being provided with a movable jaw, a yielding abutment for said movable jaw, and mechanism, substantially such as described, for imparting longitudinal movement to said carriage, substantially as specified.

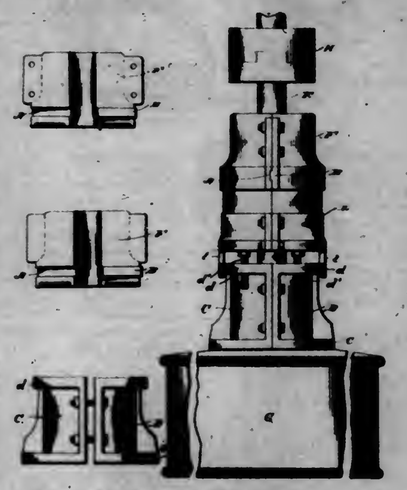
4. In a ticket-registering machine, the combination of a carriage adapted to receive a ticket, a movable jaw comprised in said carriage, a yielding abutment for said jaw, mechanism, substantially such as described, for imparting longitudinal movement to the carriage, and a releasing device for releasing the ticket from the carriage, substantially as specified.

5. In a ticket-registering machine, the combination of a carriage adapted to receive a ticket, a movable jaw comprised in said carriage, a rigid jaw also comprised in said carriage, said jaws being provided with grooves into which the ticket is inserted, a yielding abutment for the movable jaw, mechanism, substantially such as described, for causing the longitudinal movement of the carriage, a releasing device for a ticket, and a spring operating to force a ticket to one side in said grooves, substantially as specified.

6. In a ticket-registering machine, the combination of a carriage, a movable jaw comprised in said carriage, adapted to be moved by a ticket upon its insertion between the jaws, a lock for securing the carriage in its normal position, a trip operated by the ticket upon its insertion to release the lock, and mechanism, substantially such as described, for imparting longitudinal movement to the carriage, substantially as specified.

7. In a ticket-registering machine, the combination of a carriage provided with a fixed jaw and a movable jaw, a trip on the fixed jaw moved in one direction by a ticket upon its insertion between the jaws, a signal operated from said trip, and a stop for limiting the movement of said trip, substantially as specified.

8. In a ticket-registering machine, the combination of a carriage comprising a movable jaw moved by the insertion of a ticket into the carriage, mechanism, substantially such as described, for imparting longitudinal movement to said carriage, a movable device having a portion extending into the path of said carriage when moved in one direction, and with which said carriage will contact upon being moved, and a register-train operated from said movable device, substantially as specified.



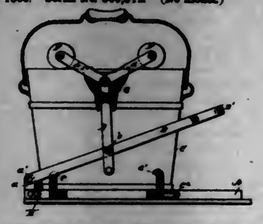
9. In a ticket-registering machine, the combination of a carriage comprising a movable jaw, a yielding abutment for said jaw, mechanism, substantially such as described, for imparting longitudinal movement to the carriage, a segment provided with gear-teeth and having a portion extending into the path of said carriage, and with which the latter will contact when moved in one direction, in order to rock the segment, and a graduated step on said yielding abutment for limiting the rocking movement of the segment, substantially as specified.

10. In a ticket-registering machine, the combination of a carriage having a movable jaw, of mechanism, substantially such as described for imparting longitudinal movement to said carriage, a segment provided with gear-teeth and having a portion extending into the path of said carriage, and with which the carriage will contact when moved in one direction, an arm on said segment, and a pin or projection on said carriage contacting with said arm and operating to return the segment to its normal position when the carriage is moved in the other direction, substantially as specified.

11. In a ticket-registering machine, the combination of a carriage having a movable jaw and a fixed jaw, said jaws being provided with longitudinal grooves into which a ticket is passed, a movable device extending into the path of the ticket and moved by the ticket upon its insertion in the groove, a register-train, and mechanism, substantially such as described, between said movable device and the register-train operated by the said movable device, substantially as specified.

12. In a ticket-registering machine, the combination of a carriage adapted to receive a ticket, a movable device arranged in the path of said ticket and adapted to be moved by the latter when the same is inserted in the carriage, a rock-shaft, an arm on said rock-shaft with which said movable device will contact, a second arm on the rock-shaft, provided with a bifurcated portion, a shaft, a sleeve on said shaft embraced by said bifurcated portion, a cam on the sleeve, a lever, and a time-register train, substantially as described, whereby when the rock-shaft is rocked by the movable device said cam will be shifted into a position to operate said lever.

413,208. BEARING FOR TURBINE WHEELS. GEORGE I. RISLARRISON, Brunswick, Me. Filed Apr. 13, 1889. Serial No. 307,079. (No model.)



Claim.—1. The combination of the wheel-casing, the wheel-shaft, a sectional collar F, surrounding said shaft, an adjustable collar L, and a supporting-stand for the adjustable collar, substantially as described.

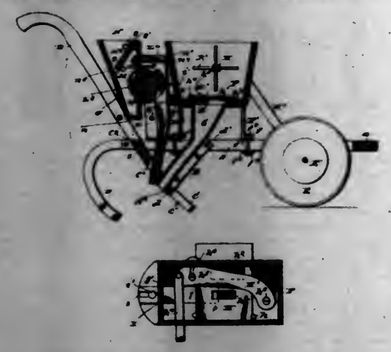
2. The combination, with the wheel-casing, the wheel-shaft, and the coupling rigidly secured to said shaft, of a supporting-stand made in sections adapted to be bolted together around the shaft, said stand resting on the wheel-casing, collars surrounding said shaft, and screws working in the stand and engaging one of said collars to give it vertical adjustment, as set forth.

3. As a bearing for turbine water-wheels, a collar F, made in sections provided with interlocking devices and adapted to be bolted together around the wheel-shaft, combined with the wheel-casing, the wheel-shaft, and a supporting-stand bearing on the wheel-casing and interposed between the collar and the wheel-casing, substantially as described.

4. The combination, with the wheel-casing, the wheel-shaft, and the coupling rigidly secured to the upper end of said shaft, of a stand made in sections adapted to be bolted together around the shaft, said stand having a flange at its lower end adapted to rest on the wheel-casing, and having also a flange at its upper end provided with threaded holes, screws working in said holes, a metal collar surrounding said shaft and being vertically adjustable by means of said screws, and a sectional wooden collar supported by said metal collar, substantially as set forth.

413,209. MOP-WRINGER. SOLOMON H. SCHNUCK, Cleveland, Ohio. Filed May 1, 1889. Serial No. 309,312. (No model.)

Claim.—1. In a mop-wringer, the combination, with rollers mounted on links, the latter being arranged in pairs and operatively connected with a depressible treadle, of yokes embracing, respectively, each pair of links for collapsing the links with the depression of the latter, substantially as set forth.

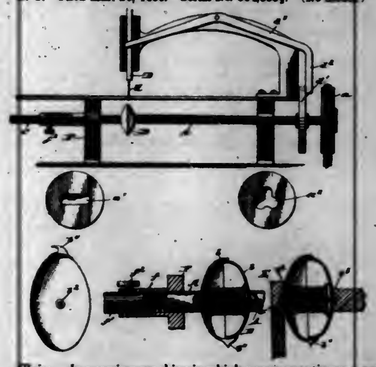


2. The combination, with a base, a treadle pivoted thereto, and a receptacle mounted thereon, of yokes secured to the sides of the receptacle, links arranged in pairs and passing through the yokes, and rollers mounted in the upper ends of the links, substantially as set forth.

413,210. SEED-PLANTER. CORYDON W. SIMS, Waynesborough, Ga. Filed Jan. 8, 1889. Serial No. 295,809. (No model.)

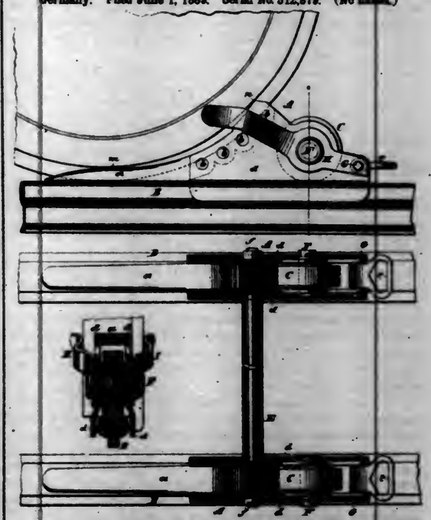
Claim.—The combination, with the hopper, of the plate N, secured above the opening in the bottom of the hopper, the sprig M, secured within the hopper across one end thereof, above one end of said plate, and at right angles to the said plate, the sliding dropper-plate working in guides in the bottom of the hopper and sliding in the plate N, the arm *a*, extending through the opening in the bottom of the hopper and attached to the dropper-plate, and the rod J, connecting said arm with the crank of the furrow-wheel, substantially as shown and described.

413,211. SEED-PLANTER. CICERO S. TYNDAW, Walnut Grove, Ga. Filed Apr. 19, 1889. Serial No. 307,779. (No model.)



Claim.—1. The combination of the hopper having a discharge-opening in its bottom and provided with a longitudinal groove, the gage-slide fitted adjustably in said groove, and a knife mounted pivotally in the bottom of the hopper above said gage-slide and having an operating-lever, substantially as set forth.

2. The combination of the hopper having slotted sides and provided with a longitudinal groove and a discharge-opening in its bottom, the gage-slide fitted in said groove, the transversely-adjustable plate having slots of different sizes fitted in the side slots of the hopper above the gage-slide, the knife pivoted in the bottom of the hopper and extending above said transversely-adjustable plate, and a handle pivoted to the free end of said knife and extending through the slot in one side of the hopper substantially as set forth.

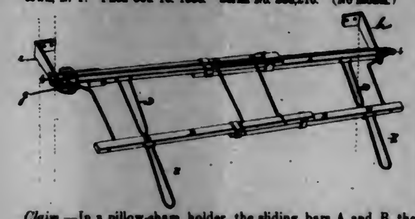


3. The combination, with a hopper having a discharge-opening in the bottom and long narrow slots in each side, of a knife pivoted at one end to the bottom of the hopper and having at its other end a slotted enlargement or projection, a screw passing through the slot in the enlargement into the bottom of the hopper, and an operating-lever attached to the knife and extending through one of the slots in the side of the hopper, substantially as specified.

413,212. SEWING-MACHINE. HARRIET R. TRACY, New York, N. Y. Filed Mar. 26, 1889. Serial No. 304,880. (No model.)

Claim.—In a sewing-machine in which a reciprocating eye-pointed needle is employed, a driving-shaft provided with a rounded-oblong or rounded-polygonal engaging end, in combination with a correspondingly-provided case or shuttle mounted loosely against the said end, contiguous to the needle, there being complemental means upon the opposite face of the shuttle to engage and support the same, and driven from the shaft by the described rounded-oblong or rounded-polygonal engaging end thereof, the case or shuttle having a thread-engaging device and a continuous opening, whereby the loop of thread thrown out by the needle will be taken by the thread-engaging device, be spread over the outer surface of the shuttle, and be passed through the juncture thereof with the driving-shaft to be locked by the thread from the shuttle, all substantially as set forth.

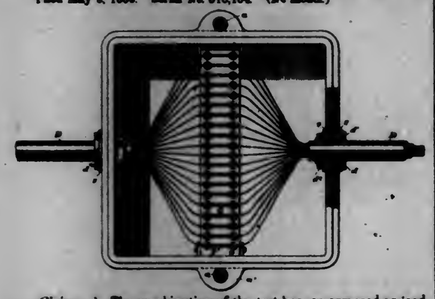
413,213. RAILWAY SHOE-BRAKE. LUDWIG TRAPP, Göttingen, Germany. Filed June 1, 1889. Serial No. 312,879. (No model.)



Claim.—1. A railway shoe-brake having the tongue at one end and a roller at the other, the tongue having a curved upper surface with contact-points for the car-wheel, whereby, when in use, the shoe may be alternately thrust forward and retarded, substantially as set forth.

2. A railway shoe-brake having a tongue at one end to rest on the rail, a roller at the other end to enable the shoe to slide forward, and a guide for retaining it in position, the upper surface of the tongue being curved to receive the car-wheel and provided with contact-points on different planes, whereby, when in use, the car-wheel may alternately impel and check the shoe, substantially as set forth.

3. The shoe consisting of the tongue *a*, plates *d d*, and roller C, the tongue being adapted to rest on the track-rail and having contact-points *m n* for the car-wheel, substantially as set forth.



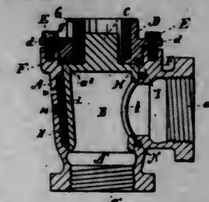
4. The shoe consisting of the tongue *a*, plates *d d*, roller C, and plates H I, substantially as set forth.

413,214. PILLOW-SHAM HOLDER. WILLIAM C. VAN CISE, Jamestown, N. Y. Filed Oct. 16, 1888. Serial No. 288,216. (No model.)

Claim.—In a pillow-sham holder, the sliding bars A and B, the connecting wire arms D, secured to the bars A and hinged to the bars B, the arms E, and the wire frame secured to the sliding bars, said arms being adapted to support the wire frame when the latter is thrown outward, and means for locking the holder in position, substantially as herein described.

413,215. UNDERGROUND CONDUIT. GEORGE H. WARD, New York, N. Y., assignor to William Hampden Johnstone, Philadelphia, Pa. Filed May 9, 1889. Serial No. 310,104. (No model.)

Claim.—1. The combination of the test-box, an armored or lead-covered cable extending through an opening in the box, a collar *d*, secured to the cable and fitting said opening and having a flange *d'* exterior to the box, and clamping devices on the collar within the box, substantially as set forth.

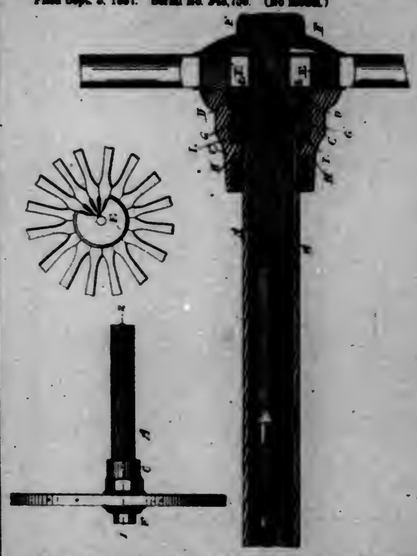


2. The combination, with the sides or walls of the box having an aperture for the passage of the armored or lead-covered cable, of the flanged collar secured to the cable, the washers *e*, and the clamping devices, as d^3, substantially as set forth.

3. The combination of the enameled wall of the test-box, the cable extending through the enameled wall, the flanged collar secured to the cable and passing through the wall of the box, the clamping-nut on the end of the collar, and washers interposed between the nut, the flanged collar, and the wall of the box.

4. The combination, substantially as set forth, in a subway manhole, of the interally-projecting bolts *c*, a vertically hung test-box into which cables run, having suspending ears or lugs through which said bolts pass, the test-box cover, and clamping devices, as a clamp a^2, and nuts on the end of the bolts to secure the vertical cover of the test-box.

413,216. VALVE. ADOLPH WEBER, Detroit, Mich., assignor of one-half to William L. B. Mahon, same place. Filed Apr. 24, 1889. Serial No. 308,366. (No model.)

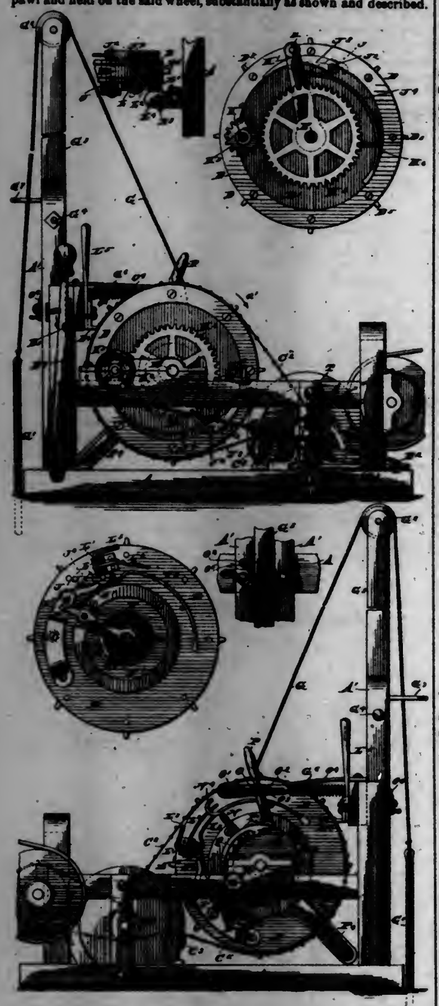


Claim.—1. The combination of the valve-case A, containing the valve B, with the valve B, seated in the valve-case, the rectangular valve-stem C, turning the valve B, the cap D, retaining the valve in the valve-case and perforated to allow the passage of the valve-stem, the annular flange G, projecting from the upper face of the cap D as high as the valve-stem, the recess G', cut in the annular flange to permit the insertion of the key H, the shoulders *g g'* on the flange G, limiting the movement of the key H, the circular key H, having the rectangular aperture to engage with the rectangular valve-stem, and the stud O on the key, limiting its movement by contact with the shoulders *g g'*, all substantially as described.

2. The combination of the valve-case A, having the shoulders a^3, with the valve B, seated in the valve-case, the cap D, retaining the valve in its seat and carrying the packing I, the recess H, cut out on the under side of the cap to receive the packing, the shoulder A, formed by the recess H, holding the packing on the cap, and the packing I, held on the cap by the shoulder A, all substantially as set forth.

3. The combination of the valve-case A, containing the valve B, with the valve B, the recess L, cored out of the valve-case to receive the soft-metal valve-seat, the annular flange around the port *a* to prevent the outflow of the fluid soft metal, the orifice M, through which the fluid soft metal is poured to form the valve-seat, and the soft-metal valve-seat, all substantially as set forth.

413,217. WHEEL AND AXLE. AARON B. WHITE, Meadow, Mich. Filed Sept. 3, 1887. Serial No. 248,730. (No model.)



Claim.—The combination of hollow axle A with arm B revolving within it and held in position by screw-cap C, in connection with collars D and G, with the hub E, rigidly secured by flanged nut F, all constructed and operating substantially as described.

413,218. DRILLING-MACHINE. VALENTINE WIBON, Rochelle, Ill., assignor to himself, and John H. Sutphen, Huron, Dak. Filed Dec. 3, 1888. Serial No. 292,066. (No model.)

Claim.—1. In a drilling-machine, the combination, with a shaft, a drum mounted to rotate loosely thereon, and a rope held on the said drum and supporting the drilling-tool, of an arm secured to the shaft and engaging the said drum, a tripping-pawl adapted to engage and disengage the said arm, a wheel having a rotary motion and carrying the

said pawl, and a notched arm adapted to engage and disengage the said pawl and hold on the said wheel, substantially as shown and described.

2. In a drilling-machine, the combination, with a shaft, a drum mounted to rotate loosely thereon, and a rope held on the said drum and supporting the drilling-tool, of an arm secured to the shaft and engaging the said drum, a tripping-pawl adapted to engage and disengage the said arm, a wheel having a rotary motion and carrying the said pawl, a notched arm adapted to engage and disengage the said pawl and held on the said wheel, and a spring secured on the said wheel and acting on the said tripping-pawl, substantially as shown and described.

3. In a drilling-machine, the combination, with a shaft, a drum mounted to rotate loosely thereon, and a rope held on the said drum and supporting the drilling-tool, of an arm engaging the said drum, a tripping-pawl adapted to engage and disengage the said arm, a wheel having a rotary motion and carrying the said pawl, a notched arm adapted to engage and disengage the said pawl and held on the said wheel, a curved arm secured on the shaft of the said notched arm, a friction-roller arm adapted to be locked in place and engaged by the said curved arm at every revolution of the said wheel, and a spring secured to the said wheel and pressing the said curved arm outwardly, substantially as shown and described.

4. In a drilling-machine, the combination, with a shaft, a drum mounted to rotate loosely thereon, and a rope held on the said drum and supporting the drilling-tool, of an arm engaging the said drum, a tripping-pawl adapted to engage and disengage the said arm, a wheel having a rotary motion and carrying the said pawl, a notched arm adapted to engage and disengage the said pawl and held on the said wheel, a curved arm secured on the shaft of the said notched arm, a friction-roller arm adapted to be locked in place and engaged by the said curved arm at every revolution of the said arm, and means, substantially as described, for shifting the position of the said friction-roller arm, as set forth.

5. In a drilling-machine, the combination, with an adjustable friction-roller arm, of a wheel having a rotary motion and carrying a tripping device operated by the said friction-roller arm, a shaft on which the said wheel is mounted, a rope-drum mounted to rotate loosely on the said shaft and carrying the drilling-tool, and a yielding arm secured to the said shaft and acting on the said drum and being engaged and disengaged by the said tripping device at every revolution of the said wheel, substantially as shown and described.

6. In a drilling-machine, the combination, with a friction-roller arm held adjustable, of a wheel having a rotary motion and carrying a tripping device operated by the said friction-roller arm, a shaft on which the said wheel is mounted, a rope-drum mounted to rotate loosely on the said shaft and carrying the drilling-tool, a yielding arm secured to the said shaft and acting on the said drum and being engaged and disengaged by the said tripping device at every revolution of the said wheel, a stopping-arm secured on the said drum, and a yielding rod against which strikes the said stopping-arm after the drum is disengaged, substantially as shown and described.

7. In a drilling-machine, the combination, with a friction-roller arm held adjustable, of a wheel having a rotary motion and carrying a tripping device operated by the said friction-roller arm, a shaft on which the said wheel is mounted, a rope-drum loosely mounted on the said shaft and carrying the drilling-tool, a yielding arm secured to the said shaft and acting on the said drum and being engaged and disengaged by the said tripping device at every revolution of the said wheel, a stopping-arm secured on the said drum, a yielding rod against which strikes the said stopping-arm after the drum is disengaged, and a brake mechanism operated from the said yielding rod and acting on the said drum, substantially as shown and described.

8. In a drilling-machine, the combination with a friction-roller arm held adjustable, of a wheel having a rotary motion and carrying a tripping device operated by the said friction-roller arm, a shaft on which the said wheel is mounted, a rope-drum loosely mounted on the said shaft and carrying the drilling-tool, a yielding arm secured to the said shaft and acting on the said drum and being engaged and disengaged by the said tripping device at every revolution of the said wheel, a stopping-arm secured on the said drum, a yielding rod against which strikes the said stopping-arm after the drum is disengaged, and an adjustable pin to limit the forward movement of the said stopping-arm when the drilling-tools are lifted, substantially as shown and described.

9. In a drilling-machine, the combination, with a friction-roller arm held adjustable, of a wheel having a rotary motion and carrying a tripping device operated by the said friction-roller arm, a shaft on which the said wheel is mounted, a rope-drum loosely mounted on the said shaft and carrying the drilling-tool, a yielding arm secured to the said shaft and acting on the said drum and being engaged and disengaged by the said tripping device at every revolution of the said wheel, a stopping-arm secured on the said drum, a yielding rod against which strikes the said stopping-arm after the drum is disengaged, a brake mechanism operated from the said yielding rod and acting on the said drum, a ratchet-wheel secured on the said drum, and a pawl adapted to engage the said ratchet-wheel to prevent a return motion of the drum, substantially as shown and described.

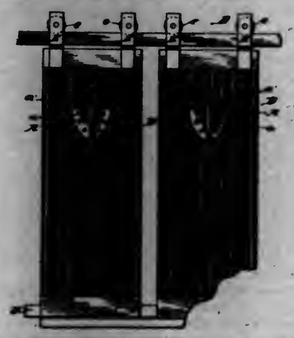
10. In a drilling-machine, the combination, with a wheel having a rotary motion and carrying a tripping device provided with a curved arm, of a friction-roller under which passes the said curved arm, an arm carrying the said friction-roller, a gear-wheel held concentric with the said wheel and carrying the said arm, a pinion meshing into the said gear-wheel, a hand-wheel for turning the said pinion, and a pawl for locking the said gear-wheel in place, substantially as shown and described.

11. In a drilling-machine, the combination, with a wheel having a rotary motion and carrying a tripping device, of a shaft on which turns loosely the said wheel, a drum loosely mounted on the said shaft and provided at one end with a recess, and an arm secured to the said shaft and projecting through the recess in the said drum and being also engaged and disengaged by the said tripping device at every revolution of the said shaft, substantially as shown and described.

12. In a drilling-machine, the combination, with a wheel having a rotary motion and carrying a tripping device, of a shaft on which turns loosely the said wheel, a drum loosely mounted on the said shaft and provided at one end with a recess, an arm fulcrumed loosely on the said shaft and projecting through the recess in the said drum, being also engaged and disengaged by the said tripping device at every revolution of the said shaft, and a spring pressing against the said arm, substantially as shown and described.

13. In a drilling-machine, the combination, with a shaft, a drum, and a yielding arm for rotating the said drum mounted to rotate loosely thereon, of a tripping-pawl adapted to engage the said yielding arm, a spring acting on the said tripping-pawl, a yielding wheel mounted to rotate and carrying the said tripping-pawl, a notched arm held to swing on the said wheel and adapted to engage and disengage the said tripping-pawl, and an arm held to swing on the said wheel and serving to lock the said notched arm in place when disengaged from the said tripping-pawl, substantially as shown and described.

14. In a drilling-machine, the combination, with a shaft a drum, and a yielding arm for rotating the said drum mounted to rotate loosely thereon, of a tripping-pawl adapted to engage the said yielding arm, a spring acting on the said tripping-pawl, a yielding wheel mounted to rotate and carrying the said tripping-pawl, a notched arm held to swing on the said wheel and adapted to engage and disengage the said tripping-pawl, an arm held to swing on the said wheel and serving to lock the said notched arm in place when disengaged from the said tripping-pawl, and a lever mounted to swing and adapted to operate the said arm so as to unlock the latter and the said notched arm, substantially as shown and described.

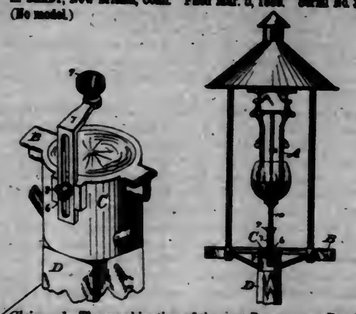


15. In a drilling-machine, the combination, with a shaft and a drum mounted to turn loosely thereon, of a stopping-arm secured on the said drum, and a yielding rod carrying a pin against which strikes the said stopping-arm, substantially as shown and described.

16. In a drilling-machine, the combination, with a shaft and a drum mounted to turn loosely thereon, of a stopping-arm secured on the said drum, a yielding rod carrying a pin against which strikes the said stopping-arm, a brake-lever pivotally connected with the said yielding rod, and a brake-band connected with the said lever and acting on the said drum, substantially as shown and described.

17. In a drilling-machine, the combination, with a shaft and a drum mounted to turn loosely thereon, of a stopping-arm secured on the said drum, a yielding rod carrying a pin against which strikes the said stopping-arm, a brake-lever pivotally connected with said yielding rod, a brake band connected with said lever and acting on the drum, and an arm carrying a link pivoted to the said brake-lever, the said rod being also connected by a second link with the said brake-band, substantially as shown and described.

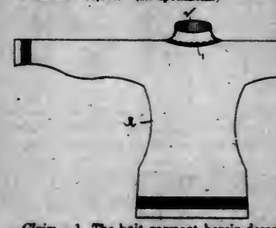
18. In a drilling-machine, the combination, with a shaft, a drum mounted to turn loosely thereon, and a stopping-arm secured on the said drum, of a slotted disk held concentric with the said drum, a pin projecting from the said disk and forming a stop for the said stopping-arm, and a bolt passing through the slot in the said disk and serving to lock the latter in place, substantially as shown and described.



418,219. SHUTTER-WORKER. CONRAD ANDREES, Omaha, Nebr. Filed July 1, 1889. Serial No. 316,217. (No model.)

Claim.—1. The combination, with the supporting-rail and with the door or shutter mounted to slide thereon, of the striker-plate projecting from said shutter or door and in position to receive the impact of the hose-stream, whereby the door or shutter may be shifted, substantially as described.

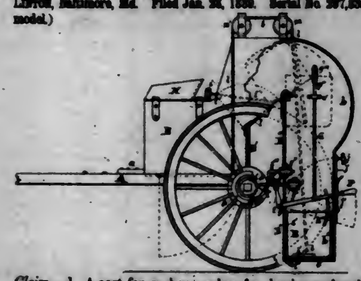
2. The combination, with the supporting-rail and with the door or shutter mounted to slide thereon, of the striker-plate projecting from said shutter or door and having an overhang at its top to form a pocket or cavity against which a hose-stream may be directed to shift the door or shutter, substantially as described.



418,220. HOLDING ATTACHMENT FOR ARC LAMPS. THOMAS H. BRADY, New Britain, Conn. Filed Mar. 5, 1889. Serial No. 301,886. (No model.)

Claim.—1. The combination of the post D, cross-arm B at its top, the lamp A, suspended from the upper ends of the uprights on said cross-arm, the holder 7, adjustably secured at the top of said post, and the insulating-socket secured to the upper member of said holder and engaging the lamp at the end farthest from its point of suspension, substantially as described, and for the purpose specified.

2. The combination of the post D, cap-iron C, and cross-arm B at the top of said post, the lamp A, supported on said cross-arm, the vertically-recessed socket at one side of said cap-iron, the insulating-socket 9, and the holder 7, fitted to said vertically-recessed socket and provided with fastening devices for said holder, substantially as described, and for the purpose specified.



418,221. KNIT GARMENT. WALTER BRAMLEY, Chicopee Falls, Mass., assignor to Taylor & Bramley, same place. Filed Feb. 15, 1889. Serial No. 300,067. (No specimens.)

Claim.—1. The knit garment herein described, having a folding collar composed of an endless band, which from its line of juncture with the body of the garment to the fold-line thereof is of a slightly-decreasing diameter and from said fold-line to the outer edge thereof is of a constantly-increasing diameter, substantially as described.

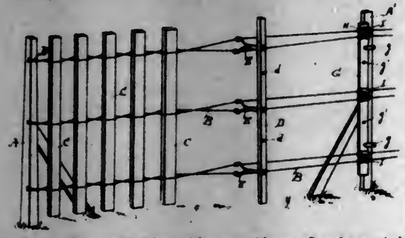
2. The knit garment herein described, consisting of a seamless jersey having a collar composed of an endless band united at one edge thereof to the body of the garment, said collar having a slightly-decreasing diameter from said line of juncture to a fold-line located between its edges, and having a constantly-increasing diameter from said fold-line to the outer edge thereof, substantially as and for the purpose set forth.

418,222. GARBAGE-CART. ROBERT S. BREWINGTON and JOHN W. LINTON, Baltimore, Md. Filed Jan. 28, 1889. Serial No. 297,836. (No model.)

Claim.—1. A cart for garbage, ashes, &c., having a closed cover, in combination with a bucket located in the rear and operated automatically by the rotation of the wheels when the cart is in motion, as described.

2. A garbage-cart having two compartments or more with a movable double sliding cover supplied with holes or slots, as described, and a bucket hung on cords, and operative mechanism for elevating and dumping the bucket automatically.

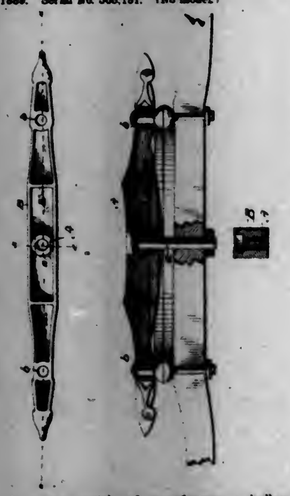
3. A garbage-cart having two or more compartments and a movable cover to them made of two plates constructed with holes or slots therein to be opened or closed, substantially as and for the purpose described.



4. The bucket suspended by cords, in combination with the pulleys, drums, and ratchets attached to the hubs of cart-wheels, whereby the bucket is elevated and detached automatically, as described.

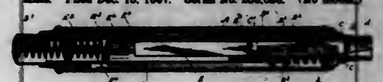
5. The bucket E suspended by cords *l l*, in combination with the pulleys *m m'*, drums D D on the axle, ratchets *c' c'*, attached to the hubs of the wheels, the pawl *c''*, spring *c'''*, bolts *f' f'*, and the lever F, substantially as and for the purpose described.

6. The lever F, vertical connecting-rod G, having a bent end *g''*, and the bolt *f''*, in combination with the pawl *c''*, ratchet *c'*, wheel-hub c, and drum D, substantially as and for the purpose described.



7. The bucket E, having pins *e'* on its side and hook *l''* on or near the bottom, in combination with the vertical rod G, having a pin *g''* at its end, whereby the pins *e* engage the hooks *k* and the hook *l''* elevates the rod G to automatically release the ratchets and drums to let the bucket fall to its place, as described.

413,223. MACHINE FOR MAKING SLAT-AND-WIRE FENCE. WILLIAM CARTER, Martinsville, Ohio, assignor of one-half to Daniel M. Turner, same place. Filed June 27, 1889. Serial No. 278,329. (No model.)



Claim.—The combination, with a movable post D and a nut-bolt bifurcated at one end, of the bibranched wire-carrier E, bent as shown at *e e'*, and pivoted in the middle on a cross-pin of the bolt, as shown and described.

413,224. HEAD-BLOCK FOR VEHICLES. FRANKLIN P. CIRCLE, Springfield, Ohio, assignor of one-half to A. Parthurst, same place. Filed Mar. 13, 1889. Serial No. 303,181. (No model.)

Claim.—As a new article of manufacture, a hollow metallic head-block cast integrally with all its component parts, open on its lower sides and having a cylindrical shaft A, securely attached to the inner sides of the center of the head-block to form a journal-box to receive the king-bolt, and provided with apertures for attaching the fifth-wheel, and transverse braces arranged to support the sides intermediately between the center and the ends, and provided on its upper side with a bed to receive the head of the king-bolt.

413,225. FINGER-NAIL CUTTER. GEORGE H. COATES, Worcester, Mass. Filed Dec. 15, 1887. Serial No. 258,098. (No model.)

Claim.—1. The combination, with a shell or case forming a handle, of elastic clamping-jaws rigidly attached to said handle, a sliding ring sliding over said jaws, and a spring whose tension is applied to said ring to hold said jaws in a state of compression, substantially as described.

2. In combination, the shell or case forming the handle, clamping-jaws rigidly attached to said handle and inclosing a sliding blade, said jaws having inwardly-projecting edges arranged to engage notches in the sliding blade, a sliding blade inclosed within said jaws and having notches, a sliding ring sliding over said clamping-jaws, by which they are compressed, and a spring actuating said sliding ring to compress said jaws, substantially as described.

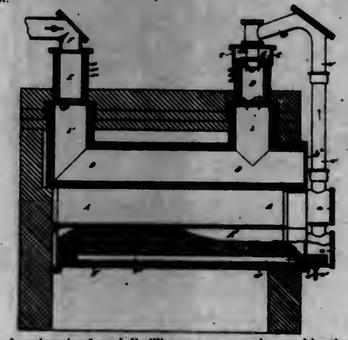
3. The combination, with a shell or case forming a handle and a sliding blade inclosed in said handle and provided with a pin, of a pair of clamping-jaws rigidly attached to said handle, said jaws being provided with a lug to limit the outward movement of said sliding blade, and a notch arranged to inclose the pin on said blade, a sliding ring sliding over said clamping-jaws, and a spring actuating said sliding ring, substantially as described.

4. The combination, with a shell or case forming a handle and a sliding blade inclosed in said handle, of clamping-jaws C C, provided with a tubular stem *b*, attached to the shell or case, a sliding ring D^4, and a spiral spring D^5, by which said jaws are compressed upon said sliding blade, substantially as described.

5. The combination, with a shell or case forming the handle, clamping-jaws attached to said handle and provided with projecting lugs, and a sliding wedge placed between said lugs, whereby the clamping-jaws are opened, substantially as described.

6. The combination, with a shell or case forming the handle, and a sliding blade sliding in said handle, of a pair of clamping-jaws attached to said handle, a sliding sleeve sliding in said handle and having a ring-shaped section inclosing said clamping-jaws, and a wedge-shaped section passing between lugs on said clamping-jaws whereby they are opened, and a spring applied to said sliding sleeve for the purpose of holding the ring-shaped section over said clamping-jaws and maintaining said jaws compressed against the sliding blade, substantially as described.

7. In combination, a shell or case forming a handle, a blade inclosed by and capable of sliding in said handle, clamping devices by which said blade is held in position in said handle, a sliding rod with one end resting against the inner end of said blade and having an attached disk, and a spring inclosed in said handle, with its tension applied to said sliding rod, whereby it is moved and said blade forced out of the handle, substantially as described.



8. The combination, with a shell or case forming the handle and a blade sliding within said handle, of the clamping-jaws C C, sleeve D, operatively connected with said jaws, rod E^1, provided with an attached disk E^2, said rod resting against the inner end of the blade, and a spring E^3, with its tension applied to said blade through said rod and disk to force the blade out of the handle when released by the clamping-jaws, substantially as described.

9. The combination of a shell or case forming the handle, a blade sliding within said handle, clamping-jaws attached to said handle, a sliding tube or sleeve sliding over said jaws, by which they are compressed upon said blade, said tube or sleeve extending through the handle and terminating in a cap to receive pressure, and a spring with its tension applied to said tube or sleeve to compress said clamping-jaws, substantially as described.

10. The combination, with a metallic blade having a mortise or slit whose end walls form cutting-edges with one side of said blade, of projecting ribs running lengthwise said blade upon each side of said cutting-edges for the purpose of guards to said cutting-edges, substantially as described.

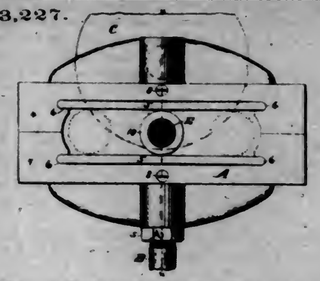
413,226. APPARATUS FOR MAKING ILLUMINATING-GAS FROM COAL. JOHN R. R. DUNCAN, Liverpool, County of Lancaster, England. Filed July 16, 1888. Serial No. 280,209. (No model.) Patented in France July 17, 1888, No. 191,051; in Belgium July 16, 1888, No. 82,605; in Spain Oct. 2, 1888, No. 8,519; in Canada Nov. 16, 1888, No. 30,201, and in Austria-Hungary Jan. 13, 1889, No. 29,[illegible] and No. 49,982.

Claim.—1. In a bench of coal-distilling apparatus, the combination of a distilling-retort adapted to receive the fuel to be distilled, a fixing-retort adapted to be externally heated, and a duct adapted to be artificially cooled, said duct being arranged directly above and springing vertically from said fixing-retort, and provided with a pipe connecting the distilling-retort with said duct, substantially as described.

2. In a bench of coal-distilling apparatus, the combination of a distilling-retort adapted to receive the fuel to be distilled, a fixing-retort adapted to be externally heated, ducts adapted to be artificially cooled, one of said ducts being at each end of said fixing-retort and both being arranged directly above and springing vertically from the same, a liquid seal in direct contact with one of said ducts, and a pipe connecting the distilling-retort with said duct, substantially as described.

3. In a bench of coal-distilling apparatus, the combination of a distilling-retort adapted to receive the fuel to be distilled, a fixing-retort adapted to be externally heated, a duct adapted to be artificially cooled, a liquid seal in direct contact with said duct, and a pipe connecting the distilling-retort with said liquid seal, substantially as described.

4. In a bench of coal-distilling apparatus, the combination of a fixing-retort adapted to be externally heated, ducts adapted to be artificially cooled, one arranged on each end of said retort, in communication therewith and arranged directly above and springing vertically from it, and a liquid seal in connection with one of said ducts, substantially as described.

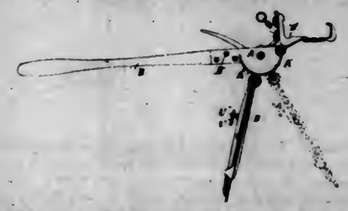


5. In a bench of coal-distilling apparatus, the combination of a retort, a duct adapted to be artificially cooled in communication therewith and arranged directly above and springing vertically from said retort, provided with an opening thereto smaller than the communicating passage, substantially as described.

6. In a bench of gas-making retorts, a distilling-retort adapted to receive the fuel to be distilled, a fixing-retort adapted to be externally heated, a duct adapted to be artificially cooled, and a valve-chamber having inlet-pipes connected, respectively, with said duct, said distilling-retort, said fixing-retort, and with an exit-pipe, combined with a four-way valve within said valve-chamber, so arranged that the course of the gas from said distilling-retort to said exit-pipe may be either through said duct and said fixing-retort or from said distilling-retort directly to said exit-pipe, substantially as described.

7. In an apparatus for making gas, the combination of a distilling-retort, a fixing-retort adapted to be externally heated, a suitable device for introducing liquid tar into said fixing-retort at the entrance end, and an artificially-cooled duct arranged immediately upon the exit or gas-outlet end of said fixing-retort, whereby the tar-gas after it is distilled passes through the fixing-retort to make it permanent, and on leaving said retort immediately enters the cooled duct, substantially as described.

413,227. CROSS-HEAD. ARTHUR H. ENDY, Hartford, Conn. Filed Apr. 8, 1889. Serial No. 306,309. (No model.)



Claim.—1. The herein-described slotted cross-head provided with friction-plates for the crank-pin or crank-pin roller, with the middle point between the plates closely fitted thereto, and with a slightly-increasing space upon each side of said middle point, substantially as described, and for the purpose specified.

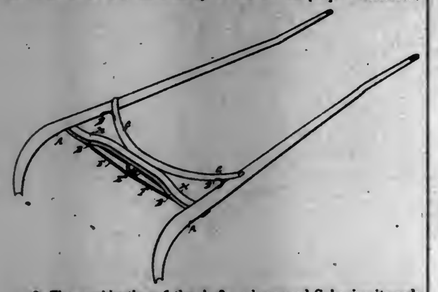
2. The combination of a slotted cross-head, two friction-plates secured therein, screw-adjusting devices for springing the middle portion of said plates toward each other, and the crank-pin or crank-pin roller working between said plates, substantially as described, and for the purpose specified.

413,228. CAR-MOVER. LORD B. OFFORD, Toledo, Ohio. Filed July 22, 1889. Serial No. 318,180. (No model.)

Claim.—1. In a car-mover, an angle-plate and a lever connected therewith by means of side plates formed with a semicircular bearing concentric with a pivot-bolt, in combination with a leg movable upon the pivot-bolt and provided with rollers adapted to rest upon the circular bearings, said leg moving concentrically when adjusted to push or pull by means of the pivot-bolt passing through a circular perforation formed in the upper part of the same, substantially as and for the purpose set forth.

2. In a car-mover, an angle-plate formed with a recess in the rear side thereof and lugs projecting at right angles thereto, in combination with a chain-holder formed with elongated openings, into which the lugs project, a lever for raising the chain-holder, and a chain resting within the recess and held to any desired adjustment by being engaged with the chain-holder and put in tension thereby, as and for the purpose set forth.

3. In a car-mover, side plates, an angle-plate pivoted thereto, a lever pivoted between the side plates, and a stud-lever pivotally connected with the angle-plate and with said lever, whereby, when the first-named lever is raised, the stud is projected through an opening in the angle-plate, as and for the purpose set forth.



4. In a car-mover, an angle-plate, a lever pivotally connected therewith, a chain-holder movably connected with the angle-plate and with the lever by plates of a length to lock in vertical alignment with the plate-holder when raised, and a plate upon the chain-holder formed with a recess, in combination with a chain passed through the recess and engaging with the sides of the plate, as and for the purpose set forth.

5. In a car-mover, a leg formed of an upper section having a series of perforations, in combination with a lower section movably secured to the upper section and formed with a perforation having a keyway, and a catch within the perforation formed with a key adapted to register with the keyway and allow of lateral movement thereby and be locked from lateral movement when out of alignment therewith, as and for the purpose set forth.

413,229. VEHICLE-SHAFTS. JACKSON W. HEWITT, Jackson, Mich. Filed June 27, 1889. Serial No. 315,811. (No model.)

Claim.—1. In a vehicle, as described, the combination of the shafts, a brace-rod C, having its ends secured at the upper surface of the shafts, a cross-bar having its ends secured at the lower surface of the shafts, said brace-rod and cross-bar being secured together at

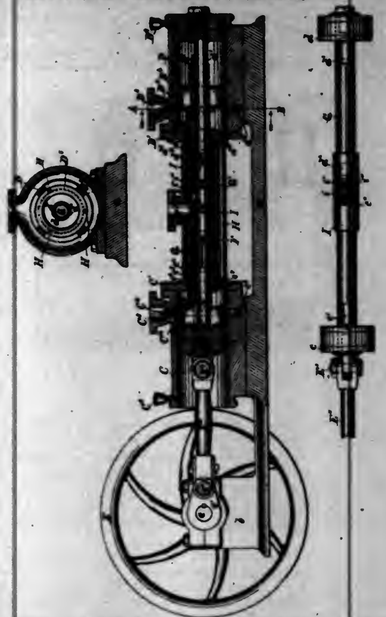
their centers, and rods D, secured to and forming loops between said shafts and brace-rod, substantially as and for the purpose described.

2. The combination of the shafts, a brace-rod C, having its ends secured to the upper surface of said shafts, a cross-bar B, provided with double bends H H between its center and each of its ends and having its ends secured at the lower surface of the shafts, said brace-rod and said cross-bar being secured together at their centers, the rods D D, secured to and forming loops between said brace-rod and shafts, the hanger E, extending downward from the center of said cross-bar, and the singletree secured to said hanger, substantially as and for the purpose described.

413,230. HARROW. ALBERT HIRSHHEIMER, La Crosse, Wis. Filed Dec. 18, 1888. Serial No. 294,013. (No model.)

Claim.—1. In a harrow, a tooth-bar of channel or equivalent form having two sides with parallel edges and connecting back, and a clamp-plate adapted to embrace the outside of said edges to prevent the same from spreading, in combination with a tooth passing through said plate and the back of said bar, and means, substantially as described, for securing the same therein, as and for the purpose specified.

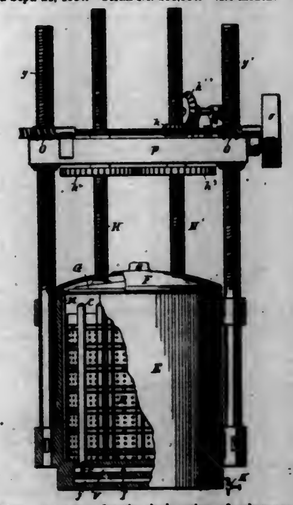
2. In a harrow, a tooth-bar of channel or equivalent form having two sides with parallel edges and a connecting back, and a clamp-plate having flanges adapted to abut against the inside of said parallel sides and rest against said edges, in combination with a tooth passing through said plate and the back of said bar and means, substantially as specified, for securing the same therein, as and for the purpose set forth.



3. In a harrow, a tooth-bar of channel or other equivalent form having two sides with parallel edges and a connecting back, and a clamp or truss plate having grooves adapted to receive said edges, in combination with a tooth passing through said plate and the back of said bar and means, substantially as described, for retaining the said tooth and plate removably in position, as and for the purpose set forth.

4. In a harrow, a tooth-bar of channel or other equivalent form having two sides with parallel edges and connecting back, a clamp or truss plate adapted to embrace said parallel edges, and a tooth having its upper end adapted to pass through said plate and back, having a shoulder adapted to abut against the under side of said plate, and a screw-thread and nut at the upper end of said tooth outside of said back, substantially as and for the purpose specified.

5. In combination, in a harrow, a tooth-bar of channel or other equivalent form having two sides with parallel edges and connecting back, a clamp or truss plate adapted to embrace said parallel edges, said plate and back having a circular aperture therein for the insertion of the tooth, and said plate having an angular countersink on its under side around said aperture, and a tooth having an upper cylindrical portion adapted to pass through said aperture, a lower angular portion terminating in a shoulder adapted to fit said countersink, and a screw-thread and nut at said cylindrical end, substantially as and for the purpose herein specified.

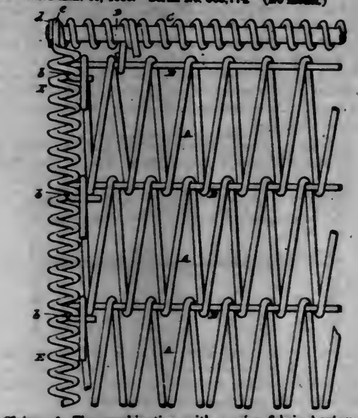


6. The combination, with a tooth-bar of a harrow, of a flanged clamp-plate fitting the bottom and sides thereof, said tooth-bar and clamp-plate being provided with a circular aperture therethrough, and the said clamp-plate having an angular countersink around said aperture on the under side thereof, and a tooth having an upper cylindrical portion adapted to fit said aperture and a lower angular portion terminating in a shoulder adapted to fit said countersink, and a screw-thread and nut on said upper portion, substantially as and for the purpose herein specified.

413,231. STEAM-ENGINE. ADDISON S. HODGES, Chelsea, Mass. Filed Feb. 4, 1889. Serial No. 298,654. (No model.)

Claim.—The cylinders C D, open in their outer ends, and having the pressure-supply pipe F secured to and connecting their inner ends, and having the respective circumferential exhausts c^3 d^3, combined with the pistons c d, connected together by means of the ported pipe G, having partition G', supply-ports c'' d'' on opposite sides of said partition, the ported valve-sleeve I, surrounding the pipe G, as described, ports c' d' at or near the respective pistons c d, and the annular valves C^3 D^3, connected together for operation, as herein set forth.

413,232. PROCESS OF DESICCATION. THOMAS R. HOUSEMAN and CHRISTIAN R. M. SPROWLES, Philadelphia, Pa., assignors to the United States Food Fertilizer and Manufacturing Company, of Pennsylvania. Filed Sept. 21, 1887. Serial No. 250,307. (No model.)

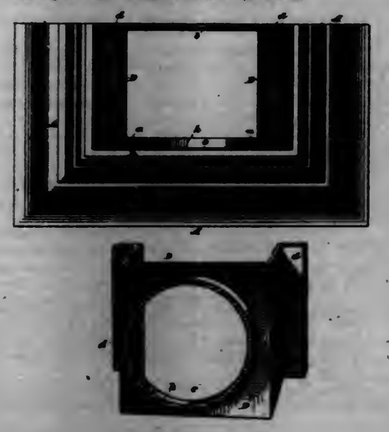


Claim.—A process for the desiccation of substances, which consists in compressing the substance and at the same time heating it by a dry heat throughout its mass.

413,233. ALTERATIVE TONIC. CARRIE R. DEERE, Paris, Ky. Filed Mar. 20, 1889. Serial No. 303,976. (No specimens.)

Claim.—The herein-described alterative tonic or remedy for blood and cutaneous diseases, consisting of blackberry, poke, burdock, sarsaparilla, silk-weed, May-apple, and wild-cherry roots, horehound, hops, and spirits, in the proportions specified.

413,234. FLEXIBLE-WIRE FABRIC. GEORGE KELLY, Chicago, Ill. Filed Mar. 13, 1889. Serial No. 303,774. (No model.)

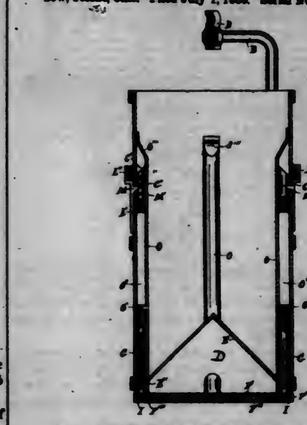


Claim.—1. The combination, with a wire fabric having transverse rods B, of the border E, when said border is secured to the fabric by the engagement with the coils of the border, and the eyes b upon the transverse rods, substantially as set forth.

2. A flexible-wire fabric comprising in combination the body of the fabric formed of a series of flattened spirals A, connected together by transverse tie-rods B, the ends of which are formed with eyes or loops b, and side borders consisting of cylindrical spirals E, engaged in the eyes b of the transverse tie-rods B, essentially as herein described.

3. A flexible-wire fabric comprising, in combination, the body of the mat formed of a series of flattened spirals A, connected together by transverse tie-rods B, the ends of which are formed with eyes or loops b, rigid end borders formed of spirals inclosing transverse rods D, and side borders consisting of cylindrical spirals E, engaged in the eyes b of the transverse tie-rods B, and having at their ends longitudinal eyes e, engaging over the ends of the rods D, and secured in place by washers d and an upset on the ends of said rods, essentially as herein described.

413,235. CLOCK-CASE. FLORENCE KROMER, New York, N. Y. Filed July 23, 1889. Serial No. 318,363. (No model.)



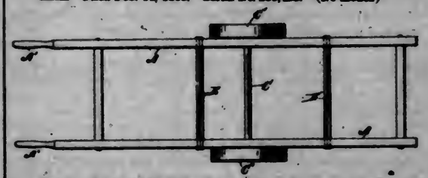
Claim.—1. The internal metal framing D, open at the back and forming an aperture e in front, combined with the ornamental clock-case A, for the purpose of carrying the movement E and the sash B of said clock, as specified.

2. The internal cast-metal framing D, open at the back and having the perforation e in front, combined with the annulus h, which projects from the front of said frame D, as and for the purpose specified.

3. The combination of the clock-case A with the internal cast-metal framing D, open at the back and forming or helping form the aperture e in front, and with the movement E, which is directly secured to the front wall of said frame D from behind, and with the sash B, which is directly secured to said frame D in front thereof, substantially as and for the purpose herein shown and described.

413,236. COAL-BUCKET. WILLIAM R. LUDLOW and EDGAR S. LUDLOW, Toledo, Ohio. Filed July 1, 1889. Serial No. 316,152. (No model.)

Claim.—1. A coal-bucket in which are comprised a body portion provided with ways or guides, spring-catches, and a vertically-slidable cone-shaped bottom provided with rods within said guides, which rods are adapted to engage said catches, substantially as shown and described.

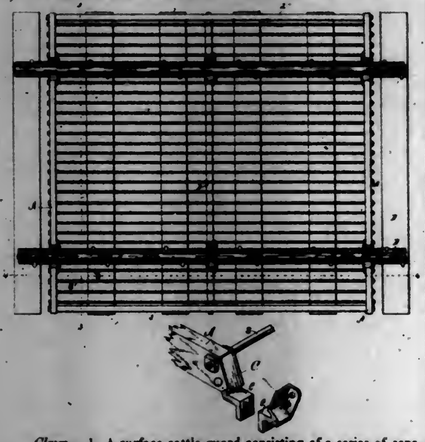


2. A coal-bucket in which are comprised a body portion, a band having a projection or cam, a lever to actuate said band, a vertically-slidable cone-shaped bottom, and means whereby said bottom may be either held in contact with the body portion or permitted to drop therefrom, substantially as shown and described.

3. A coal-bucket comprising a body portion having a series of vertical guideways and pins passing through said guideways, a vertically-slidable bottom portion, and the rods rigidly connected to the bottom portion and working in the guideways, said rods being slotted centrally, in which slots work the pins, substantially as described.

4. A coal-bucket in which are comprised a body portion provided with ways or guides and spring-catches, a band having a projection or cam, a lever to actuate said band, a vertically-slidable bottom portion, and the rods rigidly secured to said bottom and working in the guideways, said rods being constructed and adapted to engage the spring-catches, substantially as shown and described.

5. In a coal-bucket, the combination, with a body portion provided with guideways and catches arranged in the upper ends of said ways, of a vertically-slidable cone-shaped bottom portion, the rods rigidly secured to said bottom working in the guideways and adapted to engage with the catches within the same, and the stops arranged near the lower ends of the guideways to limit the downward movement of the bottom portion, substantially as shown and described.



413,237. BARREL-SHEET TRUCK. HUGO MATTHIAS, Detroit, Mich. Filed Feb. 11, 1889. Serial No. 299,426. (No model.)

Claim.—A barrel-sheet truck consisting of horizontal bearers A,

having straight upper surfaces, the inclined supports B, the wheels C, the leg-supports D, and braces E, substantially as described.

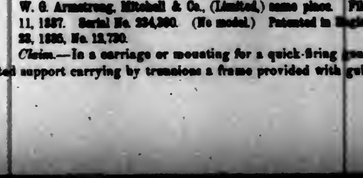
413,238. CATTLE-GUARD. PARKER MERRILL, St. Louis, Mich. Filed June 22, 1889. Serial No. 315,218. (No model.)

Claim.—1. A surface cattle-guard consisting of a series of separated bars arranged between the rails and entirely supported by said rails, and a series of separated bars on the outside of each rail, the ends of the outside sections next to the rails being supported by said rails, substantially as set forth.

2. A surface cattle-guard, consisting of the beams between and outside of the rails of the track, having their contiguous ends attached to said rails, and a series of separated bars supported by said beams, with a space between the ties and said bars, substantially as set forth.

413,239. BEE-HIVE. FRANCIS R. MERRIMAN, Boston, Mass. Filed Apr. 3, 1889. Serial No. 305,842. (No model.)

Claim.—1. The combination, with a hive having an entrance or aperture leading to its interior, of a removable and reversible alighting-board having a back piece E', provided with securing devices, substantially as described, said back piece being of a width sufficient to close the inlet-opening when the alighting-board is reversed, substantially as herein set forth.



2. The combination, with a hive having an entrance or opening leading to its interior and provided with slots in its front wall, of a removable and reversible alighting-board having a back piece provided with headed pins or bolts adapted to engage said slots, said back piece being sufficiently wide to close the said entrance or opening when the alighting-board is reversed, substantially as herein set forth.

3. A hive having a brood-chamber, a honey-rack having honey-sections, and slightly elevated above the comb-frames in the brood-chamber to form the bee space or passage *t*, and an exterior casing having an opening or passage leading to the bee-space *t*, in combination with a removable and reversible bridge interposed between the space *t* and the entrance, and having a passage in communication with said bee-space and entrance, substantially as herein described.

4. The combination, with a hive having a brood-chamber and a honey-rack, said brood-chamber having some of its central comb-frames extended, whereby the honey-rack and comb-frames of the brood-chamber are separated from each other to form the bee space or passage *t*, and an exterior casing having an entrance in alignment with the bee space or passage between the honey-rack and comb-frames in the brood-chamber, of a bridge spanning the vertical space between the inner wall of the casing and the front of the comb-frames in the brood-chamber, and having a passage communicating at its central portion with the entrance-opening and at its end portions with the bee space or passage, substantially as and for the purpose described.

5. An improved bee-hive comprising a base, the casing formed of the sections A' and A'', and ventilating top or cover A''', the brood-chamber in the section A', the honey-rack in the section A'', and separated from the comb-frames in the brood-chamber by the horizontal bee space or passage *t*, an entrance or opening between the sections A' and A'' and in alignment with the bee-space *t*, a removable and reversible bridge between the front of the bee-space *t* and the entrance, and having a passage communicating with both, and a removable and reversible alighting-board exterior of the hive, and detachably secured to the casing just below the entrance-opening, substantially as and for the purpose described.

413,240. HORSE-DETACHING DEVICE. JOHN H. HALL, Berryton, Kans. Filed July 6, 1889. Serial No. 316,691. (No model.)

Claim.—1. In a shaft-detaching device, the combination, with detaching mechanism, a movable bolt, and a supporting-clip therefor, of a flat spring secured at one end to the bolt and at the other at a higher plane to the clip, substantially as set forth.

2. In a shaft-detaching device, a releasing-bolt co-operating with the eye of the shaft, said bolt being provided with a peripheral groove at a point corresponding to the side of the shaft-eye toward which the bolt moves in detaching, whereby liability of failure on account of wear is avoided.

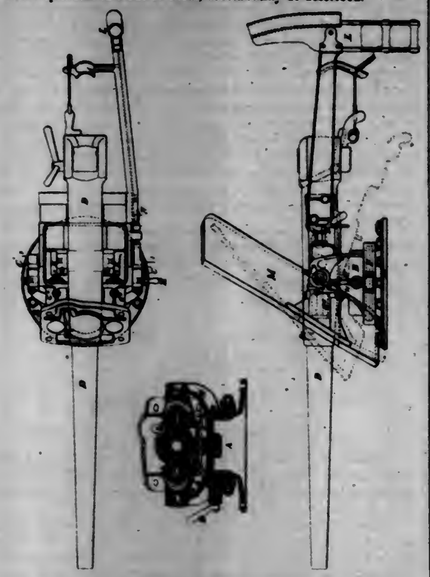
3. In a shaft-detaching device, a securing-bolt provided at its outer end with a beveled groove, in combination with a shaft-shank having its outer shoulder beveled, substantially as described.

4. In a shaft-detaching device, the combination of sliding bolts for securing the shafts, means for limiting the play of said bolts, a bracket supported by a lug extending under the axle of the vehicle and perforated to allow the king-pin to pass through it, and by a brace secured at its ends to the axle and at its middle to the bracket, and a lever supported in the bracket for withdrawing the bolts, substantially as described.

5. In a shaft-detaching device, the combination, with sliding bolts, of a cylinder, chains connecting the bolts to the cylinder, a bracket supporting the cylinder, a rod rigid with the cylinder and extending upward therefrom, a standard to support the rod, and a handle-bar connected to the rod, substantially as described.

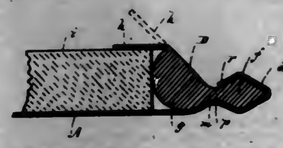
6. In a shaft-detaching device, securing-bolts, a cylinder, chains connecting the bolts to the cylinder, a rod rigid with the cylinder, a handle-bar surmounting the rod, and upturned handles at the extremities of the bar, in combination with a supporting-bracket, substantially as described.

7. In a shaft-detaching device, a handle-bar provided with upturned handles at its ends, and adapted thereby to serve as a rein-rest, and a clip for holding the bar rigid, said clip being provided with a knob to serve as a rein-holder, substantially as described, in combination with detaching mechanism, substantially as set forth.



8. In a detaching device for shafts, the combination, with movable connecting-bolts, of a shaft-shank provided with a beveled shoulder, as and for the purpose set forth.

9. In a shaft-detaching device, shafts, the cross-bar of which is provided on the under side with a pad, in combination with detaching means, substantially as described.



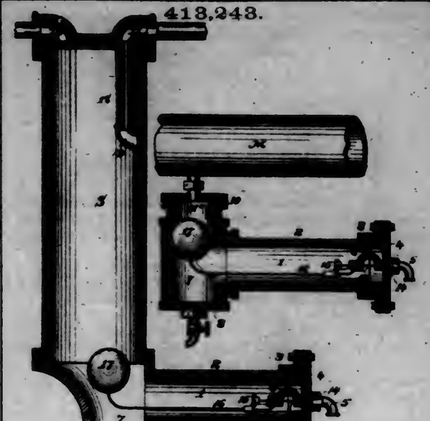
10. In a shaft-detaching device, in combination, a handle-bar provided with upturned handles at its ends, a standard, and a clasp hinged to the rear of the standard and capable of being turned up over the handle-bar to lock it in place, substantially as described.

413,241. CARRIAGE OR MOUNTING FOR QUICK-FIRING GUNS. ANDREW NOBLE, Newcastle-upon-Tyne, England, assignor to W. G. Armstrong, Mitchell & Co., (Limited,) same place. Filed Apr. 11, 1887. Serial No. 234,360. (No model.) Patented in England Oct. 23, 1885, No. 12,730.

Claim.—In a carriage or mounting for a quick-firing gun, a pivoted support carrying by trunnions a frame provided with guide-surfaces along which blocks attached to the gun slide, and provided, also, with springs in rear of the blocks, and pistons working hydraulic buffer-cylinders in front of them, substantially as described.

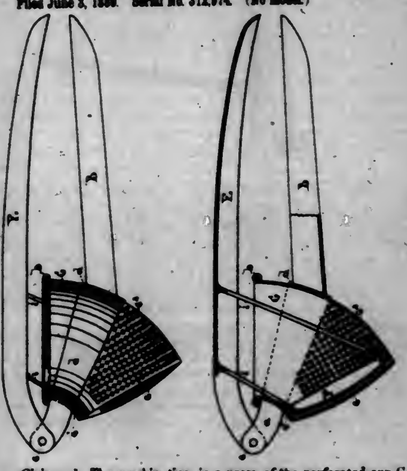
413,242. BEADED FILLET FOR STREET-LAMPS. RICHARD PATTISON, Boston, Mass., assignor to the Wheeler Reflector Company, same place. Filed July 1, 1889. Serial No. 316,142. (No model.)

Claim.—A beaded fillet for reflectors, having one leaf approximately diamond-shaped in cross-section, substantially as described.



413,243. SEPARATOR AND TRAP. JOHN W. PERRY, Kokomo, Ind., assignor of one-half to George R. Stewart, same place. Filed Feb. 11, 1889. Serial No. 299,446. (No model.)

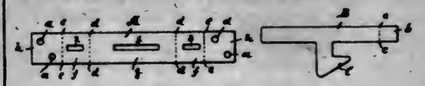
Claim.—1. In a fluid-trap, the combination, with the trap-chamber, of an elbow-lever pivoted by its angle within said chamber, an outwardly-opening discharge-valve connected by its stem with one arm of said elbow-lever, and a float connected with the opposite arm of said elbow-lever, substantially as and for the purposes specified.



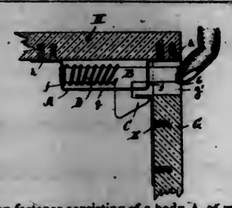
2. In a fluid-trap, the combination, with a trap-chamber, of a U-shaped valve-casting having a discharge-port therethrough and a valve-seat on its outer end, an outwardly-opening valve having a stem which extends through the port or passage of said valve-casting, an elbow-lever pivoted at its angle and connected by one arm with the valve-stem, and a float connected with the other arm of said elbow-lever, substantially as and for the purposes specified.

3. In a combined separator and fluid-trap, the combination, with an L-shaped chamber the vertical arm of which forms an expansion or separator chamber and the horizontal arm a fluid chamber or trap, of an inlet-pipe arranged in said vertical arm to deliver against the walls thereof, and an outlet-pipe, a trap-valve at the distant end of the horizontal arm of the L-shaped chamber, a valve-lever arranged longitudinally in said arm to actuate the valve, and a float arranged in the vertical arm and connected with the valve-lever, substantially as and for the purposes specified.

4. In a separator and fluid-trap, the chamber S, having the horizontal extension 1, the inlet-pipe 18 19, outlet 12, trap-valve 13 14, bell-crank lever 15, float-lever 16, and float 17, said parts arranged and combined substantially as and for the purposes specified.



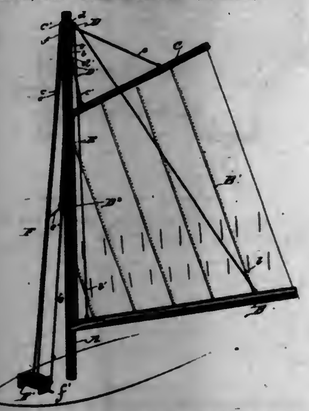
413,244. FRUIT-SQUEEZER. DAVID H. RICE, Brookline, Mass. Filed June 3, 1889. Serial No. 312,974. (No model.)



Claim.—1. The combination, in a press, of the perforated cup C, having its opposite sides c' c^2 in substantially parallel curves, the concave side c' being shorter than its convex side c^2, with the handle E, pivoted outside on the shorter side c' and carrying the follower F, attached thereto in position to pass down into and fit said cup, substantially as described.

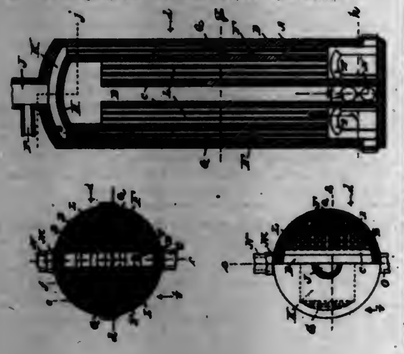
2. The combination, in a press, of the perforated cup C, having its opposite sides c' c^2 in substantially parallel curves, the concave side c' being shorter than the convex side c^2, the band *d*, secured circumferentially around said cup between its mouth and its lower end, the handle E, pivoted to one side of said band opposite the side c' of said cup and carrying the follower F in position to enter into and fit said cup, and the handle B, attached to the opposite side of said band and opposite to the handle E, substantially as described.

413,245. BOX-FASTENING. CHARLES C. RICHARDSON, Boston, Mass. Filed June 1, 1889. Serial No. 312,907. (No model.)



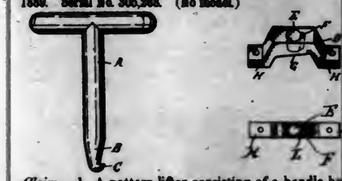
413,245.

Claim.—A box-fastener consisting of a body A, of wrought metal bent into form and having slots 1 2 3, a push-bar B, and catch C, of wrought metal, the coil-spring D, and catch-plate E, substantially as shown and described.



413,246. RIGGING FOR SAILS. CHARLES T. SEGAR, Utica, N. Y. Filed June 27, 1889. Serial No. 315,770. (No model.)

Claim.—1. The combination, with the mast and gaff, of an endless belt extended alongside the mast, ropes *c c'*, suspended on the mast with one end connected to the gaff and the other to the endless belt, ropes *b b'*, also suspended on the mast, with one end connected to a movable block D' and the other to the boom or suitable weight for counterbalancing the gaff, a fixed block D^2, and a rope E, said rope being attached to said movable block, passed to and through the fixed block, and connected to the endless belt, substantially as specified.



2. The combination, with the mast, boom, and gaff, of an endless belt extended alongside the mast, ropes *b b'*, suspended on the mast, with one end connected to the boom and the other through a movable block, a fixed block, and a rope E, connected with the endless belt, and ropes *c c'*, also suspended on the mast, with one end connected to the gaff and the other to the endless belt, substantially as specified.

413,247. HOT-BLAST STOVE. VICTOR O. STRÖBEL, Philadelphia, Pa. Filed July 22, 1889. Serial No. 318,288. (No model.)

Claim.—In a regenerative hot-blast stove, the combination, substantially as set forth, of a circular shell-wall, a metallic jacket for the stove, a pair of vertical walls arranged as chords of the stove-circle and extending from side to side of the stove and from the base of the stove to near the top thereof and forming a combustion-chamber between them, a pair of walls exterior to said combustion-chamber walls and parallel thereto and extending from near the base of the stove to the top of the stove, regenerative wall-work arranged in the two chambers formed between said last-mentioned walls and the shell-wall of the stove, a chimney-connection and cold-blast inlet at the top of the stove, a roof-flue placing said regenerative work in communication at the top of the stove with said chimney-connection and cold-blast inlet, regenerative flues formed in the two chambers immediately exterior to the combustion-chamber and extending from near the base of the stove to near the top thereof, and connections for gas and air of combustion and hot blast communicating with the base of said combustion-chamber.

413,248. PATTERN-LIFTER. JACOB R. WEIRICK, Reading, Pa., assignor of one-half to Henry J. Hunsicker, same place. Filed Mar. 29, 1889. Serial No. 305,263. (No model.)

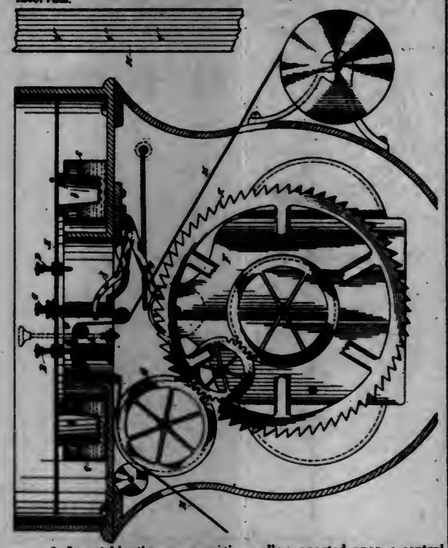
Claim.—1. A pattern-lifter consisting of a handle having a stem with a hooked end of reduced size, in combination with a receiver perforated to admit said hooked end and having a beveled under surface, all substantially as set forth.

2. A pattern-lifter consisting of a handle having a stem with tapering hooked end, substantially as described, in combination with a receiver having a tapering perforation adapted to admit said end and a beveled under surface, whereby said handle is firmly secured by rotating it, substantially as set forth.

413,249. COMPOSITION FOR PRESERVING ORANGES. AUGUST C. WUERPEL, Tampa, Fla. Filed May 24, 1889. Serial No. 311,909. (No specimens.)

Claim.—The herein-described composition of matter, to be used for removing the acid from the rinds of oranges and preventing them from rotting, consisting of water, alcohol, slaked or unslaked lime, flour of sulphur, spirits of ammonia, bicarbonate of soda, and alum, in the proportion specified.

413,250. AUTOMATIC RECORDING-COMPASS. CHARLES O. FARCOT, San Francisco, Cal., assignor of two-thirds to Nathan W. Spaulding and Charles Goodall, same place. Filed Sept. 22, 1886. Serial No. 214,269. (No model.)



Claim.—1. In combination, a compass having a pivoted or suspended magnetic needle, indicating or marking points or pencils arranged at different places upon said needle and at approximately equal distances from the pivot, each of said points being adapted to make a distinctive mark, and a surface upon which the said indicating-points may inscribe their marks, whereby the course of the vessel with any variations thereof, and also all complete changes of course, will be automatically indicated by the different marking-points being brought into action and making different marks upon said surface.

2. A compass having a centrally suspended or pivoted magnetic needle, with a series of indicating or marking points fixed to it in a circle around the central pivot, each of said points being adapted to make a distinctive mark, a surface or tablet beneath the needle, and a clock work or mechanism by which said surface is moved at a uniform rate of speed, in combination with a lever or equivalent mechanism connected with the clock, whereby the needle with its marking-points and the indicating-surface may be made to approach each other at regular intervals, substantially as herein described.

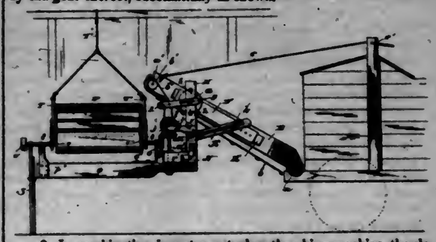
3. In combination, a centrally-suspended magnetic needle having marking-points arranged about its center corresponding to the various points of the compass, each of said marking-points being adapted to make a distinctive mark, and a strip with which the marking-points may be separately brought into contact, said strip being divided by transverse lines and moved at a uniform rate, whereby the times at which the vessel changed its course or deviated from its mean course may be automatically recorded.

4. In combination, a pivoted magnetic needle having marking-points depending therefrom, a receiving-surface arranged below the needle, said points being adapted to mark upon said surface, an annular float depending from the said needle, and an annular chamber containing liquid, all substantially as described.

5. In combination, a magnetic needle having marking-points B C D E having distinctive characters, said points being held rigidly to the needle and depending therefrom, a surface adapted to receive the marks from said points, a central pivot-pin for the needle, the whole structure—viz., needle, pivot-pin, and depending points—being adapted to have vertical movement, a lever or arm engaging with the pivot-pin, and an arm connected with said lever and actuated by clock-work, whereby at regular intervals the pivot-pin and needle will be raised, lifting the depending point from the receiving-surface, so that the needle will be free to turn and drop by gravity at regular intervals.

6. In combination, a magnetic needle supported upon a central pivot-pin, marking-points having distinct characters arranged at different points in a circle about the needle-center, and a marking-surface placed tangential to the path of the marking-points, whereby the said points separately engage with the marking-surface, substantially as described.

7. A pivoted magnetic needle having marking-points depending therefrom, an annular float fixed beneath the needle, and a corresponding chamber containing liquid in which the float rests, in combination with a table supported within the inner circumference of the liquid-containing chamber and above the plane of its bottom and a traveling tape or receiving-surface upon the top of said table in a vertical line beneath one side of the circle in which the marking-points are arranged, substantially as herein described.



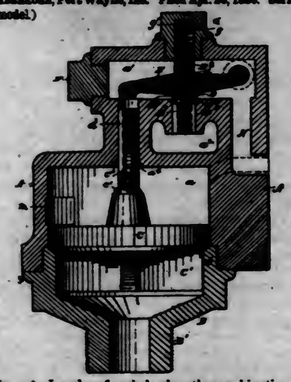
8. A pivoted magnetic needle having marking-points projecting downward at intervals in a circle around the pivot, an annular float fixed beneath the needle in a circle of larger diameter than that of the markers, and a similarly-shaped annular liquid-containing chamber within which the float dips, in combination with a receiving-surface and table and a lever by which the pivot-pin and needle are alternately elevated and depressed, all arranged within the inner circumference of the annular chamber, substantially as herein described.

9. A pivoted magnetic needle having marking-points projecting downward from it in a circle around its pivot, an annular float, and chamber with a table to support a receiving-surface beneath one side of the circle of the marking-points, as shown, in combination with a traveling receiving-surface moving across the table and an ink or printing ribbon passing across the table transversely to the receiving-surface.

10. A compass-needle fulcrumed upon a pivot and float within a bowl having gimbals, as shown, in combination with arms extending upward from the supporting-frame and the hinged suspending-joints N, substantially as herein described.

413,251. STRAW-CARRIER FOR THRASHING-MACHINES. JOSEPH H. FULTON, West Lebanon, Pa. Filed June 20, 1889. Serial No. 314,826. (No model.)

Claim.—1. The combination, in a straw-stacker thrashing-machine, of the elevator-frame B, provided with an adjustable frame carried thereby, said frame having suitable driving-gear, with a second adjustable carrier-frame secured to the adjustable frame and driven by the gear thereof, substantially as shown.



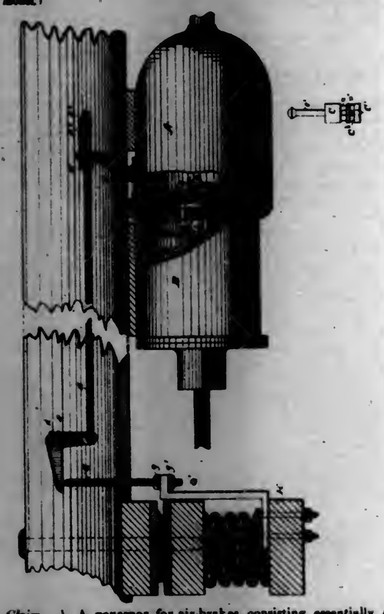
2. In combination, in a straw-stacker thrashing-machine, the elevator-frame B, pivotally attached to the thrashing-machine, and said frame to be adjustable vertically, a plate attached to the side of the elevator-frame and adapted to support adjustably one end of a frame composed of a standard H, foot-piece N, and beam O, gearing supported by the standard H, and a second adjustable conveyer secured to the foot-piece N of the adjustable frame, substantially as and for the purpose set forth.

3. The combination, in a straw-stacker for thrashing-machines, of an elevator B, carrying a frame which is adjustable thereon, said frame carrying a horizontal shaft having a sprocket-wheel and beveled pinion mounted thereon, the sprocket-wheel being driven by a belt from the sprocket-wheel on the elevator-frame, and a gear-wheel M, having teeth on both faces thereof, its lower teeth meshing with the beveled wheel attached to the shaft of the conveyer-frame P by an adjustable frame, substantially as shown, and for the purpose set forth.

4. In combination, in a straw-stacker thrashing-machine, an elevator B, either one of the side frames thereof having a plate E attached thereto, a disk G, rigidly secured to a movable plate adjustable upon the plate E, a standard H, pivotally secured to the disk and provided with clamps A, a slotted arm K, serving as a brace for the standard H, belt-tightener, and guide I, and bearings for horizontal shafts, through which power is transmitted to a second conveyer pivotally attached to the foot-piece of the standard H, substantially as shown, and for the purpose set forth.

5. The combination, in a straw elevator or carrier for thrashing-machines, of an elevator B, provided with a conveying-belt, and an adjustable frame, as shown, secured to one side of the elevator-frame, a second carrier mounted between the side frames T T, said side frames being adapted to be pivotally secured upon the shaft O' so as to be reversed thereon and convey the straw from the first elevator either to the right or left of the thrashing-machine, and a supplemental conveyer U, substantially as shown, and for the purpose set forth.

413,252. VALVE MECHANISM FOR AIR-BRAKES. THEODORE H. HAMERSLY, Fort Wayne, Ind. Filed Apr. 26, 1889. Serial No. 308,703. (No model.)

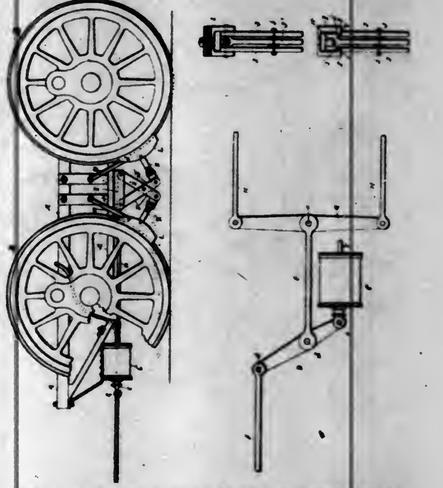


Claim.—1. In valves for air-brakes, the combination, with the casing having primary, secondary, and exhaust chambers, and having ports and connecting-openings, substantially as indicated, of primary valve C, so constructed as, when depressed, to close the induction-opening of the casing, and when elevated to close communication between primary and secondary chambers, and a valve for closing the exhaust-

opening, the latter valve having a lever attachment for engaging the primary valve, whereby the exhaust-valve is opened by the upward movement of the primary valve, substantially as set forth.

2. The combination, with valve-casing having primary, secondary, and exhaust chambers, of ducts respectively connecting the primary and secondary chambers and connecting the secondary and exhaust chambers, the primary chamber being connected with the air-supply and having a port connecting with the auxiliary air-reservoir, the secondary chamber having a port connecting with the brake-cylinder, a double-seated differential gravity-valve operating in the primary chamber for closing, when depressed, the induction-opening, and closing, when elevated, communication between auxiliary reservoir and brake-cylinder, such valve having a stem adapted to extend into the secondary chamber, and an exhaust-valve having a lever attachment adapted to engage the stem of the primary valve, whereby the exhaust-valve is opened by means of elevating the primary valve, substantially as set forth.

413,253. GOVERNOR FOR AIR-BRAKES. THEODORE H. HABERKORN, Fort Wayne, Ind. Filed Apr. 26, 1889. Serial No. 308,704. (No model.)



Claim.—1. A governor for air-brakes, consisting, essentially, of a valve located in the line of communication between the auxiliary air-reservoir and co-operating brake-cylinder, a spring for depressing the valve to its open position, the valve being raised to or toward its closed position by means of compressed air from the reservoir admitted under the valve, and a variable stop for limiting the upward or closing movement of the valve, such stop being automatically depressed by the down movement of the car-body caused by the load of the car, substantially as set forth.

2. In a governor for air-brakes, a valve located in the line of communication between cylinder and co-operating air-reservoir, the valve being adapted, according to its position, to admit more or less air to the cylinder, a spring for opening the valve, the reverse or closing movement of the valve being effected by compressed air admitted from the connected reservoir, and a stop for limiting the closing movement of the valve, such stop being automatically varied according to the load of the car, substantially as set forth.

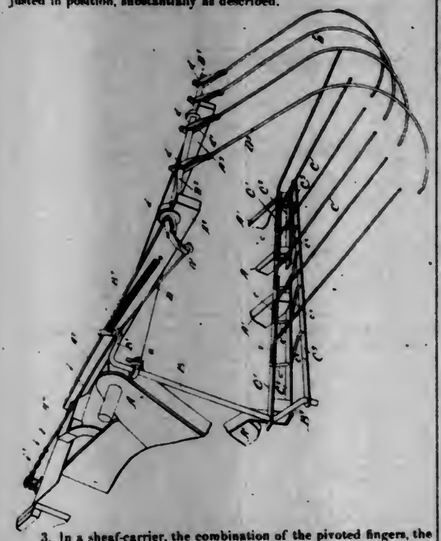
3. In a governor for air-brakes, a valve located in the line of communication between brake-cylinder and adjacent air-reservoir, such valve having graduated openings adapted to admit more or less air to the cylinder, according to the position of the valve, such valve being closed by air-pressure and opened by the action of the spring, and a variable stop for limiting the closing movement of the valve, such stop being automatically shifted in the direction of opening the valve by means of the depression of the car-body caused by the loading of the car, substantially as set forth.

4. In a governor for air-brakes, the combination, with reservoir, brake-cylinder, and valve C, substantially as indicated, of connected bell-crank levers D and E, located substantially as shown and supported directly or indirectly from the body of the car, the former lever engaging a stop connected with the car-trucks and the latter lever constituting a movable stop adapted to limit the closing movement of the valve, whereby the valve is held open with a maximum car-load and is more or less closed by reducing the load, substantially as set forth.

413,254. BRAKE FOR LOCOMOTIVES. THEODORE H. HABERKORN, Fort Wayne, Ind. Filed June 21, 1888. Renewed July 22, 1889. Serial No. 318,198. (No model.)

Claim.—1. In brake mechanism for locomotives, the combination, with a single cylinder for operating the brakes, of a lever attached to the piston, a single rod leading therefrom to the brakes on the tender, a rod leading forwardly from the lever, an equalizing-bar attached to the front end of said rod, and two rods attached to the equalizing-bar and connected to the brake mechanism of the driving-wheels, substantially as set forth.

2. The combination, with a cylinder located at or near one side of the engine, the piston-rod thereof being pivoted to the one end of a lateral lever, of connecting-rods F and E, pivoted, respectively, to the opposite end and midway of such lateral lever, the former rod leading rearward for operating the tender-brakes, the latter rod leading forward and connecting with an equalizing-bar at the center thereof, said equalizing-bar being operatively connected at either end with the respective brakes of the driving-wheels, substantially as set forth.

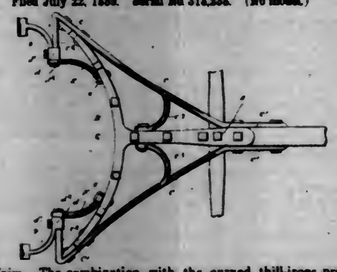


3. The combination, with depending levers J and J' of the bell-crank variety set in reverse order and pivoted together at the elbows thereof, the lower ends of these levers being connected with the brake-heads of the driving-wheels, the upper ends of levers J being pivoted to a fixed support, of mechanism, substantially as indicated, for operatively connecting the free end of levers J' with the piston-rod of a single cylinder for operating the brakes, substantially as set forth.

4. The combination, with yoke I, having depending legs and internal shelves i, of levers J and J' of the bell-crank variety and pivoted at the elbows, substantially as indicated, the levers J being pivoted to the yoke and the levers J', having lateral projections for engaging supporting-lodges, substantially as set forth.

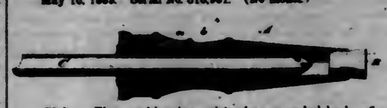
413,255. SHEAF-CARRIER FOR HARVESTERS. MARCUS KANE, Chicago, Ill., assignor to the Warder, Bushnell & Glessner Company, same place. Filed July 6, 1889. Serial No. 316,737. (No model.)

Claim.—1. In a sheaf-carrier, the combination, with the binder-frame, of the upper depending fingers mounted on a rock-shaft, the lower fingers supported on vertical or approximately vertical pivots, a suitable link connecting said lower fingers together so that they are vibrated in unison, a double-crank shaft, and suitable connections between the upper crank on said crank-shaft and a crank on the before-mentioned rock-shaft, together with suitable connections between the lower crank on said crank-shaft and the before-mentioned link, substantially as described.



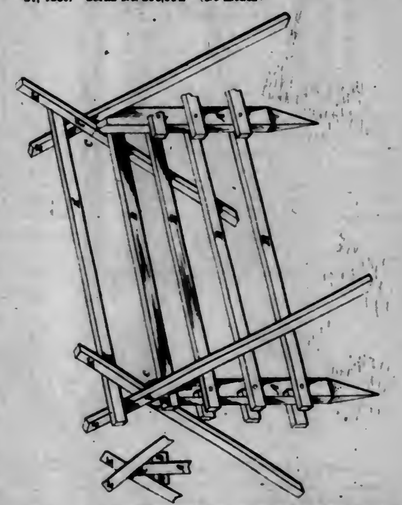
2. In a sheaf-carrier, the combination, with the binder-frame, of the upper depending fingers mounted on a rock-shaft, the lower fingers supported on vertical or approximately vertical pivots, a suitable link connecting said lower fingers together so that they are vibrated in unison, a double-crank shaft, and suitable connections between the upper crank on said crank-shaft and a crank on the before-mentioned rock-shaft, together with suitable connections between the lower crank on said crank-shaft and the before-mentioned link, a spring for turning said double-crank shaft and dumping the sheaf, and a treadle connected to said crank-shaft, by which the sheaf-carrier may be readjusted in position, substantially as described.

3. In a sheaf-carrier, the combination of the pivoted fingers, the spring which tends to swing said fingers about their pivots in the direction to dump the sheaf-carrier, together with the treadle and connections which act to readjust the pivoted fingers in position, the said connections being such that when the said treadle is down upon the seat-board the line of thrust upon it passes below the fulcrum on which it turns, substantially as described.



4. In a sheaf-carrier, the combination of the binder-frame, upper and lower sets of vibratable fingers, suitable connections between said sets of fingers, and a common lever, together with a spring, which tends to draw said lever in the direction to swing the two sets of vibratable teeth apart, whereby through the vibration of the lever in one direction and its automatic retraction by the spring the two sets of vibratable fingers are simultaneously operated, substantially as described.

413,256. WAGON-TONGUE. JAMES T. KETCHLEDGE, Tunkhannock, Pa. Filed July 22, 1889. Serial No. 318,236. (No model.)



Claim.—The combination, with the curved thill-irons provided with sleeves, of the tongue, the cross-bar, the brace-rods secured to the tongue and the cross-bar and having their ends extending around the rear of the cross-bar and threaded, the curved stay-irons having perforated ends, each of said stay-irons having one of its ends bolted to the cross-bar and its other end receiving the threaded end of the brace-rod, and nuts for securing the stay-irons to the brace-rods, substantially as described.

418,257. BEER-FAUCET. HENRY KOLL, South Omaha, Nebr. Filed May 16, 1889. Serial No. 310,961. (No model.)

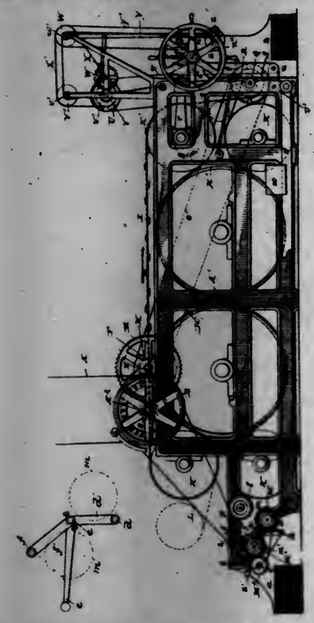
Claim.—The combination, with the extended body of a faucet, of a removable tapered plug independent of the inner end of said tapered portion, and a flexible elastic strip connected to said plug and extending longitudinally within the body of the faucet, and secured within an opening in the bore of the same by a removable pin, substantially as set forth.

413,258. FENCE. PETER LICHTNER, Landisburg, Pa. Filed Jan. 21, 1889. Serial No. 296,964. (No model.)

Claim.—A panel-and-rider fence, each panel having a single post at each end, said posts connected by stringers, the top of these posts being beveled, and to each post a pair of cross-stakes, both bearing at their juncture on the beveled top of the posts, and riders resting in the crotch of the cross-stakes, all substantially as described.

413,259. COMBINED SHEATHING AND LATH. THOMAS MASON, Topeka, Kans. Filed Dec. 21, 1888. Serial No. 294,300. (No model.)

Claim.—A combined sheathing and lath wherein the grooves for keying the mortar are cut in curved lines, substantially as shown and specified.



413,260. MACHINE FOR PRESSING CLOTH. GEORGE W. MILLER, Woonsocket, R. I. Filed Aug. 5, 1887. Serial No. 246,186. (No model.)

Claim.—1. In a cloth-pressing machine, the combination of the supporting-frame A' A', two pressing-cylinders arranged side by side, guide-rollers arranged at the ends of the machine outside of the said cylinders, continuous pressing-band supported by said rollers to encircle the cylinders except opposite the ends of the machine, a cloth-feed at one end of the machine opposite the uncovered part of one of the cylinders, and a cloth-receiver opposite the uncovered space of the other cylinder, substantially as described.

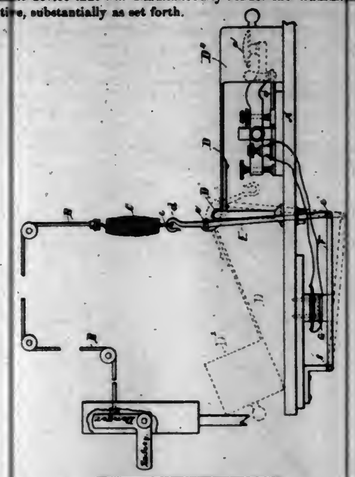
2. In a cloth-pressing machine, the combination of two pressing-cylinders arranged side by side, two guide-rollers arranged one above the other at the side of each cylinder and at the ends of the machine, one roller being adjustable, a continuous pressing-band supported by said rollers to encircle the cylinders except opposite the space between the adjacent guide-rollers, and means for adjusting the adjustable roller to change the tension upon the belt, substantially as described.

3. In a cloth-pressing machine, the combination of the frame A'

A', the pressing-cylinders H H', mounted side by side therein, the rollers K K' K K, also mounted in said frame near its opposite ends, and the endless pressing-band passing around said rollers and partially encircling the cylinders, it passing both over and below both cylinders, though not in contact therewith, in its passage between the rollers at the opposite ends of the machine, substantially as described.

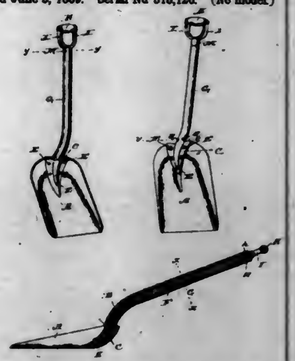
4. In a cloth-pressing machine, the combination of a cylinder, an endless pressing-band, the guide-rollers supporting the band in a position partially encircling the cylinder, the adjustable bearings in which one of the rollers is mounted, the yielding pressure device to maintain the band under tension, and devices, substantially as described, whereby said pressure device is adjustably connected with said bearings, substantially as described.

5. In a cloth-pressing machine, the combination of a cylinder, an endless pressing-band, guide-rollers K K' K K, supporting the band, sliding bearings in which roller K' is mounted, screws *q*, connected with the sliding bearings, a transverse shaft *n*, and gear-connections, whereby said screws *q* may be simultaneously rotated, and yielding pressure-levers bearing against said screws to maintain tension on the band, substantially as described.



6. In a cloth-pressing machine, the combination of a cylinder, an endless pressing-band, guide-rollers supporting the band in a position partially encircling the cylinder, sliding bearings in which one of said rollers is mounted, screw-rods connected with the sliding bearings, a transverse shaft *n*, gears between said screw-rods and shaft, one such gear being fast to one screw-rod and the other loose on the other screw-rod, and a clutch member *y*, substantially as described.

7. In a cloth-pressing machine, the combination of a cylinder, an endless pressing-band, guide-rollers supporting the band in a position partially encircling the cylinder, sliding bearings in which one of the rollers is mounted, rods *q*, connected with said bearings and extending rearward therefrom, levers through which pressure is applied to said rods, and pivoted adjusting-bearings for said rods carried by the levers, substantially as described.



8. The combination of the regulator-shaft *c*, a handle for moving the same, two regulator-roll frames separately adjustable on said shaft and extending in different directions therefrom, and means for retaining said frames in their adjusted positions, substantially as described.

413,261. METHOD OF OPERATING RAILROAD-TRAIN ORDERS, &c. ALBERT M. MOSIER, Galion, Ohio. Filed July 3, 1889. Serial No. 316,475. (No model.)

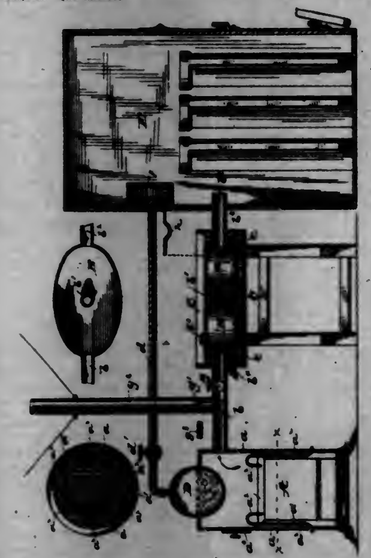
Claim.—The method or system herein described of operating signals and transmitters for railway service, and consisting, essentially, in holding the safety-signal in position displayed by means of a suitable device that will simultaneously render the transmitter inoperative, substantially as set forth.

413,262. SHOVEL OR SCOOP. ROBERT T. PETTEBONE, Wyoming, Pa. Filed June 5, 1889. Serial No. 313,126. (No model.)

Claim.—1. The combination, with the blade of a shovel or scoop having the depression therein, of the back strap having the extended lower end removably secured within the said depression and formed into the tubular handle at the upper end, substantially as described.

2. The combination, with the blade of a shovel or scoop, of the back strap having the extended flanged lower end secured to the blade on the outside, the tubular-handle portion, and the front strap on the blade secured to the lower end of the tubular-handle portion, substantially as described.

3. The combination, with the blade of a shovel or scoop having the depression in the rear portion, of the back strap having the extended flanged lower end removably secured within said depression and having the tubular-handle portion integral therewith, and the front strap on the blade removably secured to the lower end of the tubular-handle portion, as set forth.



4. As an improved article of manufacture, a shovel-handle formed of sheet metal, having the edges brought together on the upper side, with the flanged lower end on the under side, substantially as described.

5. The combination, with the blade having the front strap thereon, of the back strap having the extended lower end, the sheet-metal tubular handle integral therewith, having the edges brought together on the upper side, the bolts uniting the lower corners of the tubular portion and front strap, and the bolts uniting the back strap and blade, substantially as described.

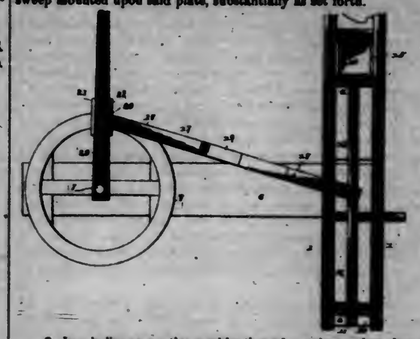
6. The combination, with the tubular handle formed of sheet metal and the blade and front strap, of the crossed bolts passing through the handle and uniting the same and front strap, substantially as described.

7. In a shovel, the combination, with the tubular handle or sheath, of the wooden core and the separate malleable-iron grip or handle secured thereon, and against which the upper end of the tubular portion abuts, substantially as described.

413,263. APPARATUS FOR HARDENING ARTIFICIAL STONE. GEORGE RICHARDSON, Washington, D. C. Filed Sept. 7, 1888. Serial No. 323,239. (No model.)

Claim.—1. In an apparatus for hardening artificial stone, the combination, with the indurating-chamber, of gas and steam generators having each a pipe-delivery into said indurating-chamber, a cooling-box located in said gas-pipe intermediate the gas-generator and indurating-chamber, and a perforated cooling-box in the indurating-chamber, into which the steam is delivered, substantially as and for the purposes described.

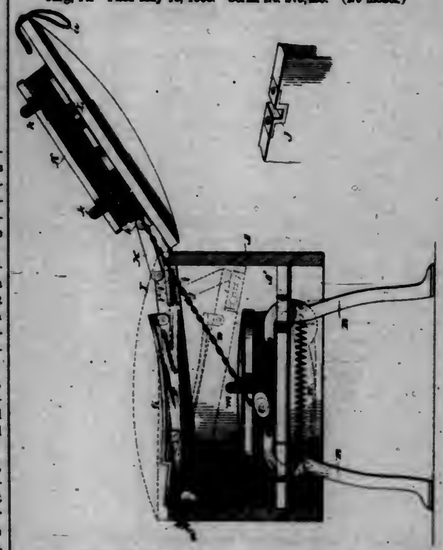
2. In an apparatus for hardening artificial stone, the combination, with the gas-generating furnace and indurating-chamber, of a flue leading from the furnace to the chamber, a box or enlargement located in said flue, through which the gas is caused to pass, and a tank containing cold water, in which said box or enlargement is immersed, whereby the gas is cooled in its direct passage to the indurating-chamber, substantially as and for the purposes described.



3. In an apparatus for hardening artificial stone, the combination, with a steam-generator and indurating-chamber, of a perforated cooling-box, into which the steam is delivered from the generator, said cooling-box located in the indurating-chamber, substantially as and for the purposes described.

4. In an apparatus for hardening artificial stone, the combination, with the indurating-chamber, of a carbonic-acid-gas-generating furnace having a lining of fire-brick and a series of goose-neck air-inlet pipes arranged in said lining, whereby the air will be drawn in near the bottom of said furnace and discharged in downward jets above the fuel, and a gas-pipe leading from the furnace to the indurating-chamber, substantially as and for the purposes described.

413,264. HAY-PRESS. GEORGE W. ROSEBERRY, Elmo, Tex. Filed July 25, 1889. Serial No. 318,619. (No model.)



Claim.—1. In a baling-press, the combination of the frame, the baling-chamber at the front end of the same, the plunger, the toggle-links connecting said plunger with a cross-piece at the rear end of the frame, a base extending laterally from the frame, a horizontal crank mounted pivotally upon said base, the pitman connecting said crank with the connecting-point of the toggle-links, said pitman consisting of end pieces connected by a bridge-piece lying in a lower plane than the said end pieces, and an operating-sweep, substantially as set forth.

2. In a baling-press, the combination of the frame, the baling-chamber, the plunger, the toggle-links connecting the latter with a cross-piece at the rear end of the frame, a base extending laterally from the frame, a crank mounted horizontally upon said base, a bolt mounted rigidly in the outer end of said crank, a pitman connecting said bolt pivotally with the connecting-point of the toggle-links, a flanged plate mounted rigidly upon the upper end of said bolt, and a sweep mounted upon said plate, substantially as set forth.

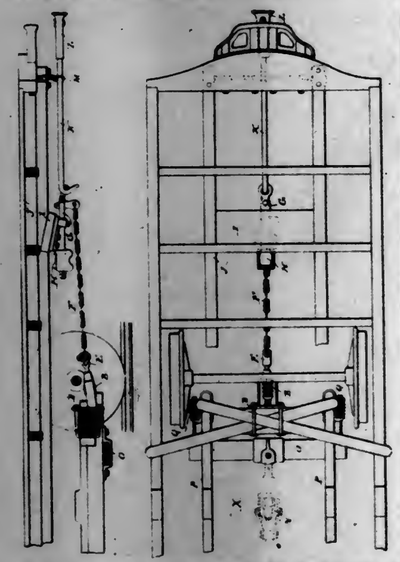
3. In a baling press, the combination of a reciprocating plunger, toggle-links connecting said plunger with a cross-piece at the rear end of the press-frame, a horizontal crank mounted upon a laterally-extending base, a pitman connecting the outer end of said crank with the connecting-point of the toggle-links, a sweep mounted rigidly upon the upper end of the bolt, connecting said crank and pitman, a wheel or roller at the lower end of said bolt, and a circular track supporting said roller, substantially as and for the purpose set forth.

413,265. SHOE-BLACKING-KIT CASE. EDWIN D. SMITH, Pittsburg, Pa. Filed May 10, 1888. Serial No. 273,426. (No model.)

Claim.—1. The combination, in a blacking-kit, of a receptacle provided with a hinged top, legs hinged to the bottom of the receptacle and flexibly connected to the top, so as to open away from the bottom when the lid is raised, substantially as shown, and for the purpose set forth.

2. The combination, in a blacking-kit, of a receptacle having a hinged top, legs hinged to the bottom of the receptacle, springs connected to said legs beneath their pivots for folding said legs against the bottom, and flexible connections attached to the upper portion of the legs and to the hinged top for moving said legs away from the bottom when the top is raised, substantially as shown, and for the purpose set forth.

3. The combination, in a blacking-kit, of a receptacle having a hinged top, chains connected to said top and passed through pulleys to the inwardly-turned ends of the legs B, the legs being hinged to the under side of the bottom of the receptacle, one of the pair of legs being provided with pulleys, springs connected to said legs beneath



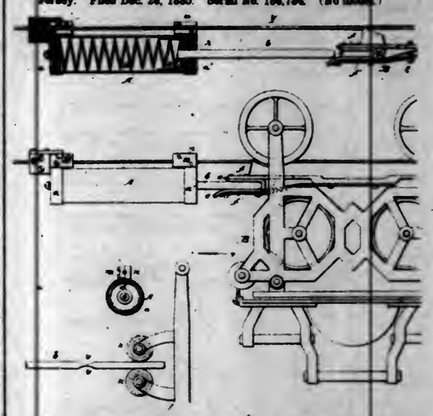
the bottom for closing the same, and a pivoted bar carrying a latch for holding the receptacle in a raised position, substantially as shown, and for the purpose set forth.

4. The combination, in a blacking-kit, consisting of a suitable receptacle having a hinged top, and folding legs hinged to the bottom of the receptacle, and flexible connections secured to the top and inner ends of the legs for moving said legs to or from the bottom of the receptacle, a pivoted bar F, connected by a link to the hinged top, and a spring-actuated latch for locking said bar and top in a raised position, substantially as shown, and for the purpose set forth.

5. In combination with a receptacle A, having a bottom A' secured above the lower edge thereof, said bottom having openings therein through which the upper ends of the legs pass, legs B B, hinged under said bottom and having their upper ends bent inwardly, springs E, for holding said legs against the under side of the bottom, a chain D, attached to the opposite legs of each pair, said chain passing through pulleys C C connected to the other legs and secured to the hinged top of the receptacle, a pivoted bar F, carrying a foot-rest, a link H, connected to said hinged bar and to the top of the receptacle, and a spring-actuated latch I, substantially as shown, and for the purpose set forth.

6. A combined shoe-blacking case and hassock consisting of a casing having a fixed bottom, a lid hinged to the top thereof, legs hinged to the bottom with their upper curved ends protruding through openings in said bottom, and chains secured at one end to the hinged lid and connected at their other ends to the upper ends of the legs, whereby the legs may be extended to a supporting position by the raising of the lid, substantially as described.

413,266. CAR DRAW-HEAD. JOHN STEPHENSON, New York, N.Y.
Filed Aug. 10, 1889. Serial No. 320,394. (No model.)



Claim.—1. A car draw-head apparatus with the head supported by a link or chain hanging on a transverse bar near the car end, whereby the buffer draw-head may have freedom of motion in any required direction, substantially as and for the purpose described.

2. A car draw-head apparatus having a draw-head with its draw-spring secured to the cross-rail of a car-truck, with its grip-carrier having freedom of motion in a central well of the truck and yieldingly connected with the frame to allow the cable when gripped to put the truck in motion before starting the car-body, substantially as and for the purpose described.

3. A car draw-head apparatus consisting of a buffer draw-head supported at one end of the car by a link or chain on a transverse bar, and connected by a stiff bar with a spring sliding bar, on which is a double-acting spring capable of being crushed by pull or push of the buffer draw-head, the spring sliding bar having chain-connection with a draw-spring attached to the car-truck, substantially as and for the purpose described.

413,267. BUFFER FOR STORE-SERVICE APPARATUS. JACOB F. TIERRELL and ARIUS B. TAYLOR, Boston, Mass., assignors, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey.
Filed Dec. 28, 1885. Serial No. 186,734. (No model.)

Claim.—1. In a store-service apparatus, the combination of a track, a car traveling thereon, a yielding stop carried by or adjacent to the track, and a clamp on the car provided with jaws arranged to grasp and move with their opposite faces in frictional contact with said stop, substantially as described.

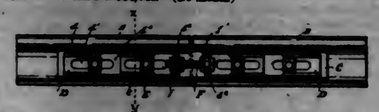
2. The combination, with a track and a car-buffer having a longitudinally-yielding rod *b*, of a car provided with a clamp having parallel faces arranged to make contact with and move frictionally against the opposite sides of the rod in the direction of its length, substantially as set forth.

3. The combination, with the track of a store-service apparatus, of an air-cushion provided with a projecting rod and a car having a clamp with parallel jaws arranged to make frictional contact with the sides of the rod and to move thereon as the car approaches the point where it is to be arrested, substantially as described.

4. The combination, with the track and car of a store-service apparatus, of a frictional buffer consisting of a clamp having longitudinal parallel friction-faces extending in the line of the track and a rod or bar also extending in the line of the track and adapted to enter endwise between the frictional faces of the clamp, whereby to gradually increase the extent of frictional surface and resistance to the movement of the rod, substantially as described.

5. The combination, with the track and car of a store-service apparatus, of a rod *b*, supported in the line of the track, and a frictional clamp arranged to slide upon the rod in the direction of its length, and consisting of two parallel jaws, one fixed and the other yielding, and arranged to receive between them the end of the rod, substantially as described.

6. The combination, in a store-service apparatus, of a track and a car, an air-cylinder provided with a piston and projecting rod arranged adjacent to the track, and a spring-clamp arranged upon the car to receive the end of the rod and to slide upon the same with a frictional resistance, substantially as set forth.

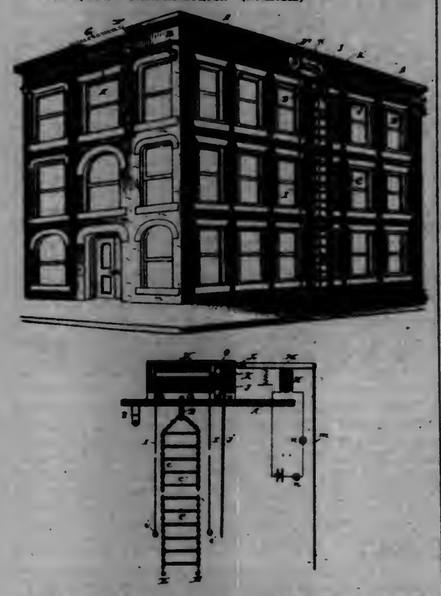


7. The combination, in a buffer for store-service apparatus, of an air-cushion, a yielding stop supported thereby, and a frictional clamp, one carried by the car and the other adjacent to the way, and arranged to operate substantially as set forth.

413,268. SCREW-PROPELLER. LEWIS N. TOWNE, New Brighton, N. Y.
Filed May 21, 1884. Serial No. 132,336. (Model.)

Claim.—A propeller-wheel having a blade or blades transversely leaned or extended back in a plane parallel with the axis of the hub, the said blade or blades being of such width that the fore and aft edges will extend at all parts between two parallel planes at right angles to the axis of the hub, substantially as specified.

413,269. NUT-LOCK. JAMES R. TYSON, Reading, Pa.
Filed June 13, 1888. Serial No. 314,702. (No model.)



Claim.—1. The combination, with the fastening bolts and nuts, of the slotted wedge-bolts with ears d^3, and a bolt F, connecting said plates, all adapted to operate substantially as set forth.

2. The combination, with the fastening bolts and nuts, of the slotted plates provided with the flat surfaces d^4, flanges d, and ears d^3, and a bolt F, connecting said plates, all substantially as set forth.

3. The combination, with the fastening bolts and nuts, of the slotted wedge-plates provided with flat surfaces d^4, flanges d, and ears d^3, and a bolt F, connecting said plates, all substantially as set forth.

4. The combination, with the rails, fish-bar, and fastening bolts and nuts, of the slotted wedge-plates provided with flat surfaces d^4, flanges d, and ears d^3, and a bolt F, with nuts f and f' connecting said plates, all substantially as set forth.

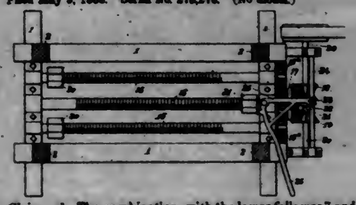
413,270. FIRE-ESCAPE. ORRIN T. WILSON, Topeka, Kans.
Filed Dec. 24, 1888. Serial No. 294,540. (No model.)

Claim.—1. In a fire-escape, the combination, with a permanently-secured windlass or drum and a permanently-secured rail, of a ladder adapted to be wound upon the windlass or drum and having one end attached to the rail, substantially as described.

2. In a fire-escape, the combination, with a permanently-secured windlass or drum and a permanently-secured rail, of a ladder one end of which is permanently but freely secured to the rail and the other end of which is detachably secured to the windlass, the arrangement being such that the ladder is adapted to be wound upon the windlass, substantially as set forth.

3. In a fire-escape, the combination, with a permanently-secured windlass and a permanently-secured rail, of a ladder provided with a traveler permanently but movably secured to the rail, and cords permanently connected to the windlass adapted to be connected to the free ends of the ladder, substantially as described.

4. In a fire-escape, the combination, with a permanently-secured windlass and a permanently-secured rail, of a ladder supported upon the rail, cords connected to the windlass adapted to engage the free ends of the ladder, and a friction-pulley upon the windlass, whereby the ladder may be wound thereon, substantially as described.



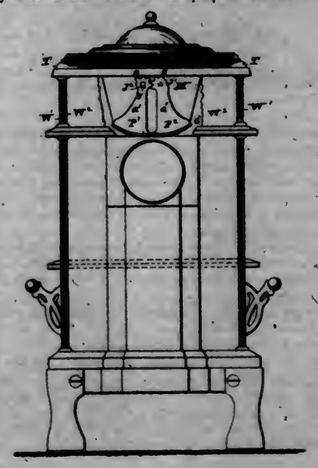
5. In a fire-escape, the combination, with a permanently-secured windlass, of the cords connected thereto, a ladder adapted to be connected to the cords, a friction-pulley connected with the windlass, a tension device also connected to the windlass, and a pawl and ratchet controlling the movement of the windlass, substantially as described.

6. In a fire-escape, the combination, with a windlass adapted to retain a ladder, of a tension device normally holding the windlass under strain, a pawl and ratchet holding in check the tension device, and connections for operating the pawl and ratchet to release the windlass, substantially as described.

7. In a fire-escape, the combination, with a permanently-secured rod, of a ladder permanently secured to the rod, but free to travel thereon, and a windlass adapted to hold the ladder when not in use, substantially as described.

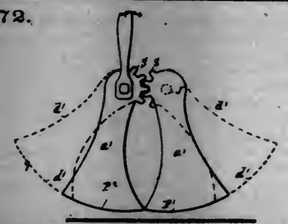
8. In a fire-escape, the combination, with a permanently-secured rod, of a ladder one end of which is secured thereto, but free to travel thereon, and a permanently-secured windlass provided with cords to engage the ladder and store the same when not in use, substantially as described.

413,271. BALING-PRESS. CARLOS G. WILSON, Milledgeville, Ga.
Filed May 9, 1888. Serial No. 273,276. (No model.)



Claim.—1. The combination, with the lower follower 7 and cross-head 14, of the three screws 15 16 15, the nuts 30 31, traveling on said screws, and the paired toggle-bars carried by the said nuts and stepped at their opposite ends into the follower and cross-head, respectively.

2. The combination, with the lower follower 7, cross-head 14, screws 15 16 15, and nuts 30 31, of the toggle-bars 32 33, stepped into the follower and crossing or passing one another, as herein shown and described, to afford increased length of stroke.

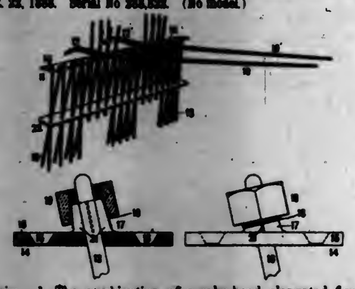


3. The combination of the press-box, upper and lower followers, cross-heads, tie-rods, and crossed toggle-bars operated by separate screws geared together so as to have simultaneous movement, substantially as described.

413,272. MAGAZINE-STOVE. GURDON G. WOLFE, Troy, N. Y., assignor to the Fuller & Warren Company, same place.
Filed Jan. 2, 1889. Serial No. 295,144. (No model.)

Claim.—The combination, with a magazine that is arranged within the combustion-chamber and above the fire-pot of the stove, of a magazine-bottom that is made in two parts, which are hung upon journals at the sides of the magazine, said journaled parts being connected by engaging geared sectors and arranged to be operated substantially in the manner as and for the purposes set forth.

413,272.



413,273. PLATFORM ROCKING-CHAIR. JOHN W. BROWN, Rock Falls, Ill. Filed Mar. 29, 1889. Serial No. 305,755. (No model.)

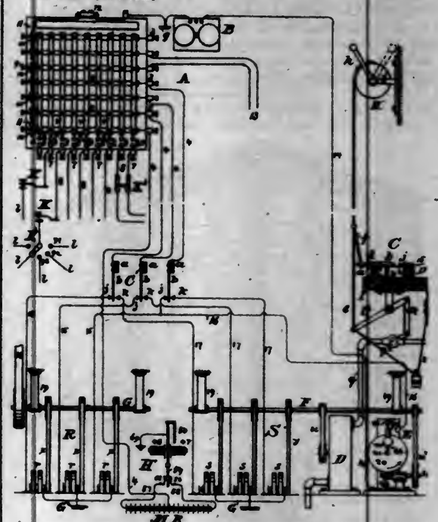
Claim.—In a platform rocking-chair, the combination of the rocker A, the plate D, attached thereto and provided with projection R and stud E, the platform B, the plate F, attached to said platform and provided with recess P and lugs M, N, and O, the pendant H, provided with the spring-supporting lugs K K and lug T, and with opening J, adapted to be loosely collared on stud E, springs L L, having respectively their upper ends inserted between the lugs M and N, their central portions curved outwardly parallel with said rocker, and their lower ends supported on said lugs K K, and the wires S and V, respectively passed over the outside of the springs L L and their extremities suitably fastened in the outer ends of the lugs O and M and K and T to hold said springs in their aforesaid position, substantially as shown, and for the purpose described.

413,274. WEEDER. WILLIAM A. BROWN, Lynn, Mass. Filed Oct. 22, 1888. Serial No. 288,322. (No model.)

Claim.—1. The combination of a rake-head, elongated fingers vertically adjustable therein, and a vertically-adjustable check-bar through which said fingers pass, substantially as described.

2. The combination of a rake-head, finger-holders thereon having split thimbles provided with external screw-threads, elongated fingers adjustable in said holders, and nuts on said thimbles for causing them to clamp the fingers.

3. The combination of a rake-head, finger-holders thereon, each comprising an attaching-plate and a conical split thimble, elongated fingers adjustable in said thimbles, and nuts on said thimbles, substantially as described.



4. A finger-holder for a rake-head, consisting of an attaching-plate and a conical split thimble thereon provided with an external screw-thread for receiving a nut, substantially as described.

413,275. METHOD OF MAKING UMBRELLA-RUNNERS. FREDERICK A. ELLER, Tabard Works, County of Surrey, England. Filed May 31, 1888. Serial No. 274,471. (No model.) Patented in England May 28, 1887, No. 7,616; in France May 3, 1888, No. 190,364; in Belgium May 3, 1888, No. 81,695; in Germany May 4, 1888, No. 45,574, and in Austria-Hungary Feb. 4, 1889, No. 46,035 and No. 1,396.

Claim.—The herein-described mode of manufacturing umbrella runners and top notches, each in a single piece of metal, which consists in first turning down a portion of the length of metal tubing and in then upsetting the remainder of said tubing in dies, as and for the purpose specified.

413,276. CENTRAL-STATION CALLING APPARATUS. ISAIAH H. FARNHAM, Malden, Mass., assignor to the New England Telephone and Telegraph Company, of New York. Filed Apr. 20, 1889. Serial No. 307,946. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, in a call apparatus for telephone-exchanges, of a series of magneto-electric generators operated by power, connecting-wires extending therefrom to the signal-sending appliances of a series of telephone-switch-board sections, each of the said wires being adapted to form part of a sub-station circuit for sending outgoing signals, a distributing switch-board placed in the circuit of said wires between the generators and the telephone switch-board, and means, as indicated, for testing the said generators and their connecting-wires, for the purposes specified.

2. In a call apparatus for telephone exchanges, a series of magneto-electric generators operated by power, connecting-wires extending therefrom to the signal-sending appliances of a series of telephone-switch-board sections, each of the said wires being adapted to form part of a sub-station circuit for sending outgoing signals, a distributing switch-board placed in the circuit of said wires between the generators and the telephone switch-board, whereby the connection of the generators with the switch-board sections may be varied at will, and a testing device for the said generator-circuit, comprising a series of test-keys located at the said switch-board, one in permanent connection with each generator-wire, and an electro-magnetic alarm-instrument connected on one side to earth and on the other with the common front contact of the said keys, substantially as and for the purposes specified.

3. In a call apparatus for central telephone-stations, a series of magneto-electric generators operated by steam or other power, connecting-wires extending therefrom to the signal-sending appliances of a series of telephone switch-board sections, each of the said wires being adapted to form part of a sub-station or trunk circuit for the purpose of sending outgoing signals, a series of equalizing resistances interposed in the generator-circuits—one for each—between the said generators and the said signal-sending appliances, and means for shunting or short-circuiting the said resistances, substantially as described, and for the purposes specified herein.

4. The combination, substantially as hereinbefore described, of a series of constantly-operating electric generators, circuit-connections therefor extending therefrom, a distributing switch-board receiving the outer ends of said circuit-connections, extension-wires leading from the said distributing switch-board to the signal-sending appliances of a series of telephone-switch-board sections, a series of equalizing resistance-coils interposed in the circuit of said extensions, one for each, and a shunt-circuit controlled by a manual circuit-closer for each resistance.

5. The combination, in a telephone-exchange, of two sets of magneto-generators for sending outgoing call-signals, one of the said series of generators being regularly operated by steam or other power, the other series being adapted to be actuated by a water or other motor under the control of the central station, an automatic circuit-changing switch interposed between the telephone switch-board and the two series of generators, and adapted, when operated, to disconnect one of the said series of generators from the said switch-board and to connect the other in lieu thereof, duplicate circuit-connections extending, respectively, from the two series of generators to the said automatic switch, and a single set of circuit-connections extending therefrom to the telephone-switch-board sections, and in circuit with one or the other of the series of generator-connections, according to the position of said automatic switch, a mechanical controlling device located in the central station acting upon the throttle of the water-motor, whereby the same can be started or stopped from the said station, and means, substantially as described, actuated by the said motor-controlling device, whereby the automatic switch may be simultaneously operated by the action of starting or stopping the motor, and the circuit-connections thereupon changed from the quiescent to the active generators.

6. In a central station of a telephone system, a regular series of magneto-generators for furnishing currents for sending outgoing signals, adapted for practically constant operation and actuated by steam or other power, a supplementary or substitute series of similar generators actuated by a water-motor or like local power and adapted to be brought into action during the temporary stoppage of the regular series, an automatic switch controlling the circuit-connections of both generators and adapted to connect the series at any given moment in operation with the switch-board, and to disconnect therefrom those which are quiescent, and means, substantially as described, comprising, as shown, a link-and-lever mechanism extending from a manually-operated lever in the operating-room to the valve or throttle of the water-motor and also to the said automatic switch, whereby the said motor may be thrown into and out of operation as required, and whereby the said automatic switch may simultaneously and without independent action be moved in correspondence therewith.

7. The combination, substantially as hereinbefore described, of two series of call-generators operated by independent sources of power, one of the said series being intended for regular operation and being actuated by power uncontrolled by the central station, and the other being adapted for use in case of the temporary stoppage of the first and being actuated by power—such as a water-motor—controlled by means of suitable mechanism at the central station, an automatic circuit-changing switch actuated also by the said controlling mechanism and adapted to transfer the switch-board generator-wires from one series of generators to the other when the substitute generators are started and stopped, and an alarm-signal comprising a bell or other electro-magnetic device, an electric circuit, and an intermittent circuit-closer therefor, the said alarm being adapted to be actuated only by the simultaneous and concurrent action of both series of generators, whereby the central-station operator may be notified whenever the water-motor is being unnecessarily employed.

8. The combination of two series of magneto-electric generators driven by independent sources of power, with an automatic electro-magnetic alarm adapted to indicate the concurrent operation of both series, the said alarm having its actuating-magnet included in circuit with a generator of one of the said series and deriving its actuating-current therefrom, and an intermittent and periodic circuit-closer and breaker included also in said alarm-circuit and operated by the driving mechanism of the other series, substantially as and for the purpose specified.

9. The combination of two series of magneto-electric generators driven by independent sources of power, with means for indicating at a given point that both series are working at the same time, said means comprising an electric circuit, an electro-magnetic alarm-instrument included therein, an intermittent vibratory circuit-closer operating at intervals to momentarily close the said circuit, said circuit-closer being actuated by the motor mechanism of one of the series of generators and one of the generators of the other series, the said generator being included in the said electric circuit with the circuit-closer and alarm, whereby attention may be called to the unnecessary simultaneous operation of both series by an alarm capable of being operated only when both series are at work, substantially as described.

10. The combination, with a regular series of power-driven magneto-generators, of a normally-open alarm-circuit including an electric bell and one of the said generators, an auxiliary or substitute series of generators driven by independent power and adapted for use when the first series are temporarily stopped, and an intermittent vibratory circuit-closer also included in the said normally-open circuit, actuated by the motor mechanism of the said substitute series of generators and adapted to close the alarm-circuit at intervals, whereby the simultaneous operation of both series of generators is automatically announced, as set forth.

11. The combination of an intermittent circuit-closer comprising the rotary disk 20 and the pin 24, carried thereon, the pendulum or rod 22, the spring-contact 26, supported thereby, and the insulated fixed contact-piece 27, the said wheel being arranged to rotate in such a direction that the pin will strike the pendulum away from said fixed contact, with an electric circuit and an alarm-instrument included therein, the said spring 26 and fixed contact 27 being, respectively, terminals of the said electric circuit, whereby a brief and intermittent and periodic signal may be given only when the rotary disk is in motion at the same time that an electro-motive force is connected with said circuit.

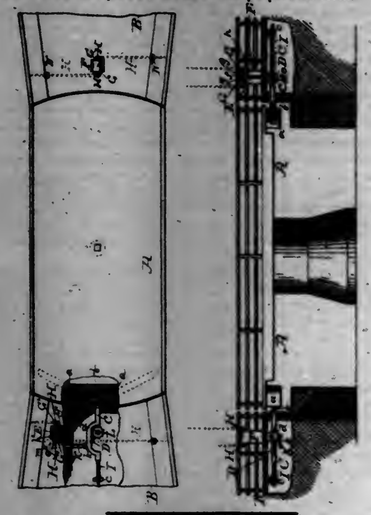
12. In a telephone central-office system, the combination, substantially as hereinbefore described, of a series of power-driven magneto-electric generators adapted for regular and constant use, a substitute series of generators driven by independent power under the control of the central station and adapted for use when the first series are from any reason at rest, for the purpose of maintaining at all times a supply of calling-currents, an automatic signal, substantially of the character indicated herein, comprising an electro-magnetic alarm, a normally-open electric circuit in which the same is included, and a circuit-closer actuated by the stoppage of the first series of generators for the purpose of calling attention to such stoppage, and an independent automatic alarm operated by the current of one of the generators of the first series flowing in an electric-bell circuit which is closed at intervals by the motor mechanism of the generators of the substitute series, whereby attention is called to the simultaneous operation of both series, substantially as described.

13. The combination, with two series of magneto-electric generators actuated by independent sources of power, of an electric alarm or signal adapted to become operative only when both series are working at the same time, the said alarm comprising an electric circuit, an electric signal-bell included therein, one of the generators of one of the series and a periodic circuit-breaker driven by the motor mechanism of the other series.

14. The combination, with two series of magneto-electric generators actuated independently by suitable power, of an electric signal or alarm adapted to indicate the simultaneous operation of both series and depending upon the concurrent action of a current developed by the generators of one series and the movement of the motor mechanism of the other series, the circuit of said signal being provided with an intermittent and periodic circuit-closer driven by the motor mechanism of one generator series and including one of the generators of the other series, substantially as described.

413,277. GATE FOR SWINGING BRIDGES. EDWARD GIRARD, Chicago, Ill. Filed Oct. 29, 1888. Serial No. 289,449. (No model.)

Claim.—1. The combination, with a swinging bridge and transverse cam-surfaces secured to the under surfaces thereof near the end, of a reciprocating bar C, having a rack D, said rack D, gear *d*, shaft E, bevel-gear A, spindles G G, and beveled gears *g g*, as set forth.



2. The combination, with a swinging bridge and cam-surfaces secured to the under side of said bridge near the ends thereof, of a longitudinally-reciprocating bar projecting from the abutting wall of the approaches of said bridge and parallel therewith, having an offset near its center of length, rack D on the inner side of said offset, gear *d*, shaft E, bevel-gear A, spindles G G, beveled gears *g g*, and gate-poles secured to and projecting from the ends of said spindles, as set forth.

3. The combination, with a swinging bridge and transverse cam-surfaces secured to the under side thereof near the ends, of a longitudinally-reciprocating bar C, having a rack D, said rack D, spring I, gear *d*, shaft E, bevel-gear A, spindles G G, beveled gear *g g*, and poles secured to and projecting from the outer ends of said spindles, as set forth.

4. The combination, with a swinging bridge and transverse cam-surfaces secured to the under side thereof near the end, of a longitudinally-reciprocating bar C, having an offset near its center of length, rack D on the inner side of said offset, spring I, surrounding said bar between said offset and the guide through which its rear end passes, shaft E, rocked by said bar, bevel-gears *g g*, meshing with gear A, and poles secured to the ends of said spindles, as set forth.

5. The combination, with a swinging bridge and cam-surfaces secured to the under side thereof near the ends, of a longitudinally-reciprocating bar C, having a rack D, said rack D, shaft E, gear *d* on

said shaft engaged by said rack, arm *k*, projecting from said shaft, arm *m*, shaft L, and connecting-rod K, connecting said arms, gear *h* on the upper end of shaft L, transverse spindles G G, beveled gears *g g*, meshing with gear A, and gate-poles secured to and projecting from the ends of said spindles, as and for the purpose set forth.

418,278. CONCRETE PAVEMENT. THOMAS F. HAGERTY, San Francisco, Cal. Filed Oct. 22, 1888. Serial No. 288,848. (No specimens.)

Claim.—1. The process of covering street and other surfaces with bituminous or concrete substances capable of being softened by heat in order to make pavements, floors, or roofs, consisting, first, in pressing the bituminous or concrete substance into blocks or slabs; secondly, laying these blocks or slabs upon the roadway or surface to be covered, so that their edges will be in juxtaposition, and, thirdly, in passing a heated iron or roller over the edges of the adjoining blocks or slabs, so as to unite their edges by heat, substantially as described.

2. The process of making pavements, roofs, and floors, consisting, first, in preparing a foundation of coarse rubble and a top coating of thin grout; secondly, coating the surface of the foundation with hot pitch-tar; thirdly, placing upon said pitch-coated foundation blocks or slabs of bituminous or concrete substances which are capable of being softened by heat; fourthly, uniting the edges of such bituminous or concrete blocks or slabs by means of heat, substantially as above described.

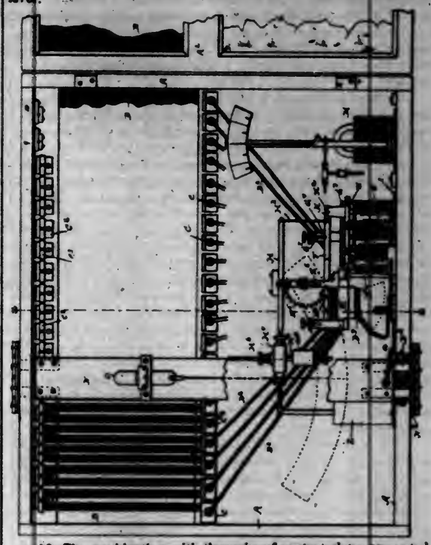
418,279. ELECTRIC REGULATOR. WILLIAM HOCHHAUSER, Brooklyn, N. Y. Filed Mar. 12, 1889. Serial No. 303,011. (No model.)

Claim.—1. The combination, with a regulating or controlling magnet having a movable core, of a pendulum-retractor, as and for the purpose described.

2. The combination, with a regulating or controlling magnet having a movable core, of a keeper or mass of iron near its free end, and a pendulum or bent lever retractor.

3. The combination, with the regulating or controlling magnet or magnets having movable cores, of a vertically and horizontally adjustable pendulum or bent lever retracting-weight.

4. The combination, with the regulating-magnets having movable cores, of a rocking contact-lever, a supplemental retracting-lever, and a vertically-adjustable weight suspended from the latter.



5. The combination, in an electric regulator, of the magnet or magnets having hollow spools, movable cores entering such coils from above, an armature-plate beneath the coils, and a frame or support above the coils, by which said coils are suspended in position to leave a ventilating air-space beneath them.

6. The combination, with the rocking contact-lever and its operating-magnet, of a supplemental retractor-lever having a fixed fulcrum, as and for the purpose described.

7. The combination, with the rocking contact-lever, of the supplemental guide-lever, as and for the purpose described.

8. In an electric regulator, a high-resistance regulator-magnet consisting of a gang of coils separated from one another by free air-spaces and having movable cores, all connected to a common regulating-lever, as and for the purpose described.

9. The combination, with the movable cores for the regulating or controlling magnets, of a sustaining yoke and a vertically-adjustable pin mounted on said yoke having a conical bearing on the regulator-lever.

10. The combination, with the series of contact-plates connected to a series of resistances, of a rocking contact-lever, derived-circuit magnet-cores adjustably suspended from said lever, and a supplemental retractor-lever, as and for the purpose described.

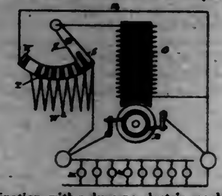
11. The combination, with the series of movable magnet-cores secured to a common support, of a conical suspension-bearing, as and for the purpose described.

12. The combination, with the movable magnet-cores, of the suspension-yoke and the vertically-adjustable supporting-pin passing through said yoke, as and for the purpose described.

13. The combination, with the series of contact-points, of the rocking contact-lever, a yoke carrying an adjustable pin or screw resting on said lever, and a series of magnet-cores sustained from said yoke.

14. The combination, with the series of regulating-magnet coils suspended above a common iron plate, of movable cores for said coils having their lower ends in proximity to said plate, and a support for said cores connected to a lever having a vertically-adjustable retracting-weight suspended from an arm of said lever opposite the cores, as and for the purpose described.

15. The combination, with the regulator-case, of the conducting bar or rod extending across the same and fastened to studs or rods projecting through the case from the under side of plates on the outside of the case, clamping devices secured to said plates, and a magnetized bar or plate pivoted over the face of the bar, as and for the purpose described.

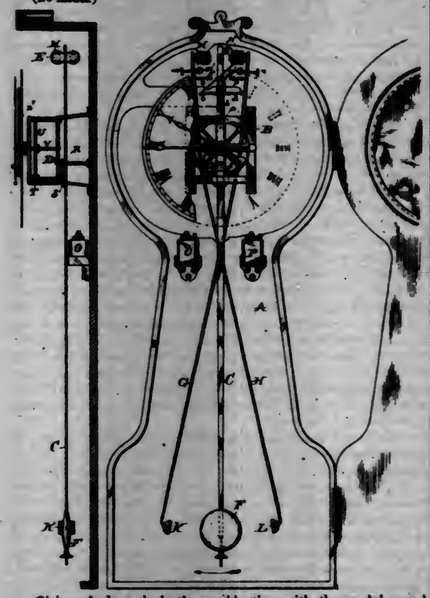


16. In an electric regulator, two sets of conducting blocks or electrodes secured to the interior of the casing parallel to one another, each having two contact-seats on the same side for variable-resistance rods or strips, in combination with the opposite spring-contact electrodes insulated from one another.

17. In an electric regulator, the combination, with a series of conducting angle-pieces secured to the inside of the case, of a second series of plate-rings, each perforated as described, and an intermediate set of carbon rods secured between the springs and angle-pieces.

18. In an electric regulator, the combination, with a series of carbon sticks or pencils, forming an electric resistance, of a series of blocks, each having two contact seats or sockets receiving pairs of the pencils at one end, and a second series of spring-plate sockets secured in pairs to a common conducting-support, each spring-socket of a pair receiving the ends of rods or pencils resting at their opposite ends in adjoining blocks.

418,280. SWITCH FOR DYNAMO-ELECTRIC MACHINES. WILLIAM HOCHHAUSER, Brooklyn, N. Y. Filed Mar. 12, 1889. Serial No. 303,013. (No model.)



Claim.—1. The combination, with a dynamo-electric machine, of a switch connected to a field-magnet coil of said machine a shunt around said coil connected with a contact of a switch, an artificial resistance, and means controlled by said switch for introducing such resistance gradually into the circuit containing the coil immediately before the completion of the shunt, as and for the purpose described.

2. The combination, with a dynamo-electric machine, of a switch for throwing the same out of action, an artificial variable resistance connected to the circuit of the field-magnet, and means controlled by said switch for gradually varying the resistance to cut down the field magnetism before the switch stops the flow of current through the field-magnet coils, for the purpose described.

3. The combination, with a dynamo-electric machine, of a shunt around the field-magnet coil of the machine, a switch for completing said shunt, and an artificial resistance having its initial contact in position to be closed by the operation of said switch previously to the completion of the shunt.

418,281. ELECTRIC PENDULUM-DRIVEN CLOCK. MARCUS L. M. HUBBELL, Menlo Park, N. J. Filed Aug. 27, 1888. Serial No. 283,842. (No model.)

Claim.—1. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod, electro-magnets between which said armature vibrates with the oscillations of the pendulum, a battery cell or cells or other source of electrical energy, and a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

2. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod, electro-magnets between which said armature vibrates with the oscillations of the pendulum, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer, also operated by the oscillations of the pendulum, which operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

3. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point and its upper end, electro-magnets between which said armature vibrates with the oscillations of the pendulum, a battery cell or cells or other source of electrical energy, and a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

4. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point and its upper end, electro-magnets between which said armature vibrates with the oscillations of the pendulum, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer, also operated by the oscillations of the pendulum, which operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

5. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, a battery cell or cells or other source of electrical energy, and a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

6. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer, also operated by the oscillations of the pendulum, which operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

7. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point at its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers having buffers on their lower ends and supporting said electro-magnets on their upper ends, a battery cell or cells or other source of electrical energy, and a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

8. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro magnets between which said armature vibrates with the oscillations of the pendulum, levers having buffers on their lower ends and supporting said electro-magnets on their upper ends, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer, also operated by the oscillations of the pendulum, which operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

9. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets on their upper ends, a battery cell or cells or other source of electrical energy, and a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

10. In a clock, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets on their upper ends, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer, also oper-

ated by the oscillations of the pendulum, which operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

11. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets on their upper ends, a battery cell or cells or other source of electrical energy, and a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

12. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets on their upper ends, a battery cell or cells; a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer, also operated by the oscillations of the pendulum, which operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

13. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells or other source of electrical energy, and a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

14. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer, also operated by the oscillations of the pendulum, which operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

15. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillation of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells or other source of electrical energy, and a circuit-changing device consisting of a spring-finger a, lever b, and contact-terminals c and d, which device is operated by the oscillations of the pendulum and itself operates to alternately magnetize and demagnetize the electro-magnets, substantially as hereinbefore described.

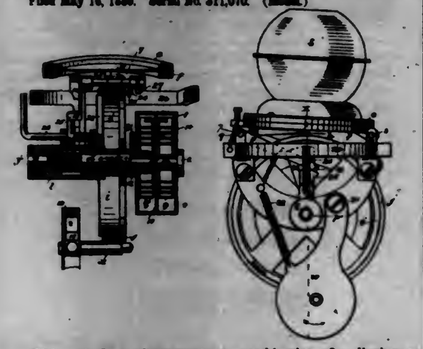
16. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer consisting of a ring or rings made of metal and insulation, and a brush or contact on the metal and a brush or contact on the insulation, said brushes or contacts being connected with both the battery or batteries and the electro-magnets, substantially as hereinbefore described.

17. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells, a circuit-changing device consisting of a spring-finger a, lever b, and contact-terminals c and d, which device is operated by the oscillations of the pendulum and itself operates to alternately magnetize and demagnetize the electro-magnets, and a battery-controller or circuit-changer consisting of a ring or rings made of metal and insulation, and a brush or contact on the metal and a brush or contact on the insulation, said brushes or contacts being connected with both the battery or batteries and the electro-magnets, which device operates to alternately throw into and out of circuit first one battery and then another, substantially as hereinbefore described.

18. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells or other source of electrical energy, a circuit-changing device consisting of a spring-finger a, lever b, and contact-terminals c and d, which device is operated by the oscillations of the pendulum and itself operates to alternately magnetize and demagnetize the electro-magnets, an escapement R S, lantern-wheel T, wheel U, lantern-wheel X, pinion X', lantern-wheel Y, and pinion Z, substantially as hereinbefore described.

19. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells, a circuit-changing device operated by the oscillations of the pendulum, which device operates to alternately magnetize and demagnetize the electro-magnets, a battery-controller or circuit-changer consisting of a ring or rings made of metal and insulation, and a brush or contact on the metal and a brush or contact on the insulation, said brushes or contacts being connected with both the battery or batteries and the electro-magnets, which device operates to alternately throw into and out of circuit first one battery and then another, an escapement R S, lantern-wheel T, wheel U, lantern-wheel X, pinion X', lantern-wheel Y, and pinion Z, substantially as hereinbefore described.

20. In a clock, the combination of the pendulum-rod C, hung or pivoted at a point D below its upper end on the same shaft with the escapement-pallet R, an armature on said pendulum-rod located between the pivotal point and its upper end, adjustable electro-magnets between which said armature vibrates with the oscillations of the pendulum, levers G H, which cross each other below their fulcrums, and having buffers on their lower ends and supporting said electro-magnets M N on their upper ends, adjusting-screws m n and springs o p, a battery cell or cells, a circuit-changing device consisting of a spring-finger a, lever b, and contact-terminals c and d, which device is operated by the oscillations of the pendulum and itself operates to alternately magnetize and demagnetize the electro-magnets, a battery-controller or circuit-changer consisting of a ring or rings made of metal and insulation and a brush or contact on the metal and a brush or contact on the insulation, said brushes or contacts being connected with both the battery or batteries and the electro-magnets, which device operates to alternately throw into and out of circuit first one battery and then another, an escapement R S, lantern-wheel T, wheel U, lantern-wheel X, pinion X', lantern-wheel Y, and pinion Z, substantially as hereinbefore described.



21. In a clock, the combination, with the pendulum-rod, of buffers between which the pendulum oscillates and against which the pendulum-bob strikes, substantially as hereinbefore described.

22. In a clock or other measuring apparatus, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of buffers between which the pendulum oscillates and against which the pendulum-bob strikes, substantially as hereinbefore described.

23. In a clock or other measuring apparatus, the combination of the pendulum-rod hung or pivoted at a point below its upper end of levers having buffers on their lower ends between which the pendulum oscillates and against which the pendulum-bob strikes, substantially as hereinbefore described.

24. In a clock or other measuring apparatus, the combination, with the pendulum-rod hung or pivoted at a point below its upper end, of levers which cross each other below their fulcrums, and having buffers on their lower ends between which the pendulum oscillates and against which the pendulum-bob strikes, substantially as hereinbefore described.

413,282. PHONOGRAPH. WILLIAM W. JACQUES, Newton, Mass. Filed May 16, 1888. Serial No. 311,070. (Model.)

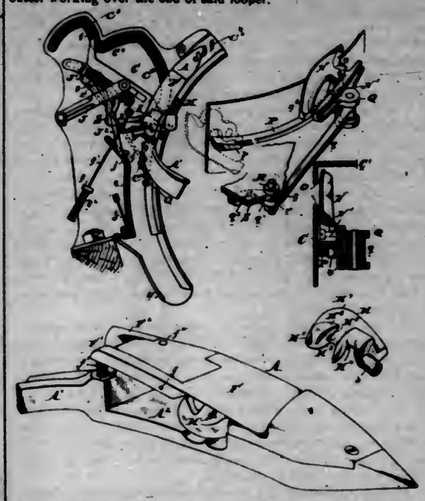
Claim.—1. In a phonograph, the combination of a diaphragm supported in a hinged frame which is held by a spring in operative relation with the record-surface and an automatic chipping device operated by contact with the record-cylinder to stop the record-surface and withdraw the stylus therefrom when it has completely traversed the record contained thereon, substantially as described.

2. In a phonograph having a diaphragm pivoted at one side and a spring to hold its stylus in operative relation to the record-surface, the combination of a latch-lever adapted to engage with the phonograph-cylinder and stop the record-plate and to withdraw the stylus therefrom, an automatically-actuated arm to hold said lever in its raised position, and a cam-brake to withhold the said record-plate from progressive rotation while the motive spring of the apparatus is being wound up, substantially as described.

3. In combination with a phonograph provided with a spring-actuated cylindrical record-plate having a traversing motion parallel with its axis, a latch-lever pivoted at one side to stop the cylinder and raise the stylus therefrom when the stylus has completely traversed the record thereon and an automatically-operated retaining-arm pivoted at the other side of the cylinder to hold the stylus in its raised position while the said actuating-spring is being wound up, substantially as described.

4. In combination with the revolving record-plate of a phonograph, a regulator pivoted to a fixed portion thereof eccentrically to the axis of the record-plate and a spring to hold it in frictional contact therewith, substantially as described.

5. In combination with the record-plate of a phonograph, a motive spring consisting of two helices, one of which is attached to the journal of the record-plate and the other to a loose sleeve thereon, and an arm projecting from said sleeve adapted to act in opposition to the winding of the actuating-spring by its bearing upon a fixed portion of the apparatus, substantially as described.



6. In a phonograph, an inflexible enduring record-plate, substantially such as described, having lines of undulations corresponding to a series of sound-waves impressed or cut thereon in contradistinction to a flexible perishable plate or foil indented or bent in lines of such undulations, or a plate of soft or waxy material in which they have been produced.

413,283. GRAIN-BINDER. ARTHUR M. JOHNSON, Norristown, Pa. Filed Dec. 26, 1888. Serial No. 294,231. (No model.)

Claim.—1. A looper consisting of a rotating head having two integral or rigid jaws, forming between them a notch, and in which the outer jaw has upon its outer surface and to one side a rearwardly-extending hook.

2. A looper consisting of a rotating head having two integral or rigid jaws, forming a notch between them, and in which the outer jaw has upon its outer surface and to one side a rearwardly-extending hook and a groove extending from the back of the hook toward the outer end and point of the jaw.

3. A looper consisting of a rotating head having two integral or rigid jaws, forming a notch between them, and in which the outer jaw has upon its outer surface and to one side a rearwardly-extending hook and a groove extending from the back of the hook toward the outer end and point of the jaw, in combination with a cord-holder and cord-cutter working over the end of said looper.

4. A looper consisting of a rotating head having two parallel notches H^0 H^1, parallel to the plane of rotation and opening in the same direction, one longitudinal groove H^2 at substantially right angles to the plane of rotation, in combination with a cord-holder, cord-cutter, and stripper working over the end of said looper, means to rotate the looper, a lock to lock the looper against rotation, and a needle-head carrying the looper, the movement of the needle-head and looper causing the cord-holder, cord-cutter, and stripper to pass over the end of the looper when locked.

5. A needle-head of a grain-binder, provided with a knot-tyer contained within and carried by it, and consisting of two rigid jaws, forming a notch between them, and in which the outer jaw has upon its outer surface, exterior to the notch and to one side, a rearwardly-extending hook.

6. A looper for a knot-tyer, consisting of two jaws rigidly connected to form a notch, the inner jaw being formed wide and the outer jaw formed narrow, but with a laterally-arranged and rearwardly-extending hook exterior to the notch and overhanging the surface of the inner jaw.

7. A looper-head for a cord-knotter, consisting of two integral or rigid jaws having an unobstructed notch or opening between them and located wholly to one side of the axis of rotation of the looper-head, and in which one of the jaws is provided on its outer surface and side, which is in the rear in rotating the looper-head upon making a loop, with a rearwardly-extending hook.

8. The combination of a movable needle-head carrying a cord-looper, a movable cord-holder, a separable connection between the needle-head and cord-holder for moving the cord-holder with the needle-head during a portion of its travel, a link pivoted to the cord-holder at its middle to allow it to oscillate, and cam devices acting upon the rear end of the cord-holder to move the cord-holder to or from the looper of the needle-head during each associated travel.

9. The combination of a movable needle-head carrying a cord-looper and having a notch J^4, a movable cord-holder, a separable connecting-arm J^3 between the needle-head and cord-holder for moving the cord-holder with the needle-head during a portion of its travel, and a cam *c*, acting on the arm J^3 to move it away from the needle-head to break said connection between the needle-head and cord-holder at a given point in the travel of said needle-head.

10. The combination of a movable needle-head carrying a cord-looper of a knot-tyer with a movable cord-holder, a hinge-arm carrying the cord-holder at its free end on a hinge-joint, a separable connection between the hinge-arm and needle-head whereby the former operates the latter, and cams to control the oscillation of the cord-holder upon the hinge-arm during its travel with the needle-head.

11. The combination of the cord-guide segment B, having cam-surface B', with cord-holder segment C, having cam-surface *c'* and de-

pression c, a rotating needle-head moving through said segments and having a cord-looper of a knot-tyer, and a pivoted jaw F, having the rear extension F', for coming in contact with the said cam-surfaces to open the jaw and guide the cord to the looper.

12. The combination of a rotating needle-arm, a stationary segment or frame through which the needle-head passes, a cord-gatherer movable in the path of the needle-arm, a link for holding said cord-gatherer during its travel, a separable link-connection between the needle-arm and the cord-gatherer whereby the movement of the needle-arm causes the cord-gatherer to move with it for a given distance of its travel, and a cam to control said link-connection to liberate the cord-gatherer from the needle-arm.

13. The combination of a movable needle arm and head, a movable carriage moved thereby, a pivoted cord-gatherer pivoted to said carriage, and a guide to hold said cord-gatherer in a position to hold the cords until it reaches the end of its movement and then allow it to tilt to liberate the cords.

14. The combination of a movable needle arm and head, a movable carriage moved thereby, a pivoted cord-gatherer pivoted to said carriage, a guide to hold said cord-gatherer in a position to hold the cords until it reaches the end of its movement, then allow it to tilt to liberate the cords, a movable cord-holder, also actuated by the needle-arm, and a lock actuated by the cord-holder-actuating devices to lock the gatherer in its tilted position until after the reverse movement of the cord-holder.

15. A rotary looper formed of a solid piece of metal having a notch opening to one side, and a hook located on the looper beyond the notch and extending to one side of the looper and away from the notch, leaving it unobstructed, in combination with a stripper working over said looper, passing toward and to the rear of the hook.

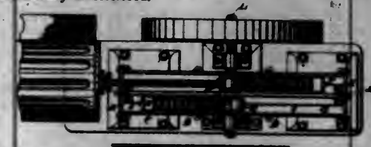
16. A rotary looper formed of a solid piece of metal having a notch opening to one side, and a hook located on the looper beyond the notch and extending to one side of the looper and away from the notch, leaving it unobstructed, in combination with a cutter and holder working over said head of the looper.

17. The combination of a movable needle-head carrying a looper, a movable cord-holder movable with said needle-head, and also movable to and from it, and in which the cord-holder passes through the needle-head and past the looper during a portion of their travel.

18. A looper consisting of a rotating head having a notch H^2 in the plane of rotation, a backwardly-extending hook H^4, and a transverse groove H^3, transverse to the plane of rotation in the head and back of the notch H^2 and hook H^4, substantially as and for the purpose specified.

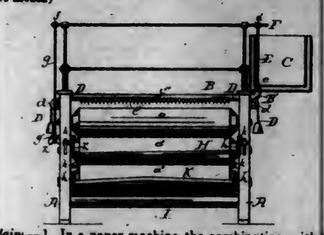
413,284. SAFETY STEAM-GENERATOR. SAMUEL W. LUDLOW, Madisonville, assignor of one-third to John R. Brownell, Dayton, Ohio. Filed Feb. 16, 1889. Serial No. 300,116. (No model.)

Claim.—1. A steam-generator within a hermetically-sealed vessel exposed to direct heat and surrounded by a fluid in the hermetically-sealed vessel through which the heat is transmitted, substantially as described.



2. A steam-generator consisting of an outer vessel hermetically sealed and containing a heat-transmitting fluid, and an inner vessel containing a vaporizable fluid and surrounded by the fluid in the outer vessel, substantially as described.

3. A steam-generator consisting of an outer vessel hermetically sealed, having a series of fire-tubes extending through the body thereof, an inner vessel provided with flues, and a vaporizable fluid in which the inner vessel is enveloped, substantially as described.

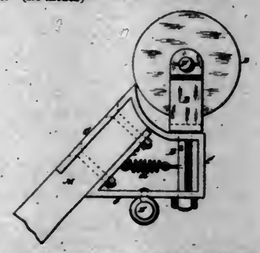


4. A steam-generator consisting of an outer vessel hermetically sealed and containing vaporizable heat-transmitting fluid, and an inner vessel for generating steam as a motor or other power enveloped by said fluid, substantially as described.

413,285. RACK-AND-PINION MECHANISM. PETER H. MACDONALD, Kerrville, Tex. Filed June 6, 1889. Serial No. 313,696. (No model.)

Claim.—The combination of a reciprocating rod, a yoke carrying a series of teeth and adapted to slide in a guideway, another yoke carrying a similar series of teeth and movable in a contiguous guideway, flexible connections between said yokes, whereby the movement of one reversely moves the other, and toothed wheels fixed upon a shaft and adapted to engage alternately the teeth in said yokes, substantially as described.

413,286. PAPER-WATERPROOFING MACHINE. FREDERICK W. MILLER and JOHN J. NEWMAN, Elkhart, Ind., assignors to the Globe Tissue Paper Company, same place. Filed Mar. 22, 1887. Serial No. 231,897. (No model.)



Claim.—1. In a paper-machine, the combination, with the means for applying waterproofing material to the web of paper, of the hot calender-rolls and doctors inclined toward one or both ends, as set forth.

2. In a paper-machine, the combination, with a reservoir, distributing-pipe, and needle-valves provided with wheels c'', of a weighted chain engaging with the said wheels, as set forth.

3. In a paper-machine, the combination, with a reservoir and distributing-pipe, of plug c, plunger E, arms c' and f, shaft F, and adjustment-rod g, as set forth.

413,287. CONTACT-TROLLEY FOR ELECTRIC-RAILWAY CARS. JAMES MITCHELL, Des Moines, Iowa. Filed June 21, 1889. Serial No. 315,053. (No model.)

Claim.—1. The combination, with the trolley arm or pole M, of a bearing for the trolley vertically swiveled on the end of said arm, so as to permit the trolley to turn in a substantially horizontal plane into different angular positions with reference to the arm or pole, as and for the purpose described.

2. The combination, with the trolley arm or pole M, of a rotating trolley carried by the same, and a bearing for said trolley mounted at the end of the arm on a vertical swivel beneath the trolley.

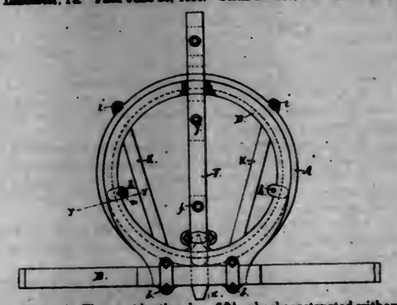
3. The combination, with a traveling electric contact mounted on a swiveled bearing, of a centering-spring, as and for the purpose described.

4. The combination, with a contact-trolley, of a fork-bearing having a spindle by which it is swiveled, and a centering-spring for bringing the trolley into parallel with the arm or support, as and for the purpose described.

5. The combination, with the contact-trolley, of the vertical fork B, having spindle B^3, the frame C, in which the spindle turns, a centering-spring e, and an arm or support M, to which the frame is attached.

413,288. SCHOOL-SLATE. JACOB R. MOYER, Bethlehem, Pa. Filed Apr. 10, 1889. Serial No. 306,660. (No model.)

Claim.—1. A slate-frame composed of side and end pieces, having intersecting grooves upon opposite faces, combined with a muffler seated and held in said grooves at the sides, ends, and corners of the frame, substantially as described.



2. A slate-frame having grooves in its sides and end pieces, said grooves crossing each other at the corner, having recesses at said corners, combined with a muffler seated and held in said grooves in the sides and ends and at the corners and cemented in said recesses, substantially as described.

3. The combination of the slate-frame having grooves in its end and side pieces, the grooves intersecting each other at the corners, with a muffler in a single piece and embracing the ends and sides of the frame, with its edges seated and held in said grooves at the ends, sides, and corners and cemented in the grooves at the corners, whereby sewing of the muffler at said corners is avoided, substantially as shown and described.

4. A slate-frame provided around its outer edges with a groove and with undercut grooves on each face, a binding-wire in the edge groove, and a cover or muffler covering the outer edges of the frame, extending over the wire and groove, and having its edges secured in the undercut grooves in the faces of the frame, substantially as shown and described.

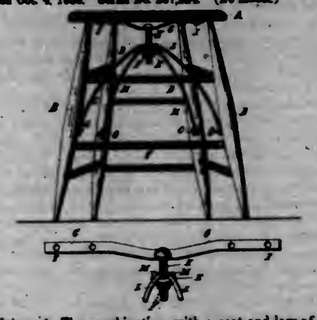
413,289. FIFTH-WHEEL FOR VEHICLES. HENRY HOLST, Jr., Lancaster, Pa. Filed June 20, 1888. Serial No. 316,094. (No model.)

Claim.—1. The combination, in a fifth-wheel constructed without a king-bolt or other pivot, of a lower recessed wheel-plate having the front part of the rim secured to the axle, and an upper wheel-plate rabbeted into the lower plate and having the front parts of the rim thereof secured to the head-block, substantially as specified.

2. The combination, in a fifth-wheel constructed without a king-bolt or other pivot, of a lower recessed wheel-plate having a head formed on the front thereof, by which it is secured to the axle, and an upper wheel-plate rabbeted into the lower and having a head which projects over the head of the lower plate and is connected with the head-block, substantially as specified.

3. In a fifth-wheel, the combination, with a lower recessed wheel-plate provided with a head a, secured to the axle, of an upper wheel-plate rabbeted into the lower and having a head c, which projects over the head a and is connected with the head-block, a perch-plate rigidly secured to the upper wheel-plate, and plates fastened to the perch-plate and hooking under the lower recessed wheel-plate, substantially as and for the purpose specified.

4. In a fifth-wheel, the combination, with a lower wheel-plate having the head thereof connected with the axle and an upper wheel-plate rabbeted into the lower plate and having the head thereof secured to the head-block, of draft-straps k, fastened to the lower wheel-plate and extending forward and secured to the axle, all arranged substantially as and for the purpose specified.



5. The combination, in a fifth-wheel constructed without a king-bolt or other pivot, of a lower plate secured to the axle, an upper plate rabbeted into the lower and connected with the head-block, ears A, formed on the upper plate, and hook-bolts I, passing through said ears and embracing the under face of the lower plate, a perch-plate rigidly secured to the upper plate, and plates fastened to the perch-plate and hooking under the lower plate, ears i, formed on the lower plate, and draft-straps k, bolted to said ears and extending to the axle and secured thereto, all constructed and operating substantially as and for the purpose specified.

413,290. PLOW-FENDER. JOHN C. FOX, Big Creek, Ga. Filed Apr. 23, 1889. Serial No. 308,203. (No model.)

Claim.—The combination, with a plow-beam, of a link adjustably attached to the beam, a second link pivotally attached near one end of the first-named link, and a fender-bar carrying at one end a fender and the other end adjustable to and from the beam on the free end of the last-mentioned link, substantially as specified.

413,291. CHAIR-BRACE. JAMES P. SARGENT, Brooklyn, N. Y. Filed Oct. 4, 1888. Serial No. 287,204. (No model.)

Claim.—1. The combination, with a seat and legs of a chair or stool, of an ordinary carriage-bolt, its nut, washer, and braces, substantially as described, attached to said seat and surrounding the neck of said bolt to hold the same in place, and wire braces attached by either end to said legs and by a half-turn in their middles surrounding the tine of said bolt within said nut and washer, substantially as and for the purpose set forth.

2. The combination, with a seat and legs of a chair or stool, of a common carriage-bolt, its nut and washer, two wire braces attached by their ends to the front and back rails of said seat and by a half-turn in their middles surrounding the neck of said bolt to hold the same in place, and two wire braces attached by their ends to said legs and by a half-turn in their middles surrounding the tine of said bolt within said nut and washer to hold said tine in place, and all so arranged that facility is afforded for straining said braces and holding the parts of said chairs and stools firmly in proper position, substantially as and for the purpose set forth.

413,292. ELECTRIC MEASURING-INSTRUMENT. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Apr. 26, 1887. Serial No. 236,269. (No model.)

Claim.—1. The combination, with an electric conductor carrying an electric current, of a mass of iron partially embracing said conductor and adapted to form through its whole range of movement from zero a partial magnetic circuit around the same and movable in the general longitudinal direction of the conductor to positions where it will gradually effect a change in the degree of closure of the magnetic field around the conductor, as and for the purpose described.

2. The conductor C, having its mass at one side modified or varied, as described, in combination with an armature adapted to partially close the magnetic circuit around said conductor, as and for the purpose set forth.

3. The combination, with an electric conductor, of a U-shaped armature or its equivalent, as described, mounted at the end of a pivoted arm and movable bodily in the general longitudinal direction of the conductor, as described, to positions where it may effect a

variable closure of the magnetic circuit around the conductor, as set forth.

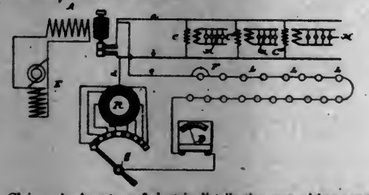
4. The combination of a conductor and an armature which normally partially embraces and closes the magnetic circuit around the conductor, said conductor or armature, one or both, being movable with relation to one another in the general direction of the axis of the conductor, as and for the purpose described.

5. The combination, substantially as described, of an electric conductor and a U-shaped armature partially surrounding the conductor and mounted, as described, on the end of a pivoted arm so as to have a movement of translation bodily over the conductor in the general direction of the axis of the same.

6. The combination, with the electric conductor, of a mass of iron partly encircling the same constantly or through its whole range of movement, said conductor and mass of iron being movable bodily with relation to one another, as described, in the general direction of the conductor's longitudinal axis, but at a slight angle, so that the conductor may be gradually inclined more and more within the iron, as and for the purpose described.

7. The combination, with two coils or conductors placed one beside the other, but eccentrically, of the two armatures or magnet-closing pieces, one for each coil, mounted upon a movable support or its equivalent, as described, and adapted to move in the general plane of the coils or conductors.

8. The combination, with the two conductors C, of the two armatures partially encircling the same in the zero position and mounted upon a common support in proper manner to balance one another.



9. The combination, with the curved conductor C, of the index and connected armature forming an iron mass partially surrounding the conductor and mounted on an arm pivoted eccentrically to such curved conductor, said armature consisting of one or more pieces of iron which normally or in the zero position of the apparatus overlap upon the sides of the conductor, as and for the purpose described.

10. The combination of the armature and the conductor C, having its mass near the open side of the armature, or just in advance of the same, reduced or contracted, as and for the purpose described.

11. The conductor C, having on its outer side a web of varying depth, in combination with the armature whose magnetic circuit is closed across or around said web.

12. The combination, with an electro-responsive device, of an artificial resistance of carbon connected to the circuit of the same and so proportioned with relation to the normal current that its resistance shall be critical or subject to immediate and sudden change on a change in the flow of current, whereby the change of current actuating the electro-responsive device may be magnified, as and for the purpose described.

413,293. SYSTEM OF ELECTRICAL DISTRIBUTION. ELIHU THOMSON and EDWIN W. RICE, Jr., Lynn, Mass. Filed July 30, 1888. Serial No. 281,410. (No model.)

Claim.—1. A system of electric distribution comprising constant-potential mains having translating devices of any desired character in multiple between them, a series circuit of distribution connected across said mains and containing translating devices in series, and a current-regulator in said series circuit.

2. In a system of distribution of electric light comprising a series incandescent-lamp circuit connected across mains of constant potential, means connected with said series circuit for keeping the current on the same constant upon the extinguishment of series lamps, and transformers or compensators connected in multiple across the constant-potential mains, and having sub-circuits supplying translating devices in multiple.

3. The herein-described system of electric distribution, comprising alternating-current mains of constant potential, a series circuit containing translating devices—such as series lamps—means for keeping the current of said circuit constant, transformers or converters connected in multiple between said mains, and incandescent lamps or other translating devices supplied in multiple from said transformers.

4. In an alternating-current system of electric lighting, constant-potential mains having transformers or compensating coils connected in multiple between them, incandescent lamps supplied in multiple from sub-circuits connected to said transformers, a series circuit connected between said mains and containing incandescent series lamps, and a current-regulating device included in said series lamp circuit.

5. In a system of electric distribution, a source of alternating current supply, constant-potential mains connected therewith, transformers or compensators arranged in multiple between said mains and having a sub circuit or circuits connected with them for supplying translating devices in multiple, a series circuit of distribution, also connected between said mains, a variable reactive coil in said circuit, and a device responsive to variations in the current of said circuit for adjusting the reactive coil in the manner described to keep the current constant.

6. In an alternating-current system of distribution, alternating-current mains of constant potential, translating devices of any desired character supplied in multiple between said mains, a series circuit of distribution containing translating devices in series, a variable reactive coil in the series circuit, and devices responsive to the variations in the current on said circuit for adjusting the reaction of said coil.

413,294. CONDUIT FOR ELECTRIC RAILWAYS. ELIHU THOMSON, Lynn, Mass. Filed Mar. 6, 1889. Serial No. 301,912. (No model.)

Claim.—1. A railway slotted conduit having a continuous slot-closing brush or brushes the fibers or stems of which project transversely into the slot, as and for the purpose described.

2. A railway slotted conduit having a slot-closing brush or brushes projecting transversely into the slot from the side thereof and at a slight upward inclination.

3. The combination, with the slotted conduit, of a yielding slot-closer soaked with an oily material or water-repellent substance.

4. The combination, with the slotted conduit, of a springy slot-closer adapted to yield in a longitudinal direction or in the direction of travel of the vehicle.

5. The combination, with the conduit, of the fibrous or springy slot-closer clamped by a removable top piece of the conduit, as and for the purpose described.

6. The combination, with a slotted electric conduit, of an elastic or springy slot-closer clamped by a removable wear-plate at the edge of the slot, as and for the purpose described.

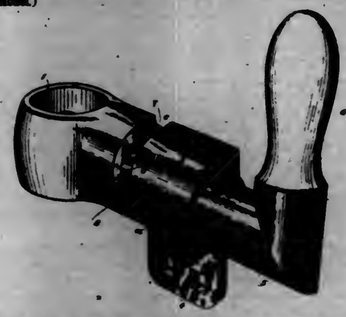
7. A slotted conduit having a groove at the edge of the slot holding a yielding or springy slot-closer.

8. The combination, with the inverted-V or trough shaped conductor, of the supporting-brackets A, having at their upper ends insulating-pieces in the groove or trough of the conductor and coated or enameled with an insulating material, as and for the purpose described.

413,295. OIL-CUP. MILTON S. CARELL, Quincy, Ill., assignor to the Consolidated Manufacturing Company, Washington, D. C. Filed Mar. 21, 1889. Serial No. 304,162. (No model.)

Claim.—1. The combination, with an oil-cup provided on its lower end with a guard formed with an inlet leading to the cup and an outlet leading therefrom, of a supply-pipe communicating with the inlet, a pipe located in the cup and communicating with the upper end of the outlet, a nozzle secured to and communicating with the lower end of such outlet, and two stop-cocks, one for the inlet and the other for the outlet, as and for the purpose set forth.

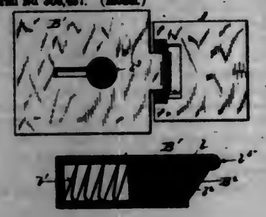
2. The herein-described oil-cup, the same comprising the body B and the guard G, having an exteriorly-threaded extension *g*, provided with a central perforation, and with an enlarged recess around the lower end of said perforation, in combination with the cock J, having an exteriorly-screw-threaded projection *j*, provided with a central perforation, and with an enlarged recess around the upper end of said perforation, and the glass tube S, its ends fitting in said recesses, and packing-nuts K, engaging said exterior screw-threads at their ends, and with the curved arm A, having threaded apertures near its ends engaging said projections above and below the glass tube, as and for the purpose described.



3. In an oil-cup, the guard G, having the passage *p* and the inlet *i*, the pipe P, screwed into the upper end of said passage, the drip-nozzle N, screwed into the lower end of said passage, and the pipe I, connected with said inlet, in combination with the stop-cock E, for controlling the flow of oil through said passage, and the stop-cock F, for controlling the flow of water through said inlet, substantially as described.

413,296. TIRE-TIGHTENER. OTIS W. CHRAT, Willow Springs, Mo., assignor of one-half to Henry H. Wathers and William H. Drew, same place. Filed June 18, 1889. Serial No. 314,711. (No model.)

Claim.—As an improvement in tire-tighteners, the combination, with the fellies having recesses B at their meeting ends, of the plates having right and left hand threaded perforations, said plates being provided with wings or flanges extending over and attached to the inner sides of the fellies, shoulders or offsets, and flanges extending from the ends of said offsets and constituting the meeting edges, and the right and left hand threaded bolt having a wrench-seat fitted between the said shoulders or offsets, substantially as and for the purpose set forth.



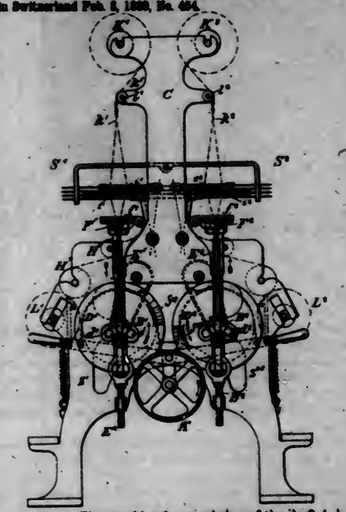
413,297. ELEVATOR-LOCK. HENRY I. COE, JAMES L. SHEDLEY, and WILLIAM A. CROSWELL, New York, N. Y., assignors to the Safety Hatch Door Company, of Illinois. Filed Nov. 17, 1888. Serial No. 291,088. (Model.)

Claim.—1. A lock for the operating cable or chain of an elevator, having housing 3, jaw 1, rigid on said housing and having an enlarged opening, and bolt 5, having heavy handle 6 and pin 7, the said housing having slot 8 extending approximately one-half way around the bolt, having a steep inclination from *a* to *b* and inclined at a less angle from *b* to *c*, substantially as and for the purposes set forth.

2. In combination with the bolt 5, having handle 6 and removable pin 7, the housing 3, having slot 8 for said pin, and shield or cover 9, fixed over said slot, substantially as and for the purposes set forth.

413,298. LATCH-HINGE. ERNEST R. DE KALB, Syracuse, N. Y. Filed Dec. 21, 1888. Renewed Oct. 3, 1888. Again renewed Apr. 8, 1889. Serial No. 306,627. (Model.)

Claim.—1. A latch-hinge consisting of one leaf or side having a pintle and a second leaf or side having a receptacle for the pintle, and a sliding latch for holding the pintle in said receptacle, or releasing it therefrom, substantially as described.



2. A latch-hinge consisting of a leaf or side having a pintle and a leaf or side having a receptacle for the pintle, and a spring-actuated sliding latch for closing over the pintle, as set forth.

3. A latch-hinge consisting of a leaf or side having a pintle and a leaf or side provided with a receptacle for said pintle, and a spring-actuated sliding latch for closing over said pintle when in the receptacle, and provided with means, substantially as described, for withdrawing said latch.

4. In a latch-hinge, the combination of the part B', having the socket for the pintle, and the sliding spring-latch portion B², with the leaf A and pintle *a*, having the lug or projection *a*².

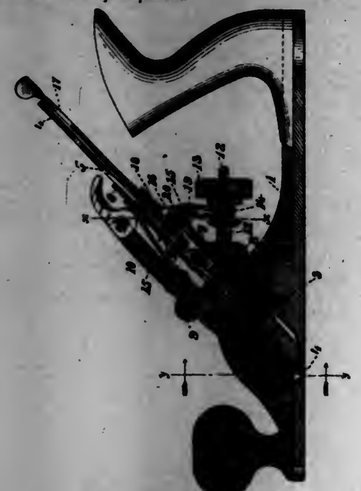
5. The combination, with a latch-hinge having the spring-latch portion, of the lever for operating said latch portion, and a wire, rod, or cord extending to a knob or handle, substantially as and for the purpose set forth.

413,299. LOOM. JAMES F. HAGGENMACHER, Zurich, Switzerland. Filed Oct. 3, 1888. Serial No. 287,103. (No model.) Patented in England Aug. 3, 1888, No. 11,946; in Belgium Oct. 15, 1888, No. 83,300, and in Switzerland Feb. 3, 1889, No. 464.

Claim.—1. The combination consisting of the shaft A, bent levers W' W², toothed wheels A' and A², toothed wheels C' and C², and the shafts B' B², substantially as shown and described.

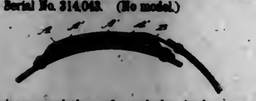
2. The combination consisting of the bent levers W' and W², shaft A, wheels A' A², driving-shafts B' and B², wheels C' C², brake-pulleys X' X², brake-band *c'* *c²*, catches V' V², and springs Z' Z², substantially as shown and described.

3. The combination, with bent levers W' W², shaft A, with wheels A' A², shafts B' B², wheels C' C², brake-pulleys X' X², brake-bands *c'* *c²*, catches V' V², and springs Z' Z², of the shedding mechanism, disks D' D², with crank-pins *d'* *d²*, and picking-cams S' S², lifting-rods E' E², lathes F' F², picking-arms *e'* *e²*, reeds *f'* and *f²* in the lathes F' and F², rollers H' and H², and beams L' L², substantially as shown and described.



413,300. PIANO. GEORGE D. MOSHER, Birmingham, Conn., assignor to the Birmingham Piano Company, same place. Filed June 25, 1889. Serial No. 315,506. (No model.)

Claim.—1. In a piano of the character described, the combination, with the bit and the cap-plate, of the screw-operated lever, whose end engages the cap-plate, and the laterally-adjusting lever engaging and adapted to move the screw-operated lever and therethrough the bit, substantially as set forth.



2. In a piano, the combination, with the bit and the perforated cap-plate thereon secured, of the yoked and screw-operated lever pivoted to the frog and movable longitudinally of its bearing and the pivoted laterally-adjusting lever arranged around and adapted to actuate the screw-operated lever, substantially as specified.

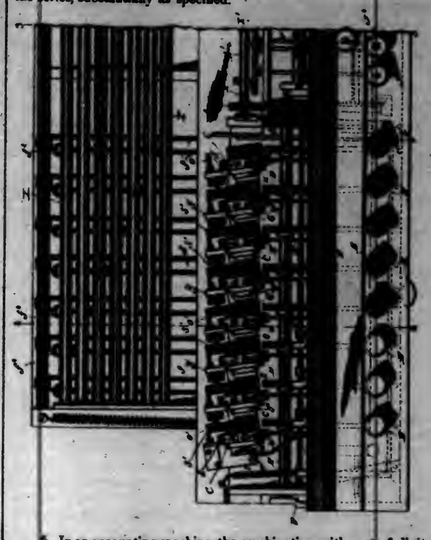
3. The combination, in a piano, with the stock and the frog of the slotted bit, of the cap-plate having the opening 11, means, as the wedge,

for securing the bit and plate to the frog, the lever 15, engaged and operated by the nut 13 and projecting into the opening 11 in the cap-plate, and the laterally-adjusting lever 17, fulcrumed to the frog and engaging the lever 15, whereby said lever 15 may be moved along its fulcrum, substantially as specified.

413,301. CLASP. TOWNSEND W. HOXON, St. Louis, Mo. Filed June 12, 1889. Serial No. 314,042. (No model.)

Claim.—1. A clasp consisting of a tabular body, segmental or crescent-shaped in longitudinal section, adapted for attachment to one end of a strap and formed with a transverse slot in its outer wall, and a tongue separate from said body and extending at right angles to the slot thereof and adapted to pass through the same into the body and be held by frictional contact with the walls thereof, substantially as described.

2. A clasp consisting of a tabular body, segmental or crescent-shaped in longitudinal section, the upper wall of which is slotted transversely, and a resilient tongue adapted to pass through either of said slots lengthwise of the body and adapted to bear against the upper and lower walls thereof, substantially as shown and described.



413,302. CALCULATING, RECORDING, AND NUMBERING MACHINE. HENRY C. O'NEILL, Louisville, Ky., assignor, by direct and mesne assignments, to the Standard Recorder Company, of New York. Filed July 13, 1888. Serial No. 279,994. (No model.)

Claim.—1. The combination, with a calculating-machine having digit-keys and gearing operated by said digit-keys to move the digit wheels or indicators, the said digit wheels or indicators, the notation-keys, and shifting devices effecting the engagement of said digit-wheels, of a numbering-machine and indicating and recording devices in shifting-connection with the gearing operated by said digit-keys, substantially as specified.

2. In an accounting-machine, the combination, with a series of digit wheels or indicators, gear-turning mechanism, and a series of digit-keys independently engaging said gear-turning mechanism, adapted to move any digit wheel or indicator of the series, of a series of notation-keys and shifting devices adapted to move any digit-wheel of said series into engagement with said mechanism, substantially as specified.

3. In an accounting-machine, the combination, with a series of digit-keys and a series of digit wheels or indicators, of gear-turning mechanism common to all of and independently engaged by each of said digit-keys and a set of notation shifting-keys governing the operation of the gear-turning mechanism upon the digit wheels or indicators, substantially as specified.

4. In an accounting-machine, the combination, with a series of notation shifting-keys and a corresponding series of digit wheels or indicators in connection therewith, of a set of digit-keys adapted separately to act in conjunction with any or all the notation keys of the series, substantially as specified.

5. In an accounting-machine, the combination, with a set of digit-keys, gearing operated thereby, and digit wheels or indicators normally disengaged from said gearing, of a series of notation-keys and shifting-connections whereby the digit wheels or indicators of any notation-column are brought into engagement with said gearing operated by said digit-keys, substantially as specified.

6. The combination, with a series of geared digit-wheels and the gear-turning mechanism and the digit-keys independently engaging the same, of the series of digit-wheels, their notation-keys, and shifting-connections, whereby any digit-wheel of the series is brought in engagement with said gear-turning mechanism by its notation-key for operation by any digit-key of the series, substantially as specified.

7. In an accounting-machine, the combination, with the digit-wheels, their gearing, the resetting-slide, and its pinion-shaft, of the series of digit-keys, the gear-turning mechanism operated by said digit-keys, the series of notation-keys, and the resetting-lever adapted to operate all of said notation-keys simultaneously to bring the digit-wheels in gear with the pinions of said pinion-shaft, substantially as specified.

8. A pivoted digit-wheel and a shifting-frame carrying said pivoted digit-wheel and provided with a returning spring and gear, in combination with digit-wheel-shifting mechanism, a notation-key adapted to effect the engagement of its wheel with the digit-wheel-setting mechanism, and digit-keys operating through said turning mechanism to actuate the digit-wheel when set, substantially as specified.

9. The combination, with the digit-gear-turning mechanism and its keys, of the digit-wheels having each a full and mutilated gear-wheel, the swinging frames of the digit-wheels, their returning-springs and notation-keys, and the resetting-slide and pinions thereon, substantially as specified.

10. The combination, with the digit-wheels and their swinging frames and returning-springs, of the digit-keys and gearing, and a rotary shaft parallel to the line of digit-wheels and carrying a series of pinions normally out of engagement with the gear of the digit-wheels, and notation-keys connected to said swinging frames, whereby the latter are brought into engagement with the pinions of said rotary shaft, substantially as specified.

11. The combination, with the digit-gear-turning mechanism and a rotary pinion-carrying shaft and the digit-keys, of the swinging digit-wheels having stop-pins and returning-springs, the notation-keys, the stop-fingers, a resetting-lever, and mechanism adapted to operate said pinion-carrying shaft and its pinions when the resetting-lever is pressed, substantially as specified.

12. The combination, with a series of digit-wheels and the notation-keys for bringing them to engagement position, of the digit-gear-turning mechanism, a pinion and the pinion-carrying shaft, an automatic stop normally engaging said pinion-carrying shaft, and the digit-keys, substantially as specified.

13. The combination, with the digit-gear-turning mechanism and the independent digit-keys having stop projections, of a main toothed wheel, a bail-lever common to all the digit-keys and having its arms pivoted to the arms of a supplementary bail-lever journaled or pivoted in the axial line of said wheel, an actuating-pawl connected to said bail-lever, a holding-pawl, a spring returning device connected to the keys and bail-lever, and a stop, substantially as set forth.

14. In an accounting-machine, the combination of a set of digit-keys, gear-turning mechanism common to all of said keys, a pawl, a bail lever, mechanism actuating said gear-turning mechanism, the locking-pawl for the gear-turning mechanism, the notation-keys, their levers, and the shifting-frames connected to said levers and carrying the digit-wheels, substantially as specified.

15. The combination, with adjustable digit-wheels and rack-indicators, of a set of digit-keys, their common gear-turning mechanism, the notation shifting devices, the pinion-shaft, and the means common to all said notation shifting devices for guarding the action of said digit-keys, substantially as specified.

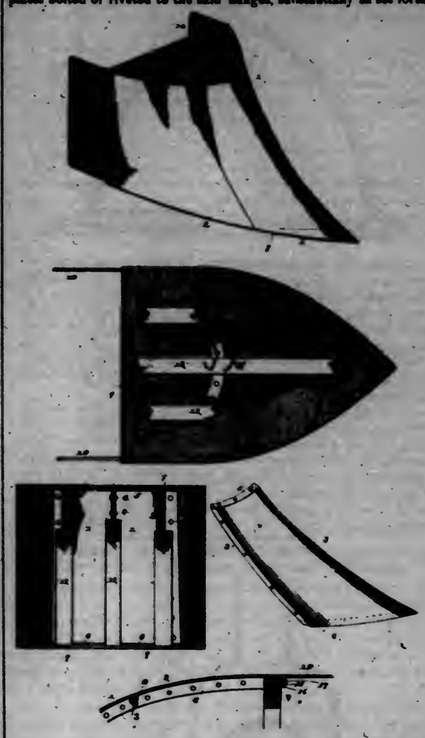
16. The combination, with movable or shiftable digit wheels or indicators arranged in series and a corresponding series of notation-keys having shifting devices in connection with said digit wheels or indicators, of a single series of digit-keys and gear-turning mechanism common to all said digit-keys and normally disengaged from said digit wheels or indicators, but adapted to operate the same when engaged therewith by means of the notation-keys, substantially as specified.

413,303. FLOUR-SIFTER. GEORGE H. PAINE, Philadelphia, Pa. Filed July 11, 1889. Serial No. 317,202. (No model.)

Claim.—1. The combination of the scoop A, its horizontal screen B, the revolving agitator *c*, pivoted in the screen and provided with the horizontal arm c^4, the handle H, pivoted vertically in the brackets *a a* on the side of the scoop and having its horizontally-extended pivoted arm *e* linked to the arm c^4, whereby the partial rotation of the handle in the brackets is made to partially rotate the agitator *c*, substantially as described.

2. The combination of the scoop A, provided with the tapering or contracted downward extension below its screen, the horizontal screen B, the rotary agitator *c*, arranged to vibrate above the screen and provided with the vibrating arm c^4, extending horizontally below the screen in the path of the material sifted through the same, the handle H, pivoted vertically in brackets on the side of the scoop and having its pivoted arm *e* linked to arm c^4, whereby the tapering downward extension of the scoop incloses and prevents the scattering of the sifted material by said arms, substantially as described.

413,304. SHAFTS FOR ROAD-CARTS. NATHANIEL W. PARKER and FRANKLIN WILSON, Hamilton, N. Y. Filed Aug. 3, 1889. Serial No. 319,636. (No model.)



Claim.—1. The combination, with two sections of a vehicle pole or shaft arranged end to end, of a bracket attached to one section extending past the proximate ends and hinged to the other section, and a spring bearing on one shaft-section and on the bracket, substantially as described.

2. The combination, with the divided section of a vehicle-shaft, of a pair of brackets secured to one section and extending across the break, a leaf on one shaft-section pivoted to one bracket, and a leaf on the other section loosely connected to its bracket, substantially as described.

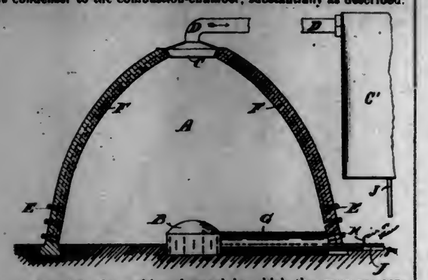
413,305. PILOT FOR LOCOMOTIVES. EDWIN G. PHILLIPS, Charleston, S. C., assignor of two-thirds to Samuel Weinhopf and Thomas P. Livingston, both of same place. Filed July 12, 1889. Serial No. 317,346. (No model.)

Claim.—1. A locomotive-pilot composed of a series of plates or sections provided at their meeting edges with flanges extending rearwardly to receive the connecting bolts or rivets, substantially as set forth.

2. A locomotive-pilot composed of the central and side plates or sections provided at their meeting edges with flanges to receive the connecting bolts or rivets and provided at their upper and lower horizontal edges with rearwardly-extending flanges, and top and bottom plates bolted or riveted to the said flanges, substantially as set forth.

3. In a locomotive-pilot, the combination of the central and side plates or sections provided with connecting-flanges at their meeting edges and horizontal flanges at their upper and lower edges, the top and bottom plates secured to said horizontal flanges, and the vertical rectangular frame secured between the rear ends of said top and bottom plates, substantially as set forth.

4. In a locomotive-pilot, the combination of the central and side sections having connecting-flanges at their meeting edges and provided with horizontal flanges at their upper and lower edges, the top and bottom plates secured to said horizontal flanges, the rectangular vertical frame secured between the rear ends of said top and bottom plates, the cross-braces in said horizontal frame, and the longitudinal braces connecting the upper side of said horizontal frame with the bottom plates of the pilot-body, substantially as and for the purpose set forth.



5. In a locomotive-pilot, the combination of the rectangular frame, the top and bottom plates secured to the same, the central and side plates or sections having connecting-flanges at their meeting edges, said side sections being extended in rear of the frame to form guards or fenders, the cross-braces in the rectangular frame, and the longitudinal braces connecting the latter with the bottom plates of the pilot, substantially as and for the purpose herein set forth.

6. The combination, with a locomotive-pilot constructed of plates or sections having flanges extending inwardly from their meeting edges and bolted together, of the rearwardly-extending guards or fenders, substantially as and for the purpose set for.

413,306. KILN FOR MAKING CHARCOAL. EDWARD W. RATHBUN, Deseronto, Ontario, Canada. Filed Mar. 22, 1887. Serial No. 231,940. (No model.) Patented in Canada Apr. 2, 1887, No. 26,265.

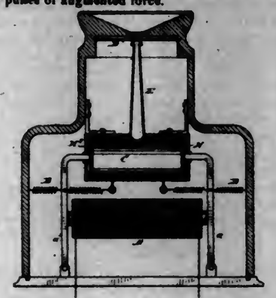
Claim.—1. In a kiln for making charcoal, in which the gases are conveyed from the kiln to a condenser and then returned to the combustion-chamber of the kiln, the combination of the walls provided with flues beginning near the bottom of the kiln and terminating near

the top thereof, a chamber C for receiving the gases from said flues and having a pipe leading to the condenser, the perforated combustion-chamber B, having passage G, and a pipe J, to convey gas from the condenser to the combustion-chamber, substantially as described.

2. In a kiln for making charcoal, in which the gases are conveyed from the kiln to a condenser and then returned to the combustion-chamber of the kiln, the combination of the walls provided with flues beginning near the bottom of the kiln and terminating near the top thereof, and provided with a series of valves near the lower ends, a chamber C for receiving the gases from said flues and having pipe D leading to the condenser, the perforated combustion-chamber B, having passage G, and a pipe J to convey gas from the condenser to the combustion-chamber, substantially as described.

3. In a kiln for making charcoal, in which the gases are conveyed to a condenser and then returned to the combustion-chamber of the kiln, the combination of the walls provided with flues beginning near the bottom of the kiln and terminating near the top thereof, a chamber C for receiving the gases from said flues and having a pipe D leading to the condenser, the perforated combustion-chamber B, having passage G, a pipe J, leading from the condenser to the combustion-chamber, and the pipe H, for the purpose set forth.

413,307. TWO-SEAL SEWER-GAS TRAP. CHARLES H. RENTZ, Baltimore, Md. Filed Jan. 22, 1889. Serial No. 297,217. (No model.)

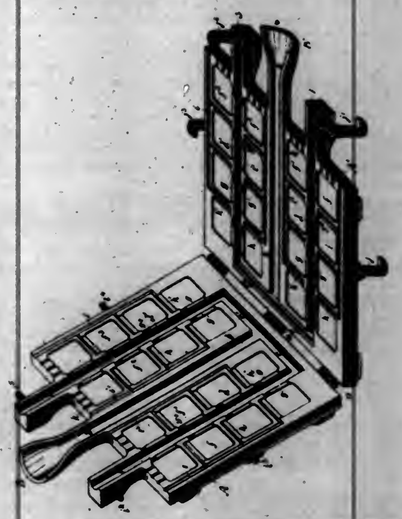


Claim.—1. A sewer-gas trap consisting of a chamber having an inlet-orifice at the top and an outlet-orifice at the bottom, a trap connected with the outlet-orifice having its outlet above the floor of the chamber, but below the main portion of the trap, and a buoyant and gravitating valve having sufficient weight to seat against the outlet-orifice when the chamber is full only to the level of the outlet of the trap and sufficient buoyancy to move from its seat when additional liquid enters the chamber, substantially as described.

2. In combination with a sewer-gas trap consisting of a chamber having an inlet-orifice at the top and an outlet-orifice at the bottom, and a trap connected with the outlet-orifice having its outlet above the floor of the chamber, but below the main portion of the trap, a buoyant and gravitating valve of more than double the diameter of the outlet-orifice upon which it is seated, whereby the valve, closing the outlet by its gravitation, is enabled to float when liquid is discharged into the chamber, whether the said outlet be empty or filled with liquid, substantially as described.

413,308. TELEPHONE-RECEIVER. CHARLES SELDEN, Baltimore, Md. Filed Jan. 6, 1888. Serial No. 259,190. (No model.)

Claim.—1. In a telephone-receiver, the combination, with an air-chamber having a movable or vibratory wall, of a magnet acting on the same, an air pipe or opening for said chamber having a reduced area, and a diaphragm placed opposite the opening for receiving the air puffs or pulses of augmented force.



2. In a telephone-receiver, the combination of an air-chamber having two movable heads or walls, a magnet or magnets for acting on the same, an exit-pipe, and a diaphragm placed opposite the end of said pipe.

3. A telephone-receiver consisting, essentially, of an air-chamber having movable heads or walls opposite one another, an intermediate magnet acting with its opposite pole ends respectively upon said heads, and a pipe leading from said chamber and arranged to deliver air pulses or vibrations upon a sound-receiving surface or diaphragm.

4. The combination, in a telephone-receiver, of an air-chamber of variable capacity, a magnet or magnets acting on the same, a pipe or opening of reduced size, whereby augmented vibrations or pulses of air may be expelled through said pipe by the action of the magnet in reducing the capacity of the chamber, and a diaphragm or sound-receiving surface placed opposite said pipe or opening.

413,309. MOLD FOR CASTING THE PLATES OF STORAGE-BATTERIES. WALDRON SHAPLEIGH, Camden, assignor to the Electric Storage Battery Company, Gloucester City, N. J. Filed July 2, 1889. Serial No. 316,334. (No model.)

Claim.—The herein-described mold for casting plates for secondary batteries, provided with a sprue or feed merging with a central channel extending through the mold and communicating with channels *e* and *e'*, and the latter merging with risers *d'* and *f'*, matrices in communication with said risers through the channels *g* and *g'*, horizontal channels *h* and *h'* between said matrices and in communication with air-escape channels *i* and *i'*, and means for clamping the parts of the mold together, substantially as and for the purposes set forth.

413,310. MACHINE FOR MANUFACTURING COMPRESSED PILLS. CHARLES SHEET, Bridgeton, N. J., and HARRY K. MULFORD, Philadelphia, Pa.; said Sheet assignor to said Mulford. Filed Mar. 15, 1889. Serial No. 303,415. (No model.)

Claim.—1. In a machine for forming pills by compression, a vertical standard or frame-work, a horizontal bed supported upon said frame-work and embodying a bed-die, vertically-operating upper and lower plunger-dies, a driving-shaft in the upper part of the frame-work, a crank on said shaft which is connected with and reciprocates the upper plunger-die, a cam on said driving-shaft, a rock-shaft provided with a rocker oscillated by said cam, a stirrup-rocker connected to said rock-shaft, and a plunger-stirrup depending from said rocker, which actuates the lower plunger-die, substantially as set forth.

2. In a machine for forming pills by compression, a vertical standard or frame-work, a horizontal bed supported upon said frame-work and embodying a bed-die, vertically-operating upper and lower plunger-dies, a driving-shaft in the upper part of the frame-work, a crank on said shaft which is connected with and reciprocates the upper plunger-die, a cam on said driving-shaft, a rock-shaft provided with a rocker oscillated by said cam, a stirrup-rocker connected to said rock-shaft, a plunger-stirrup depending from said rocker, which actuates the lower plunger-die, a feeding-hopper adapted to travel upon the bed, and mechanism for occasioning both the travel and the shaking of the hopper, substantially as set forth.

3. In a machine for forming pills by compression, in combination, the vertical standard or frame-work, the upper plunger-die, the lower plunger-die, the bed embodying the bed-die, the main shaft, a crank thereon, a pitman connecting said crank and the upper plunger-die, a plunger-stirrup the lower end of which is attached to the lower plunger-die, a cam, and mechanism for supporting said plunger-stirrup and transmitting to it motion from said cam, substantially as set forth.

4. In a machine for forming pills by compression, in combination, the upper plunger-die, the lower plunger-die, the bed embodying the bed-die, the main shaft, a crank thereon, a pitman connecting said crank and the upper plunger-die, a cam, and a plunger-stirrup the lower end of which is attached to the lower plunger-die and the upper end of which is connected by intermediate adjusting devices to the cam, substantially as set forth.

5. In a machine for forming pills by compression, in combination, the upper plunger-die, the lower plunger-die, the bed embodying the bed-die, the main shaft, the crank thereon, a pitman connecting the crank and the upper plunger, a plunger-stirrup the lower end of which is attached to the lower plunger-die, a rock-shaft, a stirrup-rocker mounted thereon, to which the upper end of the plunger-stirrup is connected, a cam, a rocker mounted on said rock-shaft and oscillated by the cam, a hopper, and means for causing said hopper to travel backward and forward on the bed-plate and for shaking it when over the bed-die, substantially as set forth.

6. In a machine for forming pills by compression, in combination, the supporting standard or frame-work, the upper plunger-die, mechanism for supporting and occasioning the reciprocation of said die, the bed-plate embodying the bed-die, the plunger-stirrup formed with an upturned lower end, the lower plunger-die pivotally connected thereto, the stirrup-rocker on which the plunger-stirrup is hung, the rock-shaft to which said rocker is attached, the rock-shaft arm, and the cam, substantially as set forth.

7. In a machine for forming pills by compression, in combination, the supporting standard or frame-work, the upper plunger-die, mechanism for supporting and occasioning the reciprocation of said die, the bed-plate embodying the bed-die, the plunger-stirrup, the stirrup-foot which said plunger-stirrup encounters at the lowest point of its stroke, the lower plunger-die pivotally connected to the plunger-stirrup, the rocker provided with a segmental dovetailed slot, in which slot the stirrup is hung, the rock-shaft to which said rocker is attached, the rock-shaft arm, and the cam, substantially as set forth.

8. In a machine for forming pills by compression, the upper plunger-die, the lower plunger-die, a bed-plate embodying the bed-die, means for causing the reciprocation of the plunger-dies, a feeding-hopper, and means for causing said hopper to travel backward and forward on the bed-plate and for shaking it when over the bed-die, substantially as set forth.

9. In a machine for forming pills by compression, in combination, the upper and lower plunger-dies, a bed-plate embodying a bed-die, means for occasioning the reciprocation of the plunger-dies, a feeding-hopper, means for occasioning the travel of the said hopper relatively to the bed-die, a magazine for supplying said hopper, and means for imparting vibratory movement to the magazine, substantially as set forth.

10. In a machine for forming pills by compression, in combination, the upper plunger-die, the lower plunger-die, a bed-plate embodying a bed-die, mechanism for occasioning the reciprocation of the upper plunger-die, mechanism for reciprocating the lower plunger-die, part of which latter mechanism consists of the slotted stirrup-rocker, and the plunger-stirrup adjustably mounted in the slot of said stirrup-rocker, substantially as set forth.

11. In a machine for forming pills by compression, in combination, the vertical standard or frame-work, the upper plunger-die, the lower plunger-die, the bed embodying the bed-die, the main shaft, a crank thereon, a pitman connecting said crank and the upper plunger-die, a plunger-stirrup the lower end of which is attached to the lower plunger-die, mechanism for supporting said plunger-stirrup, a cam for actuating the plunger-stirrup, mechanism for transmitting motion from said cam to the plunger-stirrup, a feeding-hopper having a flat bottom surface through which an aperture is communication with the interior of the hopper opens, embodying also a pin-socket, the spring, the hopper-shaft, the lever-arm, the lateral pin, the rocker-arm, and the cam for actuating said rocker-arm, substantially as set forth.

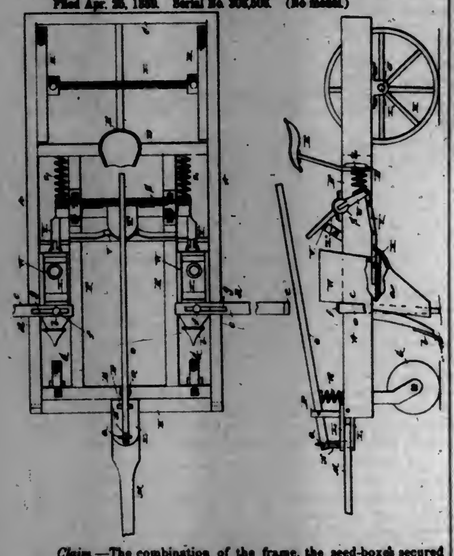
12. In a machine for forming pills by compression, in combination, the upper and lower plunger-dies, a bed-plate embodying a bed-die, means for occasioning the reciprocation of the plunger-dies, a feeding-hopper, a cam having both a crest and corrugations, connective mechanism through which the crest occasions the retraction and the corrugations the shaking of the said hopper, and a spring for advancing said hopper, substantially as set forth.

13. In a machine for forming pills by compression, in combination, the upper and lower plunger-dies, a bed-plate embodying a bed-die, means for occasioning the reciprocation of the plunger-dies, a feeding-hopper, and a magazine adapted to discharge into the hopper and connected to a rocking or oscillating portion of the machine, substantially as set forth.

14. In a machine for forming pills by compression, in combination, the upper and lower plunger-dies, a bed-plate embodying a bed-die, means for occasioning the reciprocation of the plunger-dies, a feeding-hopper, a magazine adapted to discharge into the hopper, and a link connecting the said magazine to a moving part of the machine, substantially as set forth.

15. In a machine for forming pills by compression, in combination, the upper plunger-die, the lower plunger-die, means for occasioning the reciprocation of said plunger-dies, a feeding-hopper, means for occasioning the backward and forward movement of said hopper on a bed-plate, and a bed-plate embodying a bed-die, which bed-plate is, as to that part of its surface in contact with the feeding-hopper, formed of a single piece or surface of material, substantially as set forth.

16. In a machine for forming pills by compression, in combination, the upper and lower plunger-dies, a bed-plate embodying a bed-die, means for occasioning the reciprocation of said plunger-dies, the feeding-hopper, means for occasioning the backward and forward travel of the hopper, and the chute provided with a sieve-bottom, substantially as set forth.



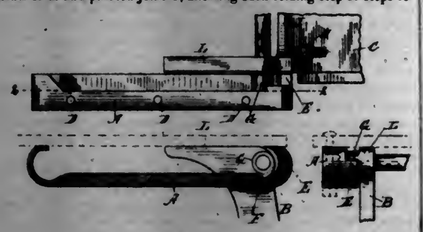
17. In a machine for forming pills by compression, in combination, the upper and lower plunger-dies, a bed-plate embodying a bed-die, means for occasioning the reciprocation of said plunger-dies, means for sweeping finished pills from the bed-plate, the sieve-bottomed chute, and devices for causing the jarring of said chute, substantially as set forth.

18. In a machine for forming pills by compression, in combination, the upper and lower dies, means for occasioning the reciprocation of the upper die, a train of devices, of which the plunger-stirrup forms a part, for occasioning the reciprocation of the lower plunger, the bed-plate, devices for sweeping the finished pills from the bed-plate, the

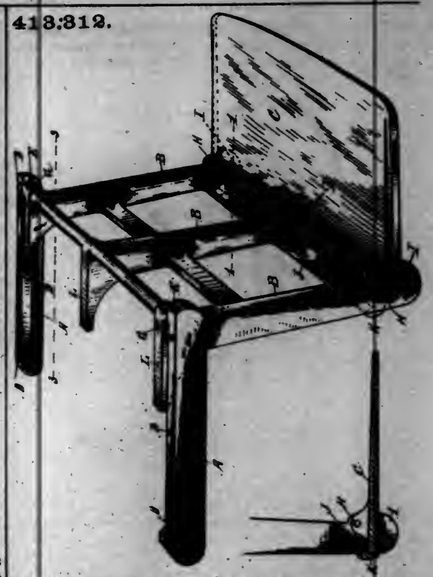
sieve-bottomed chute, and an arm connected to said chute and projecting into the path of the plunger-stirrup, substantially as set forth.

19. In a machine for forming pills by compression, in combination, the upper and lower dies, means for occasioning the reciprocation of the upper die, a train of devices, of which the plunger-stirrup forms a part, for occasioning the reciprocation of the lower plunger, the bed-plate, devices for sweeping the finished pills from the bed-plate, the sieve-bottomed chute, supporting-wires upon which said chute is mounted, and an arm connected to said chute and projecting into the path of the plunger-stirrup, substantially as set forth.

413,311. CORN-PLANTER. JAMES T. WILLIAMS, Caddo Mills, Tex. Filed Apr. 25, 1889. Serial No. 308,808. (No model.)



Claim.—The combination of the frame, the seed-boxes secured thereon, the horizontally-moving slides in the bottoms of the seed-boxes, the rock-shaft mounted transversely on the frame in rear of the seed-boxes and having depending crank-arms at its ends, the pitmen connecting said crank-arms with the slides, the treadle projecting upward from the center of the rock-shaft, the springs arranged in rear of the crank-arms between the same and a cross-bar of the frame, the stop arranged transversely on the frame in advance of the rock-shaft and in the path of the treadle, and the seat secured on the frame in rear of the rock-shaft and adjacent to the treadle, as set forth.



413,312. STEP FOR RAILWAY-CARS. ASBO B. ALLEN, Sanford, Fla. Filed Dec. 20, 1888. Serial No. 294,942. (No model.)

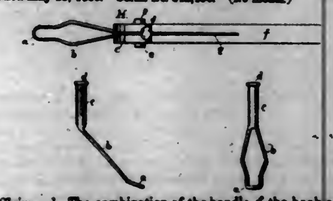
Claim.—1. In folding steps, the step-platform C, in combination with the supports I I in front of the pivot, and the bar J, arranged above the platforms back of the pivot, to also serve as a stop to the downward movement of the platforms, substantially as set forth.

2. In a folding step or steps, the combination of a pivoted joint with a stop E, shoulder F, and arms or supports L L L, as specifically described.

3. The combination, in a folding step or steps, of the two hinged joints H H and pivoted joint G, allowing such folding step or steps to

be folded and placed at the under side of any stationary step or steps, all substantially as set forth.

413,313. NON-CONDUCTING HAND-WHEEL FOR COCKS, &c. JOHN W. RISKER, Cincinnati, Ohio. Filed May 17, 1888. Serial No. 311,101. (No model.)



Claim.—1. A non-conducting hand-wheel for valves and steam-fittings, having on its under side a central circular aperture for the reception of the disk or flange-plate of the valve-stem, and having also a circular kerf or groove *f* above or within said aperture, combined with an independent ring *g*, inserted in said kerf or groove inside of said aperture, substantially as set forth.

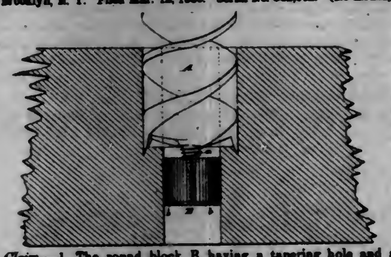
2. The combination, with a valve-stem having a disk or flange-plate *c*, provided with the detents or projections *d*, of a non-conducting hand-wheel having on its under or inner side an aperture *e* for the reception of said disk or flange-plate, and a kerf or groove *f* above or within said aperture, and on its upper or outer side a recess or central aperture *a*, the washer *h* in said aperture *a*, the ring *g*, inserted in said kerf or groove, and the attaching-screw *i*, having its head within the upper or outer face of the hand-wheel.

3. The combination, with a valve-stem having a disk or flange-plate *c*, of a non-conducting hand-wheel having on its under side the aperture for the reception of said disk or flange-plate, and having also a circular groove or kerf *f* above or within said aperture or disk, and the metal ring *g*, independent of or separate from said disk or flange-plate and fitting in said groove or kerf.

413,314. BUTTON-HOOK. THEODORE R. BEERS, New York, N. Y. Filed May 25, 1889. Serial No. 312,156. (No model.)

Claim.—1. The combination of the handle *f*, the hook consisting of the part *c*, passing diagonally through the handle and at an angle therewith, and the part *a b*, bent at an angle to the part *c*

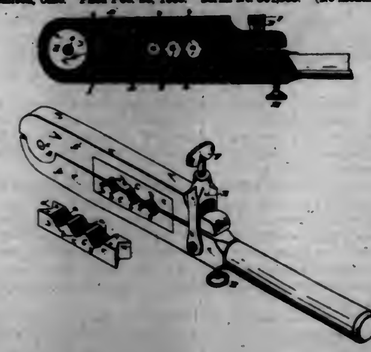
2. The combination of the split handle *f*, the rivet *e*, and the hook which consists of the part *c*, passing diagonally through the handle, and the parts *a b*, the part *b* being bent at an angle to part *c*, and part *a* bent at an angle to part *b*.



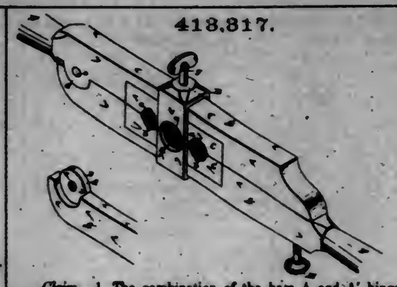
413,315. BUTTON FOR SLEEVES OR OTHER ARTICLES. MARIE DEHAYE, Paris, France. Filed Jan. 14, 1889. Serial No. 296,944. (No model.)

Claim.—1. The combination, in a button, of a flattened post having in it a transverse slot arranged wholly inward of the end thereof and extending in the direction of greatest width of the post, a pin arranged centrally and longitudinally within said post to turn therein, a button-head fast on one end of the said pin, and a cross-bar fast on said pin within the slot of the post and adapted to lie either within the said slot or crosswise of the post, the outer end of the post extending over said cross-bar, substantially as and for the purpose herein described.

2. The combination, in a button, of a flattened post having in it a transverse slot arranged wholly inward of the end thereof and extending in the direction of greatest width of the post, a pin arranged centrally and longitudinally within said post to turn therein, a cross-bar fast on said pin near one end thereof and within the said slot in the post, a button-head on the other end of said pin, having in it an arc-shaped opening, a projection on the post passing through said opening, and a spring secured upon one side of the button-head and provided with a projection adapted to engage with said projection on the post to hold the latter after it has been moved to either end of said opening, for the purpose of holding the cross-bar within the slot in the post or crosswise of the post, substantially as herein set forth.



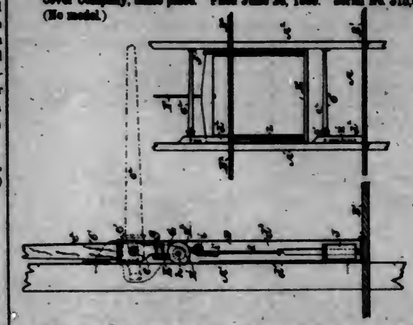
413,316. ATTACHMENT FOR AUGERS. WILLIAM J. M. DOBSON, Brooklyn, N. Y. Filed Mar. 12, 1889. Serial No. 302,962. (No model.)



Claim.—1. The round block B, having a tapering hole and a slightly-tapered exterior adapted to match on a screw-auger of larger diameter and to serve therewith, as herein specified.

2. The combination of a screw-auger A *a*, for boring wood, and a round block B of less diameter, the latter being provided with a hole adapted to fit on the tapering screw-point and to be readily applied and removed, as herein specified.

413,317. DIE-STOCK. AUGUST ERTZBERG and LEVI L. DEWEESE, Canton, Ohio. Filed Feb. 26, 1889. Serial No. 301,895. (No model.)



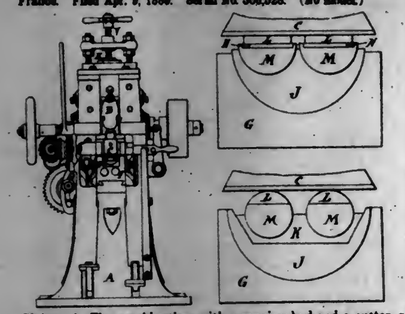
Claim.—1. The combination of the bars A and A', hinged together, the dies C, provided with the screw-threaded recesses *a*, the spring D, the clamp E, the set-screw K, and the set-screw *g*, substantially as and for the purpose set forth.

2. The combination of the bars A and A', the dies C, provided with the recesses *a*, the spring D, provided with the extensions or arms *c*, adapted to enter the recesses *f*, the set-screws E and *g*, and the clamp E, substantially as and for the purpose set forth.

413,318. ELEVATOR-HATCHWAY GUARD. DANIEL FRASER, New York, N. Y., assignor to the Excelsior Elevator Guard and Hatch Cover Company, same place. Filed June 26, 1889. Serial No. 315,092. (No model.)

Claim.—1. The combination, with a hoistway of an elevator, of a lever, a counterbalance-weight for the lever, a drum having a spiral surface, a flexible connection between the drum and the lever, a second drum united with the first and having a spiral surface reverse to the first-named spiral, and a flexible connection between the second drum and the counterbalance-weight, substantially as specified.

2. The combination, with a hoistway of an elevator, of a lever, a counterbalance-weight for the lever, a drum, a flexible connection between the drum and the lever, a second drum united with the first and having a spiral surface, and a strap sustaining the counterbalance-weight and having a series of blocks of different projections attached to its inner side, substantially as specified.



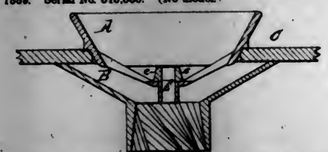
3. The combination, with a hoistway of an elevator, of a lever, a counterbalance-weight for the lever, a drum, a flexible connection between the drum and the lever, a second drum united with the first and having a spiral surface, a strap sustaining the counterbalance-weight and having a series of blocks of different projections attached to its inner side and its extremity doubled back and united to the main portion, substantially as specified.

4. The combination, with a hoistway of an elevator, of a lever, a counterbalance-weight for the lever, a drum, a flexible connection between the drum and the lever, a second drum united with the first, and a flexible connection between the second drum and the counterbalance-weight, the said drums being made in the form of reverse spirals, substantially as specified.

5. The combination, with a hoistway of an elevator, of a lever, a counterbalance-weight for the lever, a drum, a chain, cord, or strap connecting the drum with the lever, the chain, cord, or strap of the drum being connected to the lever at a point offset to one side of the longitudinal center of the lever, substantially as set forth.

6. The combination, with a hoistway of an elevator, of a lever, a counterbalance-weight having a flexible connection with the lever, a box-shaped casting containing the weight, a spring connected to the casting, a detent at the end of said spring to engage with and lock the lever, and a cam carried by the elevator-car for operating the spring, substantially as specified.

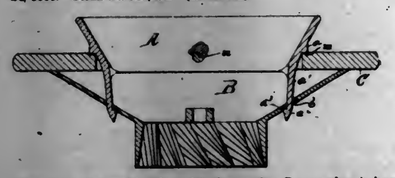
413,319. FILE-CUTTING MACHINE. ALFRED GOLDENBERG, Paris, France. Filed Apr. 9, 1889. Serial No. 306,528. (No model.)



Claim.—1. The combination, with a moving bed and a cutter, of a holder for two or more files, and mechanism, substantially such as described, transversely oscillating said holder, substantially as specified.

2. The combination, with a moving bed and a cutter, of a block having a half-round groove, a fulcrum-block in said groove, and two or more file-holders in said fulcrum-block, the parts being so arranged that each file-holder has an independent oscillation, substantially as specified.

3. In a file-cutter, the combination, with a bed and a cutter, of a transversely-oscillating fulcrum-block and independently-oscillating file-holders on said block, substantially as specified.

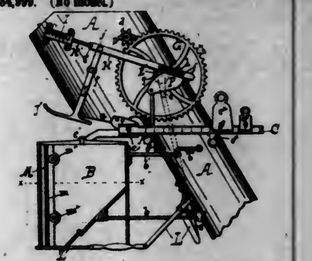


413,320. COFFEE-MILL. WILLIAM A. HAHCK, Freeport, Ill., assignor to the Warner Manufacturing Company, same place. Filed June 24, 1889. Serial No. 315,333. (No model.)

Claim.—1. In combination with the case-cover C, a hopper A, resting thereupon, and bearing-arms F F, projecting inward toward the center, and a grinding-shell B beneath said cover and having a diametrical bridge D, provided upon its central portion with shoulders *e e*, adapted to be engaged with the arms F F by rotating said hopper with reference to said shell, and thereby firmly clamp all of said parts together, as and for the purpose stated.

2. The combination of the casting A, bearing the arms F F, containing the depressions *f f*, the cover C, and the casting B, having the bridge D, provided with the shoulders *e e* upon the central portion E thereof, as and for the purpose stated.

413,321. COFFEE-MILL. WILLIAM A. HAHCK, Freeport, Ill., assignor to the Warner Manufacturing Company, same place. Filed June 24, 1889. Serial No. 315,334. (No model.)



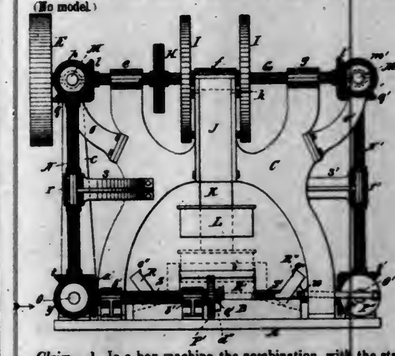
Claim.—1. In combination with the casting B, a casting A, bearing lugs *a*, adapted to be engaged with some portion of the casting B by springing the casting A slightly out of its original form and to hold said castings tightly together by means of the elastic force with which said casting A tends to resume its former shape, as and for the purpose stated.

2. The combination of the casting A, bearing the lugs *a'*, and the flange *a*, having the sharp rim *m*, in combination with the casting B, slotted at *b*, as and for the purpose stated.

3. The casting A, provided with lugs *a'* and points *n*, in combination with the casting B, slotted at *b*, as and for the purpose stated.

4. The combination of the casting A, having the lugs *a'*, flange *a*, sharp-rimmed at *m*, and points *n*, in combination with the casting B, slotted at *b*, as and for the purpose stated.

413,322. GRAIN-METER. STACY R. HART, Peoria, Ill., assignor to the Hart Weigher Company, same place. Filed Sept. 10, 1888. Serial No. 284,999. (No model.)



Claim.—1. In an automatic grain-weighing device, the combination of the vertically-movable hopper B, provided with the rigidly-attached stop b^3, the driven wheel G, arranged above said stop, the plate F, connected to and operated by said wheel, substantially as described, and provided with the arm K to engage with the stop b^3, and the valves L' J', controlled by the movements of said plate F, substantially as herein set forth.

2. The combination of the swinging hopper B, the stop b^3, rigidly attached thereto, the pendent lever K and its spring *k'*, the plate F, attached to the shaft E, the gear-wheels *g* G, fastened together, loosely mounted on the shaft E, and driven by the wheel *d* on the end of driving-shaft D, the bar H H', the spring I, the lever J, and the grain-valve J', substantially as described.

3. The combination of the swinging hopper B, the stop b^3, rigidly attached thereto, the pendent lever K and its spring *k'*, the plate F, attached to the shaft E, the gear-wheels *g* G, fastened together, loosely mounted on the shaft E, and driven by the gear-wheel *d* on the end of the driving-shaft D, and the crank *c*, pitman *c'*, bell-crank lever L, and hopper-valve L', substantially as described.

4. The combination of the swinging hopper B, the stop b^3, rigidly attached thereto, the pendent lever K and its spring *k'*, the plate F, attached to the shaft E, the gear-wheels *g* G, fastened together, loosely mounted on the shaft E, and driven by the gear-wheel *d* on the end of the driving-shaft D, the crank *c* on the end of the shaft E opposite to the plate F, and means for operating the two valves J' L' from the plate F and crank *c*, substantially as described.

413,323. BOX-MAKING MACHINE. TOBY HERRINGER and ROBERT SINGER, Dayton, Ohio. Filed Mar. 18, 1889. Serial No. 303,700. (No model.)

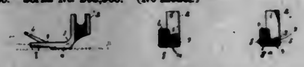
Claim.—1. In a box-machine, the combination, with the stationary bed-plate and a vertically-reciprocating clamping-platen above the same, of laterally-arranged sliding and swinging presser-blocks, and mechanism for actuating said clamping-platen and presser-blocks, substantially as described.

2. In a box-machine, the combination, with a stationary bed-plate and a vertically-reciprocating clamping-platen above the same, of laterally-arranged sliding and swinging presser-blocks provided with flanges on their upper inner edges and rounded swells on their lower inner edges adapted to be caught and engaged by grooves in the bed-platen while the blocks are being swung up, and mechanism for actuating said clamping-platen and presser-blocks, substantially as described.

3. In a box-machine, the combination, with a vertically-reciprocating clamping-platen, a bed-plate beneath the same, and sliding and swinging presser-blocks, of a pitman for each block, and mechanism for actuating said platen and pitman, substantially as described.

4. The combination and arrangement of the base A, beds B *i*, frame C, guide-housing J, with its slots *j*, platen L, with its plunger K and pins *k*, shaft G, with its cam-slotted disks I and pinions *l l'*, shafts M M', with pinions *m p m' p'*, shafts N N', with pinions *q t q' t'*, shafts O O', with pinions *u y u' y'* and disks P P'', shafts S S', with pinions *s' s''* and disks P' P''', pitmen Q Q' Q'' Q''', and presser-blocks R R' R'' R''', all substantially in the manner and for the purpose specified.

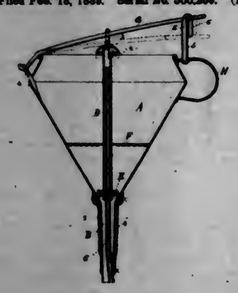
413,324. FOLDING TABLE. LORIN L. KNOWLTON, Madison, Wis. Filed Mar. 19, 1888. Serial No. 267,761. (No model.)



Claim.—1. In a folding table, the combination, with a table-top, of two pairs of cross-legs hinged thereto, the inner leg of each pair consisting of the parts B' *b*, the part *b* being hinged to the table-top and pivotally connected to the part B', thereby forming a joint at D, the round F, rod G, braces H H, and means for retaining the jointed legs in position, substantially as described, and for the purposes set forth.

2. In a folding table, the combination, with the rigid top A, legs B B, hinged thereto, and round F, of jointed legs crossing said legs B B and consisting of the parts B' B' *b b*, the parts *b b* being hinged to the top A and pivoted to the upper ends of the parts B' B', forming joints at D D, whereby all of the legs may be folded against the table-top, the parts *b b* projecting beyond the pivotal joints D D to such a distance as to engage with the said round F when the table is open, and having their projecting ends connected by the rod G and braces H H, substantially as described, and for the purposes set forth.

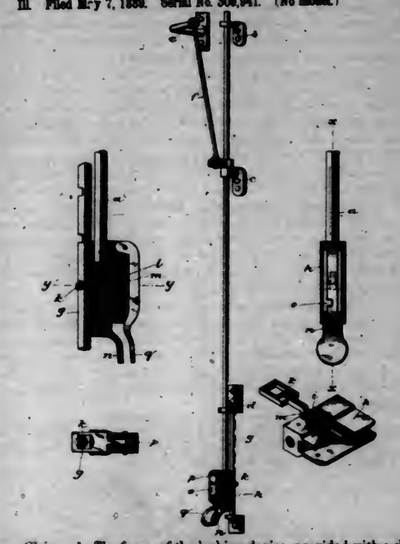
3. In a folding table, the combination, with the rigid top A, legs B B, hinged thereto, and round F, of jointed legs consisting of the parts B' B' *b b*, the parts *b b* being hinged to the top A and projecting beyond the pivotal joints D D to such a distance as to engage with said round F, and having their projecting ends connected by the rod G and braces H H, substantially as described, and for the purposes set forth.



413,325. PRESSER-FOOT AND OVERLAY-GUIDE FOR SEWING-MACHINES. CHARLES F. LITTLEJOHN, Bridgeport, Conn. Filed Dec. 11, 1888. Serial No. 293,305. (No model.)

Claim.—1. A sewing-machine presser-foot having a bottom bearing-surface 4, and in front thereof an upwardly-turned arm 6, and an arm 7, having a shoulder 9, with a slot between said arms, said arm 7 carrying a flat horizontally-extending guide 8, projecting beneath the said upwardly-turned arm 6, but separated therefrom, and the bottom of said guide being above said bearing-surface 4.

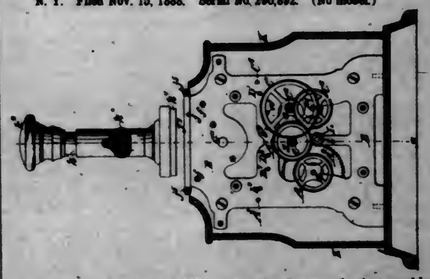
2. A sewing-machine presser-foot having a bottom bearing-surface 4, and in front of said bearing-surface an upwardly-turned arm 6, and an arm 7, having a shoulder 9, with a slot 5 between said arms, said arm 7 being provided with a flat horizontally-extending guide 8, projecting laterally across the presser-foot from said arm 7, beneath said upwardly-turned arm 6, and having the upwardly-turned lip 8', the bottom of said guide being above said bearing-surface 4.



413,326. MEASURING-FUNNEL. QUIRICO MAGLIOLA, West Hoboken, N. J. Filed Feb. 18, 1889. Serial No. 300,209. (No model.)

Claim.—1. The combination, with the funnel and central air-tube, of a valve and tubular stem, and a spring-lever passing through an eye at the upper end of the tubular stem and into a stationary eye on the funnel, the moving end of the spring-lever being adjacent to the handle of the funnel, substantially as set forth.

2. The combination with the funnel, of the valve and tubular stem, a spring-lever connected to the upper end of the stem and received at one end into a stationary eye upon the funnel opposite to the handle, the tube 5 upon the handle of the funnel, and the wire hook passing through the same and adapted to receive and hold the spring-lever, substantially as set forth.



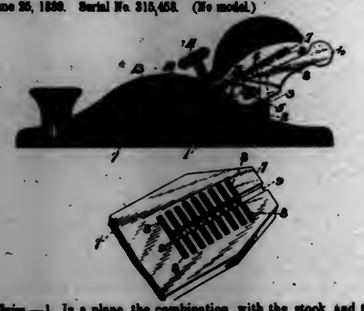
413,327. TRANSOM-LIFTER. LAURENCE MOHAT, Jr., Chicago, Ill. Filed May 7, 1889. Serial No. 309,941. (No model.)

Claim.—1. The frame of the locking device, provided with a slot for the latch of the same, said latch consisting of a loop which surrounds a fixed bar, in combination with a spring placed in the opening in said frame and normally pressing against the latch to hold the same in engagement with the bar, and a thumb-lever pivoted to the frame and adapted to be pressed against the anvil or bearing provided upon the latch to disengage the latch from the bar.

2. The locking device having the slotted frame, which frame is provided with a finger-piece *n*, in combination with the lever pivoted to the frame and provided with the thumb-piece *q* and the spring-clamp mounted in the frame and adapted to engage with notches at different positions thereon, said clamp being released on pressing upon the thumb-piece to force the lever against the lug *m* to compress the spring *l*, substantially as and for the purpose specified.

413,328. TIME-STAMP. REMEMBER H. ROGERS, Jr., New York, N. Y. Filed Nov. 15, 1888. Serial No. 290,692. (No model.)

Claim.—1. In a time-stamp, a series of indicator-wheels rotatable independently of each other, pivoted levers carrying pawls engaging said indicator-wheels, shafts carrying cams for acting on said levers, and pinions on said shafts, combined with a clock mechanism pro-



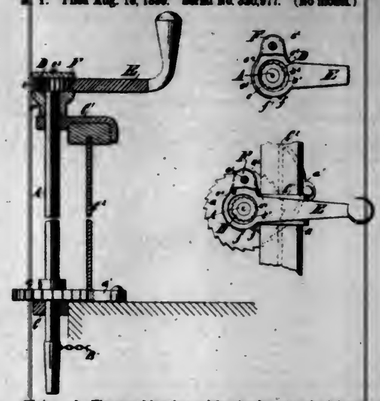
vided with pinions meshing directly with the pinions of the indicator mechanism, whereby motion is imparted to the shaft-carrying cams and thence through the levers carrying pawls to the indicator-wheels, as set forth.

2. In a time-stamp, the indicator-wheels A^4, B^4, C^{11}, and D^4, provided with ratchets fast at their sides and rotatable independently on a shaft, pawls engaging said ratchets, and pivoted levers connected to said pawls, shafts *a* and C^4, a ratchet-wheel A^3, and a snail-cam *b*, and gear A on shaft *a*, a snail-cam C^3, an S-cam C^5, and a gear C^2 on shaft C^4, the said ratchet-wheel and cams being arranged to act directly on the pivoted levers, combined with a clock mechanism the minute-shaft of which is provided with pinions A', C, C', and C^2, through the latter of which motion is imparted to shaft C^4, the said clock mechanism being arranged with its pinions A' and C in direct engagement with the pinions A and C', respectively, whereby motion is imparted to the shafts *a* and C^4, and thence to the indicator-wheels, substantially as and for the purpose described.

3. In a time-stamp, the indicator-wheels A^4, B^4, C^{11}, and D^4, provided with ratchets fast at their sides and rotatable independently on a shaft, pawls engaging said ratchets, and pivoted levers connected to said pawls, shafts *a* and C^4, a ratchet-wheel A^3, and a snail-cam *b*, and gear A on shaft *a*, a snail-cam C^3, an S-cam C^5, and a gear C^2 on shaft C^4, the said ratchet-wheel and cams being arranged to act directly on the pivoted levers, combined with a clock mechanism the minute-shaft of which is provided with pinions A' and C and C' C^2, through the latter of which motion is imparted to shaft C^4, the said clock mechanism being arranged with its pinions A' and C in direct engagement with the pinions A and C', respectively, whereby motion is imparted to the shafts *a* and C^4 and thence to the indicator-wheels, and the indicator-wheel G, with separate means for rotating the same, substantially as and for the purpose described.

4. The combination, with time mechanism, of time-indicator mechanism comprising a day indicator-wheel and an indicator-wheel for a. m. and p. m., a shaft deriving motion from the time mechanism, a snail-cam for transmitting motion to the day indicator-wheel, and an S-cam for transmitting motion to the a. m. and p. m. indicator-wheels, both said cams being mounted on said shaft, substantially as specified.

413,329. PLANE. Solon R. Rist, New Hartford, assignor to the Birmingham Plane Manufacturing Company, Birmingham, Conn. Filed June 25, 1889. Serial No. 315,453. (No model.)



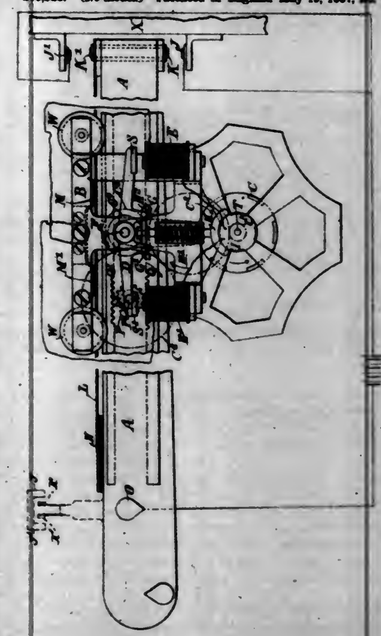
Claim.—1. In a plane, the combination, with the stock and the doubly-fulcrumed lever, of the cutting-bit having at its rear side the transversely-extended groove and the shallow longitudinal groove intersecting the transverse grooves at right angles, substantially as set forth.

2. In a plane, the combination, with the cutting-bit, the same having the transverse grooves and the longitudinal groove, whereby a bearing is afforded for its actuation longitudinally and laterally, of the lever having thereon the operating-teeth and two fulcrum-points, one for the operation of the bit longitudinally and the other for its adjustment laterally, substantially as specified.

3. In a plane, the combination, with the bit, the same having the transverse and longitudinal grooves in its rear side, of the divided post, upon which said bit rests, the toothed lever loosely pivoted on a pin within said divided post, and adapted, in addition to its movement upon said pin as a center, to have a movement longitudinally thereof, substantially as set forth.

4. In a plane, the combination, with the bit, having at its rear side the transverse grooves and the shallower longitudinal groove intersecting said transverse grooves at right angles, of the divided post having the beveled inward projections at its rear side, the lever provided with operating-teeth and having a countersunk pivot-hole, and the pin secured in said post and passing loosely through the hole in the lever, substantially as specified.

413,330. CAR-BRAKE. Edward T. Schoonmaker, New York, N. Y. Filed Aug. 16, 1889. Serial No. 320,977. (No model.)



Claim.—1. The combination, with a brake, of a shaft having near its upper end a projection, a crank pivoted upon said projection so as to be capable of longitudinal movement toward and from said shaft, said crank and shaft, the one being provided with a ratchet and the other with a tooth for engaging the ratchet, substantially as specified.

2. The combination, with the shaft A, having mounted upon it the sleeve or hub e^4, of the crank E, pivoted upon said sleeve or hub so as to be capable of longitudinal movement toward and from the shaft, the ratchet-wheel D on said shaft, and the tooth e^2 upon the crank for engaging said ratchet-wheel, substantially as specified.

3. The combination, with the shaft A, provided with the sleeve or hub e^4, of the crank E, pivoted upon said sleeve or hub so as to be capable of longitudinal movement toward and from said shaft, the tooth e^2 on said crank, the ratchet-wheel D on the shaft, and a stop for preventing a too extended longitudinal movement of the crank, substantially as specified.

413,331. WEIGHING APPARATUS. William Shelbrooke, Bankwood, County of Worcester, England. Filed July 10, 1888. Serial No. 279,523. (No model.) Patented in England May 19, 1887, No. 7,336.

Claim.—In a weighing-machine, the combination of a rocking beam provided with electrical contact-pieces, racks on said beam, other and fixed electrical contact-pieces between which the first-named contact-pieces oscillate to make and break contact, a moving poise comprising a frame, an electrometer, a train of gearing for operating on said racks, reversing mechanism for causing a reverse movement of the poise and brake mechanism, and electrical conductors, in connection with the last-named contact-pieces, the electrometer, and a source of electricity, as and for the purpose set forth.

413,332. ROAD-CART. George F. Woodard and George H. Carroll, Sterling, Ill. Filed Aug. 8, 1888. Serial No. 280,160. (No model.)

Claim.—1. The combination of the thills C C, suitably supported at their rear ends by the axle A, the seat E, foot-board F, bar D, plate G, provided with ears G', clip J, provided with ears K, bolt M, spring L, bolt N, spring O, and rods P P, pivotally suspended from thills C, respectively, and pivotally attached at their lower ends, respectively, to spring O, substantially as shown, and for the purpose described.

2. The combination of the thills C C, bar D, axle A, wheels B, seat E, foot-board F, a centrally-located universal joint suspending the front end of said foot-board to said thills, spring L, spring O, and arms P P, pivotally attached at their upper ends to said thills and at their lower ends to said spring O, substantially as shown, and for the purpose described.

3. In a road-cart, the combination of the thills C, bar D, seat E, foot-board F, clip J, provided with ears K, spring L, pivotally attached at one end to said clip, plate G, pivotally attached to bar D and to the opposite end of spring L, and provided with ears G', substantially as shown, and for the purpose described.

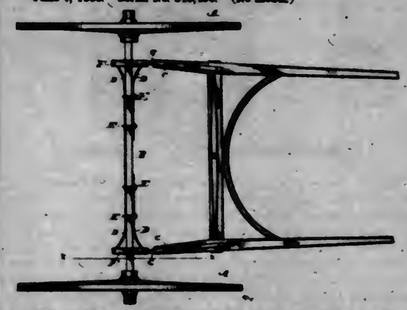
413,333. DOOR-LOCK. Thomas J. Young, North Plainfield, N. J. Filed Mar. 16, 1889. Serial No. 303,616. (Model.)

Claim.—1. The combination, with the spindle-hub, latch, and case adapted to be inserted in the edge of the door, of the door-plates, a lock-case connected with one of the door-plates, and having a lateral opening in the lock-case for the reception of the latch-case, the knob-spindle passing through the door-plates, lock-case, latch-case, and hub, and a bolt within the lock-case and adapted to retain the latch when projected, substantially as set forth.

2. The lock-plate F, lock-case O, and cap-plate G', in combination with the vertically-moving bolt H, having a stop-plate 10, a spring for moving the bolt in one direction, and the hanging tumbler hook and stud upon the bolt, for retaining the bolt when projected against the action of the spring, substantially as set forth.

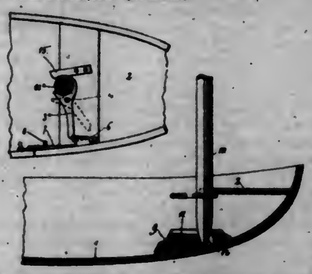
3. The latch-case A A' and latch B, adapted to be inserted in the edge of the door, and having the flanges or claws 2 on the latch that projects through the latch-case, in combination with the lock-case adapted to be inserted into the face of the door, and having a bolt and stop-plate passing behind the flange or claw of the latch when the bolt is projected, and the spindle-hub and spindle, substantially as set forth.

4. The combination, with the lock-case G G' and the door-plate F, to which the lock-case is connected, of a vertical bolt H, having a plate 10 sliding through an opening in the case, the helical spring 11 for moving the bolt toward the key-hole, the tumbler-hook I, pivoted at 12, and the stud 13 upon the bolt, with which the hook of the tumbler engages, and the latch-case and latch to be inserted through the edge of the door, the spindle-hub, and knob-spindle, substantially as set forth.



413,334. BUTTON-HOOK. Terrence B. Burns, New York, N. Y. Filed Feb. 16, 1889. Serial No. 300,169. (No model.)

Claim.—1. In a button-hook, the combination of the shank *a*, having a hook or loop *v*, and the slide *c*, substantially as described.



2. In a button-hook, the combination of the shank *a*, having the hook *b* deflected from the line of the shank, and the slide *c*, having the tongue *d* also deflected, as shown, and the flanges *f f'*, substantially as and for the purpose set forth.

413,335. THILL-COUPLING. John Cosnaver, Oxford, Ind. Filed June 7, 1889. Serial No. 313,466. (No model.)

Claim.—The combination, with a vehicle-axle, of front and back springs D secured thereto, frame-pieces E, to which the ends of the springs are fastened, and thills or a pole pivoted to the frame-pieces, substantially as set forth.

413,336. AUTOMATIC MAST-SUPPORT. John Cosen, Clayton, N. Y., assignor of one-half to Frank L. Hall, same place. Filed May 16, 1889. Serial No. 310,807. (No model.)

Claim.—1. The combination of a mast, a socket adapted to receive the lower end of the mast, a stationary deck or cross-bar above the socket, and an opening and closing clasp for engaging the mast above the socket and securing it to the deck or cross-bar.

2. The combination of a mast, a socket adapted to receive the lower end of the mast, a stationary deck or cross-piece above the socket, and an automatically-closing clasp or catch for engaging the mast above the socket and securing it to the deck or cross-piece.

3. The combination of a mast, a socket adapted to receive the foot of the mast, the supporter-piece, and the bifurcated pivoted lever-catch upon the supporter-piece adapted to engage the mast above the foot and secure the same.

4. The combination, in a mast-supporting device, of the mast, the socket adapted to receive the lower end of the mast, the supporting-piece above the socket having a recess adapted to receive the mast, a clasp for securing the mast in the recess, and a catch for securing the clasp en engagement with the mast.

5. The combination, in a mast-supporting device, of a mast, a socket adapted to receive the lower end of the mast, a stationary sup-

porter-piece above the socket, an automatically closing and an opening clasp for engaging the mast above the socket and securing it to the supporter-piece.

6. In a mast-supporting device, the combination of a mast, a socket adapted to receive the lower end of the mast, a supporter-piece above the socket, an automatically closing and an opening catch for engaging the mast above the socket and securing it to the supporter-piece, and a catch for securing the clasp in closed position.

7. The combination of a mast having a shoulder 14 thereon adjacent to its lower end, a socket having a projecting edge adapted to engage the shoulder on the mast from above, and a mast-supporter engaging the mast above the socket.

8. The combination of a mast, a socket having a deeper portion and opposed walls 11 extending therefrom, and an opening and closing mast-supporter above the socket, substantially as set forth.

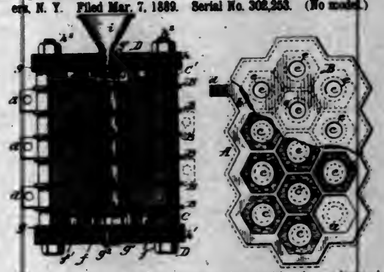
413,337. DYNAMO-ELECTRIC MACHINE. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed Feb. 8, 1889. Serial No. 299,171. (No model.)

Claim.—1. In a dynamo-electric machine, the combination of a rectangular frame having a top and bottom which serve as portions of an electro-magnet and ends which couple the top and bottom and serve as standards for an armature-shaft, a field-coil substantially rectangular in outline mounted within and parallel with the top and bottom of said frame, and concaved cheek-pieces which are bolted to the opposite edges of said frame at top and bottom, have a width substantially equal to the interior length of the coil, confine said coil in place, and afford between their concave faces and within the coil a cylindrical space for the reception of an armature of appropriate length and diameter, substantially as and for the purposes specified.

2. In a dynamo-electric machine, the combination of a rectangular frame having a top and a bottom which serve as portions of an electro-magnet, counterpart cheek-pieces bolted to the opposite edges of said top and bottom of the frame and concaved exactly midway of their length, a field-coil rectangular in outline within said frame and secured in position between and by said cheek-pieces and affording within said coil and between the concave faces of the cheek-pieces a cylindrical armature-space, and end plates which couple the top and bottom of the frames and are provided with seats for shaft-bearing, which are centrally located and in line with the axial line of said armature-space, substantially as and for the purposes described.

3. In a dynamo-electric machine, the combination of a rectangular frame having a top and a bottom which serve as portions of an electro-magnet, cheek-pieces composed of curved wrought-iron having cheek-extensions bolted thereto, and a field-coil substantially rectangular in outline within said frame, secured in position by and between said cheek-pieces, which are bolted to the edges of the top and bottom of the frame, said coil inclosing said cheek-extensions and affording within it and between the concaved cheek-pieces a cylindrical space for the reception of an armature, substantially as and for the purposes specified.

4. In a dynamo-electric machine, the combination of a rectangular frame having end plates to which are bolted a top and a bottom composed of wrought-iron bars which serve as parts of an electro-magnet, wrought-iron carved cheek-pieces provided with cheek-extensions bolted thereto, and a field-coil substantially rectangular in outline within and parallel with said frame, which surrounds said cheek-extension and is secured in position by and between said cheek-pieces, which are bolted to said top and bottom plates and afford between their concave faces and within the coil a cylindrical space for the reception of an armature, substantially as and for the purposes specified.



413,338. MAGNETIC GAGE FOR TESTING THE MAGNETIC CONDUCTIVITY OF METALS. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed Feb. 23, 1889. Serial No. 300,812. (No model.)

Claim.—1. In a magnetic gage for testing the magnetic conductivity of metals, a central magnetic field, two or more contact-faces located within an external or outer magnetic field and adapted to receive pieces of metal to be tested, and a magnetic indicator which is normally uninfluenced by said central field in its normal condition, but will respond to changes or variations in said central field resulting from changes or variations in said outer field, as when any two of said contact-faces are temporarily connected by metal having more or less magnetic conductivity.

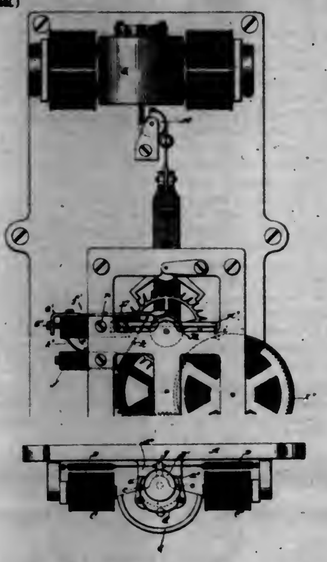
2. In a magnetic gage for testing the magnetic conductivity of metals, two open magnetic circuits, contact-faces in either or both circuits, adapted to receive pieces of metal to be tested, and a magnetic indicator which responds to variations in either or both of said circuits and discloses the extent to which either or both of them are closed, as by the application to said faces of metal to be tested, said indicator being influenced in its movements in proportion to the magnetic conductivity of metal thus applied.

413,339. SECONDARY BATTERY. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed Mar. 7, 1889. Serial No. 302,253. (No model.)

Claim.—1. In a secondary battery, the combination, substantially as hereinbefore described, of a suitable clamp and two or more counterpart lead castings or foundations insulated from each other, and each provided with holes or recesses lined or coated with active material, which register with similarly lined or coated holes or recesses in the next adjacent casting or foundation and afford spaces or cells for the reception of the electrolyte.

2. In a secondary battery, the combination, substantially as hereinbefore described, of a suitable clamp, one or more pairs of elements, each composed in part of a foundation or support of metallic lead and in part of suitable porous active material applied thereto as a lining or coating, the coated surfaces serving as walls to a space for the reception of electrolyte, and plates which not only insulate said foundations or supports from each other, but also project into the space occupied by the electrolyte and obviate liability of short-circuiting, due to displaced active material, without obstructing the circuit through the electrolyte.

3. In a secondary battery, the combination, substantially as hereinbefore described, of two or more lead plates substantially counterparts in form and dimensions, each provided with holes or openings extending through from side to side and lined or coated with suitable porous active material, said plates piled one above another, the registering holes constituting in each instance a cell lined with said porous material for receiving electrolyte, interposed insulating-plates provided with holes registering with those in the lead plates, and a clamp for firmly binding the several plates together.



4. In a secondary battery, the combination, substantially as hereinbefore described, of two or more metallic lead plates or foundations, each having one or more holes which extend through from side to side and are lined or coated with suitable porous active material, said holes in each plate registering with corresponding holes in the other plates, interposed insulating-plates provided with holes which register with but are of less area than said lined holes, and a suitable clamp for tightly binding all of said plates in a pile and enabling the registering holes to serve as suitable receptacles for liquid electrolyte, and also enabling said insulating-plates to thoroughly protect the metallic lead in the foundation-plates from direct contact with the electrolyte, and still further to support the active material and prevent displaced portions thereof from making short-circuit contact with the adjacent lined or coated surfaces of other plates.

5. In a secondary battery, the combination, substantially as hereinbefore described, of two or more substantially counterpart piled lead plates, each provided with holes extending through from side to side, which register with corresponding holes in adjacent plates in the

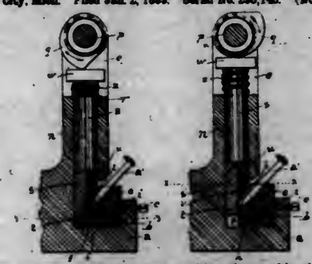
pile and are lined or coated with suitable porous active material, said registering holes constituting cells or spaces for the reception of electrolyte, insulating-plates between said lead plates and provided with similarly registering holes, a clamp, and between the clamp and the lead plates at the top and bottom of the pile other plates provided with holes and channels which communicate with all of the electrolyte-spaces, whereby all of said cells or spaces may be readily charged with electrolyte and free vent afforded for the gases developed within the battery.

6. The combination, with a secondary battery having a tightly-inclosed cell or space for the electrolytic liquid and a feed-aperture, of an open stand-pipe which tightly fits said aperture and projects below the upper interior surface or wall of said space or cell, substantially as described, whereby the battery may be conveniently charged with electrolyte, the supply of the latter readily observed, a vent afforded for gases, hydrostatic pressure maintained in an interior air-space which receives the gases on leaving the electrolyte, and affording in said stand-pipe ample space in which the electrolyte may rise under rapidly-developed gaseous pressure, without liability of overflow.

413,340. ELECTRIC REGULATOR FOR PENDULUM CLOCKS. JAMES H. GIBBY, Brooklyn, N. Y. Filed Aug. 9, 1889. Serial No. 320,248. (No model.)

Claim.—1. In a clock, the combination, with the threaded spindle for adjusting the vibrating length of the pendulum and a ratchet-wheel secured thereto, of an oscillating armature, pawls carried thereby and adapted to engage with said ratchet on opposite sides of its axis, electro-magnets on opposite sides of said armature, and circuit-controlling mechanism adapted to energize one or the other of said magnets, as set forth.

2. The combination, with the two electro-magnets for varying the vibrating length of a clock-pendulum, of contacts included in the independent circuits of said magnets, two means for holding said contacts open—one a twenty-four-hour wheel, notched at a given point, the other two disks on the escapement-arbor with portions of their edges cut away, these parts being adjusted relatively to each other, in the manner herein described.

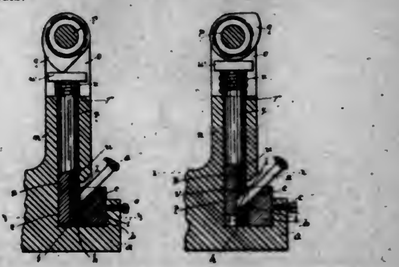


3. The combination, with the disk to the periphery of which the pendulum is connected by a flexible band, the threaded spindle for adjusting the disk and thereby varying the length of the pendulum, and a ratchet-wheel carried by said spindle, of an oscillating armature mounted concentrically with the spindle and ratchet, pawls carried thereby and adapted to engage with the ratchet on opposite sides of its center, electro-magnets on opposite sides of the armature, and circuit-controlling mechanism for energizing either of said magnets, as set forth.

4. The pendulum raising and lowering mechanism consisting of the combination of the adjusting-spindle and ratchet-wheel passing through the stud A', the armature with curved or circular face mounted concentrically with the spindle and ratchet, the spring-actuated pawls engaging with the ratchet, the equilibrium-springs secured to the armature, and the electro-magnets C and C', adapted to swing the armature in opposite directions, as set forth.

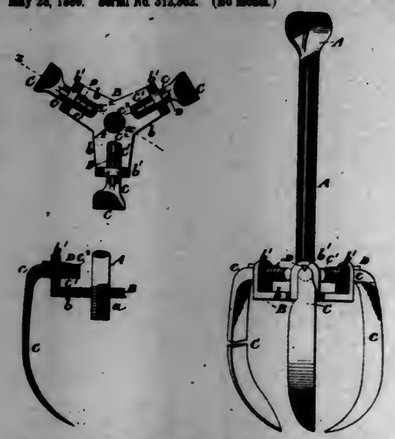
5. The current-controlling device for electro-magnetically-regulated pendulum clocks, consisting in the combination of a fixed conductor, two flexible or yielding contacts secured to a pivoted insulating-support, and two disks secured to the escapement-arbor under the yielding contacts, respectively, each disk being formed with a notch or depression in its edge so placed that one contact and notch will pass into and out of engagement before the others, whereby one or the other will be permitted to encounter the fixed conductor, according as the clock is fast or slow, as set forth.

6. The current-controlling device for electro-magnetically-regulated pendulum clocks, consisting in the combination of a fixed contact, two flexible or yielding contacts secured to a pivoted insulating-support, an arm extending from said support and resting upon the periphery of a twenty-four-hour wheel, whereby the yielding contacts are maintained out of engagement with the fixed contact, and two disks secured to the escapement-arbor under the yielding contacts, respectively, each disk and the twenty-four-hour wheel being formed with a notch or depression in its edge, these parts being adjusted so that the notch in the twenty-four-hour wheel and that in one of the disks on the escapement-arbor will register and permit the depression of the corresponding yielding contact when the clock is either fast or slow, as set forth.



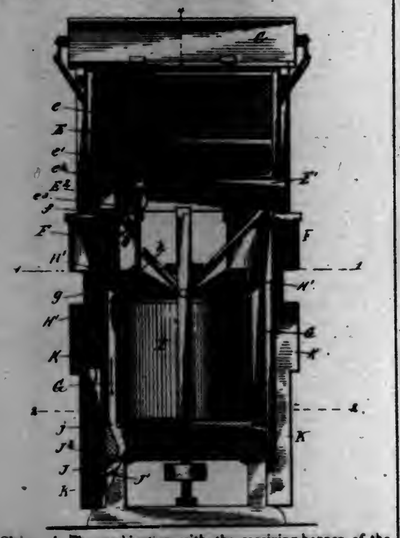
413,341. SPIKE-POINTING MACHINE. WILLIAM GOLDIE, West Bay City, Mich. Filed Jan. 2, 1889. Serial No. 295,143. (No model.)

Claim.—1. In a spike-pointing machine, the combination, with a reciprocating plunger provided on one end portion with one or more cutters, of an anvil-die having an inclined die-face for supporting the spike in a position oblique to the movement of the plunger, whereby the fiber of the rolled metal is divided obliquely in the direction of its length, substantially as set forth.



2. In a spike-pointing machine, the combination, with a reciprocating plunger provided on its lower portion with cutters, and having a gage-stop projecting below and in rear of the said cutters, with an anvil-die having an inclined face for supporting the spike with its end presented to the cutters and in a position oblique to the movement of the plunger, substantially as and for the purpose set forth.

413,342. METHOD OF POINTING SPIKES. WILLIAM GOLDIE, West Bay City, Mich. Original application filed Jan. 2, 1889, Serial No. 295,143. Divided and this application filed June 17, 1889. Serial No. 314,664. (No model.)



Claim.—The herein-described method of forming a cutting-edge on a spike-point, consisting, substantially, of swaging the point to produce front and rear compressing-surfaces, and then producing a sharp edge by shearing off the surplus metal obliquely across and in the direction of the length of the grain or fiber of the rolled iron, substantially as set forth.

413,343. POST-AUGER. GREEN B. HARRIS, Mooresville, Tex. Filed May 28, 1889. Serial No. 312,362. (No model.)

Claim.—A post-auger spider or blade-holder provided with a bored, threaded, and upturned flange *b'* on each of its arms, in combination with blades C, having on the ends of their arms c screws *c'*, a groove c^2 across each thread, and detachable wedges D, working in said grooves, as and for the purpose set forth.

413,344. APPARATUS FOR CLIPPING, SEPARATING, AND GRADING OATS, &c. WILLIAM W. INGRAHAM, Chicago, Ill. Filed Jan. 31, 1889. Serial No. 298,286. (No model.)

Claim.—1. The combination, with the receiving-hopper, of the section trunk or chute D, having inclined wall *d*, provided with one or more transverse strips or ledges d^2 to prevent the passage of the grain, substantially as and for the purposes specified.

2. The combination, with the shaker having screens *e* and *e'* and sieves e^2, of the boxes E^2 and E^3, having oppositely-inclined bottoms and adapted to deliver the grain from the different sieves at opposite sides of the apparatus, and the duplicate separating-trunks F and K, arranged on each side of the apparatus and adapted to successively receive the grain from the boxes E^2 and E^3, respectively, substantially as and for the purposes specified.

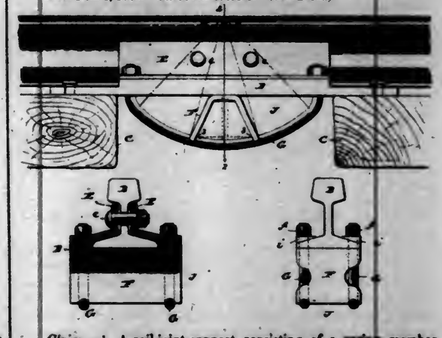
3. The combination, with the shaker and its screens, of the separating-trunks F, the direct conductors G and spouts H, opening into the bottom of each trunk, the drum I, with which said spouts H communicate, and the valves H', whereby the grain may be directed either into the direct conductors G or into the spouts H, substantially as and for the purposes specified.

4. The combination, with the main receiving-hopper and the suction trunk having its opening adjacent to the discharge-orifice thereof, of the shaker and its screens, the separating-trunks F, which receive the grain as it comes from the screens, the separating-trunks K, the drum I, conductors G and spouts H, and the valves H', substantially as and for the purposes specified.

413,345. GALVANIC-BATTERY COMPOUND. WILLIAM P. KOCKOERT, Brooklyn, assignor to the Kookogey Electric Company, New York, N. Y. Filed Dec. 14, 1886. Serial No. 221,585. (No specimens.)

Claim.—As an article of manufacture, a battery compound consisting of bisulphate of soda and trioxide of chromium, combined substantially in the proportions and manner described.

413,346. SEA-OILING CARTRIDGE. ARTHUR LOCKER, Tompkinsville, N. Y. Filed Dec. 13, 1883. Serial No. 298,436. (No model.)



Claim.—1. The combination, with the oil-holding shell A, of the plug B to close the rear end of such shell, a powder-chamber within the oil-holding chamber, a fuse passing through the plug into the powder-chamber, a shell E around and inclosing the shell A, and a separate independent charge of explosive material within the shell E and between the same and the rear of the oil-holding cartridge, and by which such oil-holding cartridge is projected from the shell E and fire-arm, substantially as set forth.

2. The combination, with the oil-holding shell A, having an open rear end, of the plug B for closing such end, and having a hole through the same, a metallic powder-chamber C within the oil-holding shell, and having a tubular neck 2 passing into the hole in the plug B, and a fuse inserted into such tubular neck, and by which such cartridge is exploded, substantially as set forth.

3. The combination, with the oil-holding shell A and the plug B for closing its rear end, of the powder-chamber C, having a tubular neck 2, a plate 5, and tube 3 attached thereto and inserted into the tubular neck 2, and a fuse passing through the tube 3, substantially as set forth.

413,347. SPRING TRUSS-SUPPORT FOR RAIL-JOINTS. RICHARD LONG, Chicago, Ill.; James M. Johnson, administrator of said Richard Long, deceased, assignor to the Long Spring Truss Joint Company, same place. Filed Feb. 1, 1889. Serial No. 298,403. (No model.)

Claim.—1. A rail-joint support consisting of a spring member suspended below and from the bases of the rails at opposite sides of the meeting-point, and a second member interposed between the spring member and the rails at the meeting-point thereof, substantially as set forth.

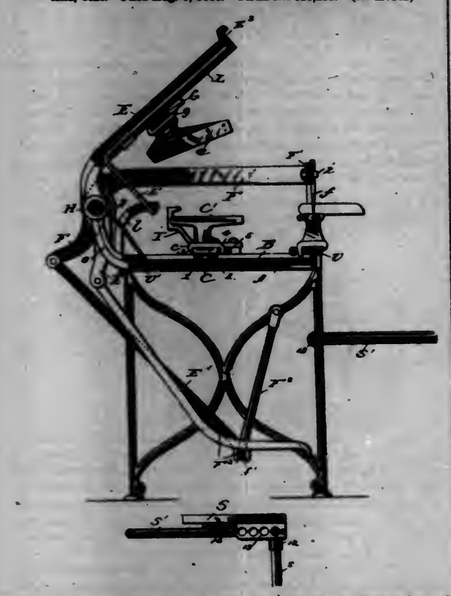
2. The combination, with the ends of two meeting rails, of a truss consisting of a member suspended below and connected with the rails and having parts out of coincidence with the lines of strain, and a second member supported by the first beneath the ends of the rails, substantially as set forth.

3. The combination, with the rails, of a spring-truss consisting of two members, one of which is a spring member, and adjusting devices for regulating the tension of the spring member, substantially as set forth.

4. The combination, with the ends of meeting rails, of a truss consisting of two members, one a curved spring plate, bar, or bars, and the other a standard interposed between the said curved member and the rails, substantially as set forth.

5. The combination of the rails, adjustable curved spring-bars suspended below the rails, and intermediate standard of an inverted-V shape, substantially as described.

6. The combination of the rails, a truss consisting of a spring member suspended below the bases of the rails, and an intermediate standard, and side plates bolted to the rails, substantially as set forth.



7. The combination of the rails and truss consisting of a curved spring member, and a standard having the form of an inverted V, substantially as set forth.

8. The combination of the rails, base-plate, and spring-truss, consisting of a spring member suspended below the base-plate, and a standard bearing upon the spring member and supporting the base-plate, substantially as set forth.

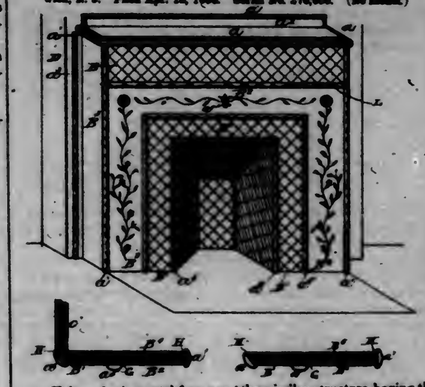
9. The spring-truss for rail-joints, consisting of curved steel rods suspended below the bases of and longitudinal to the rails, and a standard supported by the rods, substantially as set forth.

10. The combination of the rails, suspended curved rods, and an interposed standard resting at separated points upon the rods, substantially as set forth.

413,348. SLATE-DRESSING MACHINE. FRANCIS P. MARSH, Ashland, Ohio. Filed Aug. 9, 1888. Serial No. 280,982. (No model.)

Claim.—1. In combination, the supporting-frame, the punches and the knives, the supports therefor, each of said supports having a separate set of operating connections, the punch-support and its operating means being independently movable and arranged also to be engaged and moved by the knife mechanism, substantially as described.

2. In combination, the frame, the punches and knives with their movable supports, the treadle-frames for operating the support of the punches, comprising the suspending-links F^3, cross-bar *f'*, and frame F^2, and the treadle E, for operating the support of the knives, said treadle resting loosely on the cross-bar *f'*, whereby a simultaneous action of the knives and punches may be secured, or an independent action of the punches, substantially as described.



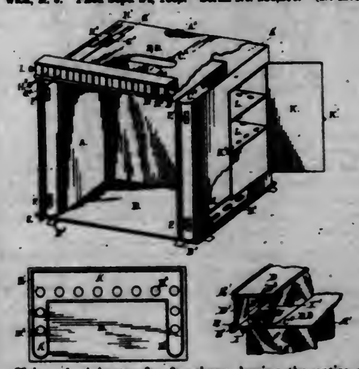
3. In combination, the supporting-frame, the punches and knives, the separate supports therefor, a treadle mechanism connected with the knives, support for operating it, a portion of said support engaging the punch-support, said punch-support also having a separate treadle mechanism, whereby it may be operated entirely independent of the knives, substantially as described.

4. In combination, the supporting-frame, the punches, the supporting-frame therefor pivotally secured to the frame, and having a cross-bar F' at its forward end for holding the punches, the knife-arm also pivotally supported and arranged to engage at its forward end with the cross-bar F', means for moving the knife-supporting arm, and separate means for operating the punches independently, substantially as described.

5. In combination, the knives and the supporting-arm therefor, the punches and their support, means for operating the knife-support, and an automatic locking-bolt for connecting the two supports as they move to work and release them as they assume normal position, and separate operating means for moving the punches independently of the knives, substantially as described.

6. In combination, the knives, the punches, the movable supports therefor, the means for operating each of the supports, the automatic lock consisting of the sliding bolt having an angular extension at its rear, and the perforated standard for moving said bolt, substantially as described.

418,349. DECORATIVE FRAME. RIVERIUS MARSH, New Brunswick, N. J. Filed Apr. 13, 1889. Serial No. 270,609. (No model.)



Claim.—1. A mantel-frame or other similar structure having the corners, edges, and faces thereof provided with grooves and combined with metal finishing-strips, substantially as herein set forth.

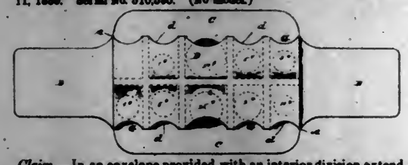
2. A mantel or other structure having sectional parts grooved, as described, in combination with metal finishing-strips for the edges and faces thereof, substantially as herein set forth.

3. A mantel having a pilaster constructed in sections, each grooved, as described, in combination with metal finishing-strips for covering the uniting edges of said pilasters, substantially as herein set forth.

418,350. VENTILATING-HEATER. RIVERIUS MARSH, New Brunswick, N. J. Filed Sept. 24, 1888. Serial No. 286,206. (No model.)

Claim.—1. A heater for fire-places, having the entire vertical body thereof formed of a single piece of sheet metal, so as to provide air-spaces at the sides, and having in the front of said air-spaces and at the bottom and top of the same openings F and F', substantially as herein set forth.

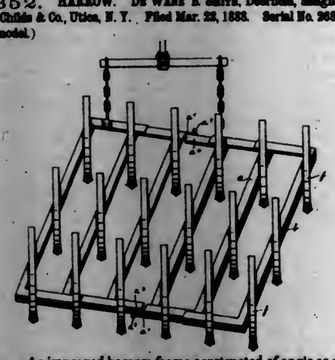
2. A heater for fire-places, having its entire vertical body formed of a single piece of sheet metal, bent up so as to provide air-spaces on the sides and rear of the combustion-chamber, substantially as herein set forth.



3. A heater for fire-places, having its entire vertical body formed of a single piece of sheet metal, so as to provide air-spaces at the side and rear, in combination with sheet-metal base and cap plates, substantially as herein set forth.

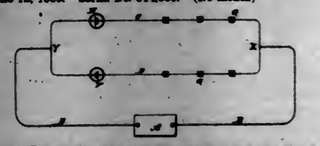
4. A heater for fire-places, having its entire vertical body formed of a single piece of sheet metal and provided with air-spaces on the sides and rear of the combustion-chamber, in combination with the metal base and top, substantially as herein set forth.

5. A heater having its body formed of single piece of metal bent so as to provide air-spaces on the sides and rear and having at the base air-openings into said spaces, and provided with suitable base and top plates, substantially as set forth.



6. A heater having its body composed of a continuous piece of sheet metal, provided with air-spaces on the side and back, as set forth, and having air-openings into said spaces and air-escapes G' and H' from said spaces, in combination with a door K, whereby a ventilated oven is formed, substantially as described.

413,351. COIN-ENVELOPE. ARTHUR F. ROLFE, JOSEPH H. ROLFE, AMAL W. ROLFE, and CHARLES M. ROLFE, Penacook, N. H. Filed May 11, 1889. Serial No. 310,395. (No model.)



Claim.—In an envelope provided with an interior division extending from end to end and nearly to either side, the combination, with one side of said division and the adjacent side of the envelope, of interposing transverse divisions and a central longitudinal division formed of narrow strips of heavier material than that of which the envelope is composed, and securely gummed to one side of the envelope and said interior division, substantially for the purpose set forth.

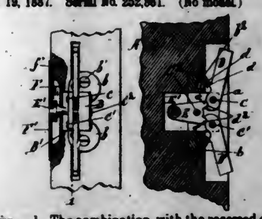
413,352. HARROW. DE WARE B. SMITH, Deerfield, assignor to J. M. Childs & Co., Utica, N. Y. Filed Mar. 22, 1888. Serial No. 268,148. (No model.)

Claim.—An improved harrow-frame constructed of angle or channel iron sections and composed of the parallel main bars connected at their ends only by transverse bars, in combination with the angle-bars connecting the main bars to the end bars, the inner ends of the inner bars being lapped and bolted together to form the hinges of the parts of the frame, substantially as described.

413,353. METHOD OF OBTAINING DIRECT FROM ALTERNATING CURRENTS. NIKOLA TESLA, New York, N. Y., assignor of two-thirds to Alfred S. Brown, same place, and Charles F. Peck, Englewood, N. J. Filed June 12, 1889. Serial No. 314,069. (No model.)

Claim.—1. The method herein set forth of obtaining direct from alternating currents, which consists in developing or producing in one branch of a circuit from an alternating-current source an active resistance to the current impulses of one direction, whereby the said currents or waves of current will be diverted or directed through another branch.

2. The method of obtaining direct from alternating currents, which consists in dividing the path of an alternating current into branches, and developing in one of said branches, either permanently or periodically, an electrical force or active resistance counter to or opposing the currents or current-waves of one sign, and in the other branch a force counter to or opposing the currents or current-waves of opposite sign, as set forth.



3. The method of obtaining direct from alternating currents, which consists in dividing the path of an alternating current into branches, establishing fields of force and leading the said branches through the said fields of force in such relation to the lines of force therein that the impulses of current of one direction will be opposed in one branch and those of opposite direction in the other, as set forth.

413,354. TAILOR'S GAS-IRON. DAVID A. UPHAM and THOMAS J. PAY, Worcester, Mass., assignors to the Worcester Gas Iron Company, Portland, Me. Filed Dec. 17, 1886. Serial No. 221,900. (No model.)

Claim.—In a tailor's gas or sad iron, the combination of the base and supply-pipe thereof with a burner consisting of the T *f* and hood *g*, said T extending forward and down from the inner end of said pipe, with its two branches projecting laterally therefrom, and provided with a longitudinal slot at the bottom and the hood made open at both ends, with suitable air-inlets at the top and sides, also with an opening to receive the T, and arranged longitudinally in the bottom of the iron over said T, substantially as set forth.

413,355. SASH-FASTENER. JAMES WATSON, Marinette, Wis. Filed Oct. 19, 1887. Serial No. 252,861. (No model.)

Claim.—1. The combination, with the recessed casing, of the sash-rail provided with a mortise, and the lock arranged within said mortise and consisting of a body portion having pivoted thereto the independent spring-controlled stop-arms extending, respectively, upward and downward, and the operating-lever pivoted to the body, engaging the stop-arms and provided with a knob or handle extending through a slot in the sash-rail and flush with the same, substantially as and for the purposes specified.

2. In a sash-lock, the combination, with the independent spring-controlled stop-arms pivoted at their inner ends, and each provided with a notch or indentation d^3, of the operating-lever E, provided with the toes *e* to engage the said notches, substantially as and for the purposes specified.

3. The combination, with the body B, having lugs *b* with recesses b^3, of the pivoted arms D D', and the springs *d*, arranged in said recesses and bearing against the said arms, substantially as and for the purposes specified.

413,356. SPRING-MOTOR. HENRY WHITTAL, Chicago, Ill. Filed Oct. 15, 1888. Serial No. 288,176. (No model.)

Claim.—1. In a spring-motor, the combination of the shaft G, wheels A and B, mounted on said shaft and having springs A^5, the springs being adapted to be wound all at one time by the turning of the shaft G, the wheel D, having projections d^2 and d^3, the trip E, and lock *c*, whereby each spring may be unwound alternately, substantially as shown and described, and for the purpose set forth.

2. In a spring-motor, the combination of a revolvable shaft having mounted thereon a plurality of springs, and having the wheels A and B, the pin-wheel D, having projections d^2 and d^3, the trip E and lock *c*, located between the springs, a gear-wheel on the shaft, and a revolving shaft having a shelf for displaying goods and provided with a gear operated through intermediate gears by the gear on the spring-shaft, substantially as shown and described.

3. In a spring-motor, the combination of the pin-wheel D, having projections d^2 and d^3, the trip E and lock *c*, the wheels A and B, and spring I, substantially as shown and described.

4. In a spring-motor, the combination, with the revolvable shaft G, journaled in the frame A', of the springs A^5, connected at one end to the frame, the wheels A and B, provided with the collar *g*, pawl *g'*, and the ratchet *a*, and friction-bearings a^2 a^3, and the gear-wheel C, substantially as shown and described, and for the purpose set forth.

5. In a spring-motor, the combination of the gear-wheel C, having the ratchet-wheel C' and pawl C^2, with the revolvable shaft G, adapted through intermediate gearing to revolve shaft H, substantially as shown and described.

6. In a spring-motor, the revolvable shaft H, journaled at top and bottom in the frame A' in boxes having anti-friction bearings, the lower end of the shaft resting on a ball in a groove at the bottom of cup or box *k*, whereby the ball travels in a circle with the revolution of shaft H, in combination, through intermediate gears, with a revolvable shaft having a plurality of operating-springs, whereby the shaft H may be revolved continuously, substantially as shown and described, and for the purpose set forth.

413,357. HOLDBACK FOR VEHICLES. HORACE BRIDGES, Chicago, Ill. Filed Aug. 14, 1889. Serial No. 320,664. (No model.)

Claim.—1. The combination of a chambered case having an opening 4 into the chamber and the flanges at the opposite ends of the said opening, and a catch having a head adapted to pass through the said opening into the case and engage with the inner faces of the said flanges at the opposite ends of the opening, substantially as set forth.

2. The combination of a chambered case having an opening 4 into the chamber and the flanges at the opposite ends of the said opening, a spring-actuated lever mounted within the said chamber, and a catch having a head adapted to pass through the said opening into the case and to bear against the inner faces of the said flanges at the opposite ends of the opening, in contact with which it is held by the said lever, substantially as set forth.

3. The combination of a chambered case having the opening 4 into the chamber and the flanges at the opposite ends of the said opening, a spring-actuated lever mounted within the chamber, and a catch having a head adapted to enter the chamber through the said opening and having at its rear end a hook 12 and at the other end a bearing-face, the said hook and bearing-face being arranged to engage with the outer or inner faces of the said flanges, substantially as set forth.

4. The combination of a case having a closed chamber 3 with an opening 4 therein and flanges at the opposite ends of the said opening, a spring-actuated lever mounted in the said chamber, and a catch having a head adapted to enter the said chamber through the said opening and to engage at its opposite ends with the said flanges and provided with the shoulder 16 and the raised portion 13, with its outer face flush with the outer faces of the flanges, substantially as set forth.

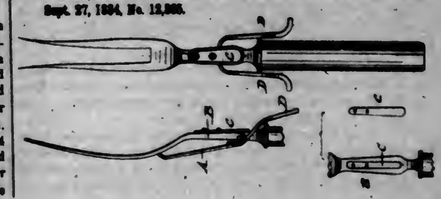
5. The combination of the chambered case having the opening 4 and flanges 9 and 10, the spring-actuated lever 8 with an outer curved surface, and the catch having the hook 1 and the head 2, the latter having the curved rear face 14 and provided with the hook 12 at one end and the flat bearing-face 11 at the other end, substantially as set forth.

6. The combination of the chambered case consisting of the plates detachably secured together and the catch which engages with the said case, substantially as set forth.

7. The combination of the chambered case consisting of two plates, one provided with lugs and the other with key-hole-shaped openings, whereby they are detachably united, and the catch having a head adapted to enter the chamber in the said case, substantially as set forth.

8. In a holdback, the chambered case 5, adapted to be secured to a carriage-thill consisting of two plates, one provided with studs 15 and the other with key-hole-shaped openings 18, whereby the plates are adapted to be detachably secured together, the enlarged portion of the said openings 18 registering with the screw-holes 17, through which the screws attaching the case to the thill pass, substantially as set forth.

413,358. METHOD OF BURNING CLAY FOR BALLAST, &c. WILLIAM BUTLER and HENRY G. BUTLER, Kenosha, Wis., assignors to the Davy Clay Ballast Company, of Illinois. Filed Apr. 1, 1889. Serial No. 305,908. (No model.)

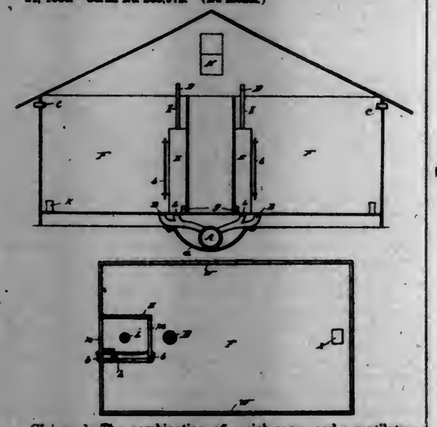


Claim.—1. In burning clay to produce ballast and the like by forming a trench and burning adjacent to it, in the open air, material taken therefrom, the method of facilitating the burning, which consists in forming a spoil-bank *r* adjacent to the trench and constructing the pile of fuel and clay to be burned on the side of the spoil-bank adjacent to the trench, substantially as and for the purpose set forth.

2. In burning clay to produce ballast and the like by forming a trench and burning adjacent to it, in the open air, material taken therefrom, the method of facilitating the burning, which consists in forming a spoil-bank *r* adjacent to the trench, constructing the pile of fuel and clay to be burned on the side of the spoil-bank adjacent to the trench, and securing the burning of any insufficiently-burned material in the pile by removing it therefrom, imposing near the base of the pile fuel and burning material from the breast of the pile, and applying thereon such insufficiently-burned material, substantially as described.

3. In burning clay to produce ballast and the like by forming a trench and burning adjacent to it, in the open air, material taken therefrom, the method of facilitating the burning, which consists in forming a spoil-bank *r* adjacent to the trench, constructing the pile of fuel and clay to be burned on the side of the spoil-bank adjacent to the trench, forming on the top of the pile a shoulder *p*, spreading burning substance from the rear of the shoulder upon the breast of the pile, and covering the rear of the shoulder from which the said burning substance is taken, substantially as and for the purpose set forth.

4. In burning clay to produce ballast and the like by forming a trench and burning adjacent to it, in the open air, material taken therefrom, the method of facilitating the burning, which consists in forming a spoil-bank *r* adjacent to the trench, constructing the pile of fuel and clay to be burned on the side of the spoil-bank adjacent to the trench, forming on the top of the pile a shoulder *p*, spreading at intervals burning substance from the shoulder upon the breast of the pile, and banking material from the spoil-bank against the said shoulder when the said burning substance is removed therefrom, substantially as and for the purpose set forth.



413,359. FORK-GUARD. ALFRED UNPLAT, Sheffield, County of York, England, assignor to Hermann Boker & Co., New York, N. Y. Filed June 21, 1889. Serial No. 315,097. (No model.) Patented in England Sept. 27, 1884, No. 12,866.

Claim.—1. A carving-fork comprising a fork proper, a shank, and a handle attached to the shank, said shank having a slot extending therethrough from the upper to the lower edge thereof, a guard provided with a heel pivoted to said shank within said slot, said heel extending through the slot and projecting beyond the lower face of the shank, and a plate-spring attached at its front end to the under side of said shank and extending backward, covering said slot, its rear end resting in contact with the projecting heel of the guard, substantially as described.

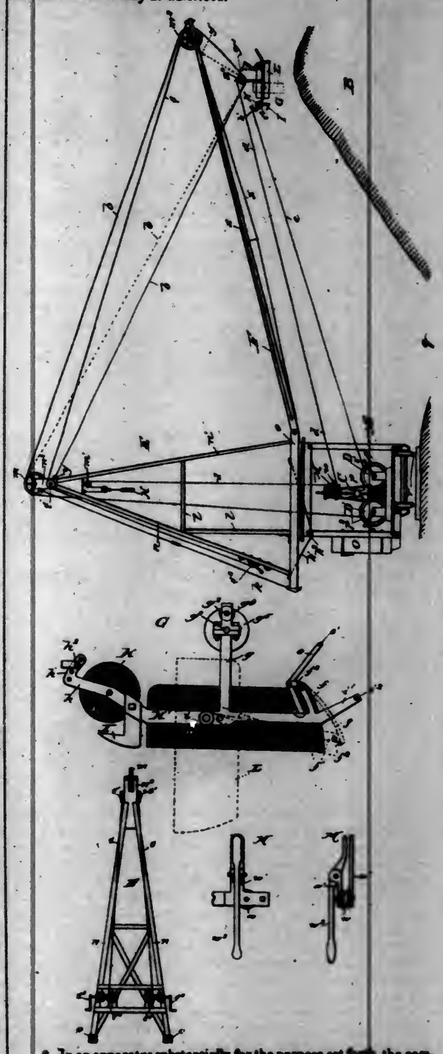
2. A carving-fork comprising a fork proper, a shank, and a handle attached to the shank, said shank having a slot extending therethrough from the upper to the lower edge thereof, a guard provided with a heel pivoted to said shank within said slot, said heel extending through the slot and projecting beyond the lower face of the shank, and a plate-spring attached at its front end to the under side of said shank and extending backward, covering said slot, its rear end resting in contact with the projecting heel of the guard, and a fork-rest integral with said guard and straddling said shank, substantially as described.

413,860. HOSPITAL FOR PATIENTS WITH INFECTIOUS OR CONTAGIOUS DISEASES. MILES L. DAVIS, Lancaster, Pa. Filed Sept. 21, 1888. Serial No. 285,972. (No model.)

Claim.—1. The combination of a sick-room and a ventilating-vestibule connecting it with the exit therefrom, substantially as specified.

2. The combination of a sick-room, a vestibule connecting said room and the exit therefrom, an air-supply flue, and an eduction-flue, by which a current of air is produced through the vestibule, substantially as and for the purpose specified.

3. The combination, in a hospital, of an air-loft provided with windows or openings N, vestibules located between the rooms of the wards and the corridors, flues connecting the loft with said vestibules, and eduction-flues leading therefrom, substantially as and for the purpose specified.



4. The combination, with a sick-room, of a ventilating-vestibule provided with two doors, one communicating with the sick-room and the other with the corridor, and a spring connecting said doors, substantially as and for the purpose specified.

5. The combination, with a sick-room, of a ventilating-vestibule connecting the room with the exit therefrom, and a disinfecting receptacle located in the vestibule, wherein disease-germs may be removed from all vessels taken from the rooms, substantially as specified.

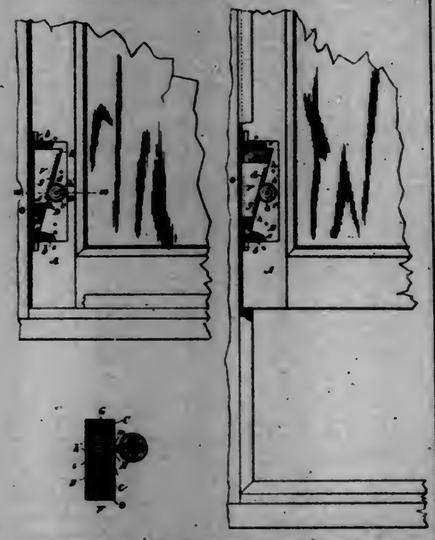
6. The combination, with a sick-room, of a ventilating-vestibule provided with two doors, one communicating with the sick-room and the other with the corridor, a spring connecting said doors, an air-supply flue and an eduction-flue, by which a current of air is produced through the vestibule, and a cut-off or damper connected with the air-supply flue, all constructed and operating substantially as and for the purpose specified.

413,861. FEEDING APPARATUS FOR USE IN BURNING CLAY TO MAKE BALLAST, &c. WILLIAM DAVY and HERBERT G. BUTLER, Kenosha, Wis., assignors to the Davy Clay Ballast Company, of Illinois. Filed Apr. 1, 1889. Serial No. 305,804. (No model.)

Claim.—1. In an apparatus substantially for the purpose set forth, the combination, with its support A, of means for supporting therefrom a scoop and the cables for controlling it, comprising a mast B, having hinged to it a boom F, and formed of parallel beams a on the support A and converging pairs of mutually-converging beams n and n', secured together near their upper ends and strengthened with light frame-work l, secured between the beams n and n' and to the beams a, substantially as described.

2. In an apparatus substantially for the purpose set forth, the combination, with a car A, forming its support, of, means for supporting therefrom a scoop and the cables for controlling it, comprising a mast B, strengthened with light frame-work l, and having hinged to it a boom F and transom-rods E', secured at their extremities to the beams a of the mast toward the opposite ends of the said beams, and passing between their fastened extremities around the beams l² of the car-frame, substantially as described.

3. In an apparatus substantially for the purpose set forth, the combination of a boom on a suitable support, a cable b, connected with the said boom and with suitable winding mechanism D', a combined scoop or scraper and dirt-loosening device hung on the cable b, and a cable c, connecting the said device with suitable winding mechanism D, substantially as described.



4. In an apparatus substantially for the purpose set forth, the combination of a boom on a suitable support, a cable b, connected with the said boom and with suitable winding mechanism D'; a combined scoop or scraper and dirt-loosening device G, hung on the cable b and having a cradle H, carrying colters K, plowing mechanism I, and a pivotally-supported scraper L, and a cable c, connecting the device G with suitable winding mechanism D, substantially as described.

5. In an apparatus substantially for the purpose set forth, the combination of a car A, carrying winding mechanism D D' and an engine for actuating it, a mast E, supported on the car and having connected with it a boom F, a cable b, connected with the boom and mast and with the winding mechanism D', a combined scoop or scraper and dirt-loosening device G, hung on the cable b and having a cradle H, carrying colters K, plowing mechanism I, and a pivotally-supported scraper L, suitable supporting means c on the cradle for the scraper, a weighted cable d, secured at one end to the said means c and fastened at its opposite end to the mast, and a cable c, connecting the device G with the winding mechanism D, substantially as described.

6. In an apparatus substantially for the purpose set forth, the combination of a car A, carrying winding mechanism D D' and an engine for actuating it, a mast E, supported on the car and having hinged to it a boom F, a cable b, connected with the boom and mast and with the winding mechanism D', a combined scoop or scraper and dirt-loosening device G, hung on the cable b and having a cradle H, carrying colters K, plowing mechanism I, and a pivotally-supported scraper L, suitable supporting means c on the cradle for the scraper, a clutch M, a weighted cable d, secured at one end to the said means c, passed thence through the clutch M, and fastened at its opposite end to the mast, and a cable c, connecting the device G with the winding mechanism D, substantially as described.

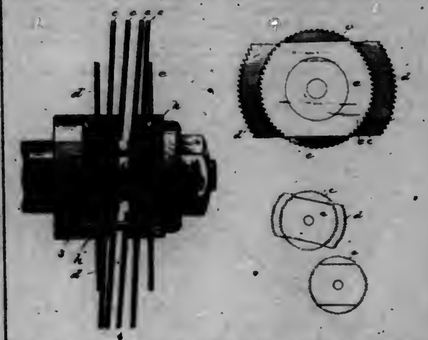
7. In an apparatus substantially for the purpose set forth, the combination of a car A, carrying winding mechanism D D' and an engine for actuating it, a mast E, supported on the car and having hinged to it a boom F, a cable b, connected with the boom and mast and with the winding mechanism D', a combined scoop or scraper and dirt-loosening device G, hung on the cable b and having a cradle H, provided with a hinged back f and carrying colters K, plowing mechanism I, and a pivotally-supported scraper L, linked to the hinged back, suitable supporting means c on the cradle for the scraper, and a cable c, connecting the device G with the winding mechanism D, substantially as described.

413,862. SASH-HOLDER. WILLIAM L. DEMPSEY, Warsaw, Mo. Filed Apr. 1, 1889. Serial No. 305,793. (No model.)

Claim.—1. In a sash-lock, the combination of a wedge, a pinion for actuating the same, and a separate facing arranged to be forced out by said wedge, in the manner and for the purpose described.

2. In a sash-lock, the combination of a wedge, a pinion for actuating the same, a key fitting said pinion, a separate facing arranged to be forced out by said wedge, and guides for said facing, substantially as described.

413,863. DYNAMO-ELECTRIC MACHINE. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed Feb. 2, 1889. Serial No. 298,643. (No model.)



Claim.—1. In a dynamo-electric machine, the combination, substantially as hereinbefore described, of an armature having a core of magnetic metal, cheek-pieces which are connected at their bases in magnetic circuit and correspond in length with the length of the armature, and a field-coil which directly polarizes the armature, is partially inclosed at its lower side by the cheek-pieces at their bases, and has its upper side and its ends wholly exposed to the open air, whereby a completed magnetic circuit is afforded through the cheek-pieces and the armature and the field-coils freely exposed to cooling influences.

2. In a dynamo-electric machine, the combination, substantially as hereinbefore described, of an armature containing magnetic metal, cheek-pieces connected at their bases in magnetic circuit, and a field-coil which directly polarizes the armature, incloses portions of the cheek-pieces, and is itself uninclosed, except at its lower side, where it is located between the bases of said cheek-pieces.

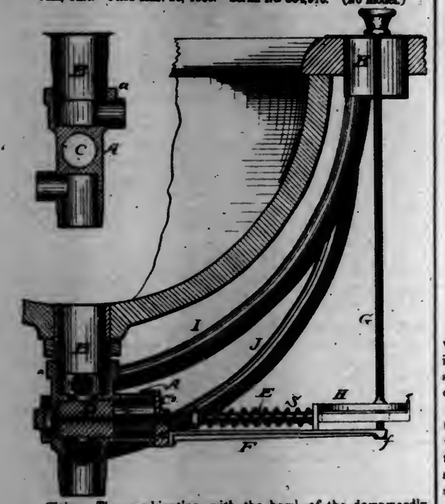
3. In a dynamo-electric machine, the combination of a bed-plate having standards to support the bearings of the armature-shaft, a pair of concaved cheek-pieces bolted upon said bed-plate, and a field-coil located between said cheek-pieces and inclosing portions thereof and affording a space within said coil and between the cheeks for the reception of an armature.

4. In a dynamo-electric machine, the combination, substantially as hereinbefore described, of a pair of cheek-pieces connected in magnetic circuit at their bases and concaved at their ends to afford between them a space for the reception of an armature, and a field-coil interposed between said cheek-pieces, partially inclosing portions thereof, and also longitudinally surrounding the armature-space.

413,864. TENONING-CUTTER. WILLIAM R. FOX, Grand Rapids, Mich. Filed Oct. 9, 1888. Serial No. 287,669. (No model.)

Claim.—1. In a cutter-head for tenoning-machines, a vertical saw for cutting the shoulder, having opposite portions of its periphery cut away and a saw or saws arranged in rear of said vertical saw, substantially as described.

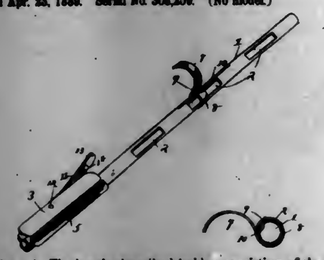
2. A cutter-head for tenoning-machines, consisting of a vertical saw for cutting the shoulder, said saw having opposite portions of its periphery cut away, and a series of inclined saws, said saws being adjustable in relation to each other to increase or diminish the width of cut, substantially as described.



3. A cutting-head for tenoning-machines, consisting of a vertical saw having opposite portions of its periphery cut away, inclined saws arranged in fixed relation thereto, and a second set of inclined saws, with means for adjusting the same, substantially as described.

4. A cutting-head for tenoning-machines, consisting of a vertical saw having opposite portions of its periphery removed, inclined saws in rear of the same, and a second vertical saw of greater diameter

than the inclined saws and having opposite portions of its periphery cut away, substantially as described.

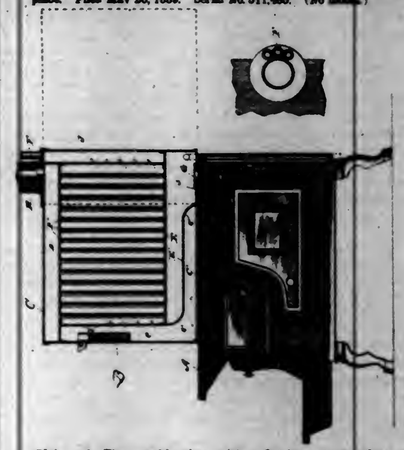


5. A cutting-head for tenoning-machines, consisting of a vertical saw *e*, two inclined saws or sets of saws *c*, adjustable in relation to the other, and a second vertical saw *d*, of greater diameter than the inclined saws, the saw *e* being connected with one set of adjustable inclined saws and the saw *d* with the other set of inclined adjustable saws, substantially as described.

413,365. BASIN WASTE AND STOP. HENRY J. GILCHER, Ashtabula, Ohio. Filed Mar. 26, 1889. Serial No. 304,916. (No model.)

Claim.—The combination, with the bowl, of the downwardly-extending valve-case A, attached to the bottom of the bowl by the neck B, a transverse horizontal valve-chamber C, made integral with said case, the plug-valve D, playing in said chamber C, the cap C^2, closing said chamber C and having valve-rod E projecting through it, and provided with retracting-spring S and connected with the cam-wheel H, attached to vertical rod G, supported by the arm F, extending from said cap C^2, and the case A, also provided with overflow-pipes I and J, all constructed to operate substantially as specified.

413,366. PEN OR PENCIL HOLDER. JOHN P. HAMLIP, Salem, Va. Filed Apr. 23, 1889. Serial No. 308,259. (No model.)

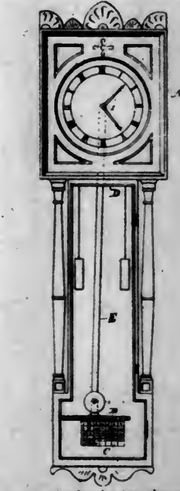


Claim.—1. The herein-described holder, consisting of the shaft 1 and the angular portions or surfaces 3 4 5 6, arranged to form a trapezium, substantially as specified.

2. The combination, with the herein-described hollow pencil-shaft 1, having the trapezium-shaped lower grasping end, slotted, as at 6, and provided with the lever 11, pivoted, as at 12, having the rear portion 13, the interposed spring 14, and the bent grooved forward end 16, substantially as specified.

3. The shaft 1, having the series of slots 2 and the trapezium-shaped lower end slotted, as at 6, in combination with the lever 11, pivoted, as at 12, and having the interposed spring 14, substantially as specified.

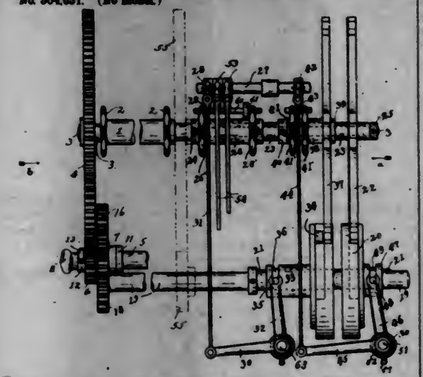
4. The shaft or holder made trapezium in form in cross-section, having the surfaces 3, 4, and 5, the surfaces 3 and 5 being acutely arranged to each other and the surface 4 being slightly oblique to the surface 5, as set forth.



413,367. AIR-WARMING ATTACHMENT FOR STOVES. FREDERICK J. HILEY, Chicago, Ill., assignor of one-half to Harry W. Treat, same place. Filed May 20, 1889. Serial No. 311,485. (No model.)

Claim.—1. The combination, with a flat-top stove, of an air-warming attachment therefor, having a heating-chamber formed by inclosing-walls pivotally mounted upon the stove-top and covering substantially the whole thereof, and having suitable air inlet and outlet openings and smoke-passages, substantially as described.

2. The combination, with a flat-top stove, of an air-warming attachment therefor, having a heating-chamber formed by inclosing-walls pivotally mounted upon the stove-top, and a heat-deflecting hood to direct the radiated heat into the chamber and in conjunction with said chamber covering the whole of the stove-top, substantially as described.

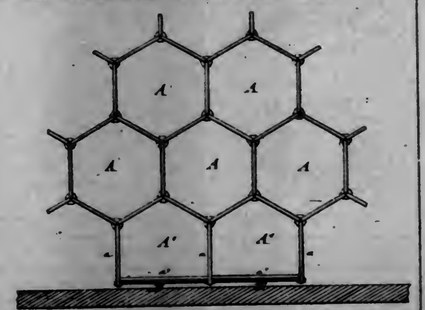


413,368. CALENDAR. JOHN H. HOBBS, Westerly, R. I. Filed Dec. 13, 1888. Serial No. 293,526. (No model.)

Claim.—1. A calendar having the representation of a clock or other suitable design printed thereon, with the connecting or swinging strip E, the slit D, the fastening-eyelets 1 and 2, the movable or swinging day-table B, fastened to the strip E and over the date-table C, the said table C, and the monthly table F, substantially as specified.

2. A calendar showing the clock or other suitable design, the swinging strip E, having its upper end secured by an eyelet, the slit D, the movable day-table B, secured to the strip E at its lower end by an eyelet and hanging over the date-table C, the said table C, and the monthly table F under the said design, substantially as specified.

413,369. LOOM. GEORGE F. HOTCHKISS, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Mar. 26, 1889. Serial No. 304,631. (No model.)

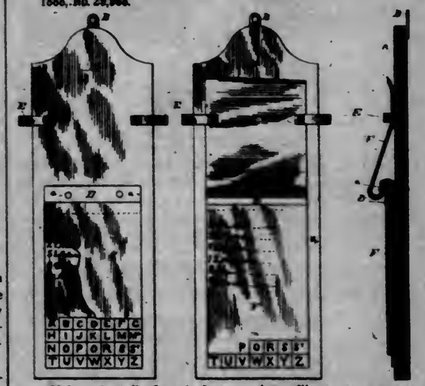


Claim.—1. In a loom, the combination, with the harness-pattern mechanism, of the repeating box-pattern mechanism driven from the harness-pattern mechanism, and consisting of the main and auxiliary star-wheels, sleeves, and pattern-barrels, pin-wheels, pin-wheel-operating levers, lever-retracting springs, connecting-links, and indicator-levers, substantially as and for the purpose stated.

2. In a loom, the main and auxiliary box-pattern indicators, star-wheels, star-wheel sleeves and pattern-barrels, pin-wheels, pin-wheel-operating levers, pin-wheel-lever-retracting springs, connecting-links, and indicator-levers, so arranged that indications on the main and auxiliary box-pattern indicators reciprocally control the times of action of the opposite pin-wheels upon their respective star-wheels, in combination with the pin-wheel shaft, its gear, the reverse gears of the harness-pattern mechanism, and shaft, substantially as described, and for the purpose set forth.

3. In a loom, the main and auxiliary box-pattern indicators, star-wheels, star-wheel sleeves and pattern-barrels, pin-wheels, pin-wheel-operating levers, pin-wheel-lever-retracting springs, connecting-links, and indicator-levers arranged so that indications on the main and auxiliary box-pattern indicators reciprocally control the times of action of the opposite pin-wheels upon their respective star-wheels, in combination with the pin-wheel shaft, the harness-pattern shaft, and intermediate connections for actuating the pin-wheel shaft from the harness-pattern shaft, substantially as set forth.

413,370. GRAIN OR MALT BIN. GOTTFRIED KROGER, New York, N. Y. Filed Jan. 30, 1889. Serial No. 298,051. (No model.)

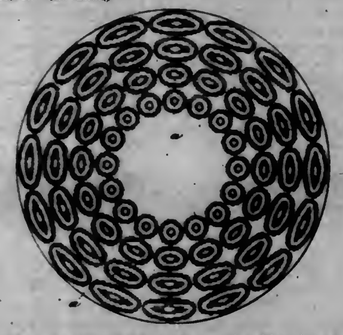


Claim.—1. The combination, in a grain and malt bin, of the side walls of the same, said side walls having dovetailed recesses at both sides near the ends, upright supporting-posts, each of which is set into the recesses of two adjoining side walls, and tie-bolts connecting said posts, substantially as set forth.

2. In a grain and malt bin, the combination of the side walls of the bin having dovetailed recesses at both sides near the ends, upright posts set into said recesses, a boot screw-bolt connecting two of said posts, and a second tie-bolt having an eye for connecting the boot bolt with the third post, substantially as set forth.

3. The combination, in a grain and malt bin, of bins located next to the main walls of the building, said bins having side walls with dovetailed recesses at both sides and ends, end walls set into said recesses, upright posts secured to the recessed ends of the side walls outside of the end walls, and tie-rods connecting the post at one corner of the bin with the posts at the opposite corner, substantially as set forth.

413,371. TELEPHONE-ADDRESS INDEX AND ADVERTISING DEVICE. JOHN F. O'BRIEN, Quebec, Quebec, Canada. Filed Oct. 31, 1888. Serial No. 289,603. (No model.) Patented in Canada Oct. 10, 1888, No. 29,968.

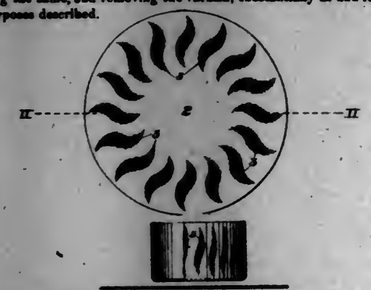


Claim.—1. A list for telephone-service or like purpose, composed of separately-indexed leaves removably secured to a support and having a spring-holder to receive and hold said leaves when opened for reference, substantially as described.

2. The combination of the board A, the alphabetical index-book C, secured thereto briefwise, and the springs E, to hold up the leaves of said index when making a reference, substantially as set forth.

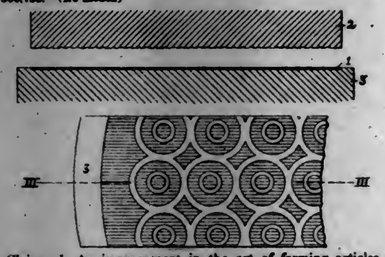
3. The combination, with the board A, having springs E, of the index-book C, secured briefwise thereto, said book having a stub-back D and leaves F, alphabetically arranged and attached removably to said back, substantially as set forth.

413,372. ART OF MAKING SHEET METAL ARTICLES. ARCHIBALD W. PAULL, Wheeling, W. Va. Filed Mar. 29, 1889. Serial No. 305,247. (No model.)



Claim.—An improvement in the art of making sheet-metal articles, which consists in embossing sheet metal and drawing the embossed portion within suitable dies, whereby a sheet-metal article having on its surface a pattern modified by drawing action of the dies is formed, substantially as and for the purposes described.

413,373. ART OF DRAWING SHEET METAL. ARCHIBALD W. PAULL, Wheeling, W. Va. Filed Apr. 1, 1889. Serial No. 305,607. (No model.)



Claim.—1. In the art of drawing sheet metal, the improvement which consists in forming a pattern by applying adhesive material to the sheet metal, drawing the same, and removing the adhesive material, substantially as and for the purposes described.

2. In the art of drawing sheet metal, the improvement which consists in forming a pattern by applying varnish to the sheet metal,

drawing the same, and removing the varnish, substantially as and for the purposes described.

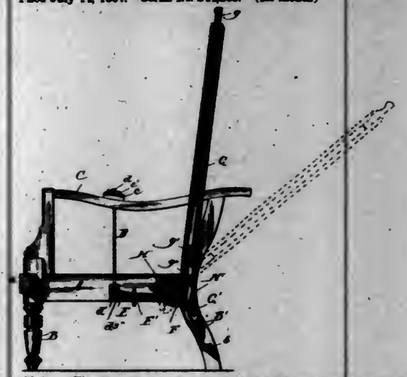
413,374. ART OF FORMING SHEET-METAL ARTICLES. ARCHIBALD W. PAHL, Wheeling, W. Va. Filed Apr. 10, 1889. Serial No. 306,753. (No model.)

Claim.—1. An improvement in the art of forming articles of sheet metal, which consists in impressing a preliminary pattern on the metal sheet by reduction of the substance of the metal on the lines of the pattern between suitable compressing-surfaces, and then drawing the metal so compressed between suitable dies, whereby is formed an article of drawn metal having a compressed surface pattern modified in configuration and appearance by the drawing action of the dies, substantially as described.

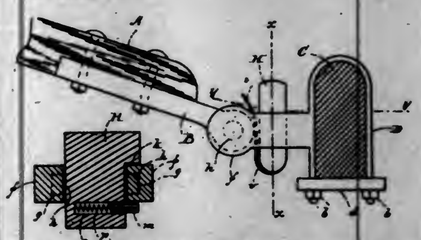
2. An improvement in the art of forming articles of sheet metal, which consists in subjecting a sheet-metal blank to compression between a forming surface or die having a pattern formed thereon and a second surface or die having a substantially smooth face, whereby a compressed and reduced pattern on one side only of the sheet is formed, and then drawing the patterned portion of the blank within suitable dies, whereby a sheet-metal article having on its surface a pattern modified by drawing action of the dies is formed, substantially as described.

413,375. BUCKLE. GEORGE L. SMITH, Newark, N. J. Filed May 17, 1889. Serial No. 311,123. (No model.)

Claim.—In a buckle, the combination, with the curved or arched side bars *a a*, of the cross-bar *c* at the lower end of the buckle, a cross-bar *b* at the upper end, an intermediate cross-bar *d*, provided with a forwardly-projecting tongue *e*, and a loop *f*, projecting backwardly from the upper end of the buckle, all substantially as shown.



413,376. METHOD OF LINING DENTAL PLATES WITH GOLD. ELI Y. STARR, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Mar. 1, 1887. Serial No. 229,394. (No model.)

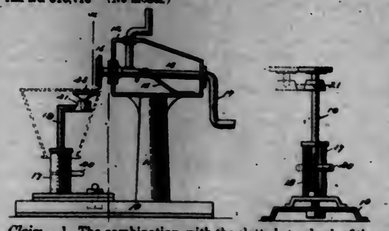


Claim.—The improvement in the art of lining rubber dental plates, which consists in applying a compound foil to the rubber prior to vulcanization and in uniting it thereto by converting the silver into a sulphide during the vulcanizing process, substantially as described.

413,377. RECLINING-CHAIR. WILLIAM S. TOTHILL, Chicago, Ill. Filed July 14, 1887. Serial No. 244,205. (No model.)

Claim.—The bar D, arm or lever E, rod E', and ratchets F, in combination with a pivoted chair-back having a cross-bar G near its lower end and springs H, substantially as and for the purposes specified.

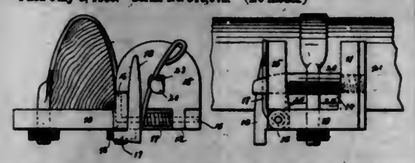
413,378. THILL-COUPLING. SAMUEL H. TYSON and [illegible] TYSON, West Boylston, Mass. Filed May 20, 1889. Serial No. 312,556. (No model.)



Claim.—The combination of an axle-clip provided with arms having inclined sockets, a thill provided with trunnions adapted to rest in said sockets, a projection on the axle between said arms, a removable block inserted between said arms and between said block and the thill, and a spring on said block bearing against said thill, said block being provided with a lateral shoulder and a spring-pin for engaging the upper and lower edges of said arm.

413,379. THILL-COUPLING. THOMAS A. WATROUS, [illegible], N. Y. Filed June 19, 1889. Serial No. 314,629. (No model.)

Claim.—As an improvement in thill-couplings, the combination, with the clip having the bearing-arms, the thill-iron pivoted between the bearing-arms, the clip-plate provided on its upper side with the shoulders J J, between which the axle rests, and having its front end extended and provided with the rib L, of the cushion resting on the extended end of the clip-plate and against the rib L, and the cap secured over the cushion and provided at its side edges with depending flanges fitting over the bearing-arms, and provided at their ends, in their inner sides, with recesses adapted to engage the ends of the pivotal pin of the thill-iron, as specified.

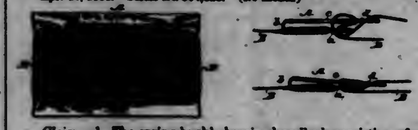


413,380. ATTACHMENT FOR TINNERS' DOUBLE-SEAMING MACHINES. PETER W. ALLEN, Pueblo, Colo. Filed May 14, 1889. Serial No. 310,716. (No model.)

Claim.—1. The combination, with the slotted standard, of the anvil-holding rod 19, having an arm projecting at right angles to its upper end, provided with a vertical socket 21, and a pin 20, projecting at right angles from the rod below its horizontal arm and forming a stop and handle, substantially as set forth.

2. The combination, with the pressure-foot or seaming-roller of a double-seaming machine, of a tubular standard having a slotted side, an angled anvil-rod held to turn in said standard, a socket formed upon the horizontal member of the rod, an anvil-block held to turn in said socket, and a pin inserted in the vertical member of the rod, projecting through the slot in the standard, substantially as shown and described, and for the purpose specified.

413,381. THILL-COUPLING. THOMAS L. BARR, Plymouth, Ohio. Filed July 9, 1889. Serial No. 316,972. (No model.)



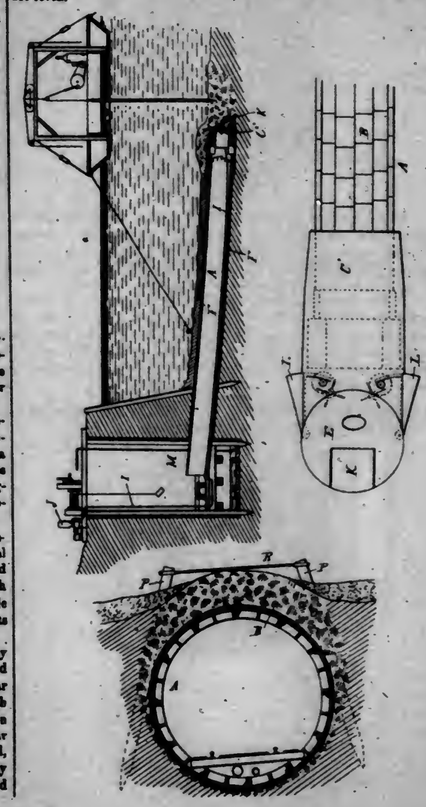
Claim.—1. As an improved article of manufacture, a thill-coupling comprising a horizontal body having a fixed vertical ear, provided with a coupling-pin, an ear hinged to swing in a vertical plane and apertured to receive the coupling-pin, and a locking device for the projecting end of the coupling-pin, substantially as described.

2. As an improved article of manufacture, a thill-coupling comprising a horizontal body having a vertical ear integral with one longitudinal side and an apertured ear hinged to the opposite side, a coupling-pin secured at one end to the fixed ear and adapted to pass through the aperture of the hinged ear, and a locking-spring engaging the projecting end of the said pin, substantially as shown and described.

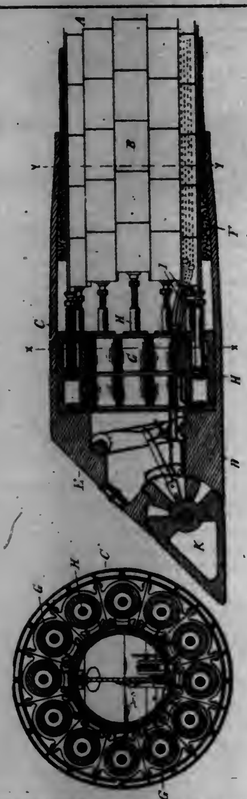
3. As an improved article of manufacture, a thill-coupling comprising a horizontal body, a vertical ear integral with one longitudinal side edge at the front, an opposed hinged ear, a pin secured to the fixed ear and passing through and beyond the hinged ear and provided with a notch in the projecting end, a spring provided with an arm capable of entering the notch in the pin, and a stop limiting the movements of the hinged ear, substantially as shown and described.

4. In a thill-coupling, the combination, with a horizontal body provided with a vertical ear integral with one longitudinal side, opposed spaced lugs integral with the opposite side, and a transverse stop-bar upon the upper face of the horizontal body, of an ear parallel with the fixed ear of the body hinged to the lugs of the said body, a pin secured to the fixed ear at one end and passed through the hinged ear at the opposite end, and provided with a notch in the projecting end, a spring coiled around the pintle of the hinged ear, having an upwardly forwardly-extending arm capable of entering the notch of the pin, and a stop extending downwardly below the outer face of the hinged ear and provided with a rearwardly-projecting horizontal arm, all combined for operation substantially as and for the purpose specified.

413,382. BUCKLE. CHARLES W. BARRETT, Alameda, Cal. Filed Apr. 17, 1889. Serial No. 307,622. (No model.)



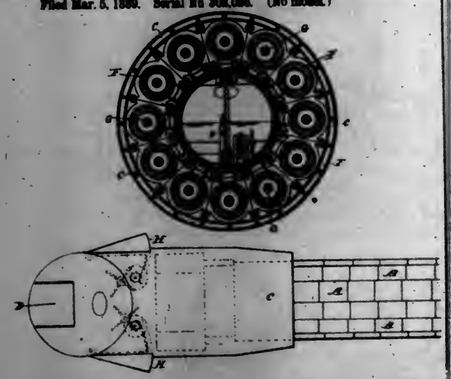
Claim.—1. The spring-buckle herein described, consisting of an oblong plate of elastic sheet metal folded on itself into substantially parallel position to form a bent spring slotted transversely at the bend *b* and having two transverse slot *c d* in the upper section and a single transverse slot *a* in the lower section, substantially as described.



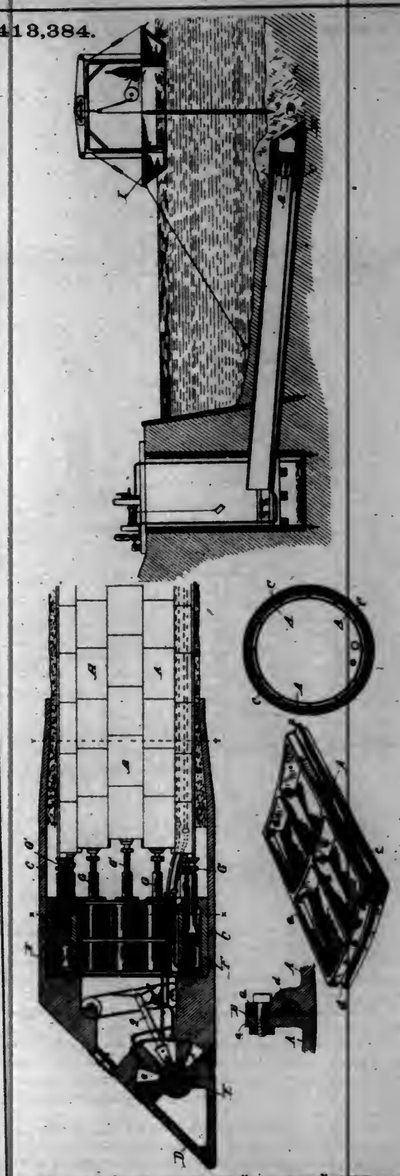
2. The spring-buckle herein described, consisting of an oblong plate of elastic sheet metal folded on itself into substantially parallel position to form a bent spring and slotted transversely both at the bend *b* and at the two ends at *a* and *c d*, in combination with a flexible tape or strap having one end permanently connected to the buckle through slots *a* and *b* and the other end laced through slots *a c d* and then through slots *a* and *d*, substantially as shown and described.

413,383. METHOD OF CONSTRUCTING TUNNELS. LUTHER BEECHER, Detroit, Mich. Filed Jan. 31, 1889. Serial No. 298,183. (No model.)

Claim.—1. The herein-described improvement in the art of subaqueous tunnel construction, which consists in slidingly operating the tunneling-ram on the construction end of the tunnel-casing, and displacing the earth upward and extending the tunnel-casing step by step as the tunneling advances, and loosening or preparing the ground in advance of the ram by mechanical means removed from the ram, as set forth.



413,383.



2. The herein-described improvement in the art of subaqueous tunnel construction, which consists in slidingly operating the tunneling-ram on the construction end of the tunnel-casing, and in compressing in a tapering space between the ram and the casing an outer covering in the advancing movement of the ram, as set forth.

3. The herein-described improvement in the art of subaqueous tunnel construction, which consists in extending the casing step by step within the tunneling-ram moving over said casing and compressing suitable packing in a tapering space between the casing and the ram and into the joints of the casing by the advancing movement of the ram, as set forth.

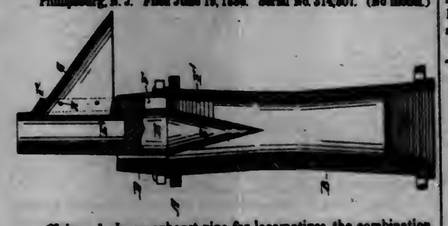
413,384. TUNNELING-RAM. LUTHER BRECHER, Detroit, Mich. Filed Mar. 5, 1889. Serial No. 302,026. (No model.)

413,384.

Claim.—1. In subaqueous tunneling, a tunneling-ram provided with a wedge-shaped bulk-head adapted to displace the ground upwardly, having a hinged point or nose and forming a water-tight compartment slidingly operating on the head of the tunnel-casing, substantially as described.

2. In subaqueous tunneling, a tunneling-ram provided with a solid bulk-head constructed in the form of a wedge, adapted to displace the ground upwardly when pushed through it, and with a movable point or nose for steering it, said tunneling-ram being adapted to slidingly operate on the head of the tunnel-casing, and forming a water-tight compartment for extending the tunnel-casing within said tunneling-ram, substantially as described.

3. In subaqueous tunneling, a tunneling-ram provided at its front end with a solid bulk-head, having its front face rearwardly inclined from the bottom to the top and having a hinged point or nose and laterally-extensible wings, substantially as described.



4. The combination, with the casing and tunneling-ram slidingly secured thereon and formed with tapered rear end, of the plastic packing applied between the tunneling-ram and casing to form a water-tight joint, substantially as described.

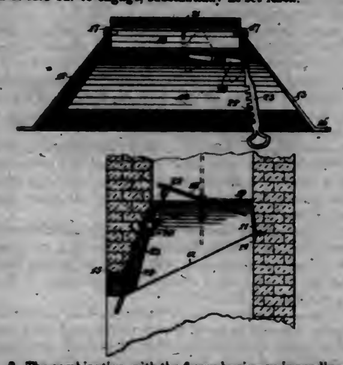
5. In subaqueous tunneling, the combination, with the casing, of a tunneling-ram provided with a tapering rear end and a plastic packing applied in the annular space between said tapering rear end and the casing of the tunnel, said tunneling-ram forming a water-tight compartment on the head of the casing and provided with means for advancing it to permit of extending the casing within the tunneling-ram, substantially as described.

6. In subaqueous tunneling, the combination, with a casing constructed of rectangular segmental cast-iron plates smooth on the outside and interiorly flanged on their edges for securing said plates together by bolts, of the tunneling-ram provided with a tapering rear end smooth on the inside and slidingly engaging with the end of the tunnel-casing by means of plastic packing adapted to form a permanent covering on the outside of the tunnel-casing, substantially as described.

7. In subaqueous tunneling, the combination of a tunnel-casing consisting of rectangular segmental iron plates adapted to be interiorly bolted together with intervening gaskets by means of interior flanges provided with corresponding tongues and grooves, a tunneling-ram provided with a solid bulk-head wedge-shaped at its outer face and with a tapering rear end sliding on the head of the casing, with a water-tight joint formed of a plastic material adapted to form a permanent covering on the outside of the tunnel-casing, and a series of hydraulic rams grouped around the inner wall of said tunneling-ram and adapted to operate with their pistons against the inner ends of the plates of the casing to force the same in place and advance the tunneling-ram, substantially as described.

413,385. EXHAUST-PIPE FOR LOCOMOTIVES. JOHN S. ROSSLOW, Phillipsburg, N. J. Filed June 19, 1889. Serial No. 314,807. (No model.)

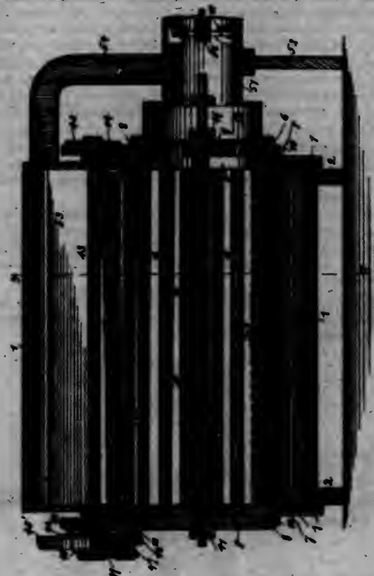
Claim.—1. In an exhaust-pipe for locomotives, the combination, with a pipe set on the bed-plate, of a nozzle secured to the upper end of said pipe, a post held centrally in the said nozzle and provided with a solid cone-shaped lower end and a recessed upper end, and a hood leading into said recess from the smoke-box, substantially as shown and described.



2. In an exhaust-pipe for locomotives, the combination, with the pipe B, provided with the transverse partition C, of the nozzle D, secured to the upper end of the said pipe B, the central post E, held in the said nozzle D and provided with a cone-shaped end E', and the hood G, secured to one side of the said central post E and leading into the recess E² of the said post, substantially as shown and described.

3. In an exhaust-pipe for locomotives, the combination, with the pipe B, provided with the transverse partition C, of the nozzle D, secured to the upper end of the said pipe B, the central post E, held in the said nozzle D and provided with a cone-shaped end E', the hood G, secured on one side of the said central post E and leading into the recess E² of the said post, and the offset F, connecting the central post with the said nozzle, substantially as shown and described.

4. In an exhaust-pipe for locomotives, the combination, with the pipe B, provided with the transverse partition C, of the nozzle D, secured to the upper end of the said pipe B, the central post E, held in the said nozzle D and provided with a cone-shaped end E', the hood G, secured on one side of the said central post E and leading into the recess E² of the said post, and the offset F, connecting the central post with the said nozzle, the said offset F being provided with a wedge-shaped end F' in line with the said partition C, substantially as shown and described.



413,386. FIRE-PLACE DAMPER. EDWARD G. BURROWS, Orange, N. J., assignor to Hattie Leah Burrows, same place. Filed June 15, 1889. Serial No. 314,293. (No model.)

Claim.—1. The combination, with a frame, of the vertically-swinging damper pivoted thereto, a transverse lever 20, pivoted between its ends to the inner side of the front wall of the frame, a link connecting one end of said lever with the damper, the notched bar pivoted at its upper end to the opposite end of said lever and extending downward therefrom along the inner side of the front wall of the frame, below the lower edge thereof, and the stud or pin 24 for the teeth of said bar to engage, substantially as set forth.

2. The combination, with the frame having an inwardly-extending flange 19 projecting from its inner wall and from the inner portions of the upper edges of its side walls, of the damper 18, pivoted between its ends on the upper edges of the sides of the frame in front of said flange, with its inner half extending thereunder when the damper is in its horizontal position, the lever 20, pivoted to the front wall of the frame, a link 21, pivotally connected with the upwardly-swinging edge of the damper, the lever 20, pivotally connected to said link, the toothed bar depending from the opposite end of said lever, and a stud or pin for said bar to engage, substantially as set forth.

413,387. CARPET-BEATING MACHINE. ALEXANDER B. COLLIER, New York, N. Y. Filed Jan. 16, 1889. Serial No. 296,478. (No model.)

Claim.—1. In a carpet-beating machine, a rotary carpet-supporting frame, with means for securing the carpet thereto, in combination with rotary shafts having flexible beater-arms and brushes mounted on the same shaft, the brushes projecting radially therefrom alternately with the beater-arms, substantially as shown and described.

2. In a carpet-beating machine, a rotary shaft having flexible beater-arms and brushes, the beater-arms projecting radially from the

shaft alternately with the brushes, substantially as shown and described.

3. In a carpet-beating machine, a rotary carpet-supporting frame, with means for securing a carpet thereto, in combination with brushes located adjacent to the rotary frame and rotary shafts having flexible beater-arms and brushes mounted on the same shaft, the beater-arms projecting radially from the shaft alternately with the brushes, substantially as shown and described.

4. A carpet-beating machine consisting of a casing, a rotary carpet-supporting frame located in the casing, with a fastening device for detachably securing one end of a carpet thereto, a number of rotary beaters and a number of brushes adjacent to the rotary frame, a suction device for drawing off dust from the casing, and a driving mechanism for operating the rotary frame, the rotary beaters, and the suction device, substantially as described.

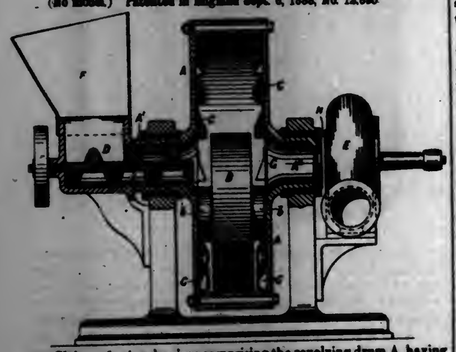
5. In a carpet-beating machine, a rotary carpet-supporting frame having its sides formed of longitudinal rods, and having a bar to clamp the end of a carpet, in combination with rotary shafts with flexible beater-arms located adjacent to the periphery of the rotary frame, substantially as described.

6. In a carpet-beating machine, a rotary carpet-supporting frame having its sides formed of longitudinal rods, and having a bar to clamp the end of a carpet, in combination with rotary shafts with flexible beater-arms and brushes located adjacent to the periphery of the rotary frame, substantially as described.

7. In a carpet-beating machine, a rotary carpet-supporting frame having its sides formed of longitudinal rods, and having a bar to clamp the end of a carpet, in combination with rotary shafts with flexible beater-arms and adjustable brushes, with means for holding them in adjusted position located adjacent to the periphery of the rotary frame, substantially as described.

8. In a carpet-beating machine, a rotary carpet-supporting frame having its sides formed of longitudinal rods, with their outer faces covered with a yielding material, substantially as described.

9. In a carpet-beating machine, a rotary shaft provided with beater-arms and detachable brushes, substantially as described.

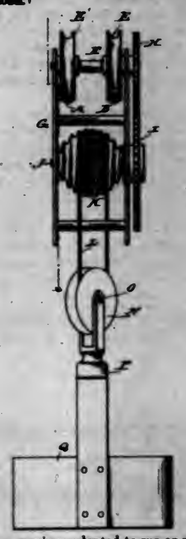


10. In a carpet-beating machine, a rotary carpet-supporting frame 3, having its sides formed with the longitudinal rods 4, with their outer face having a strip 21 of yielding material, and the longitudinal rods 11 at one side of the frame 3, with a yielding covering 12, a clamping-bar 13, located between the rods 11, having a yielding covering 14 and mounted on arms 15, with bolt-holes 18, pivoted to casing 1, having sockets 19, and spring-actuated bolts 16, substantially as described.

11. In a carpet-beating machine, a rotary carpet-supporting frame 3, having heads 5 and 6 with shouldered projecting ends 8, in combination with disks 42, held in frictional contact with projections 8 and mounted on a shaft 43, having a pulley 45, with endless belt 45', connected with and driven by a suitable power, substantially as described.

12. In a carpet-beating machine, a rotary shaft 25, having longitudinal grooves 29, in combination with rings 27, having lugs 28, engaging grooves 29, and outwardly-projecting lugs 30, with flexible beater-arms 26, secured in lugs 30 by bolts 31 and nuts 32, substantially as described.

13. In a carpet-beating machine, a rotary shaft 25, having longitudinal grooves 29, in combination with rings 27, having lugs 28 engaging grooves 29, and lugs 30, with flexible beater-arms 26, and brushes 26', secured in lugs 30 by bolts 31 and nuts 32, substantially as described.



418,388. PULVERIZING-MACHINE. William H. Coward, Bath, County of Somerset, England. Filed Nov. 20, 1888. Serial No. 292,173. (No model.) Patented in England Sept. 6, 1888, No. 12,895.

Claim.—1. A pulverizer comprising the revolving drum A, having hollow trunnions and provided with a series of wedge-shaped cups disposed around its inner faces, the edge runner B narrower than the drum and provided with bosses *b* for steadying it in the said drum, a fan or blower connected to one of the trunnions of the drum, and a screw conveyer in the other trunnion of the drum, substantially as herein shown and described.

2. A pulverizer comprising the revolving drum A, having hollow trunnions A' A^2 and provided with the wedge-shaped cups C around its inner faces, the edge runner B, provided with the bosses *b*, the screw conveyer D in the trunnion A', the exhaust-fan E, connected to the trunnion A^2, and the gauze diaphragm G across the trunnion A^2, substantially as herein shown and described.

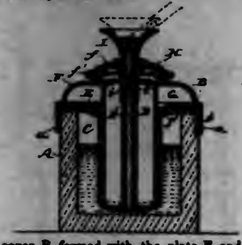
418,389. CARRIAGE ADAPTED TO RUN ON WIRE CABLES. William Y. Crenshaw, Danville, Pa. Filed Jan. 12, 1889. Serial No. 296,128. (No model.)

Claim.—1. In a carriage adapted to run on wire cables, a double conical and spirally-grooved drum, and a cord for supporting a basket, substantially as described.

2. In a carriage adapted to run on wire cables, the combination, with a compensating-drum, of an endless rope wound on the said drum and supporting the basket, substantially as shown and described.

3. In a carriage adapted to run on wire cables, the combination, with a spirally-grooved compensating-drum, of an endless rope wound on the said drum and a basket supported on the said endless rope, substantially as shown and described.

4. In a carriage adapted to run on wire cables, the combination, with the pulley traveling on the cable, of a spirally-grooved compensating-drum rotated from said pulley, an endless rope wound upon the said drum, and a basket supported on the said endless rope, substantially as shown and described.



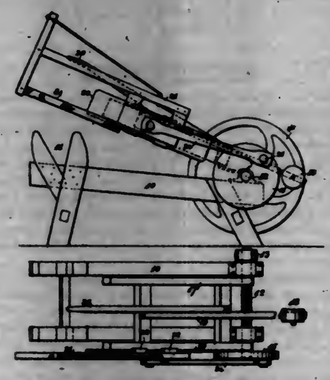
5. The combination, with a wire cable stretched between two elevated points, of a pulley traveling on the said cable, a frame supported on the said pulley, a spirally-grooved compensating-drum mounted to turn in the said frame and geared with the said pulley, an endless rope wound upon the said drum, and a basket supported on the said endless rope, substantially as shown and described.

6. The combination, with a wire cable stretched between two elevated points, of a pulley traveling on the said cable, a frame supported on the said pulley, a spirally-grooved compensating-drum mounted to turn in the said frame and geared with the said pulley, an endless rope wound upon the said drum, a basket supported on the said endless rope, and means for moving the said frame forward and backward on the said cable, substantially as shown and described.

418,390. INKSTAND. Ebby Davis, Kane, Pa. Filed Mar. 23, 1889. Serial No. 304,272. (No model.)

Claim.—1. An inkstand provided with a cover, combined with a tube fitted in the cover, a float placed in the tube, a dip-funnel fitted in the float, and a check placed in the passage of the float, substantially as and for the purposes described.

2. The cover B, formed with a plate E and surrounding flange *b*, the plate E being formed with a tube C, which projects down into the ink-well, substantially as described.



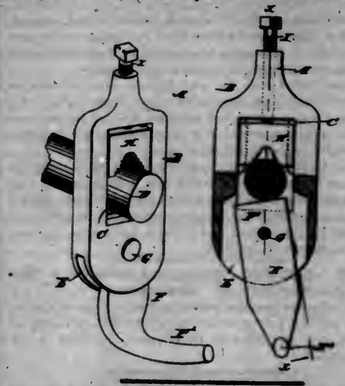
3. The cover B, formed with the plate E and dome F, having opening *f*, the said dome and plate forming a space G, substantially as and for the purposes set forth.

4. The cover B, formed with the plate E, having tube C, and the dome F, having opening *f*, which coincides with the tube C, substantially as described.

5. The cover B, formed with the surrounding flange *b*, plate E, having tube C, and the dome F, having opening *f*, which coincides with the tube C, substantially as shown and described.

6. The cover B, formed with plate E, having tube C, and dome F, having opening *f*, in combination with the supplemental cover H, float D, tube D', and dip-funnel I, substantially as described.

418,391. SAWING-MACHINE. John De Graff, Dunkerton, assignor to F. H. Page, Key, Iowa. Filed Apr. 12, 1888. Serial No. 306,976. (No model.)



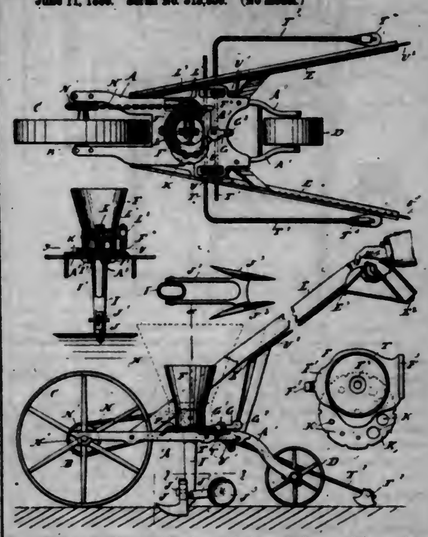
Claim.—The combination, with the back and driving-shaft 12 and the crank-wheel 15, of the vertically-swinging counterbalanced frame 17, mounted loosely on said shaft, the guide-plate 20, attached to one side of said frame, the saw-carrying frame 21, operated by a pitman and sliding on the guide-plate, and the handle 30, which is rigidly attached to the frame 17 and projects forward parallel to the saw-frame, so that it may be conveniently grasped by the operator standing in front of the back, and the saw-carrying frame depressed and raised, as required.

418,392. LATHE-DOG. George J. Brauer, Danville, N. Y., assignor to himself and Edward C. Schwingel, same place. Filed July 23, 1888. Serial No. 313,631. (No model.)

Claim.—1. A lathe-dog comprising a body part having an aperture adapted to receive the work, and a tail or elbow pivoted on the said body and adapted to engage the work, substantially as herein shown and described.

2. A lathe-dog comprising a body part having an aperture adapted to receive the work, a tail or elbow pivoted on the said body and adapted to engage the work, and a set-screw and die adapted to engage the work opposite the said tail, substantially as shown and described.

3. In a lathe-dog, the combination, with the body part having an aperture and a slot, of a tail pivoted in the said body part and extending through the said slot into the said aperture to engage the work, a die held to slide in the said aperture, and a set-screw for adjusting the said die, substantially as shown and described.



418,393. METHOD OF HANGING TOBACCO. Pleasant B. Farmer, Laurel Grove, Va. Filed Sept. 4, 1889. Serial No. 322,692. (No model.)

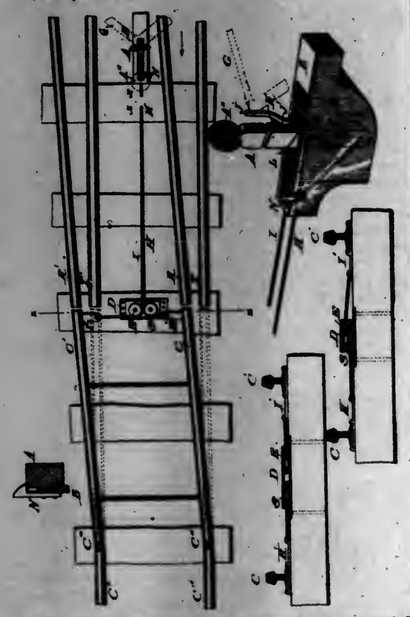
Claim.—The improved method of securing depending tobacco bundles to their supporting-sticks, which consists in securing the binding-cord to the stick, passing it thence around a bundle arranged at one side of the stick, twisting the cord between the bundle and the stick, extending it thence across the stick, passing it around a bundle on the opposite side of the stick, twisting it between said bundle and stick, carrying it thence across the stick, and so on, substantially as set forth.

418,394. DRILL. William H. Gibbons, Madison, Ohio. Filed June 11, 1889. Serial No. 313,820. (No model.)

Claim.—1. The combination, with the main frame, of the marker-rods T and T', mounted to turn in the said frame, the arms T², projecting rearward from the said rods T and T', the V-shaped markers held on the said arms, the arms U and U', secured in the said rods,

and the ropes U^2 and U^3, fastened to the said rod-arms and extending along the handles of the said frame; substantially as shown and described.

2. The combination, with the spout I, of the V-shaped runner J, held vertically adjustable on the front of the said spout, and the covering plow or disks J^2, held on an arm pivoted on the said spout and extending rearward, substantially as shown and described.



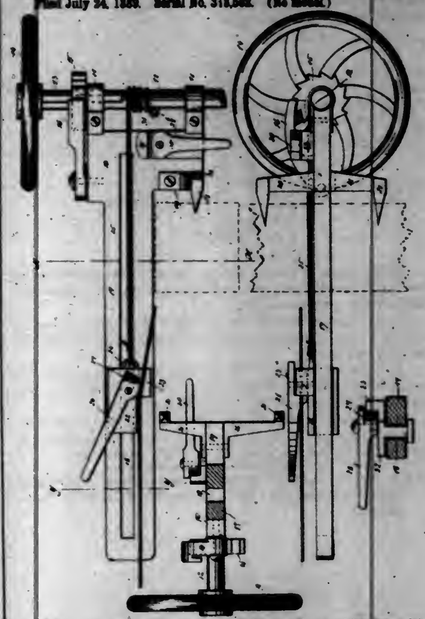
3. The combination, with the main frame A, provided with the top plate A^2, of the hopper F, provided with a flange having a lug passing into an aperture on the said top plate, and an eccentric cam pivoted on the said top plate and adapted to lock the said hopper in place, substantially as shown and described.

4. The combination, with the main frame A, provided with the top plate A^2, of the hopper F, provided with a flange having a lug fitting into an aperture in the said top plate, an eccentric cam pivoted on the said top plate and adapted to engage an edge on the said flange to lock the said hopper in place, and a handle held on the said cam, substantially as shown and described.

413,395. HAIR-TONIC. CLEMENS GROOS, Riverside, N. J. Filed July 17, 1889. Serial No. 317,766. (No specimens.)

Claim.—The herein-described hair-tonic or composition of matter to be used for making hair grow on the human skin, consisting of water, alcohol, and the pollen of pine-blossom, combined in the proportions specified.

413,396. AUTOMATIC SAFETY-SWITCH FOR RAILWAYS. JOHN L. HARVEY, Philadelphia, Pa. Filed Jan. 30, 1889. Serial No. 298,095. (No model.)



Claim.—1. The combination, with switch-rails C C' and track T T', of pivoted lever A, cables H I, passing over pulleys S E and secured, respectively, to lugs H' I' of the shifting ends of the switch-rails and at their other ends to the lever A, one above and the other below the pivoted point A' of the latter, substantially as described.

2. The combination, with switch-rails C C' and track T T', of pivoted lever A, cables H I, passing over pulleys S E and secured, respectively, to lugs H' I' of the shifting ends of the switch-rails and at their other ends to the lever A, one above the other below the pivoted point A' of the latter, and rod J, with its spring K and bar L to sustain the lever in an upright position, substantially as described.

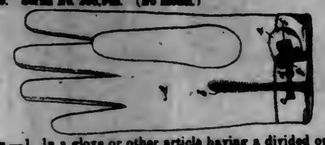
3. The combination, with switch-rails C C' and track T T', of pivoted lever A, cables H I, passing over pulleys S E and secured, respectively, to lugs H' I' of the shifting ends of the switch-rails and at their other ends to the lever A, one above and the other below the pivotal point A' of the latter, and spring-catch N to hold the lever down when the switch is closed, substantially as described.

413,397. WIRE-STRETCHER. THOMAS P. HICKMAN, Bowie, Tex. Filed July 24, 1889. Serial No. 318,562. (No model.)

Claim.—1. In a wire stretcher or tightener, the combination, with a body provided with a slotted arm projected from one side edge, a bearing surface or shoulder at the forward side, and a shaft journaled in the rear end of the body, of a block held to slide in the slot of the arm, a rope, chain, or cord connecting the said block with the shaft, a lever provided with a cam-face pivoted upon the sliding block adapted for contact with a post projected from the same, and a second lever provided with a semicircular face pivoted upon the body portion and capable of contact with a post projected upward from the said body, all combined for operation substantially as shown and described.

2. The combination, with a body, an arm projected from the forward side of the said body, provided with a longitudinal slot extending transversely in the body, a shaft journaled at the rear side edge of the body, provided with a longitudinal groove, a ratchet-wheel held to slide upon and turn with the shaft, and a pawl adapted for contact with the said wheel, of a block held to slide in the groove of the body-arm, provided with an upwardly-extending post at one end, a lever fulcrumed upon said block, having a cam-surface adapted for contact with the post, a second lever pivoted upon the body, provided with a semicircular face adapted for contact with a post fast to the body, hooks projected at a right angle from the upper and lower faces of the body and forwardly in the direction of the longitudinal axis of the body-arm, and a rope or chain connection between the sliding block and the shaft, substantially as shown and described.

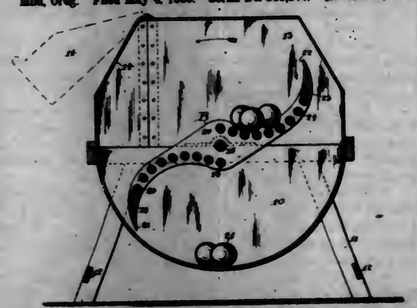
3. In a wire stretcher or tightener, the combination, with a body, an arm projected from the forward side edge of the body near one side of the center and provided with a longitudinal slot extending into the body, a shaft journaled upon the rear side edge of the body, a ratchet-wheel held to slide upon and turn with the shaft, and a pawl pivoted upon the body capable of contact with the ratchet-wheel, of a block held to slide in the slot of the arm and provided with an upwardly-extending side post, a lever fulcrumed upon the said block, having a cam-face adapted for contact with the contiguous face of the post, a post projected upward from the body, a lever fulcrumed upon the body in front of the said post, having a semicircular face adapted for contact with the post, a rope, cord, or chain connecting the sliding block and the shaft, bracket-arms projected at a right angle from the upper and the lower surface of the body near the left-hand forward corner, which bracket-arms are made to terminate in essentially wedge-shaped extremities extending at a right angle to the body of the bracket-arms inwardly and parallel with the longitudinal axis of the slotted body-arm, all combined for operation substantially as shown and described.



413,398. WATCH-CASE PENDANT. CHRISTIAN L. HOSMER, Kearney, Nebr. Filed Mar. 12, 1889. Serial No. 302,956. (No model.)

Claim.—1. The combination, with the pendant A, of the hollow bosses B B', provided with notched fillets *b*, and the bow C, having cylindrical ends *d* and lugs *e*, adapted to enter the notches of the fillets, substantially as specified.

2. The combination, with the pendant A, of the hollow bosses B B', provided with the fillets *b*, having notches *c c'*, and the bow C, provided with the cylindrical ends having lugs *e*, adapted to enter the notches *c d*, substantially as specified.



413,399. GLOVE-FASTENER. GEORGE W. JACKMAN, Littleton, N. H., assignor to himself and Ira Parker & Co., same place. Filed Feb. 7, 1889. Serial No. 299,043. (No model.)

Claim.—1. In a glove or other article having a divided opening and closing portion to be fastened, the combination, with such article, of a cord secured at its one end to the article on one side of said opening, and a flap thumb-piece secured to the article on the opposite side of such opening, provided with a holder adapted to produce friction on the cord, said cord being passed through a guide or hole in the article on the opposite side of the opening to that on which the cord is attached, and afterward passed at its free end over and under or through the friction-holder attached to the flap thumb-piece, whereby, upon drawing on the free end of the cord, the glove or article is closed and held closed at its opening, and upon lifting the thumb-piece the cord is slackened or relieved of pressure to admit of the opening of the article, essentially as described.

2. In a glove or other article having a divided opening and closing portion to be fastened, the combination, with such article, of the fastening-cord *g*, secured at its one end, as at *c*, to the article on one side of its opening, the eyelet or hole *d* on the opposite side of said opening, the flap thumb-piece *e*, and a cord-holding friction device attached to said thumb-piece, substantially as specified.

413,400. WASHING-MACHINE. JOSEPH LACHANCE, East Portland, Oreg. Filed May 4, 1889. Serial No. 309,577. (No model.)

Claim.—1. The combination, with the casing or body, of a rotary rubber journaled therein and having rigid oppositely-curved end portions, the concavities formed by said curved portions forming the open clothes-receiving spaces in the working-faces of the rubber, substantially as set forth.

2. In a washing-machine, the rubber consisting in the rigid spaced side pieces B, having curved recesses in their opposite faces at opposite sides, and the transverse series of rods 24, connecting the side pieces and conforming to the curvature of the recesses therein, substantially as set forth.

3. In a washing-machine, the combination, with the body and a rubber held to revolve in said body, comprising two spaced side pieces oppositely curved at their extremities, slats corresponding to the contour of the side pieces uniting the same at their ends, and a series of rods or bars, also connecting the side pieces, arranged in semicircular form at each side of the center of said side pieces, the two series of rods being eccentric, of a series of balls adapted to be carried by the said barred surfaces of the rubber, substantially as shown and described.

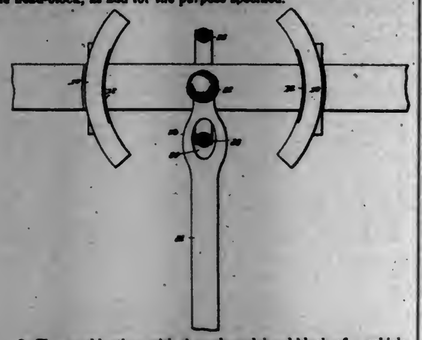
4. In a washing-machine, the combination, with a semi-cylindrical body, an axle or shaft journaled in the same, a rubber centrally secured to the said shaft, comprising side pieces oppositely curved at their extremities, slats uniting the said side pieces at the ends and corresponding to the contour of said ends, and a series of rods or bars arranged in a semicircle at each side of the shaft, the arc of the said series corresponding to the curve of the side pieces, whereby a space is obtained between the inner rods or bars and the axle, of a series of balls adapted to be carried by the curved surfaces of the rubber, and means, substantially as shown and described, for rotating the axle or shaft.

413,401. BELT-SUPPORT. LOUIS SANDERS, Brooklyn, N. Y., assignor, by mesne assignments, to Miss Sanders, same place. Filed July 10, 1889. Serial No. 317,079. (No model.)

Claim.—1. The herein-described belt-support, consisting of the two spring-tongues 10 and 11, having curved lower ends, the tongue 10 being provided with the teeth 13, and the downwardly-projecting stop-arm 12, provided with the bent shank 14 and head 15 and secured to the tongue 11, as specified.

2. In a belt-support, the combination, with the spring-tongues 10 and 11, the tongue 10 being provided with teeth 13, and the stop plate or arm 12, having the bent shank 14 and head 15, of the strap 16, secured to the head 15 of the stop-arm 12, and provided with the hook 17 at its lower end, substantially as herein shown and described.

413,402. NUT-LOCK. JEREMIAH G. LEEP, Red House Shoals, W. Va. Filed May 3, 1889. Serial No. 309,400. (No model.)



Claim.—The nut having the V-shaped recess E, the recess C, and the thin flexible intervening wall or partition F, and the dog G, pivoted in said recess C and arranged with its free beveled end adjacent to said partition, whereby the latter may be forced against the dog to hold it engaged with the bolt, as shown and described.

413,403. VEHICLE RUNNING-GEAR. WADE H. LOWE, Crumpti, La., assignor to himself and Miles I. Persinger, same place. Filed Apr. 20, 1889. Serial No. 308,008. (No model.)

Claim.—1. The combination, with the front axle and head-block, having registering concavities in the centers of their adjacent faces, and a tongue-iron provided with a ball within said socket, of upper and lower segmental plates at the opposite sides of the sockets and clipped to the axle and head-block, substantially as set forth.

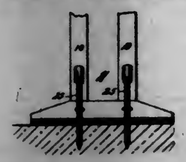
2. The combination, with the axle and head-block of a vehicle, having vertically-aligning sockets produced in their opposed faces, of a vehicle-tongue provided with a ball at the inner end seated in the sockets of the axle and head-block, a U-bar swiveled to the axle and passing upward at front and rear of the said axle and head-block, the forward member of the U-bar also passing through the tongue, and

means, substantially as shown and described, for locking the U-bar to the head-block, as and for the purpose specified.

3. The combination, with the axle and head-block of a vehicle, having vertically-aligning sockets produced in their opposed faces, and a vehicle-tongue provided with a ball at its inner end seated in said sockets, and a longitudinal opening in advance of a ball, of a U-bar pivoted beneath the axle, the members of which extend vertically upward beyond the head-block, the forward member of the U-bar passing through an opening in the tongue, a tie-plate connecting the members of the U-bar above the head-block, and jam-nuts screwed upon the said members in contact with said plate, substantially as shown and described.

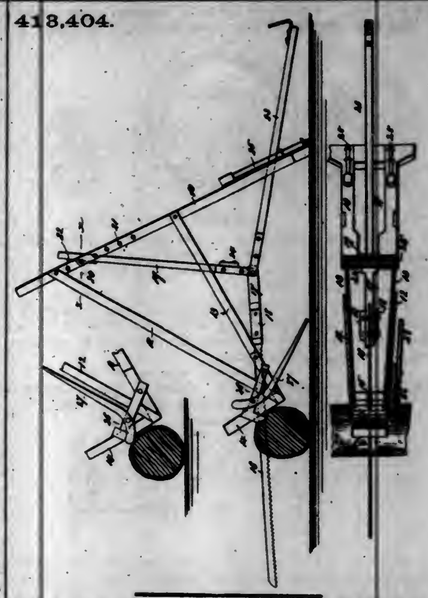
4. The combination, with the axle and head-block of a vehicle, provided with sockets in their opposed faces and a tongue terminating in a ball, which ball is seated in said sockets, of a segmental plate secured at each side of the center, respectively, of the opposed faces of the axle and head-block, constituting a fifth-wheel, the contacting faces of which fifth-wheel sections are flattened, the under sections being provided with a flange upon the inner face, all combined for operation substantially as shown and described.

5. In a vehicle, the combination, with the axle and head-block, of a segmental bar provided with a flattened upper face and a vertical flange integral with its inner edge, secured to the axle, one at each side of the center, and a second segmental bar secured to the under face of the head-block at each side of the center, having a flattened under surface adapted to contact with and slide upon the equivalent surface of the axle-bars, substantially as shown and described, whereby a fifth-wheel is formed of light, durable, and simple construction, as set forth.



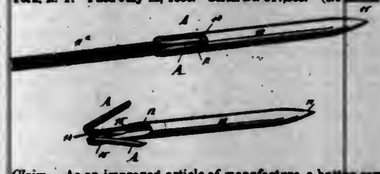
6. A tongue-iron 21, having a ball at its inner end, and a slot 24 just in advance of the ball and in rear of the portion to which the tongue is to be secured, substantially as set forth.

418,404. DRAG-SAW. RICHARD Y. MACBETH and LOUIS GOURDIN, Monk's Corner, S. C. Filed Nov. 30, 1888. Serial No. 292,206. (No model.)



Claim.—1. The combination, with the saw-frame and the saw, of a vertically-swinging log-dog pivoted to the front end thereof, and a rearward-extending releasing-lever pivoted near its front end to the side of the said dog near the front end thereof, whereby when the long arm of the lever is thrown up its short arm will bear down on the log and force the dog upward, substantially as set forth.

2. The combination, with an essentially-triangular frame, a weighted pendulum adjustably pivoted in the frame, and a weighted saw pivoted to said pendulum-rod, of a log-dog pivoted to the frame, and a releasing-lever having a convex engaging-surface pivoted to said dog, substantially as shown and described.



3. The combination, with the frame of a drag-saw, of a log-dog pivoted at the forward end of the frame, a releasing-lever pivoted upon the said dog, having a convex engaging-surface, and locking-pins held to slide upon the rear of the frame at the base, all combined for operation substantially as shown and described.

418,404.

418,405. BUTTON-SEWING NEEDLE. ADOLF HAEDE, New York, N. Y. Filed July 12, 1888. Serial No. 317,203. (No model.)

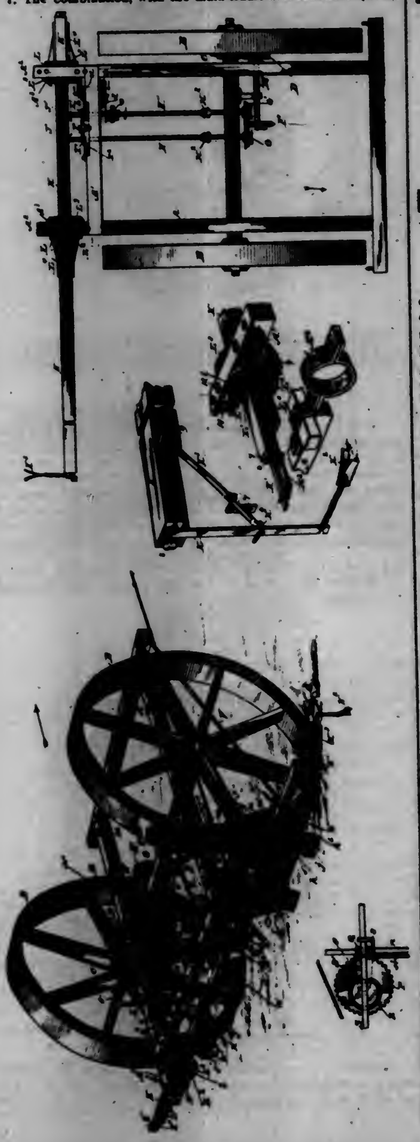
Claim.—As an improved article of manufacture, a button-sewing needle having a longitudinally-reduced butt 12, slotted, as at 14, and forming the two members 15, said members being bent back upon themselves toward the point of the needle to form the hook-like extremities A A, substantially as set forth.

418,406. CHECK-ROW CORN PLANTER AND MARKER. FRANKLIN L. MESSNER, Aurelia, Iowa. Filed Apr. 6, 1889. Serial No. 306,263. (No model.)

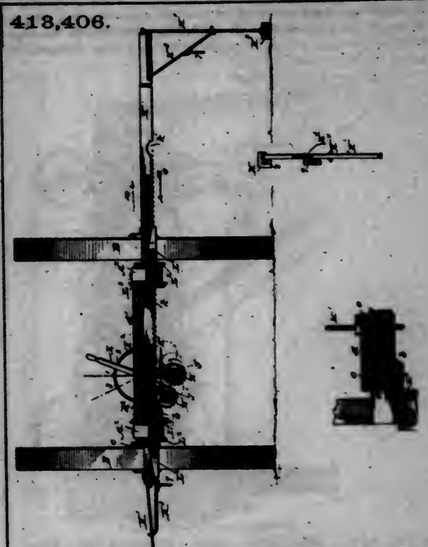
Claim.—1. In a check-row corn-planter, the combination, with the main frame, of a laterally-extending marker-arm held to rotate in said frame and adapted to support wire-reel and means for rotating said marker-arm, substantially as shown and described.

2. The combination, with the main frame, revolving disks secured in the ends of said frame, and detents for holding said disks from turning, of a reciprocating marker-arm journaled in said disks, adapted to receive and support a reel on its extended free end, and means for operating the disk, substantially as shown and described.

3. The combination, with the main frame, the revolving disks mounted thereon, and detents for holding said disks from turning, of a marking-bar journaled in said disks, the extended end thereof adapted to receive and support a wire-reel, and means for revolving the marker-bar, substantially as shown and described.



4. The combination, with the main frame, the revolving disks provided with gear-teeth mounted thereon, and detents for holding said disks from turning, of a marking-bar journaled in said disks, the extended end thereof adapted to receive and support a wire-reel, said gear-surfaces of the revolving disks adapted to engage and operate wire-shifting devices, and means for operating the said disks, substantially as described.



5. The combination, with the main frame and the drive-wheels, of a reciprocating marker-bar held to slide in the rear end of said frame, shafts mounted at one end to the frame, the rear ends journaled in movable bearings, cog-gears mounted on the said rear ends adapted to alternately engage the marking-bar, a shifting-lever for

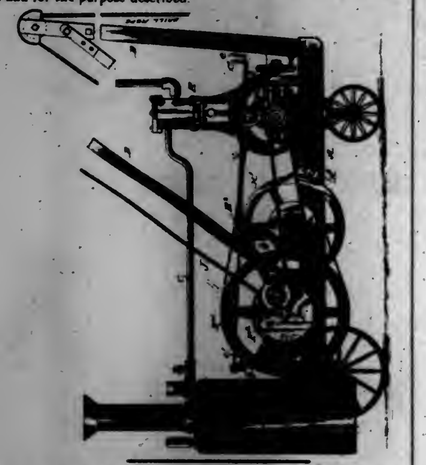
adjusting said shafts and gears into said alternate positions, and intermediate gearing devices between said shafts and one of the drive-wheels, whereby said shafts are operated, substantially as and for the purpose shown and described.

6. The combination, with the main frame, the drive-wheels, and bearings provided at the ends of said frames, having outwardly-extending open sockets, of a reciprocating marker-bar held to slide in said bearings, said bar provided with hinged marker-arms at its outer end, said arms adapted to fall into position by gravity and to be raised out of operative position by engagement with the said extending sockets, and intermediate gearing devices, substantially as shown and described, between the marker-bar and one of the drive-wheels for operating said bar, substantially as and for the purpose set forth.

7. The combination, with the main frame and the drive-wheels,

of a reciprocating marker-bar K, provided with marking devices at each end, said bar held to slide transversely in the rear ends A^1 A^2 of said frame, said bar provided with a cog-rack *k* on its under face, longitudinal shafts H H', journaled at their front ends in the frame, gear-wheels J J', secured upon their rear ends, a shifting-lever I, pivoted upon the main frame, provided with depending diverging arms I' I', forming bearings for the rear ends of said shafts H H', said lever adapted to alternately swing the gears into engagement with the rack *k* on the marking-bar K, and the intermediate gear devices between said shafts H H' and one of the drive-wheels, whereby said shafts are operated, substantially as shown and described.

8. The combination, with the main frame and bearings formed in the rear ends thereof, provided with outwardly-extended socket projections, of a marker-bar held to slide in said bearings transversely across the frame, marker-arms hinged to the outer ends of said bar and carrying markers at their lower ends, and swinging arms hinged at one end to the lower side of the marker-bar, their outer ends engaging the hinged marker-arms, said swinging arms adapted to rise and elevate the marker-arms when they engage the projecting socket portions of the bearings during the operation of sliding said bar from one side to the other and adapted to fall by gravity when released from contact with said projections, substantially as shown and described.



9. The combination, with the main frame A, the drive-wheels B, the longitudinal shafts H H', provided with articulated joints H^3, journaled at one end in the frame A, provided with cog-wheels J J' at their rear ends, a shifting-lever I, pivoted on the main frame, provided with depending diverging arms I,' forming bearings for the rear ends of the shafts H H', and intermediate gearing devices between said shafts and one of the drive-wheels, as shown, and the bar K, provided with marking devices at each end, held to slide transversely in the rear end of the frame A, said bar provided with a rack *k* on its under side, recesses $k' k^2$, disposed one at each end of the rack portion, said bar adapted to be alternately engaged by the cog-wheels J J', said wheels adapted to engage with either of said recesses $k' k^2$ when the bar is slid to its limit in either direction, substantially as and for the purpose described.

10. The combination, with the main frame provided at its rear end with bearings A^3, of a marker-bar K, held to slide transversely in said bearings, arms K', hinged on each end of said bar, lifting-arms K^2, hinged to the under side of the ends of said bar, said arms K^2 engaging the arms K' and adapted to elevate the same when raised up, a swinging latch 7, secured to the arms K^2, and studs 8 on the ends of the bar K, adapted to engage said latch to hold said arms K' K^2 in elevated position, substantially as and for the purpose described.

418,407. WELL-DRILLING MACHINE. JOHN W. MILLER, Newton Falls, Ohio, assignor of two-sevenths to ERNEST A. DAVIS, same place. Filed June 21, 1889. Serial No. 315,128. (No model.)

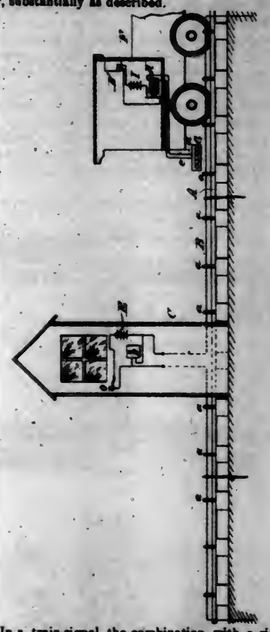
Claim.—The combination, in a drilling-machine, with the winding-drum and the revolving operating-shaft carrying an eccentric pul-

ley caught in a bight or loop of the rope, of a pulley placed in a bight or loop of the rope between the operating-pulley and the winding-drum, the two pulleys being arranged in the same plane, substantially as and for the purpose described.

418,408. HORSESHOE. ERSKEW A. MUSSER and JOHN S. ROWELL, Beaver Dam, Wis. Filed June 27, 1889. Serial No. 315,833. (No model.)

Claim.—1. The improved horseshoe herein described, consisting of upper and lower sections, with elastic cushions between and rivets connecting the two sections, the rivets being stopped short of the upper surface of the upper section to permit the lower section to rise toward the upper section without bringing the rivets in contact with the horse's hoof, substantially as shown and described.

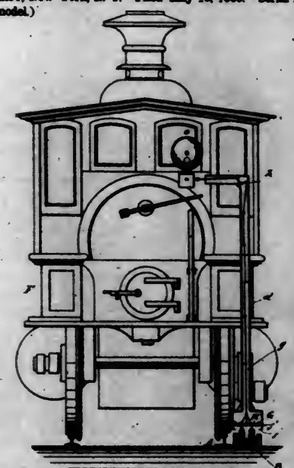
2. The improved horseshoe herein described, comprising upper and lower sections A and C, a cushion arranged between said sections, and connecting-rivets passing loosely through countersunk openings in such sections and having their upper ends below the upper surface of the upper section to permit vertical play, whereby the rear portion of sections A and C may move vertically independent of each other, the toe-piece D, and rivets E^3, tightly riveted through openings in front ends of said sections and ends of toe-piece, forming a non-elastic hinged toe, substantially as set forth.



3. In an elastic horseshoe, the combination, with a solid toe-piece, of upper and lower sections with cushion between, and rivets movably connecting them together over cushion, and rivets firmly holding them together upon the solid toe-piece, substantially as described.

418,409. RAILWAY TRAIN-SIGNAL. DANIEL S. MCELROY, New York, N. Y. Filed Feb. 26, 1889. Serial No. 301,429. (No model.)

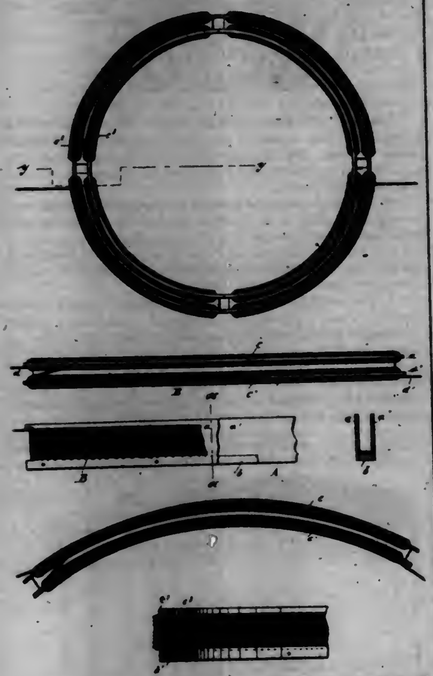
Claim.—1. In a train-signal, the combination of a plate M, provided with windows A and arms *m*, spring-actuated mechanism for rotating the said plate, the magnet J, the lever N, provided with the stud *o*, adapted to engage the arms *m*, and the spring *p* for retracting the said lever N, substantially as specified.



2. In a railway train-signaling system, the combination, with a signal-box D', provided with an opening *e*, of a lamp *f*, arranged opposite the opening *e*, the plate M, provided with windows A and arms *m*, the magnet J, the lever N, provided with the stud *o*, and the spring *p*, for retracting the said lever N, substantially as specified.

3. In a train-signal, the combination, with the plate M, provided with the windows A and arms *m*, spring-actuated mechanism for rotating said plate, and an electro-magnetic releaser for releasing the said plate, of an electric generator, a transmitting-key, a conductor arranged parallel with the track, a series of induction-coils carried by the locomotive, a relay connected with the induction-coils, and a local circuit controlled by the relay and connected with the magnetic releaser, substantially as described.

4. In a train-signal, the combination, with a signal-box D', provided with an opening *e*, a lamp *f*, arranged opposite the opening *e*, the plate M, provided with the windows A and arms *m*, and means for rotating and releasing said plate, of an electric generator, a transmitting-key, a conductor arranged parallel with the track, induction-coils carried by the locomotive, a relay connected with the induction-coils, and a local circuit controlled by the relay and connected with the releasing mechanism, substantially as herein shown and described.



418,410. ELECTRO-MAGNETIC RAILWAY-SIGNAL. DANIEL S. MCELROY, New York, N. Y. Filed May 16, 1889. Serial No. 310,962. (No model.)

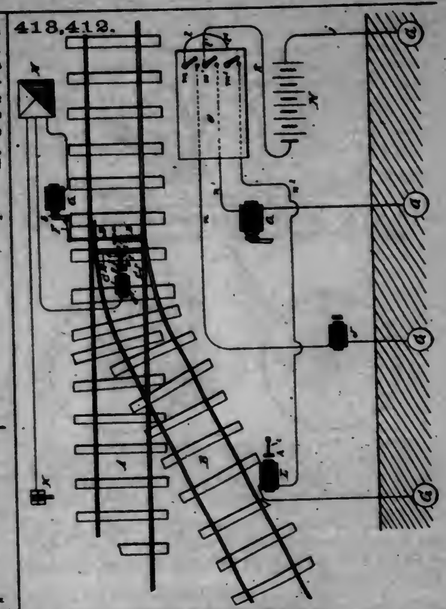
Claim.—1. In an electro-magnetic railway-signal, the combination of a series of electro-magnets arranged parallel with the track, an alarm device carried by the locomotive, a chain connected to the alarm device, and an armature connected to and supported by the chain within the influence of the magnets, substantially as described.

2. In an electro-magnetic railway-signal, the combination, with a locomotive and a series of elongated electro-magnets arranged parallel with the track, of the alarm *c*, carried by the locomotive, the tube *d*, secured to the locomotive and provided at its lower end with the box G, having stops *f f'*, the bell-crank A in the upper end of the tube and connected to the alarm, the chain *g*, connected to the bell-crank, and the armature H within the box G and connected to the lower end of the said chain, substantially as herein shown and described.

418,411. ELECTRO-MAGNET. DANIEL S. MCELROY, New York, N. Y. Filed May 16, 1889. Serial No. 310,963. (No model.)

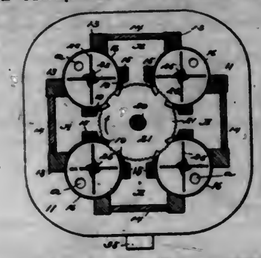
Claim.—1. An electro-magnet consisting of a yoke provided with side extensions, and coils wound on the said side extensions, the ends of the yoke and side extensions projecting beyond the coils, whereby provision is made for connecting a series of magnets together, substantially as described.

2. An electro-magnet consisting of a curved yoke provided with side extensions, and coils wound on said extensions, the ends of the yoke and side extensions projecting beyond the coils, substantially as and for the purpose set forth.



3. A circular magnet consisting of a series of sections, each formed of an annular yoke having extensions, and coils wound on the said extensions, substantially as specified.

4. A circular magnet consisting of a series of sections, each formed of a curved yoke having side extensions, and coils wound on the side extensions, the ends of the yoke and side extensions projecting beyond the coils, and the several sections being united, substantially as described.



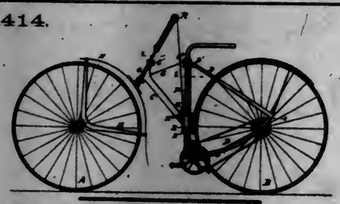
418,412. ELECTRICALLY-OPERATED RAILWAY-SWITCH. DANIEL S. MCELROY, New York, N. Y. Filed June 4, 1889. Serial No. 313,048. (No model.)

Claim.—The combination, with movable switch-rails, of a shifting-bar connecting the same, a spring and electro-magnet for alternately shifting the bar in opposite directions, an additional bar connecting each rails and provided with apertures, a spring-actuated bolt for locking the latter bar, an armature firmly and directly secured to the said locking-bar, and a separate and independent magnet directly controlling such armature, substantially as herein shown and described.

418,412.

418,418. COTTON-SEED LIFTER. EDWARD J. O'BRIEN, Texarkana, Ark. Filed Apr. 3, 1889. Serial No. 305,857. (No model.)

Claim.—1. The combination, with two or more cotton-seed-receiving chambers, of a vertical shaft, saws carried thereby, agitators arranged within the cotton-seed-receiving chambers, and means for driving the agitators, substantially as described.



2. In a cotton-seed lister, the combination, with a structure including lint-chambers A and chambers arranged to receive cotton-seed, of a central saw-carrying shaft, saws carried by the shaft and arranged to enter the cotton-seed-receiving chambers, a trough arranged beneath the cotton-seed-receiving chambers, an endless belt provided with wings which enter said trough, and a means for driving the belt, as and for the purpose stated.

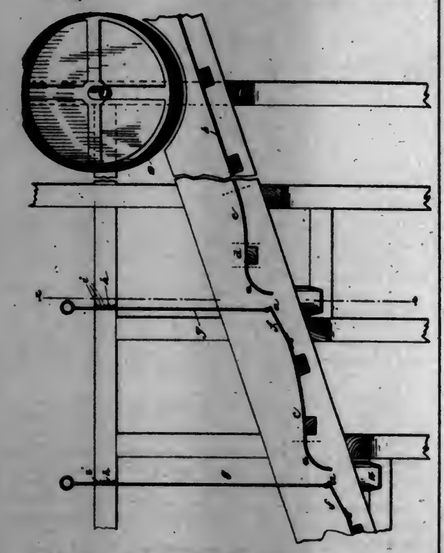
3. In a cotton-seed lister, the combination, with a structure containing chambers A, and other chambers adapted to receive cotton-seed, of shafts mounted within the cotton-seed-receiving chambers, blades or arms carried by said shafts, a central shaft, a series of saws carried thereby, a trough arranged beneath the cotton-seed chambers, communication being established between the trough and the chambers, an endless carrier-belt, wings carried by said belt and arranged to enter the trough, a delivery-spout, and driving mechanism, substantially as described.

418,414. BICYCLE. THOMAS O'BRIEN, New York, N. Y. Filed June 10, 1889. Serial No. 313,724. (No model.)

Claim.—In a bicycle or other velocipede, the combination, with the wheels A B, forks M M, mud-guard N, and steering-standard O, of the spine C C and neck G', made in one piece, standard F, ring K, split sleeve E, bolt E', and nuts E^2 E^3, slotted piece H, bolt H', and stop-pin H^2, forks D D, brace G, and split ring G^2, substantially as specified.

418,414.

418,415. BICYCLE. THOMAS O'BRIEN, New York, N. Y. Filed Aug. 20, 1889. Serial No. 321,431. (No model.)



Claim.—1. The combination, in a bicycle, with wheels A B, of the backbone or spine C C', the split clamping-sleeve H, formed to receive the dovetail E', the strengthening-piece E, the dovetail E', the forks D D, forged to the clamping-sleeve H, and the fast ring K as a stop, substantially as specified.

2. The combination, in a bicycle, with the wheels A B, of the tube C', which is received within the clamping-sleeve H, the forks D D, the bolt F', the nuts F' F², the dovetail E', and curved spine C, substantially as specified.

3. The combination, in a bicycle, with the wheel A B and connecting-frame, of the forks M, made of or in one piece, to which the mud-guard N is secured, substantially as specified.

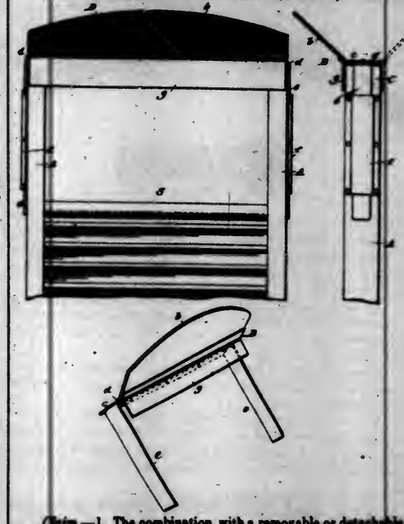
418,416. COAL-SEPARATOR. THOMAS H. PHILLIPS and JOHN R. EVANS, Wilkes-Barré, Pa. Filed Feb. 12, 1889. Serial No. 299,585. (No model.)

Claim.—1. A chute for coal-separators, having its bottom formed in sections each having reverse curves, the convex portion being at the lower end, and provided with an opening adjacent to the said convex portion, substantially as described.

2. A chute for coal-separators, having its bottom formed in sections each having reverse curves, the convex portion being at the lower end, and provided with an opening adjacent to the said convex portion and with an adjustable apron hinged below the plane of the convex portion and partially closing the said opening, substantially as herein shown and described.

3. A chute for coal-separators, having its bottom *b* formed with the concave curve *c* and the convex curve *e*, and provided with the opening *a*, in combination with the apron *f*, the rod *g*, connected to the apron, and means for locking the rod in position, substantially as herein shown and described.

418,417. DOUGH MIXER AND KNEADER. DUDLEY G. STONE, Hegansport, Mich. Filed Apr. 6, 1889. Serial No. 306,166. (No model.)



Claim.—1. In a dough mixer and kneader, the combination, with a supporting-frame, of a swivel secured in the frame, and the lever 30, loosely and removably connected to the swivel and provided with the mixer 25 and the kneader 26, projecting from opposite sides thereof, substantially as described.

2. In a dough mixer and kneader, the combination, with the supporting frame 10 12, of the table 20, mounted to turn on the said frame, and the lever 30, having one end connected to the frame by a swiveled connection and provided with the mixer 25 and kneader 26, the said mixer and kneader projecting from opposite sides of the lever, substantially as herein shown and described.

3. The combination, with a revoluble table, of hooks carried thereby, a mixing-pan arranged to be engaged by said hooks, a frame 12, a block 13, mounted on vertical trunnions and supported by the frame, a block 15, mounted on horizontal trunnions which ride in apertures formed in the block 13, a lever 30, a combined mixer and kneader carried thereby, and a projection 32 formed thereon, said projection being arranged to enter an aperture formed in the block 15, substantially as described.

418,418. WASH-BOARD. DUDLEY G. STONE, Hegansport, Mich. Filed July 22, 1889. Serial No. 318,260. (No model.)

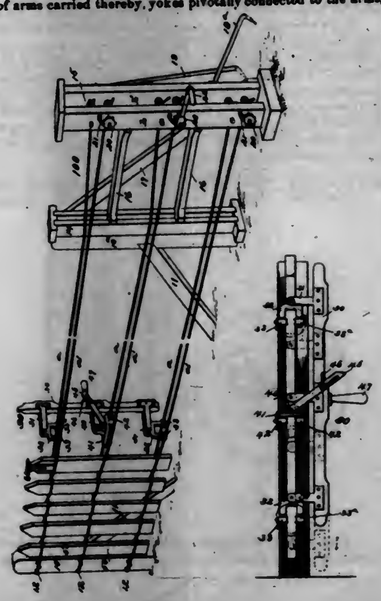
Claim.—1. The combination, with a removable or detachable and reversible wash-board protector, substantially as described, and having an inclined upper shield and supporting side legs, of sockets adapted to be carried by said board and constructed to receive said legs down within or through them, as set forth.

2. As a new article of manufacture, the within-described wash-board protector, consisting of the inclined shield *b*, base-piece *c*, downwardly-projecting flange *g*, and attached cross-strip *d*, having its ends bent down and forming legs *e e*, for attachment of the protector to the wash-board, as set forth.

418,419. BOOT OR SHOE HEEL. CARL A. STRASSER, Baltimore, Md., assignor of one-half to Joseph Schreuder, same place. Filed June 26, 1888. Serial No. 315,572. (No model.)

Claim.—1. The improvement in revolving heels herein described, comprising the metallic frame formed of an upper section having a central opening, a lower section having a central opening in register with that of the upper section, and provided at the lower end of such opening with a circular recess *b*, and the axle-section having a head *d* fitting in the recess *b*, having a portion *d'* fitting in the central openings of the upper and lower sections, and provided at its upper end with a threaded or screw portion projected above the upper section and adapted to enter the sole or heel lifts, substantially as set forth.

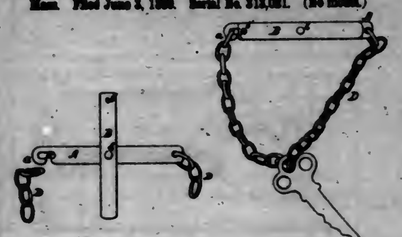
2. In a heel, substantially as described, the combination of the upper section, the lower section, the axle-section extended up through the lower section into the upper section, and the laterally-operating screw by which to secure such axle-section to the upper section, substantially as set forth.



3. An improved heel, substantially as described, consisting of the fixed upper section and an axle-section secured rigidly to such upper section and provided above the same with a screw portion to enter the sole or heel lifts, and the lower section suspended and journaled on the axle-section, substantially as set forth.

4. In a heel, substantially as described, the combination of the lower section, the upper section having a depending tubular portion resting on the lower section, the axle-section fitting in said sections, and the lateral screw turning through the tubular portion of the upper section and extending into the axle-section, substantially as set forth.

5. The improvement in heels, substantially as herein described and shown, consisting of the upper section having a central opening and a depending tubular portion, the lower section having a central opening and provided at the lower end thereof with a circular recess, the axle portion having a head *d* fitted in such recess, an axle portion fitting in the openings of the upper and lower sections and provided at its upper end with a threaded portion projected above the upper section, and the lateral connecting-screw turned through the tubular portion of the upper section and into the axle-section, substantially as set forth.

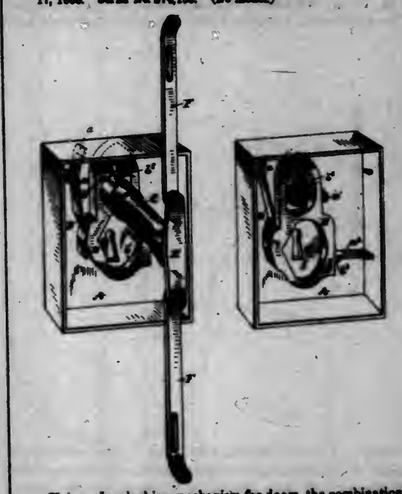


418,420. FENCE-MACHINE. HENRY M. TREMOFF and CHARLES O. TREMOFF, Pleasantville, assignors of one-third to Joseph P. Strickler, Pickerington, Ohio. Filed Aug. 6, 1888. Serial No. 319,913. (No model.)

Claim.—1. In a fence-building machine, the combination, with a strip, of arms carried thereby, yokes pivotally connected to the arms, sheaves carried by the yoke-arms, intermediate arms, a plate pivotally connected thereto, sheaves carried by the plate, and a catch arranged in connection with the plate, substantially as described.

2. In a fence-building machine, a wire-twisting machine consisting, essentially, of a strip 30, arms 31, carried thereby, yokes 32, pivotally supported by the arms, sheaves 33, carried by the yoke-arms, arms 40, a plate 41, pivotally connected thereto, sheaves 42, carried by the plate, a slotted catch 45, pivoted to the plate, and a keeper 46 on the strip and engaging the said slot, substantially as described.

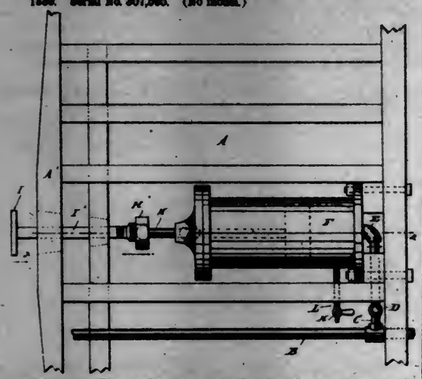
418,421. KEY-HOLDER. CHARLES E. VAN HORNAN, Waltham, Mass. Filed June 3, 1889. Serial No. 313,021. (No model.)



Claim.—1. In a key-holder device, the link or bar A, having in one end an eye to which the key-chain is attached, and having at its other end a hook or slot *d'* for receiving the free end of the chain, combined with the locking-bar B, adapted to close the chain-receiving slot, and a chain D, permanently attached to one end of said bar B, substantially as and for the purpose set forth.

2. In a key-holder device, the link or bar A, having a chain D permanently attached to one of its ends, and having at its other end a device for receiving the other end of said chain, combined with the safety-bar B, arranged upon the bar A, so that the said bar B may be moved crosswise to the bar A substantially as and for the purpose set forth.

3. In a key-holder device, the chain-bar A and chain D, attached to its ends, combined with the movable locking-bar B, connected to the said bar A and adapted to serve as a locking device for the chain D relative to the bar A, and as a means for preventing the keys from dropping off the chain while placing or removing the keys thereon, substantially as and for the purpose set forth.

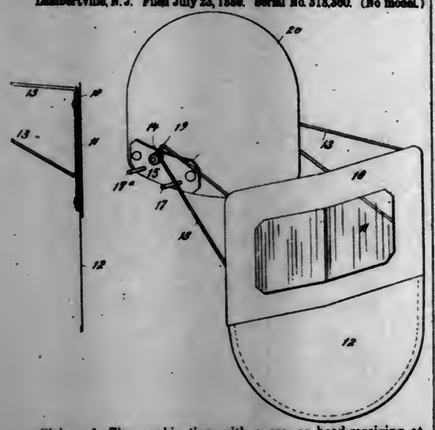


418,422. LATCH. WILLIAM A. WALKER, Racine, Wis. Filed May 17, 1888. Serial No. 274,135. (No model.)

Claim.—In a locking mechanism for doors, the combination, with two sliding bars, of a spindle provided with T-shaped arms engaging said bars, said spindle being circular in cross-section and provided with angular recesses, of a single locking-plate provided with shoulders for engaging the recesses in said spindle, said plate having also an aperture provided with bearing-faces to receive a key to actuate the same, and a projection *b'*, a spring bearing against one side of

said plate, and projections d' d^2 upon the opposite side of the plate, substantially as described.

413,423. CAR-BUFFER. FRANK S. WAY, Mount Vernon, Ill., assignor to himself and George R. Leonard, same place. Filed Apr. 17, 1889. Serial No. 307,665. (No model.)

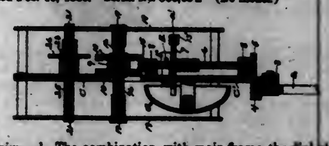


Claim.—1. The combination, with the air-cylinder, having an air-outlet pipe L N near its inner end, and the reciprocating piston and buffer, of the air-supply and pressure pipe B, its branch pipe C connecting with the inner end of cylinder, and the stop-cock D, applied to said branch pipe, as shown and described, whereby air-supply may be cut off from the cylinder and pressure in rear of the piston relieved, when required for the purpose of relieving pressure between buffers, for uncoupling, as specified.

2. The combination, with cylinder F, and the piston and buffer, of the air-outlet and stop-cock K, attached to the front end of said cylinder, and the air-supply pipe B C, connected with the other end of the same, as shown and described, whereby a vacuum may be formed in front of the piston, as and for the purpose specified.

3. The combination of the buffer and piston G with the air-cylinder F, having the lengthwise groove O located in its inner side and near its inner end, as shown and described, whereby the pressure in rear of piston is automatically relieved when the latter is near the inner limit of its stroke, as specified.

413,424. FIREMAN'S OR STOKER'S SHIELD. NIKOLAUS WEBER, Lambertville, N. J. Filed July 23, 1889. Serial No. 318,360. (No model.)



Claim.—1. The combination, with a cap or head-receiving attachment, of a frame having a transparent panel, and brackets carried by the frame and pivotally connected to the cap or head-receiving attachment, substantially as described.

2. The combination, with a cap provided with plates having studs 15 and projections 17 and 17^a, of a frame having a transparent panel, and brackets connected to the frame and mounted upon the studs 15, substantially as described.

3. The combination, with a cap provided with the plates 16, having studs 15 and projections 17 and 17^a, of a frame 10, a transparent panel 11, carried thereby, a flap 12, secured to the lower edge of the frame, and brackets 13, also secured to the frame and formed with eyes through which the studs 15 pass, substantially as described.

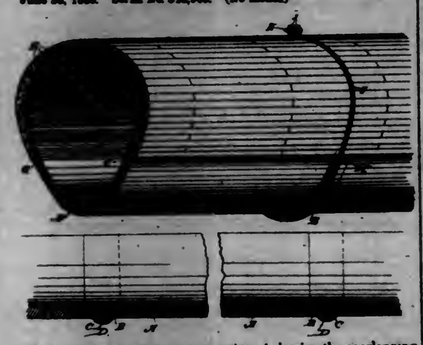
413,425. BILLIARD-REGISTER. OLIVER G. WILSON, Franklin, Ky. Filed Feb. 15, 1889. Serial No. 300,054. (No model.)

Claim.—1. The combination, with main frame, the dial-plates arranged at each side thereof, transverse shafts journaled in said frame, projected in opposite directions, extended through said dial-plates, and provided with indicator-hands, and cog-gears 10 10, mounted on the inner ends of said shaft, of the operating-shaft 2, provided with a gear 4, an intermediate shaft provided with a gear at its lower end engaging the gear 4, and a gear at its upper end engaging the gears 10 10, all arranged substantially as and for the purpose described.

2. In a billiard-register, the combination, with the main frame, a dial-plate mounted thereon, a transverse shaft journaled in said frame and extended through said dial-plate, and provided at its outer end with an indicator-hand adapted to traverse said dial and a gear-wheel 10 at its inner end, and the operating-shaft 2, provided with a gear 4 at its upper end, of the intermediate shaft 6, journaled in the frame, provided with a gear at its lower end engaging the gear 4, a gear at its upper end engaging the gear 10, a toothed disk mounted thereon, and a spring-actuated lever hinged at one end and engaging said disk at its forward end, substantially as and for the purpose specified.

3. In a billard-register, the combination, with the main frame, a gong, and a dial-plate mounted thereon, said dial-plate provided with a points-indicator scale, and a supplemental or game-register scale thereon, a transverse shaft 16, journaled in said frame and extended through said dial-plate, and provided at its outer end with an indicator-hand adapted to traverse said dial over the points-scale, a gear 10 at its inner end, provided with a projecting tooth 22, and the operating-shaft provided with a gear 4 at its upper end, of the intermediate shaft 6, journaled in the frame, provided with a gear at its lower end engaging the gear 4, a gear at its upper end engaging the gear 10, a toothed disk mounted thereon, a spring-actuated gong-lever hinged at its rear end and engaging the toothed disk at its forward end, and a transverse shaft 25, mounted over the shaft 16 in said frame and extended through the dial-plate, and provided with an indicator-hand traversing the game-register scale, and a toothed wheel mounted on its inner end adapted to be engaged by the tooth 22 on gear 10, substantially as and for the purpose hereinbefore described.

4. In a billiard-register essentially as described, the combination, with main frame and the dials mounted thereon, the transverse indicator-shafts, the main shaft 2, provided with an operating-knob at its lower end, a cog-gear 4 at its upper end, and the intermediate gear mechanism connecting said shaft with the indicator-shafts, of a spring-pawl secured to the main frame and engaging the gear 4, and a releasing-pawl hinged at one end, its opposite end adapted to be swung in rear of the spring-pawl and release same from engagement with the gear 4, substantially as and for the purpose described.

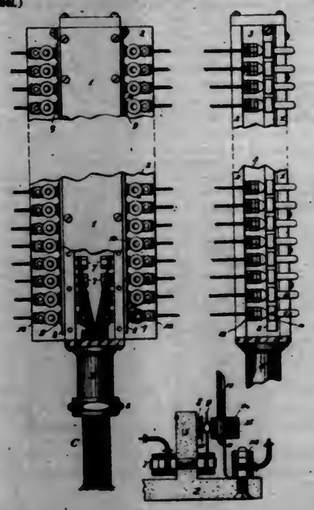


413,426. SKIRT-PROTECTING GARMENT. ELIZABETH R. WOOD, Topeka, Kans. Filed Feb. 19, 1889. Serial No. 300,484. (No model.)

Claim.—1. The combination, with the water-proof garment A, of the disk B, secured to the garment near the bottom thereof and provided with the openings *a*, the loops *c*, secured to the disk, the cross-straps d d', secured to the center of the disk and passing through the said loops, and provided with the rings *f* at their free ends, and the waistband *g*, passing through the said rings, substantially as described.

2. As an improved article of manufacture, the water-proof garment A, provided with the slitted disk B, having openings *a*, with puckering-strings *b*, the loops *c*, secured to the disk, and the cross-straps d d', secured to the center of the disk and passing through the said loops, and provided with the rings *f* at their free ends to receive a waistband, as set forth.

413,427. SEWER. HENRY ANDERSON, San Francisco, Cal. Filed June 26, 1889. Serial No. 315,505. (No model.)

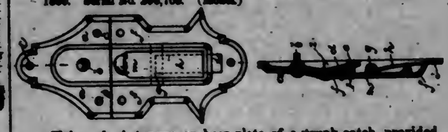


Claim.—1. The bottom sewer portions A, having the overlapping joints B, with the connecting portions C and D, substantially as herein described.

2. The sewer having the bottom formed of metallic sections united by joints, as shown, and the upper part formed of staves, brick-work, or concrete, in combination with the uniting or securing bands I, having the lower ends attached to the sections A, and a means for drawing them tight around the upper portion of the sewer, substantially as described.

413,428. PROCESS OF TREATING PYRITES CINDERS FOR THE MANUFACTURE OF PAINT. CHARLES ARNOUX, Bridgeport, Conn. Filed Mar. 13, 1889. Serial No. 303,120. (No specimens.)

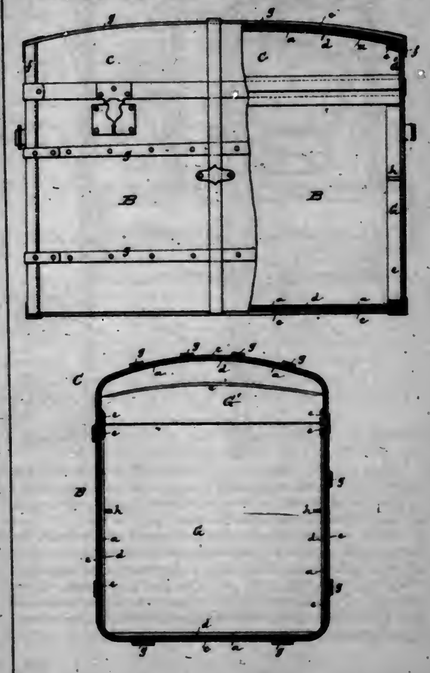
Claim.—The process, as above described, of manufacturing metallic paint from pyrites cinders by treating the same with a combination of carbonate of lime and salt, in proportions as given above, in an oxidizing dull-red heat.



413,429. CABLE TERMINAL HEAD AND PROTECTOR. ELIAS B. BAKER, New Haven, Conn. Filed May 23, 1889. Serial No. 311,773. (No model.)

Claim.—1. The improved connecting device consisting of the box-shaped terminal head having the bolts 7 passing through its sides and connected inside to the respective cable wires and on the outside having the spring-plates 9 fixed by one end thereto, a metal earth-bar facing the free ends of the row of spring-plates, and separately-removable interposed slips of non-conducting material, substantially as described.

2. The improved connecting device comprising, in a single structure, the box-shaped terminal head composed of front 1, sides 3, and widened back 2, binding-posts extending through the sides 3 and forming the terminals of the cable wires, local circuit binding-posts on the widened back provided with spring-blades 13, adapted when free to make contact with the cable terminals, and interposed removable safety-fuses mounted on the said spring-blades and forming the circuit between the cable and terminals and the spring-blades attached to the local circuit binding-posts.



413,480. TRUNK-CATCH. GEORGE M. BALLARD and SAMUEL MASON, Newark, N. J.; said Mason assignor to said Ballard. Filed Jan. 18, 1889. Serial No. 296,702. (Model.)

Claim.—1. A tongue or hasp-plate of a trunk-catch, provided with an independent pin of malleable metal, one end of said pin being firmly secured in said hasp by casting the body of the hasp around said end, the other end being adapted to serve as a rivet to secure said hasp to the trunk, as described, and for the purposes set forth.

2. In a trunk-catch, the combination, with the case-body thereof, of a cross-bar within said body at its upper end and made integral therewith, a seat or support at the lower end of said body, a spring one end of which rests on said cross-bar and the other end on said seat, a catch provided with an inwardly-projecting portion and held in position by said spring, and a socket in said body and above said catch adapted to receive and guide a tongue to said catch, and a socketed tongue, all said parts being arranged as described, and for the purposes set forth.

413,481. TRUNK. HENRY H. B. BERTH and PAUL M. B. BERTH, Paris, France. Filed June 14, 1889. Serial No. 314,195. (No model.)

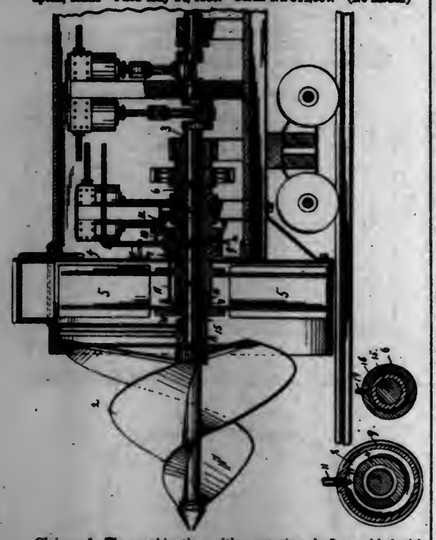
Claim.—1. The combination, with the body B, of the cover C, provided with the flanges *g* and *h*, and the bolts *i* and *j*, substantially as described.

2. The combination, with the body B, of the cover C, provided with the flanges *g* and *h*, the bolts *i* and *j*, and the lock *k*, substantially as described.

Claim.—1. As an improved article of manufacture, a trunk or similar receptacle having its sides and bottom formed in one piece from material consisting of narrow strips of wood united at their edges and covered with paper or the like, said strips being bent to form the bottom and sides of the trunk, as set forth.

2. As an improved article of manufacture, a trunk or similar receptacle having its sides, top, and bottom formed of a material consisting of narrow strips of wood with beveled edges united edge to edge and covered on both faces with paper, and strong sheet material cemented or glued to the wood, the fiber of the wood extending around the trunk, as set forth.

413,482. PURIFYING BRINES, WATER, &c. JOSEPH A. BRADBURN, EDWARD H. TRENT, and JOHN D. PERROCK, Syracuse, N. Y. Filed June 27, 1888. Serial No. 278,241. (No specimens.)



Claim.—1. The process for the purification of liquids consisting of the following steps, to wit: first, the commingling of sulphide of barium with the liquid; second, the passing of an excess of free carbonic-acid gas through the liquid; third, the decanting of the liquid so treated.

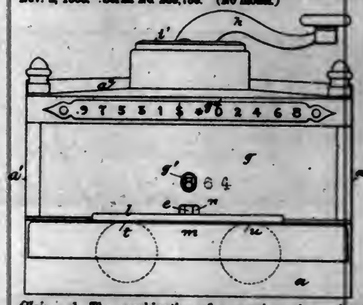
2. The process for the purification of liquid consisting of the following steps, to wit: first, the commingling of sulphide of barium with the liquid; second, the decanting of the liquid to recover the sulphide of barium; third, the passing of an excess of free carbonic-acid gas through the decanted liquid.

3. The process for the purification of liquids consisting of the following steps, to wit: first, the commingling of sulphide of barium with the liquid; second, the passing of an excess of free carbonic-acid gas through the liquid; third, the mixing of a soluble carbonate with the liquid to remove the calcium, magnesium, or barium present as chlorides.

4. The process for the purification of liquid consisting of the following steps, to wit: first, the commingling of sulphide of barium with the liquid; second, the decanting to recover the sulphate of barium; third, the passing of an excess of free carbonic-acid gas through the liquid; fourth, the mixing of a soluble carbonate with the liquid to remove the calcium and magnesium or barium present as chlorides.

413,483. ROTARY SNOW-PLOW. EDWARD P. CALDWELL, Minneapolis, Minn. Filed May 24, 1889. Serial No. 311,967. (No model.)

Claim.—1. The combination, with a rotating shaft provided with a suitable cutter, of a hollow shaft arranged upon said cutter-shaft, a fan upon said hollow shaft, and a steam-pipe connecting with the space between said hollow shaft and said cutter-shaft.



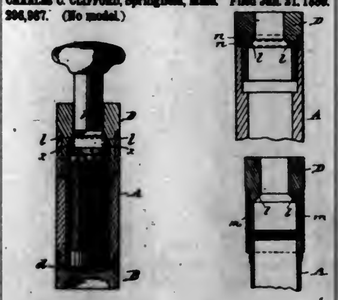
2. The combination, with the cutter-shaft 3, of the hollow fan-shaft arranged upon said cutter-shaft, and the steam-pipe connected with the interior of said hollow shaft at the forward portion thereof.

3. The combination, with the cutter-shaft 3, provided with the bushing 15, of the hollow fan-shaft 6, provided with the grooves 16 on its interior surface over said bushing, and the steam-pipe connecting said grooves, substantially as described.

4. The combination, with the cutter-shaft provided upon its exterior with the circular groove 8, of the stationary ring 9, covering said groove, the steam-pipe 11, connecting with said groove through said ring, and the steam-pipe 17, connecting said groove with the interior of said fan-shaft, substantially as described.

5. The combination, with the cutter-shaft 3, of the hollow fan-shaft mounted upon said cutter-shaft, and the bearing arranged in front of said fan-shaft and supporting said cutter-shaft and provided with a steam-pipe connecting with the space between said bearing and said cutter-shaft, substantially as described.

413,484. MACHINE FOR PUNCHING CHECKS. ANDREW CAMPBELL, Brooklyn, N. Y., assignor to William D. Elger, same place. Filed Nov. 2, 1888. Serial No. 289,786. (No model.)



Claim.—1. The combination of a punch-carrier and selecting-lever connected together, the notched dies in the carrier, a notched slide-bar provided with a grooved crown-piece, the groove in which is engaged by a branch on the selecting-lever, and an intermediate lever or part engaging the notch in said slide-bar, and also the notch in the punch at the cutting or punching point, substantially as set forth.

2. The combination, with a punch-carrier, of the notched punches therein, each provided with a supporting-pin, a fixed punch-supporting shelf on which said pins rest, said shelf having a guide-slot for said pins arranged at the punching or cutting point, and intermediate lever or part which engages the notch in the punch that stands at the punching-point, and a retracting spring under said intermediate part or lever, substantially as set forth.

3. The combination, with the selecting-lever, the punch-carrier, and the die-platform, all connected and adapted to move together, of the notched punches carried by said carrier and each provided with a supporting-pin, the punch-supporting shelf on which said pins rest, said shelf provided with a guide-slot at the punching-point for the passage of the pin on the punch, the notched guide-bar provided with a grooved crown-piece, an intermediate lever or part the end of which engages the notch in said bar and also the notch in the punch at the punching-point, the retracting-spring under said lever, and the dies, a branch on the selecting-lever engaging the groove in the crown-piece of said slide-bar, and all operating substantially as set forth.

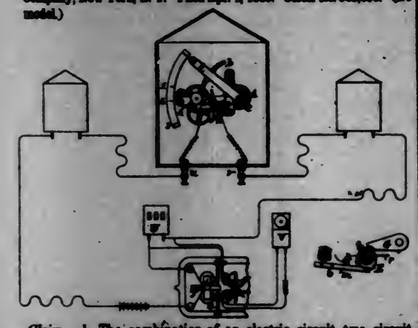
4. In a check-punch, the feeding mechanism consisting of the yoke *v* and its springs *w*, the guide-wheel *u*, mounted on said yoke, the feed-wheel *t*, its shaft *s*, which has a bearing in said yoke, the ratchet-wheel *r* on shaft *s*, the elbow-lever *o*, the pawl *q* thereon, engaging said ratchet-wheel, and the lever operating said elbow-lever, in combination with the rocking frame which bears on yoke *v*, the lever *w'*, which bears on said frame, and the depressing-button and rod, all arranged to operate substantially as set forth.

413,485. IMPLEMENT FOR LOADING AND RELOADING SHELLS. CHARLES C. CLIFFORD, Springfield, Mass. Filed Jan. 21, 1889. Serial No. 296,967. (No model.)

Claim.—1. The combination of a punch-carrier and selecting-lever connected together, the notched dies in the carrier, a notched slide-bar provided with a grooved crown-piece, the groove in which is engaged by a branch on the selecting-lever, and an intermediate lever or part engaging the notch in said slide-bar, and also the notch in the punch at the cutting or punching point, substantially as set forth.

2. The combination, with a punch-carrier, of the notched punches therein, each provided with a supporting-pin, a fixed punch-supporting shelf on which said pins rest, said shelf having a guide-slot for said pins arranged at the punching or cutting point, and intermediate lever or part which engages the notch in the punch that stands at the punching-point, and a retracting spring under said intermediate part or lever, substantially as set forth.

3. The combination, with the selecting-lever, the punch-carrier, and the die-platform, all connected and adapted to move together, of the notched punches carried by said carrier and each provided with a supporting-pin, the punch-supporting shelf on which said pins rest, said shelf provided with a guide-slot at the punching-point for the passage of the pin on the punch, the notched guide-bar provided with a grooved crown-piece, an intermediate lever or part the end of which engages the notch in said bar and also the notch in the punch at the punching-point, the retracting-spring under said lever, and the dies, a branch on the selecting-lever engaging the groove in the crown-piece of said slide-bar, and all operating substantially as set forth.



4. In a check-punch, the feeding mechanism consisting of the yoke *v* and its springs *w*, the guide-wheel *u*, mounted on said yoke, the feed-wheel *t*, its shaft *s*, which has a bearing in said yoke, the ratchet-wheel *r* on shaft *s*, the elbow-lever *o*, the pawl *q* thereon, engaging said ratchet-wheel, and the lever operating said elbow-lever, in combination with the rocking frame which bears on yoke *v*, the lever *w'*, which bears on said frame, and the depressing-button and rod, all arranged to operate substantially as set forth.

Claim.—1. In a cartridge-shell-crimping implement, in combination, the chambered cylinder for receiving and holding the shell therein, the removable crimping-head consisting of a block adapted to fit and freely move longitudinally in the end of said chambered cylinder, provided with a funnel-shaped aperture opening to one end thereof, the largest transverse area of which aperture is as great as the transverse area of said cylinder-chamber, said aperture terminating in an opening of less diameter than that of said cylinder-chamber, leading to the other end of said block, and the cylindrical crimping-stick adapted to be reciprocated through said reduced opening and within said crimping-head and cylinder-chamber and to lap the inwardly-deflected end portion of the shell in a return-bend upon the inner wall of said shell, substantially as described.

2. In a cartridge-shell-crimping implement, in combination, the chambered cylinder for receiving and holding the shell therein, the removable crimping-head consisting of a block adapted to fit and freely move longitudinally in the end of said chambered cylinder, provided with a funnel-shaped apertured opening to one end thereof, the largest transverse area of which aperture is as great as the transverse area of said cylinder-chamber, said aperture terminating in an opening of less diameter than that of said cylinder-chamber, leading to the other end of said block, means, substantially as described, whereby the said crimping-head may be adjusted longitudinally in and relatively to said cylinder, and the cylindrical crimping-stick adapted to be reciprocated through said reduced opening and within said crimping-head and cylinder-chamber and to lap the inwardly-deflected end portion of the shell in a return-bend upon the inner wall of said shell, substantially as described.

3. A shell-loading implement comprising the chambered cylinder A, the shell-retaining head fitting on and closing one end of said cylinder, the removable crimping-head consisting of a block adapted to fit and freely move longitudinally in the other end of said cylinder, provided with a funnel-shaped aperture the largest transverse area of which is as great as the transverse area of said cylinder-chamber, said aperture terminating in an opening leading to the other end of said block, of less diameter than that of said cylinder-chamber, and the crimping-stick adapted to be reciprocated through said reduced opening and within said crimping-head and cylinder-chamber and to lap the inwardly-deflected end portion of the shell in a return-bend upon the inner wall of the shell, substantially as described.

413,486. ELECTRIC SIGNALING APPARATUS. WILLIAM R. DUNCAN, Boston, Mass., assignor to The Gamewell Fire-Alarm Telegraph Company, New York, N. Y. Filed Apr. 1, 1889. Serial No. 305,690. (No model.)

Claim.—1. The combination of an electric circuit, two circuit-breakers operated successively at the transmitting-station, a shunt device for bringing one of said circuit-breakers into the circuit, the other circuit-breaker being normally in the circuit, clock-work at the receiving-station controlled by a magnet in the circuit, a short or local circuit at the receiving-station, and a circuit-closer *t'* for completing said local circuit, rotated by the action of said magnet and clock-work, substantially as and for the purposes set forth.

2. The combination of an electric circuit, three circuit-breakers operated successively at the transmitting-station, two shunt devices for bringing two of said circuit-breakers into the circuit, the other circuit-breaker being normally in the circuit, automatic mechanism at the receiving-station controlled by a magnet in the circuit, a visual indicator normally out out of said circuit, and a local circuit at the receiving-station, a circuit-closer *t'* in a shunt around said indicator, and a circuit-closer *t'* in said local circuit, said circuit-closers being operated by the action of said magnet and mechanism, substantially as and for the purposes set forth.

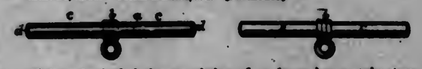
3. The combination of an electric circuit, two circuit-breakers operated successively at the transmitting-station, a shunt device for bringing one of said circuit-breakers into the circuit, the other circuit-breaker being normally in the circuit, automatic mechanism at the receiving-station controlled by a magnet in said circuit, a visual indicator normally out out of said circuit, and a circuit-closer *t'* for bringing said indicator into the circuit, said circuit-closer being in a shunt around the indicator and rotated by the action of said magnet and automatic mechanism, substantially as and for the purposes specified.

4. The combination of an electric circuit, two circuit-breakers, one normally in said circuit and the other in a shunt-circuit, two wheels to revolve together, each provided with one or more projections to operate said circuit-breakers, automatic mechanism for causing revolution of said wheels, a lever for closing the shunt-circuit, and a lever and a gear-segment on a spring or motor-shaft for causing action of said mechanism and for swinging said device for closing the shunt-circuit, substantially as described.

5. The combination of an electric circuit, three circuit-breakers, one normally in said circuit and each of the other circuit-breakers in a shunt-circuit, three wheels to revolve together, each provided with one or more projections to operate said circuit-breakers, automatic mechanism for causing revolution of said wheels, two independent levers for closing the shunt-circuits, and a lever and a gear-segment on a spring or motor-shaft for causing action of said mechanism and for swinging the levers for closing the shunt-circuits, substantially as and for the purposes set forth.

6. The combination of a wheel *n'*, provided with a notch *n'*, automatic mechanism for rotating said wheel, an electro-magnet for releasing said mechanism, an armature-lever and arm O thereof, a lever M, provided with a projection to enter said notch, an arm N, pivoted to the lever and providing a pawl, a wheel provided with ratchet-teeth for engagement with said pawl, and a circuit-closer on the shaft of said ratchet-wheel, substantially as described, and for the purposes set forth.

413,487. PROCESS OF PRODUCING FIRE-PROOF COVERINGS FOR WALLS AND CEILINGS. CARL F. W. DÖRINGER, Leipsic, Germany. Filed Nov. 27, 1888. Serial No. 292,012. (No specimens.)



Claim.—1. The improved process of producing a fire-proof covering for ceilings and walls, which consists in steeping laths in chloride of calcium and water-glass and then covering them with a plaster-retaining mixture, substantially as specified.

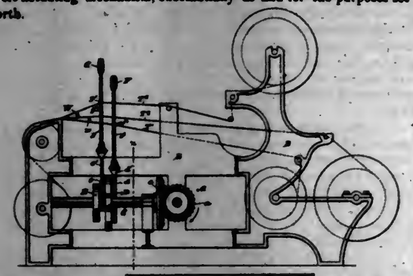
2. The improved process of producing a fire-proof covering for ceilings and walls, which consists in steeping laths in chloride of calcium and water-glass, then coating them with water-glass, baryta, and zinc powder, and finally covering them with sand, substantially as specified.

413,488. PROCESS OF MANUFACTURING BATTERY-ZINCS. FRANK P. ROGERS, San Francisco, Cal. Filed May 8, 1889. Serial No. 310,178. (No specimens.)

Claim.—The improvement in the process of manufacturing battery-zincs, consisting in pulverizing the zinc, applying thereto diluted sulphuric acid and mixing mercury therewith, and afterward compressing the mixture, without heat, into bars or forms, substantially as herein described.

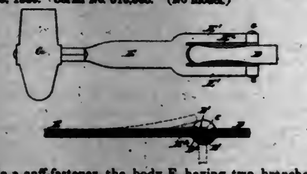
413,489. CHAIN-BAR. JOSEPH H. FARRELL, Providence, R. I. Filed Mar. 30, 1889. Serial No. 304,981. (No model.)

Claim.—1. A chain-bar consisting of an inner bar or tube, two tubular sleeves, each having one end closed, placed over the ends of the inner bar or tube, and a swivel placed on the inner bar or tube between the ends of the tubular sleeves, as described.



2. A chain-bar consisting of an inner bar or tube of inferior metal, a swivel of precious metal, and two tubular sleeves made of precious metal, each having one end closed, placed over the inner bar or tube and abutting against the swivel-piece, as a new article of manufacture.

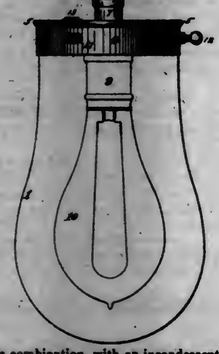
413,440. LOOM FOR WEAVING PILE FABRICS. ALEXANDER F. FIRTH, Brighouse, County of York, England. Filed May 20, 1889. Serial No. 311,602. (No model.)



Claim.—1. In a loom for weaving pile fabrics, the heald F, having the wires with eyes *f'*, mechanism for actuating said heald, the heald G, having wires with eyes *f f²*, and mechanism for actuating said heald, in combination with a lay, wire-actuating mechanism, and weft-actuating mechanism, substantially as and for the purposes set forth.

2. In a loom for weaving pile fabrics, the heald F, having wires with eyes *f'*, cam D, provided with two rising and two falling grades, connections between said heald and said cam, the heald G, having wires with eyes *f f²*, the cam E, and connections between said heald and said cam, in combination with a lay, wire-actuating mechanism, and

weft-actuating mechanism, substantially as and for the purposes set forth.

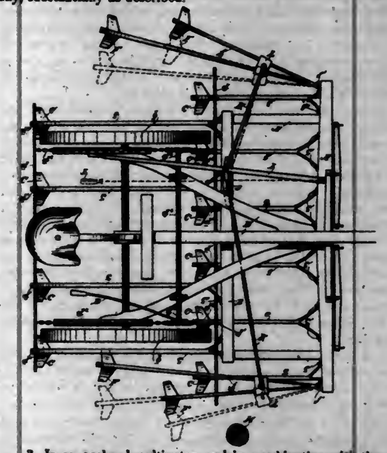


418,441. CUFF-FASTENER. HENRY C. FRANK, New York, N. Y. Filed July 3, 1889. Serial No. 316,005. (No model.)

Claim.—In a cuff-fastener, the body E, having two branches E' E, formed with eyes, and an intermediate branch E^3, formed of the same metal, adapted to serve as a spring, in combination with the pin *e*, hook D, having the cam-surfaces D' D^2, and a suitable clasp G, adapted to serve in engaging the cuff with the sleeve, substantially as herein specified.

418,442. INCANDESCENT LAMP. EMIL F. GEISSER, New York, N. Y., assignor to the E. P. Gleason Manufacturing Company, same place. Filed May 29, 1889. Serial No. 312,696. (No model.)

Claim.—1. The combination, with an incandescent lamp, of the globe 1, having inclined bayonet grooves 2, a metallic cap having the cylindrical portion 4, indentations 11, and the internal recess 5, with the packing ring or gasket 6, both said recess and ring or gasket being of larger diameter than said cylindrical portion of the cover, substantially as described.

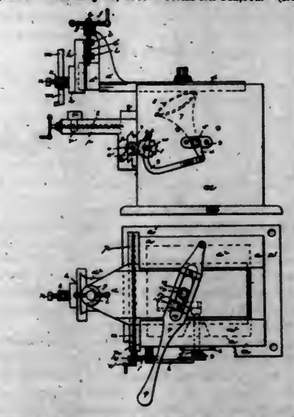


2. The combination of the metal cover or cap 4, having internal recess 5, indentations 11, and clamping-screw 12, nipple 7, nut 8, and incandescent lamp 10, with the outer inclosing-globe having the bayonet-slots 2, substantially as described.

3. The combination of the metal cover or cap 4, having indentations 11 and clamping-screw 12, and carrying the incandescent lamp 10, with the outer inclosing-globe having the indented or corrugated bayonet-slots 2, substantially as described.

418,448. ORCHARD-CULTIVATOR. LESLIE A. GREEN, San José, Cal., assignor of one-half to F. Plank, same place. Filed June 10, 1889. Serial No. 313,705. (No model.)

Claim.—1. In an orchard-cultivator, the main frame carrying the series of main teeth or lags, in combination with the laterally-swinging teeth F on each side of said main frame, a hand-lever, and connections from the hand-lever to the swinging teeth, whereby the latter may be laterally and vertically moved, substantially as described.

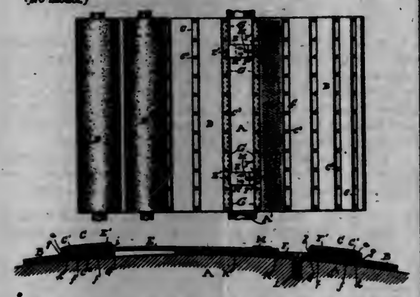


2. In an orchard-cultivator, the main frame and the main teeth carried thereby, in combination with the independent side teeth F, the standards or shanks *f* thereof, a pivotal connection between the forward ends of said standards or shanks and the frame, whereby said teeth may have a vertical and lateral movement, the pivoted lever I, and the connecting-rods K, whereby the said teeth are moved laterally, substantially as described.

3. In an orchard-cultivator, and in combination with the main frame having a series of main teeth, the pivotally-connected side teeth F on each side of said frame, the lever I and connecting-rods K, for effecting their lateral movement, and the lifting-rod, chains, eccentrics, rock-shaft, and lever for effecting their vertical movement, substantially as described.

4. An orchard-cultivator consisting of the wheeled frame, the frame A, supported from said wheeled frame by means of chains, pivotally-connected gravity teeth or lags carried by said last-named frame and in front of and behind the wheels, the pivotally-connected and swinging side teeth or lags F, the lever I and the connecting-rods K, for effecting the lateral movement of said side teeth or lags, and the lifting-rods, chains, eccentrics, rock-shaft, and lever for giving a vertical movement to all of the teeth or lags, substantially as described.

418,444. HAND PLANING-MACHINE. JACOB HANCHETT, Newark, N. J. Filed May 28, 1889. Serial No. 312,392. (No model.)



Claim.—1. The improved hand-planer herein described, combining therein a cutting mechanism, a supporting-carriage, and an automatic feed operated by the cutting mechanism, as set forth.

2. In a hand-planer, an automatic feed consisting of an operative lever in contact with the cutting mechanism and secured to a rocker-shaft, and a connecting-lever secured to said shaft and pivotally connected to one end of a reciprocating rod, the other end of said rod being pivoted to a pawl engaging a gear-wheel adapted to mesh into a gear-wheel on the feed-screw rod, as described, and for the purpose set forth.

3. In a hand-planer, a cutter-operating mechanism consisting of a slotted lever pivoted to said frame, a stud secured to the top of the sliding frame of the cutting mechanism, and a loose sleeve or collar on said stud and adapted and arranged to reciprocate in the slot in said lever, as described, and for the purpose set forth.

4. In a hand-planer, a cutter-operating mechanism consisting of a lever having an elongated slot, blocks adjustably secured in said slot, a stud secured to the top of the sliding frame of the cutting mechanism, and a loose sleeve or collar on said stud and adapted and arranged to reciprocate between said blocks in said slot, as described, and for the purpose set forth.

418,445. MECHANISM FOR ATTACHING SHEETS OF CARD-CLOTHING TOGETHER AND TO THE GRINDING-CYLINDER. WILLIAM HARRIS, Auburn, Mass. Filed May 20, 1889. Serial No. 311,468. (No model.)

Claim.—1. The combination, with a series of clamping-pieces C C^2, provided with holding-jaws *e g* and clamping-wings *f* A, respectively, of a series of sheets of card-clothing B, the sheets of card-clothing and clamping-pieces being arranged alternately and parallel to each other and held securely in such relative positions by screws C^2, substantially as and for the purposes described.

2. The combination of tightening-straps E and F, with their respective clamping-pieces C and C^2, substantially as and for the purposes set forth.

3. Clamp C, having one side provided with jaws *e g* and the other side provided with recesses, in combination with straps E F, strap E being provided with slots H, and perforated for attachment to its clamp, and strap F being provided with the series of holes I K, and perforations for attachment to its clamp and to the cylinder, substantially as described.

418,446. ROLLER-BEARING. REUBEN W. HENRY, San Francisco, Cal. Filed Mar. 25, 1889. Serial No. 304,642. (No model.)

Claim.—1. In a roller-bearing, the combination, with a series of bearing-rollers bearing on the central journal and the casing, and a series of separating-rollers keeping the bearing-rollers separate from each other, of a ring having a groove at its longitudinal center in one of its sides and recesses at its ends in its other side, and bearing in the groove or recesses in its outer side on journals of the bearing-rollers and in the groove or recesses in its inner side on journals of the separating-rollers, all substantially as set forth.

2. In a roller-bearing, the combination, with the central journal and the casing, of the series of rollers B, bearing on said journal and casing and having journals B^3, the series of rollers C, keeping the rollers B separate from each other and having journals C^3 and C^4, the ring E, having the groove *e* and the recesses *e'*, and the ring or rings F, bearing at their peripheries on the journals C^4, substantially as shown and described, and for the purposes set forth.

3. In a roller-bearing, the combination, with the central journal and the casing, of the series of bearing-rollers B, having journals B^3 and B^4, the series of separating-rollers C, bearing only on the journals B^3 and having journals C^3 and C^4, the ring E, having the groove *e* and the recesses *e'* and bearing in said groove and recesses on the journals B^3 and C^3, and the ring or rings F, bearing at their peripheries on the journals C^4, substantially as shown and described, and for the purposes set forth.

4. In a roller-bearing, the combination, with a series of bearing-rollers bearing on the central journal and the casing, and a series of separating-rollers keeping the bearing-rollers separate from each other, of a ring having a groove at its longitudinal center in one of its sides and recesses at its ends in its other side, and bearing in the groove or recesses in its outer side on journals of the bearing-rollers, and in the groove or recesses in its inner side on journals of the separating-rollers, and a ring bearing at its inner side or in a groove therein on journals of the bearing-rollers, all substantially as set forth.

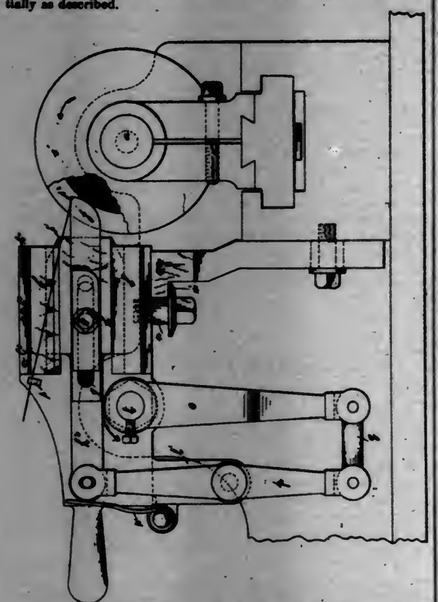
5. In a roller-bearing, the combination, with the central journal and the casing, of the series of rollers B, bearing on said journal and casing and having journals B^3, the series of rollers C, keeping the rollers B separate from each other and having journals C^3 and C^4, the ring E, having the groove *e* and the recesses *e'*, and the ring or rings F, bearing at their peripheries on the journals C^4, substantially as shown and described, and for the purposes set forth.

6. In a roller-bearing, the combination, with the central journal and the casing, of the series of bearing-rollers B, having journals B^3 and B^4, the series of separating-rollers C, bearing only on the journals B^3 and having journals C^3 and C^4, the ring E, having the groove *e* and the recesses *e'* and bearing in said groove and recesses on the journals B^3 and C^3, and the ring or rings F, bearing at their peripheries on the journals C^4, substantially as shown and described, and for the purposes set forth.

7. In a roller-bearing, the combination, with a series of bearing-rollers bearing on the central journal and the casing, and a series of separating-rollers keeping the bearing-rollers separate from each other, of a ring having a groove at its longitudinal center in one of its sides and recesses at its ends in its other side, and bearing in the groove or recesses in its outer side on journals of the bearing-rollers and in the groove or recesses in its inner side on journals of the separating-rollers, and a ring bearing at its inner side or in a groove therein on journals of the bearing-rollers, all substantially as set forth.

8. In a roller-bearing, the combination, with the central journal and the casing, of the series of rollers B, bearing on said journal and casing and having journals B^3, the series of rollers C, keeping the rollers B separate from each other and having journals C^3, the ring E, having the groove *e* and the recesses *e'* and bearing in said groove and recesses on the journals B^3 and C^3, and the ring or rings G, bearing at their inner sides on the journals B^4, substantially as shown and described, and for the purposes set forth.

9. In a roller-bearing, the combination, with the central journal and the casing, of the series of bearing-rollers B, having journals B^3, B^3, and B^4, the series of separating-rollers C, bearing only on the journals B^3 and having journals C^3, the ring E, having the groove *e* and the recesses *e'* and bearing in said groove and recesses on the journals B^3 and C^3, and the ring or rings G, bearing at their inner sides on the journals B^4, substantially as shown and described, and for the purposes set forth.



10. In a roller-bearing, the combination, with a series of bearing-rollers bearing on the central journal and the casing, and a series of separating-rollers keeping the bearing-rollers separate from each other, of a ring having a groove at its longitudinal center in one of its sides and recesses at its ends in its other side, and bearing in the groove or recesses in its outer side on journals of the bearing-rollers and in the groove or recesses in its inner side on journals of the separating-rollers, a ring or rings bearing at their peripheries on journals of the latter rollers, and a ring or rings bearing at their inner sides on journals of the bearing-rollers, all substantially as set forth.

11. In a roller-bearing, the combination, with the central journal and the casing, of the series of rollers B, bearing on said journal and casing and having journals B^3 and B^4, the series of rollers C, keeping the rollers B separate from each other and having journals C^3 and C^4, the ring E, having the groove *e* and the recesses *e'*, the ring or rings F, bearing at their peripheries on the journals C^4, and the ring or rings G, bearing at their inner sides on the journals B^4, substantially as shown and described, and for the purposes set forth.

12. In a roller-bearing, the combination, with the central journal and the casing, of the series of bearing-rollers B, having journals B^3, B^3, and B^4, the series of separating-rollers C, bearing only on the journals B^3 and having journals C^3 and C^4, the ring E, having the groove *e* and the recesses *e'* and bearing in said groove and recesses on the journals B^3 and C^3, the ring or rings F, bearing at their peripheries on the journals C^4, and the ring or rings G, bearing at their inner sides on the journals B^4, all substantially as shown and described.

418,447. MACHINE FOR WINDING THREAD ON SPOOLS. CHAS. HILL, Newark, N. J. Filed Aug. 3, 1889. Serial No. 319,674. (No model.)

Claim.—1. In a thread-winding machine, in combination, the spool-holder, the thread-guide, guideways supporting said thread-guide, wherein the same may move back from the spool in substantially a rectilinear course, and mechanism whereby the thread-guide is moved back on such guideways at the end of the traverse, substantially as described.

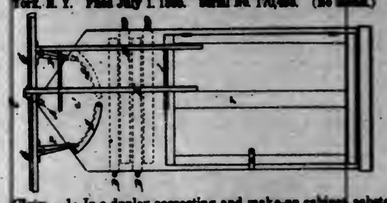
2. In a thread-winding machine, in combination, the spool-holder, the thread-guide, guideways whereby said thread-guide is supported and wherein it may move back from the spool in a substantially rectilinear course, the shaft *b*, mechanism controlled by the traverse-changer, whereby said shaft is rotated, and mechanism connecting said shaft with the thread-guide, whereby the thread-guide is caused to respond with a substantially rectilinear movement for each partial rotation of the shaft, substantially as described.

3. In a thread-winding machine, in combination, the spool-holder, the thread-guide, the carriage upon which the thread-guide is mounted, the traversing-shaft and the block mounted thereon provided with guideways wherein the carriage moves, and the rest whereby the rotation of said block is stayed, substantially as described.

4. In a thread-winding machine, in combination, the spool-holder, the thread-guide, the carriage upon which the thread-guide is mounted, the guideways whereby the carriage is compelled to move in substantially a rectilinear course, the spring whereby said carriage is impelled forward, and mechanism whereby the carriage is moved backward for each traverse of the thread-guide, substantially as described.

5. In a thread-winding machine, in combination, the spool-holder, the thread-guide, the carriage, adjustable connections between the thread-guide and the carriage, whereby the position of the thread-guide may be adjusted to suit various diameters of spools, the guideways whereby the carriage is held to move in a substantially rectilinear course, and mechanism whereby the carriage is moved backward intermittently to accommodate the accumulation of the thread upon the spools, substantially as described.

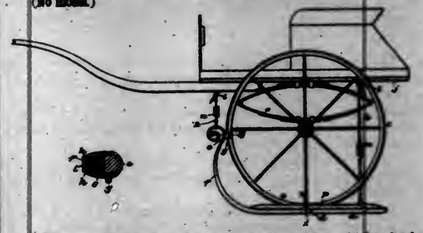
418,448. GAME APPARATUS. WILLIAM L. HOWER, Manhattan, Kans. Filed June 10, 1889. Serial No. 313,766. (No model.)



Claim.—1. As a game implement, a throwing-disk A, having series of concentrically-arranged openings *b b*, marked with various game-values, all substantially as set forth.

2. The combination of a throwing-disk, having concentrically-arranged openings of various game-values, with a rotating spear C, arranged substantially as and for the purpose specified.

3. The combination of the throwing-disk A, having concentrically-arranged openings of various game-values, spear C, base-stakes D, and station-pins B, for the purpose specified.



418,449. COMPOSITOR'S CABINET. LOUIS K. JOHNSON and ARBUCKLE A. LOW, Brooklyn, assignors to The Alden Type Machine Company, New York, N. Y. Filed July 1, 1889. Serial No. 170,493. (No model.)

Claim.—1. In a duplex correcting and make-up cabinet, substantially such as described, for compositors' use, the two galleys G G, hinged together and arranged back to back upon the top of the cabinet and adapted to be used either independently as separate inclined galleys or together as a common horizontal table, as and for the purpose described, in combination with means, substantially as described, for sustaining the said galleys in either position, as set forth.

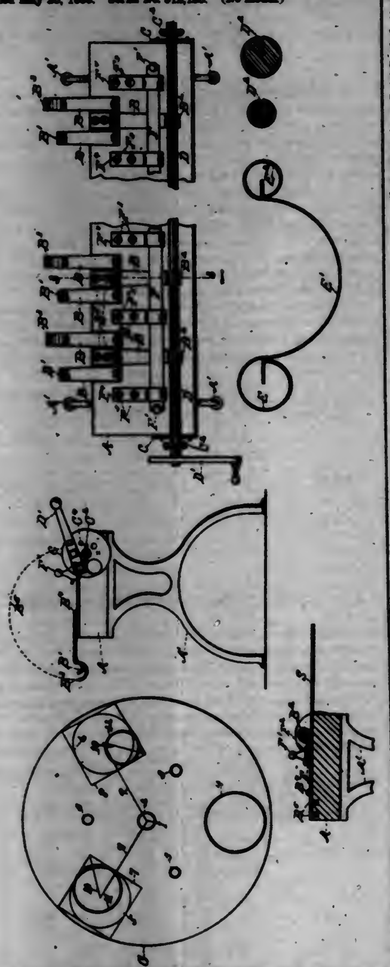
2. The two galleys pivotally connected at their edges, in combination with the pawl-braces and segmental racks arranged and operating substantially in the manner and for the purpose described.

418,450. RUNNER ATTACHMENT FOR VEHICLE-WHEELS. MOSES A. LINDER, Fullman, Ill. Filed Apr. 15, 1889. Serial No. 307,256. (No model.)

Claim.—1. The improved runner attachment for vehicle-wheels, consisting of a runner having the channel-way and binding-screw in the upper side, the clip and binding-screw on the goose-neck, and the tension-chains at the front and rear of the runner, respectively, and adapted to connect with the bed-frame of the wheel, and said channel-way and clip adapted to secure the wheel-rim, substantially as described.

2. The improved runner attachment for vehicle-wheels, consisting of a runner having the channel-way and binding-screw in the upper side, the clip and binding-screw on the goose-neck, and the tension-chains at the front and rear, respectively, said chains having tension-adjusting devices and adapted to connect with the bed-frame of the vehicle, and said channel-way and clip adapted to receive and secure the wheel-rim, substantially as described.

3. The combination, with the wheels of a vehicle, of a runner attachment to each wheel, consisting of a runner having the channel-way and binding-screw in the upper side, the clip and binding-screw on the goose-neck, and the tension-chains at the front and rear of the runner, respectively, said chains adapted to connect with the bed-frame of the vehicle, and said channel-way and clip adapted to receive and secure the wheel-rim, substantially as described.



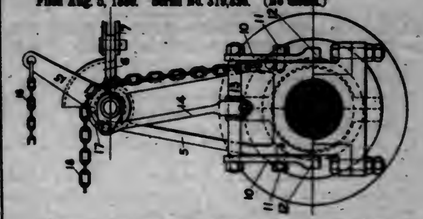
4. The combination, with the wheels of a vehicle, of a runner attachment to each wheel, consisting of a runner having the channel-way and binding-screw in the upper side, the clip and binding-screw on the goose-neck, and the tension-chains at the front and rear of the runner, respectively, said chains having tension-adjusting devices and adapted to connect with the bed-frame of the vehicle, and said channel-way and clip adapted to receive and secure the wheel-rim, substantially as described.

5. The combination, in a runner attachment for vehicle-wheels, of the runner *a*, the channel-bar *p*, attached to the upper side of the runner, and the binding-screw *d* in the side of the channel-bar, substantially as described.

6. The improvement in the construction of a runner attachment for vehicle-wheels, consisting of the runner *a*, having the goose-neck *f*,

the separately-constructed channel-bar *p*, attached to the upper side of the runner, and the clip *e*, attached to the goose-neck, said channel-bar and clip being adapted to receive the wheel-rim by rolling it along the channel, and having binding-screws in the sides, and all combined substantially as described.

418,451. SHEET-METAL-BENDING MACHINE. WILLIAM H. LOSE, Cohoes, N. Y., assignor of one-half to Stephen V. Lewis, same place. Filed May 25, 1889. Serial No. 312,126. (No model.)



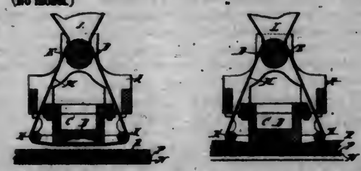
Claim.—1. In a sheet-metal-bending machine, a rotary mandrel provided with a longitudinal slot and means for communicating thereto a rotary movement, in combination with a supporting-bench, a series of former-clamps hinged to the bench, and means for holding such clamps to the mandrel, consisting of bar F and bar-clamps F', secured to the bench, all substantially as described.

2. In a sheet-metal-bending machine, a rotary mandrel provided with a longitudinal slot and means for communicating thereto a rotary movement, in combination with a supporting-bench, former-clamps differing in size and individually hinged to the bench, and means for holding to the mandrel such of said clamps as may be desired, while the others are swung back from the mandrel, consisting of the bar F and bar-clamps F, secured to the bench, substantially as described.

3. In a sheet-metal-bending machine, an adjustable mandrel-support consisting of a metallic plate having a central aperture, a plurality of pin-holes equidistant from the central aperture and from each other, and a plurality of different-sized mandrel-holes, the sides of which nearest the central aperture are equidistant therefrom, two supporting-pins adapted to enter such pin-holes, and a thumb-screw adapted to enter such central aperture and secure the plate upon such pins, in combination with the mandrel and a bed plate, substantially as described.

4. In a sheet-metal-bending machine, an adjustable mandrel-support consisting of a metallic plate having a central aperture, a plurality of pin-holes equidistant from the central aperture and from each other, and a plurality of different-sized mandrel-holes severally in contact with two similar sides of imaginary inclosing-squares, one of which sides is nearest the central aperture and equal to the diameter of the largest mandrel-hole, the several inclosing-squares inclosing and described about imaginary circles of the same diameter as the largest mandrel-hole, which circles are equidistant from the central aperture and from each other, one side of each square being at right angles to the radial line drawn from the center of the plate to the center of the larger circle about which the square is described, in combination with a thumb-screw, supporting-pins, and a mandrel, substantially as described.

418,452. CAR-BRAKE. ALBERT P. MASSEY, Watertown, N. Y. Filed Aug. 5, 1889. Serial No. 319,838. (No model.)



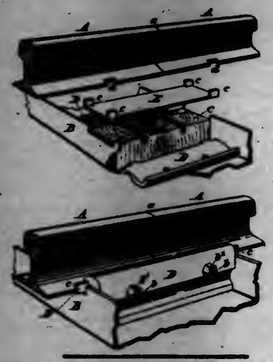
Claim.—1. In a car-brake, a sleeve on the axle with a projecting arm connected to the car-frame so that it cannot revolve, a pulley with a frictional face turning loosely on said sleeve, and a friction-disk clamped to the axle, in combination with said axle, and suitable means for pressing said pulley in contact with said disk, substantially as set forth.

2. In a car-brake, a chain barrel or pulley having a frictional face formed of a large number of wires, and turning freely on a sleeve which is restrained from turning with the axle, in combination with a friction-disk clamped to said axle, and suitable means for pressing said pulley in contact with said disk, substantially as set forth.

3. In a car-brake, the combination of bell-crank 15, rod 14, and levers 10 with pulley 8, sleeve 4, disk 2, and axle 1, substantially as set forth.

418,453. DIAPHRAGM-DIE FOR PLASTIC MOLDING. JAMES H. MITCHELL, Philadelphia, Pa. Filed Dec. 10, 1888. Serial No. 293,226. (No model.)

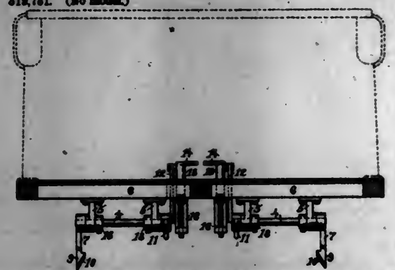
Claim.—1. The combination, with a reciprocating cutting and molding die and means for operating the same, of a movable elastic expelling diaphragm located between the face of the die and the material to be cut and molded and a flat unbroken support for said material, substantially as shown and described.



2. The combination, with a cutting and molding die, of a movable elastic expelling-diaphragm passing over the face of the die and a flat unbroken table or support beneath the face of the die, substantially as shown and described.

418,454. RAIL-JOINT PLATE. ISAAC S. MCCORMAN, Bergen Point, N. J., assignor to the Standard Metal Tie and Construction Company, of New Jersey. Filed Jan. 7, 1889. Serial No. 295,611. (No model.)

Claim.—1. The combination, with rails A A, metal tie B, block C, and clamps D D, of a flat rectangular rail-joint plate E, provided with vertical corner-lugs, substantially as and for the purpose described.



2. The combination, with rails A A, tie B, and clamps D D, of a rail-joint plate provided with vertical corner-lugs, substantially as herein shown and described, the distance between said lugs along a

side of the said plate being greater than the width of a clamp, as set forth.

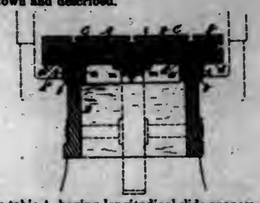
418,455. SWITCH-OPERATING DEVICE FOR STREET-CARS.

DANIEL J. MCGREER, Providence, R. I. Filed Aug. 5, 1889. Serial No. 319,781. (No model.)

Claim.—1. In a device for operating the switches of street-railways, the combination, with the platform of a car, of a shaft supported in suitable bearings below the platform, an arm secured to the outer end of said shaft, ending in a pointed wedge-shaped arm constructed to enter between the rail and the switch-tongue, the other end of the said shaft being connected with a foot-treadle held in the raised position by a spring, as described.

2. The combination, with arm 7, having the curved wedge-arm 8, the shaft 4, and the hangers 5, of the foot-treadle 14, the spring 17, the lever 11, and connecting-rod 12, as described.

3. In combination with the platform of a car, one or more switch-operating devices, consisting of the tube 13, pin 15, spring 17, the stirrup 16, connecting-rod 12, lever 11, shaft 4, hangers 5, and the arm 7, having the wedge-arm 8, bent at or nearly at right angle, as and for the purpose described.

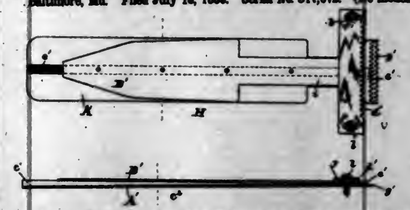


418,456. SATCHEL-LATCH. LOUIS OSWALD, Newark, N. J. Filed Mar. 5, 1889. Serial No. 301,945. (Model.)

Claim.—The combination, with a chambered and slotted plate adapted to be secured to the frame of a satchel, of a plate superposed and sliding upon said first-mentioned plate and provided with an inwardly-projecting boss and tang, which pass through and work in the slot in said plate first named, said tang being also adapted to pass through the satchel-frame and to engage with a catch therein to hold the satchel in a closed position, and a spring arranged to engage with the opposite sides of a projection, as described, whereby said tang is held into and out of holding engagement with said catch, said parts being arranged with relation to one another and operating substantially as and for the purposes set forth.

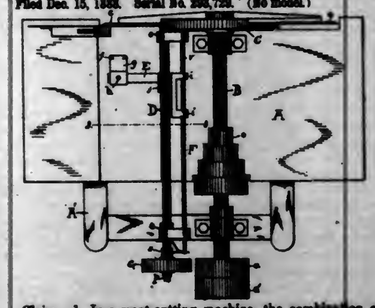
418,457. METAL-PLANING MACHINE. HENRY C. PRAIN, Worcester, Mass. Filed July 6, 1889. Serial No. 316,766. (No model.)

Claim.—1. The within-described table for metal-planing machines, having its slide-runners or tracks made hollow, with longitudinal chambers above the guiding-surfaces and embraced between two webs that join the tracks and main plate, and provided with openings at the ends and with passages from the chamber to the bearing-surfaces, substantially as shown and described.



2. The table A, having longitudinal slide-runners or tracks *a*, constructed with chambers C and two webs *d* between the track-surfaces and platen-surface or table-top, with porously-plugged passages *i* from said chambers to the guide-surfaces, the openings *e* into said chambers, provided with screw-stoppers E, and the rack T, connecting central webs *t t*, substantially as shown and described.

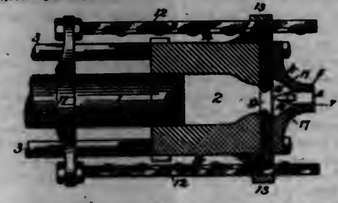
3. In a metal-planing machine, the table having slide-runners or tracks that are hollow, with longitudinal chambers C therein above the guiding-surfaces, provided with openings at the ends and with passages from said chambers to the sliding surfaces containing plugs of porous substance, in combination with the supporting-bed B, having guideways *b b*, on which said table is supported to have reciprocative sliding action, substantially as set forth.



4. The combination, with the supporting-frame B, having the guideways *b*, of the table having hollow tracks fitted to said guideways, the two side webs *d d* of said tracks projecting and overhanging the edges of the guideways at *d' d'*, substantially as and for the purpose set forth.

418,458. PAPER-BAG-TUBE CUTTER. FREDERICK B. PORTER, Baltimore, Md. Filed July 16, 1889. Serial No. 317,672. (No model.)

Claim.—The mandrel or former for paper-bag tubes, consisting of a lower and an upper plate A' B', united along their longitudinal centers and having between them tuck-grooves *c*' for the bellows fold, and each plate provided at its extremity with a serrated cutting-edge *g d*, the said edge *g* of the lower plate projecting beyond the edge *d* of the upper one, in combination with a knife J, fixed above the mandrel, and having its cutting-edge *d*' back from and so as to expose the said serrated edge *d* of the upper plate, for the purpose set forth.



418,459. MEAT-CUTTER. ROBERT B. PURPERHY, Baltimore, Md. Filed Dec. 15, 1888. Serial No. 293,723. (No model.)

Claim.—1. In a meat-cutting machine, the combination of the cutters, the table-top A, the feed-screw D, extending across the table-top, a rod F, parallel with the feed-screw, a slide-arm E, having at one end pivot-eyes which fit loosely and slide on the said rod, and having at the other end a head device to hold the meat, and provided intermediate of its ends with a half-nut or threaded part *j*, which fits on the feed-screw, for the purpose set forth.

2. In a meat-cutting machine, the combination of the cutters, the feed-screw D, a pulley G, loose on the feed-screw shaft and movable longitudinally, a clutch device to engage the pulley and feed-screw shaft, a rod F, parallel with the feed-screw, movable endwise and connected with the said pulley G and having a stop-shoulder *v*, a slide-arm E, pivoted loosely and so as to slide on the said rod and provided with a half-nut or threaded part *j*, which fits on the feed-screw, and a head device to hold the meat, for the purpose set forth.

418,460. APPARATUS FOR MANUFACTURING PLUMBERS' TRAPS. ALEXANDER B. ROBEY, Pittsburg, Pa., assignor of one-half to Thomas J. McNight, New York, N. Y. Filed Sept. 21, 1888. Serial No. 286,000. (No model.)

Claim.—1. In a lead-trap press, the combination, with the lead-cylinder having a contracted throat, of a transversely-movable valve-bar 8, having a central aperture 9, substantially coinciding with the throat-opening, and a die beyond said valve-bar, provided with a core 6, having its inner end wedge-shaped and provided with supporting-wings 16 between the valve-bar and die-orifice.

2. In a lead-trap press, the combination of the lead-cylinder having a contracted throat, a die opposite and having a core 6, whose inner end is wedge-shaped and provided with supporting-wings 16, and a removable valve-bar 8, having a central aperture 9, substantially coinciding with the throat-opening, said valve being located between the throat of the cylinder and the wedge-shaped core, and having its line of movement at right angles to the supporting-wings of the core, substantially as described.

3. In a lead-trap press, the combination of the lead-cylinder having a contracted throat, a movable valve-bar having a central aperture coinciding with said throat-opening, a core opposite the throat beyond the valve-bar, and having supporting-wings in a line transverse to the line of movement of the valve-bar, and a die having the two convergent faces 17 opposite the inner portion of the core.

4. In a lead-trap press, the combination, with the lead-cylinder, a movable plunger therein, the die, and a transversely-movable differentiating valve, of the controlling mechanism interposed between the said plunger and valve for communicating a transverse movement to the valve from the onward movement of the plunger, substantially as described.

5. In a lead-pipe press, the combination, with the lead-cylinder and die, of a transversely-movable differentiating valve and pattern-bars in contact with the ends of the valve and moved by the plunger of said cylinder, said pattern-bars having removable pattern-faces, substantially as described.

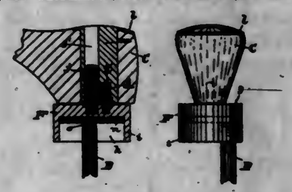
6. The combination of the cylinder 2 and its die, plunger 1, pattern-bars 12, fixed thereto, guides 13, removable undulating faces 14, and movable valve 8, adapted to be shifted by the undulations of said faces 14, substantially as described.

418,461. COAL-CART. JOSEPH R. SAGLE, Baltimore, Md. Filed Sept. 7, 1889. Serial No. 323,200. (No model.)

Claim.—1. The combination of the two reach-bars C, having their front and rear ends parallel and at the center curved or bent in toward each other, and also arched upward, two hanger-bars G, attached to the center of said reach-bars and hanging down between them, a plate N, resting on said hangers, a hopper-box D, and a lift-screw P, attached to the hopper-box and passing down through the plate.

2. The combination of the reach-bars C, two hanger-bars G, attached to the center of said reach-bars and hanging down between them, a plate N, resting on said hangers, an internally-screw-threaded pinion *r*, resting on said plate, a worm engaging the said pinion and mounted on a crank-shaft *s*', a hopper-box, and a lift-screw attached to the hopper-box and passing through said pinion.

418,462. REPAIRING DEVICE FOR BOTTLE-STOPPERS. JONAS J. SANDS, Morton, Wis. Filed May 13, 1889. Serial No. 310,895. (No model.)



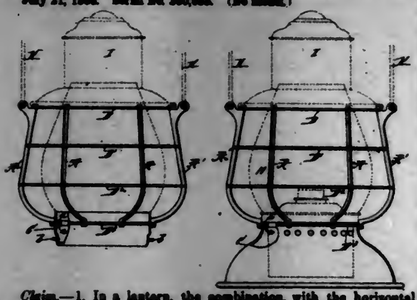
Claim.—1. The combination, with the walls of a vessel-orifice having an internal groove, and which is smaller inside of than outside of the groove, and with a stopper in the orifice, of a flexible metal holding-bar engaged at its ends with said groove, and a supporting-plate separate from the holding-bar and inserted beneath said holding-bar, said plate being larger than that part of the orifice inside of the groove, substantially as described.

2. The combination, with the walls of a vessel-orifice having an internal groove, and which is smaller inside than outside of the groove, and with a stopper in the orifice, of a flexible metal holding-bar engaged at its ends with the groove, and a supporting-plate of annular form separate from the holding-bar and inserted beneath said holding-bar, said plate being larger in diameter than that part of the orifice inside of the groove, substantially as described.

3. The combination, with the walls of a vessel-orifice having an internal groove, and which is smaller inside than outside of the groove, and with a stopper in the orifice, of a flexible holding-bar engaged at its ends with said groove and having a central aperture, and an annular supporting-plate separate from the holding-bar and inserted beneath said holding-bar, said supporting-plate being larger in diameter than that part of the orifice inside of the groove, substantially as described.

418,463. HEEL-SLUGGING MACHINE. HERMANN SCHENCK, Baltimore, Md. Filed Mar. 28, 1889. Serial No. 304,919. (No model.)

Claim.—1. In a heel-slugging machine, the combination, with the last-jack having a metal back *g* and screw-threaded studs *j k*, secured thereto, of the last C, provided with a metallic heel-plate *l* and block *m*, the vertical sockets *j' k'*, for the reception of the studs, whereby the last is held upon the jack, as described.



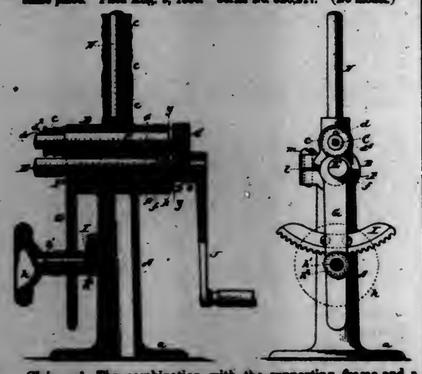
2. In a heel-slugging machine, the combination of the last-jack having a rim *i*, cavity *h*, and cushion *n*, which rests on the top of the post B, the studs *j k*, extending vertically from the top of the jack, and the last C, having vertical sockets *j' k'*, fitting over the said studs, whereby the last is held upon the jack, substantially as shown and described.

3. A last-jack for use with heel-slugging machines, consisting of a metal back *g*, provided with suitable means for attachment to the ankle part of a last and having projecting from the said back a rim *i*, forming a cavity *h*, and a cushion *n* in the said cavity.

4. A heel-slugging machine consisting of a jack having studs on its upper face portion and provided with a downwardly-projecting rim *i*, the walls of which form a cavity *h*, and a cushion located in said cavity, in combination with the ankle portion of a last having openings to receive said studs, and the post B, having its upper end inserted in said cavity, so as to bear against the cushion, whereby it can be moved freely on the cushion during the operation of slugging the top lift of the heel, substantially as specified.

5. In a heel-slugging machine, the combination, with the jack, made in the form of a shoe-heel and having a solid upper face portion *g* and a surrounding downwardly-projecting rim forming an interior opening or cavity *h*, of a cushion in said opening which bears against the under part of the face portion, said face portion being provided with vertical pins *j k*, and the last having the sockets *j' k'*, as shown and described, and for the purposes set forth.

418,464. LANTERN. FREEMAN D. STRAW, Brooklyn, N. Y. Filed July 21, 1888. Serial No. 280,693. (No model.)



Claim.—1. In a lantern, the combination, with the horizontal frame-ring B², secured to the upright guards, substantially as explained, of a body-hoop secured upon said frame-ring, substantially as and for the purposes set forth.

2. In a lantern, the combination, with the flat metal horizontal frame-ring notched upon and secured to the upright guards, of the body-hoop bent or buckled upon said flat metal ring, substantially as shown and described.

3. In a lantern, the combination, with the flat metal horizontal frame-ring secured upon the upright guards, of the body-hoop bent or buckled upon said flat metal ring and extended down to form the base or foot of the frame, substantially as shown and described.

418,465. MACHINE FOR ENLARGING FINGER-RINGS. CLARK A. STEPHENS, Buffalo, N. Y., assignor of one-half to William W. Oliver, same place. Filed Aug. 9, 1888. Serial No. 280,517. (No model.)

Claim.—1. The combination, with the supporting-frame and a roller-shaft journaled in said frame, of a rotary bearing arranged in said frame and a ring-supporting shaft journaled eccentrically in said bearing, substantially as set forth.

2. The combination, with the supporting-frame and a roller-shaft journaled in said frame and provided with a detachable roller, of a rotary bearing arranged in said frame parallel with the roller-shaft and a ring-supporting shaft journaled eccentrically in said bearing, substantially as set forth.

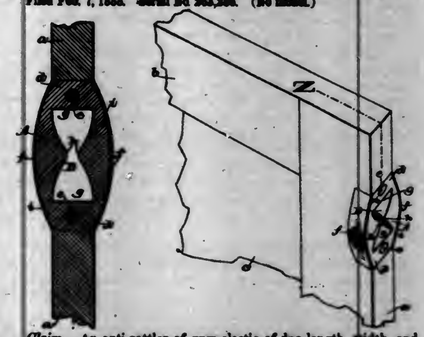
3. The combination, with the supporting-frame and a roller-shaft journaled in said frame, of a rotary bearing arranged in said frame parallel with the roller-shaft, a ring-supporting shaft journaled eccentrically in said bearing, and an arm or lever secured to said bearing, whereby the ring-supporting shaft is adjusted toward and from the roller-shaft, substantially as set forth.

4. The combination, with the supporting-frame and a roller-shaft journaled in said frame, of a roller detachably secured to one end of said shaft, a rotary bearing arranged in said frame parallel with the roller-shaft, a ring-supporting shaft journaled eccentrically in said bearing and having one of its ends arranged below the roller, and an arm secured to the bearing, whereby the ring-supporting shaft is adjusted toward and from the roller, substantially as set forth.

5. The combination, with the stationary frame, the roller-shaft and its roller, and the ring-supporting shaft, of the rotary bearing in which the ring-supporting shaft is eccentrically journaled, an arm secured to said bearing, a shaft and pinion mounted in said arm, and a gear-segment in which said pinion meshes, and which is secured to the stationary frame, substantially as set forth.

6. The combination, with the supporting-frame and a roller-shaft journaled in said frame, provided at one end with a detachable roller and its opposite end with a gear-wheel, of a rotary bearing arranged in said frame parallel with the roller-shaft, a ring-supporting shaft journaled eccentrically in said bearing, a gear-wheel secured to said ring-supporting shaft and meshing with the gear-wheel on the roller-shaft, and a hand-crank secured to one of said shafts, substantially as set forth.

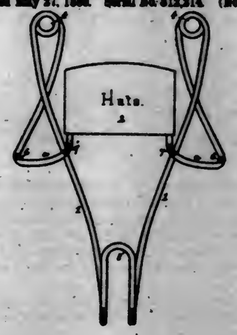
7. The combination, with the supporting-frame, the ring-supporting shaft, and the roller-shaft, of a detachable roller and an automatic locking-bolt, whereby the roller is attached to its shaft, substantially as set forth.



8. The combination, with the roller-shaft provided with a spring-bolt arranged in a radial opening formed in said shaft, of a detachable roller mounted loosely on said shaft and provided with a notch, in which the head of the spring-bolt engages, substantially as set forth.

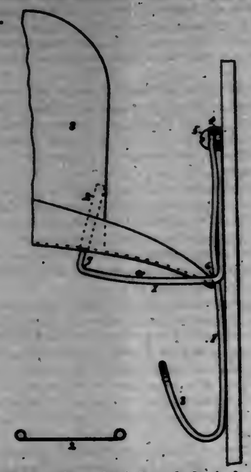
9. The combination, with the roller-shaft having a radial opening formed near one of its ends, of a spring-bolt seated in said opening and having its head beveled in the longitudinal direction of the shaft and a detachable roller mounted on said shaft and provided with a notch or recess, in which the head of the bolt engages, substantially as set forth.

10. The combination, with the stationary frame and the rotary bearing arranged therein, of a shaft journaled in said bearing and a detachable washer secured to the end of the bearing and projecting into a groove in the ring-supporting shaft, substantially as set forth.



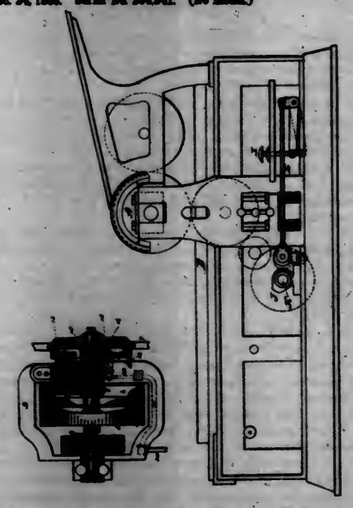
11. The combination, with the stationary frame and the rotary bearing arranged therein and provided at one end with a stop bearing against one side of the stationary frame, of a detachable washer secured to the opposite end of the bearing and bearing against the opposite side of the frame and a shaft journaled in said bearing, substantially as set forth.

418,466. SASH-HOLDER. FRANK W. TUCKER, Winthrop, Mass. Filed Feb. 7, 1888. Serial No. 263,266. (No model.)



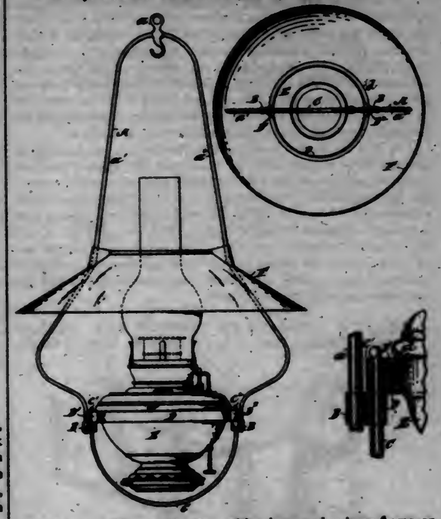
Claim.—An anti-rattler of gum-elastic of due length, width, and thickness to be inserted in the stile of the sash and formed with the swelled edges and having an interior opening therethrough, widened at its ends and narrowed at its middle by inward projections arranged to abut together when the sides are forced inward, substantially as specified.

418,467. HAT AND COAT HOOK. CHARLES L. WEBBER, Neenah, Wis. Filed May 27, 1889. Serial No. 312,314. (No model.)



418,467.

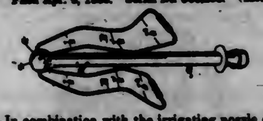
Claim.—1. A hat and coat hook formed of a single piece of wire, the wire being doubled to form the rounded top of the clothes-hook 3, the two branches of the wire extending upward, eyes formed therein for receiving screws for securing the device to a suitable support, the loops *a a* below said eyes, the bends 6 and 7 therein, and the plate 2, connecting the ends of the wire and forming a support between which and the body of the device a hat may be held by its rim, substantially as described.



2. A combined hat and coat hook consisting of a single piece of wire having the eyes 4 4, the loops *a a* below said eyes, the bends 6 and 7 therein, the extremities of the wire extending upward from said bends 7 and toward the body of the device and being connected one to the other, and the clothes-hook 3, depending from the eyes 4 4 and below the loops *a a*, substantially as described and shown.

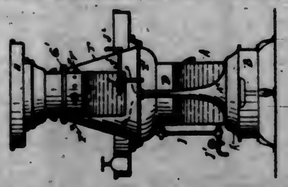
418,468. PRINTING-MACHINE. STEPHEN WHITTIER, Birmingham, Conn., assignor to the Whitlock Machine Company, same place. Filed Dec. 24, 1888. Serial No. 294,541. (No model.)

Claim.—The combination of the impression cylinder and reciprocating bed of a printing-press, a back-up mechanism substantially such as described, a cam on a revolving shaft at a position corresponding to a predetermined point at which it is desired to stop the back-up of the cylinder, and a connection from said back-up mechanism, substantially such as described, to a point in the path of the said cam, substantially as and for the purpose described.



418,469. HANGING LAMP. GEORGE W. WOODWARD, Brooklyn, assignor to the Ansonia Brass and Copper Company, New York, N. Y. Filed Sept. 15, 1888. Serial No. 285,026. (No model.)

Claim.—1. The combination, with a lamp and a lamp frame or harp, of one set of legs extending from the lamp frame or harp, another set of legs extending from the lamp-frost and resting upon the legs of the lamp frame or harp, pins extending from one set of legs, and sockets formed in the other set of legs for the reception of the pins, the pins being approximately of the length of the sockets formed for their reception, substantially as specified.

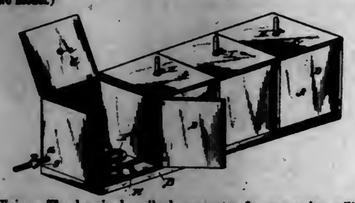


2. The combination, with a lamp frame or harp having side portions provided with clips, of a hand-piece secure to said clips and extending from beneath the lamp-bowl above the clips to form pins or projections, substantially as specified.

418,470. SPECULUM-IRRIGATOR. ELLIOTT H. WOOLSEY, Oakland, Cal. Filed Apr. 6, 1889. Serial No. 306,282. (Model.)

Claim.—In combination with the irrigating nozzle or tip, an expansion-frame composed of spring-wires secured at one end to the end of the nozzle or tip and having their other ends free, said wires having divergent portions *b*, for expanding the walls of the passage, convergent portions *b'*, serving as holds to keep the instrument in place, and divergent outer ends *b²*, for limiting the insertion of the instrument and holding the orifice or mouth of the passage open, substantially as described.

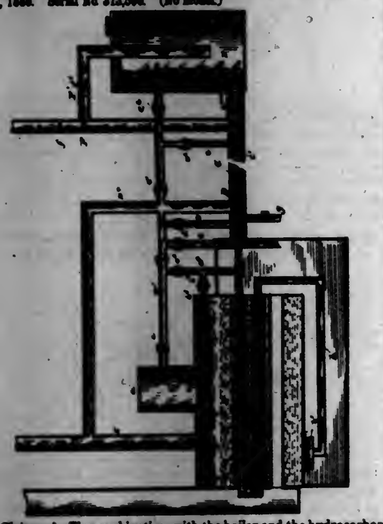
418,471. HOT-WATER URN. CHARLES SIEBERMANN, New York, N. Y. Filed Nov. 1, 1888. Serial No. 289,730. (No model.)



Claim.—1. In a hot-water urn, the combination, with a cylindrical vessel having an inverted-funnel-shaped bottom, of a tube extending upward from said bottom through the top of said vessel and serving as a flue for the products of combustion from a burner below said funnel-shaped bottom, an additional vessel supported above the upper end of the flue that extends upward from the inverted-funnel-shaped bottom of the lower vessel, whereby the products of combustion lav-

ing the top of the flue strike against the bottom of the upper vessel and heat the water in said upper vessel, said upper and lower vessels being connected, substantially as set forth.

2. In a hot-water urn, the combination, with a vessel having an inverted-funnel-shaped bottom, a tube extending upward and through the top of said vessel and forming a flue for the products of combustion from a burner below the inverted-funnel-shaped bottom, an apertured plate on said vessel, through the aperture of which plate the above-mentioned tube or flue passes, a tapering jacket resting on said plate, a vessel supported within said jacket and above the upper end of the tube or flue, and a valved pipe establishing communication between the upper and lower vessels, substantially as set forth.



3. In a hot-water urn, the combination, with a vessel having an inverted-funnel-shaped bottom, of a tube extending upward from said funnel-shaped bottom through the top of said vessel and forming a flue for the products of combustion from a burner below the inverted-funnel-shaped bottom, an additional vessel supported above the first-mentioned vessel and having its bottom above the upper end of said flue, whereby the products of combustion passing from the upper end of the flue strike the bottom of said vessel and heat the contents of said vessel, and a valved tube establishing communication with the two vessels, substantially as set forth.

418,472. APPARATUS FOR PRESERVING MILK. JOHN T. APPLEMAN, Knoxville, Tenn. Filed Feb. 15, 1889. Serial No. 299,974. (No model.)

Claim.—The herein-described apparatus for preserving milk by heating, the same consisting of a series of boxes, each adapted to contain a milk-can, having hinged tightly-fitting doors and covers and provided near the bottom with a horizontal coil of pipe adapted to support the can, and having a packed aperture in the hinged cover for the insertion of a thermometer or indicator, the several coils or supports of pipe (one for each box) communicating with one another to permit a flow of steam through the entire series, substantially as and for the purpose shown and set forth.

418,473. APPARATUS FOR BURNING HYDROCARBON OIL. WILLIAM S. RAGON and SAMUEL I. HOLMBERG, Tiffin, Ohio. Filed June 8, 1889. Serial No. 313,560. (No model.)

Claim.—1. The combination, with the boiler and the hydrocarbon tank or holder, of the series of steam-pipes connecting with the said tank or holder and vaporizing the hydrocarbon, an oil-pipe passing through a flue or flues of the boiler, and a steam-jacket surrounding the exposed portion of said oil-pipe, said steam-pipes having valved branch connections with the oil-pipe and the steam-jacket, substantially as specified.

2. The combination, with the boiler and oil or hydrocarbon holder, of the steam-pipes, the oil-pipes, and the steam-jacket including the exposed portion of said oil-pipe, one of said steam-pipes connecting with said jacket, said oil-pipe passing through the boiler flue or flues and under the boiler and having a burner connected thereto, substantially as set forth.

3. The combination, with the tubular boiler, and an oil tank or holder, of a steam-pipe connecting the steam-space of said boiler with said tank, an oil-pipe leading from the tank through the tubes of the boiler to the combustion-chamber, a steam-jacket surrounding the exposed portion of said oil-pipe, and a burner located under the boiler in the combustion-chamber and communicating with the oil-pipe, substantially as set forth.

4. The combination, with the boiler and oil or hydrocarbon holder, of the steam-pipes and oil-pipe, one of said steam-pipes connecting with and entering said oil-pipe and terminating or provided in the latter with a jet pipe or nozzle, said oil-pipe passing through a flue or flues of the boiler and under the boiler and having a burner connected thereto, and a steam-pipe connecting with the steam-chamber of the boiler and having a valved-pipe connection with the pipe leading from the live-steam chamber of the boiler to the oil-pipe, substantially as set forth.

5. The combination, with the boiler and oil-tank, of the series of steam-pipes, the oil-pipe, and the steam-jacket surrounding the exposed portion of said oil-pipe, said steam-pipes connecting with said jacket and the oil-pipe, one of said steam-pipes leading from the said jacket into and depending in said tank, the steam-pipe connecting the steam-chamber of the boiler with said holder, and a valved steam-pipe connecting with said steam-pipe and the oil-pipe, substantially as set forth.

418,474. COMBINED PLATE HOLDER AND RECEIVER. CLYDE C. BALLOU, Brooklyn, N. Y. Filed Mar. 30, 1889. Serial No. 305,263. (No model.)

Claim.—1. The combination, with a holder, of a detachable receiver secured thereto, a sliding frame for transferring the plates, and an automatically-operating recorder indirectly connected with the latter, substantially as set forth.

2. A plate or film holder constructed with a containing-frame, a sliding frame, and a rotating shaft indirectly connected with said sliding frame for the purpose of moving the same and releasing the plates from said containing-frame, substantially as set forth.

3. A plate or film holder constructed with a containing-frame, a sliding frame, a rotating shaft indirectly secured to the latter, and a recorder connected with said shaft, substantially as and for the purpose set forth.

4. The combination, with a holder, of a receiver removably secured thereto, a rotating shaft extending through said holder and having attached thereto a sliding frame for releasing the plates, and a recorder secured to the holder and connected with said shaft for automatically recording the number of plates transferred from said holder to the receiver.

5. In a plate or film holder, the combination of a containing-frame, a sliding frame moving thereon, sliding pins E, connected with said sliding frame, and rotating rod F, connected with said pins for imparting a reciprocating motion to said sliding frame, substantially as and for the purposes set forth.

6. In a plate or film holder, the combination, with the frames A B D, of the pins E, rod F, and keys G, all arranged and constructed to operate in the manner and for the purposes set forth.

7. In a plate or film holder, the combination, with a containing-frame, of a sliding frame, a rotating rod connected with the latter, a ratchet and pawl connected with said rod, and a recording-dial connected with said ratchet, substantially as and for the purposes set forth.

8. In a plate or film holder, the combination, with the frames A B D, of the rod F, indirectly connected with frame D for moving it laterally, and a recorder consisting of plates P Q, ratchet P', shaft P'', pawl S', and pointer R, substantially as and for the purposes set forth.

9. A plate or film holder constructed with a containing-frame, a sliding frame, frame J, and a spring for holding the front plate in position within the sliding frame and against the frame J, substantially as and for the purposes set forth.

10. In a plate or film holder, the combination, with a containing-frame, of a sliding frame, a rotating rod connected with said latter frame, and a turning and locking device H, for moving the rod and sliding frame and locking them in position, substantially as and for the purposes set forth.

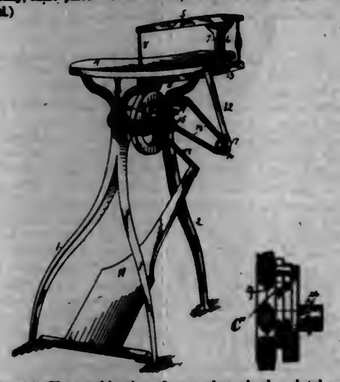
11. A plate or film holder constructed with the frames A B D, frame J, carrying slide J'', and spring M, for excluding light when the said slide is withdrawn, substantially as and for the purposes set forth.

12. A plate or film holder constructed with frame A, frame B, provided with slots B', frame D, provided with slots D' D'', pins E, fitting in said slots B' D' D'', keys G, and rod F, connected with said pins, substantially as and for the purposes set forth.

13. In a plate or film holder, the combination, with frame A and sliding frame D, of the rod F, indirectly connected with said sliding frame, turning and locking device A, connected with said rod, and automatic recorder, connected also with said rod, substantially as set forth.

14. A plate or film holder constructed with frame A, frame B, sliding frame D, and frame J, carrying the slide J'', and constructed with flanges J', serving as rests for the plates or films and as guides for said slide, substantially as and for the purposes set forth.

15. In a plate or film holder, the combination of frames A, B, D, and J, the latter being provided with a grooved removable piece or strip L and a spring M, all arranged substantially as set forth.



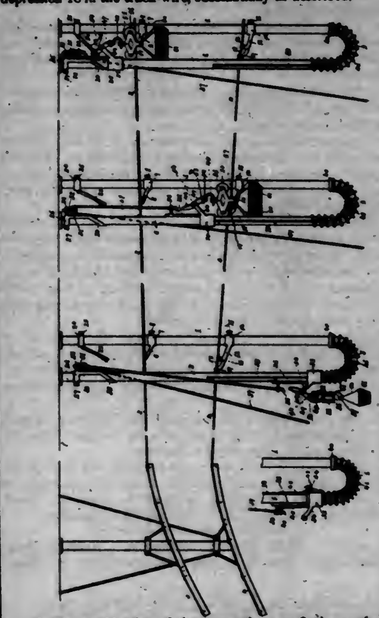
16. In a plate or film holder, the combination, with frames A, B, D, and J, of a plate or plates contained within the holder and bearing against flanges formed on frame J, a spring V, for holding them in position, and a receiver removably secured to the holder, substantially as and for the purposes set forth.

17. In a combined holder and receiver, the receiver constructed with the frames W J and slides X N', substantially as set forth.

18. A receiver constructed with frames W J, slides X N', and having springs W' W'', secured to inner side of frame W, substantially as set forth.

19. The combination, with a holder having slide J'', provided with cap J''' and slotted hinge J''', of a receiver having slide X, provided with a cap Y, slotted hinge Y'', and catch Z, substantially as set forth.

418,475. MECHANISM FOR OPERATING SCROLL-SAWS, &c. WILLIAM F BARNES, Rockford, Ill., assignor to the W. F. & John Barnes Company, same place. Filed Jan. 11, 1889. Serial No. 296,057. (No model.)



Claim.—1. The combination of a sprocket-wheel, a clutch mechanism carried by said wheel, a perforated belt engaging the sprockets of the wheel, mechanism for imparting motion to the belt intermediate its ends, and a take-up for the belt, substantially as set forth.

2. The combination of a sprocket-wheel, a clutch mechanism carried by said wheel, a perforated belt engaging the sprocket of the wheel, a foot-treadle for imparting motion to the belt, and a spring-actuated oscillating take-up arm engaging the belt intermediate its ends, substantially as set forth.

418,476. STORE-SERVICE APPARATUS. SAMUEL W. BABB, Mansfield, Ohio. Filed Apr. 4, 1889. Serial No. 305,948. (No model.)

Claim.—1. The combination of the supporting-arm 1, the track-wire 4, and the arm 13, secured to the supporting-arm and having fingers 16 and 17 of different heights for maintaining a depression 18 in the track-wire, substantially as described.

2. The combination of the supporting-arm 1, track-wire 4, and the arm 13, having the adjustable collar 14 and set-screw 15, and formed with fingers 16 and 17 of different height for maintaining a depression 18 in the track-wire, substantially as described.

3. The combination of the supporting-arm 2, the carrier-elevator having lever 47 provided with projection 48, and the tilting forked bar 23, hinged to the arm, substantially as described.

4. The combination of the supporting-arm 2, the carrier-elevator having lever 47, provided with projection 48, the adjustable collar 24, having set-screw 25, and the tilting forked bar 23, hinged to the collar, substantially as described

5. The combination of the supporting-arm 2, the sleeve 26, secured thereto, having projecting lug 28, longitudinal channel 29, and beveled portion 30, providing a flaring opening leading to the channel, and the pulley 31, having swiveled support 32 on the lug, substantially as described.

6. The combination of the supporting-arm 2, the carrier-elevator 33 free to slide thereon, having a projecting arm 34 and an upwardly-extending stem 35, formed with a lug 36, the lever 47, and the hook 49, substantially as described.

7. The combination of the cylindrical support, having the longitudinal strip 39 extending upward to a point above the lower track-wire, the carrier-elevator 33, having a longitudinal notch 38, means for elevating the carrier-elevator, and means for turning the latter above the strip, substantially as described.

8. The combination of the U-shaped support having arms 1 and 2 and bend 5 between the arms, the collar 40 on one arm, and the cushioning-spring 41, coiled around the bend, substantially as described.

9. The combination of the supporting-arms 1 and 2, having the bend 5, the flange 40, the cushioning-spring 41, the longitudinal guide-strip 39, and the carrier-elevator 33, having a longitudinal notch 38, substantially as described.

10. The combination of the supporting-arm 2, the cushioning-spring 41, the longitudinal strip 39, having teeth 42, the carrier-elevator 33, having a longitudinal notch 38, and the pawl 43, hinged to the carrier-elevator, having a ring 44, provided with an upwardly-extending stem 45, having a lug 46, substantially as described.

11. The combination of the supporting-arm 2, the cushioning-spring 41, the longitudinal strip 39, having teeth 42, the carrier-elevator 33, having a longitudinal notch 38, and an upwardly-extending arm 35, formed with a lug 36, and the pawl 43, hinged to the carrier-elevator, having a ring 44, provided with an upwardly-extending stem 45, formed with a lug 46, substantially as described.

12. The combination of the supporting-arms 1 and 2, having the bend 5, the flange 40, the cushioning-spring 41, the longitudinal strip

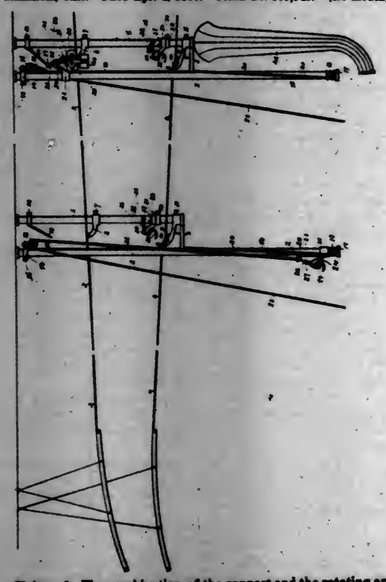
39, having teeth 42, the carrier-elevator 33, having a longitudinal notch 38, and an upwardly-extending stem 35, formed with a lug 36, and the pawl 43, hinged to the carrier-elevator having a ring 44, provided with an upwardly-extending stem 45, formed with a lug 46, substantially as described.

13. The combination of a carrier-frame 55, having grooved wheels 56, pendent hook 57, and cheek-plates 58, the block connected with the cheek-plates, and the carrier-elevator having a hook, substantially as described.

14. The combination of the carrier-elevator 33, having a projecting arm 34, the lever 47, pivoted to the arm formed with a projection 48, and the hook, substantially as described.

15. The combination of the carrier-elevator 33, having a projecting arm 34, the lever 47, and the hook 49, formed with curved prongs 50, having rearwardly-projecting teeth 51, and the cross-bar 52, having an eye 53, by which it is pivoted to the lower end of the lever, substantially as described.

16. The combination of the carrier-elevator 33, having a projecting arm 34, the lever 47, pivoted to the arm formed with a projection 48, and the tilting hinged forked arm 23, substantially as described.



17. The combination of the carrier-elevator 33, having an upwardly-extending stem 35, and the sleeve 26, having the longitudinal channel 29, and beveled portion 30, providing a flaring opening leading to the channel, substantially as described.

18. The combination of the carrier-elevator 33, having an upwardly-extending stem 35 and projecting arm 34, the lever 47, pivoted to the arm, the sleeve 26, having the longitudinal channel 29 and beveled portion 30, and the tilting hinged forked arm 23, substantially as described.

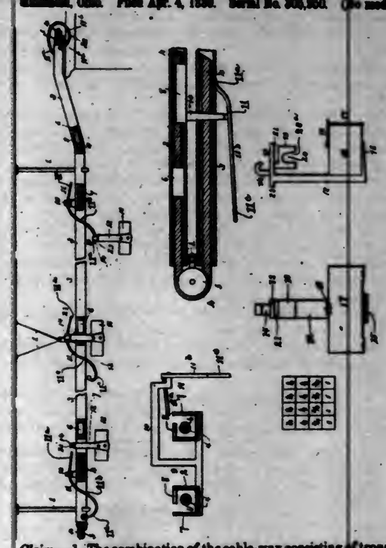
19. The combination of the carrier-frame 55, having grooved wheels 56, pendent hook 57 and cheek-plates 58, and the T-block 63, having knife-edges 64, substantially as described.

20. The combination of the carrier-frame 55, the T-block 63, having knife-edges 64, the carrier-elevator 33, having projecting arm 34, the lever 47, and the hook 49, having curved prongs 50, formed with rearwardly-projecting teeth 51, substantially as described.

418,477. STORE-SERVICE APPARATUS. SAMUEL W. BARR, Mansfield, Ohio. Filed Apr. 4, 1889. Serial No. 305,949. (No model.)

Claim.—1. The combination of the support and the rotating arm carrying the arresting and releasing hook, substantially as described.

2. The combination of the rigid support 1, having lug 36, the arm 32, carrying the arresting and releasing hook, the rod 35, connecting the hook with the lug, and the spring 37, connected at one end with the support and at the other end with the arm, substantially as described.



3. The combination of the rigid support 1, having lug 36, the arm 32, carrying the arresting and releasing hook 33, having pivoted jaw 34, the rod 35, connecting the jaw with the lug, and the spring 37, connected at one end with the support and at the other end with the arm, substantially as described.

4. The combination of the support 1, having lug 36 and the adjustable collar 29, with the arm carrying the arresting and releasing hook, substantially as described.
